391. Best treatment for massive pulmonary embolism:

- a. Intravenous tissue plasminogen activator
- b. Heparin
- c. Pulmonary thromboembolctomy
- d. Low molecular weight heparin + warfarin

392. What is the full form of ARIA?

- a. Allergic rhinitis induced asthma
- b. Allergic rhinitis and its impact on asthma
- c. Allergy rheumatology immunology and asthma
- d. Acetylcholine receptor inducing activity

393. Pneumatocele is commonly caused by:

- a. Streptococcus pneumoniae
- b. Haemophilus influenza
- c. Serratia marcescens
- d. Klebsiella pneumonia

394. Finger in glove sign is seen in?

- a. Pulmonary alveolar proteinosis
- b. Pneumocystis carinii
- c. Tuberculosis
- d. Bronchocele

395. Aspergillosis can present with all EXCEPT:

- a. Lung cavity
- b. Ear infection
- c. Normal component in sputum
- d. Rhinocerebral involvement

396. Allergic broncho-pulmonary Aspergillosis presents with all EXCEPT:

- a. Eosinophiluria
- b. Occurs in asthmatics
- c. Brownish plugs in sputum
- d. Central bronchiectasis

397. Central bronchiectasis is seen with

- a. Cystic adenomatoid malformation
- b. Cystic fibrosis
- c. Broncho carcinoma
- d. Tuberculosis

398. IOC for Bronchiectasis:

- a. HRCT scan
- b. Spiral CT
- c. Bronchoscopy
- d. Pulmonary angiography

399. Miliary shadow on X-ray is seen in all EXCEPT:

- a. Tuberculosis
- b. Loeffler's pneumonia
- c. Klebsiella
- d. Varicella pneumonia

400. TB causes all EXCEPT:

- a. Conjunctivitis
- b. Uveitis
- c. Lymphadenopathy
- d. Addison disease

401. Congenital tuberculosis affects which organ the most

- a. Brain
- b. Liver
- c. Kidney
- d. Lungs

402. Which drugs are not used in severe persistent Asthma:

- a. Short acting beta 2 agonist
- b. Oral corticosteroids
- c. Long acting beta 2 agonist
- d. Inhaled high dose Steroids

403. Most common cause of community acquired pneumonia?

- a. Pneumococcus
- b. Streptococcus pyogenes
- c. Staph. Aureus
- d. Mycoplasma

404. Unipolar flagellated organism that causes pneumonia

- a. Pseudomonas
- b. Mycoplasma
- c. Aeromonas
- d. Klebsiella pneumonia

405. Which of the following is not true in obstructive lung disease?

- a. FEV₁ ↓
- b. TLC ↓
- c. FVC ↓
- d. Reduced timed vital capacity

406. Which of the following is the common cause of respiratory failure Type 2?

- a. COPD
- b. Acute asthma
- c. ARDS
- d. Pneumonia

407. A 65-year-old lady suddenly dies 7 days after a surgery of femur fracture suddenly dies while having lunch in the ward. What would be the most likely cause:

- a. Calf vein thrombosis
- b. Pulmonary embolism
- c. Myocardial infarction
- d. Choking on food

408. A 65-year-old woman after total knee implant surgery complains of calf pain and swelling in the leg from last 2 days. Later she complains of breathlessness and dies suddenly in the ward. Probable cause?

- a. Pulmonary embolism
- b. Myocardial infarction
- c. Stroke
- d. ARDS

409. Westermark sign is seen in:

- a. Pulmonary embolism
- b. Pulmonary sequestration
- c. Pulmonary alveolar proteinosis
- d. Pneumothorax

410. Mean pulmonary artery pressure is:

- a. 15 mm Hg
- b. 8 mm Hg
- c. 25 mm Hg
- d. 10 mm Hg

411. What is not correct about smoking?

- a. Nicotine causes increase in blood sugar
- b. It reduces anxiety due to release of beta endorphins
- c. Acts a psychostimulant
- d. Acts on Alpha 2 Beta 4 nicotinic receptor

412. A 65-year-old man presented with hemoptysis and stage 3 clubbing. The probable diagnosis of the patient is?

- a. Non small cell lung Ca
- b. Small cell cancer of lung
- c. Tuberculosis
- d. Sarcoidosis

413. The following CXR shows

- a. Metastasis to lungs
- b. Pneumothorax
- c. Pneumatocele
- d. Bronchial adenoma

414. Look at the image of popcorn on CXR. In which condition is this seen?

- a. TB
- b. Metastasis
- c. Pulmonary hamartoma
- d. Carcinoid tumor

415. ARDS includes all EXCEPT?

- a. Hypoxia
- b. Hypercapnia
- c. Non cardiogenic pulmonary edema
- d. Normal P.C.W.P

416. Which component of cigarette smoke is responsible for CAD?

- a. Nicotine
- b. Tar
- c. Polycyclic aromatic hydrocarbons
- d. Benzene

417. Smoking causes all cancers EXCEPT?

- a. Liver cancer
- b. Oral cancer
- c. Kidney cancer
- d. Bladder cancer

418. Water test is done for?

- a. Pneumothorax
- b. Diabetic insipidus
- c. Peritonitis
- d. Bladder injury

419. Hypersensitivity pneumonitis is consistent with the following findings EXCEPT:

- a. Decreased DLCO
- b. Precipitating antibodies to causative antigens
- c. Granuloma on lung biopsy
- d. Eosinophilic alveolitis

420. Drug of choice for treatment of type 2 Brittle Asthma is

- a. β -adrenergic agonist
- b. Inhaled corticosteroids
- c. Antileukotrienes DM
- d. Subcutaneous epinephrine

421. All of the following criteria are required for diagnosis of obesity hypoventilation syndrome EXCEPT:

- a. Hypertension
- b. Sleep disorder breathing
- c. $\text{BMI} \geq 30 \text{ kg/m}^2$
- d. $\text{PaCO}_2 \geq 45 \text{ mm Hg}$

422. The following CXR shows

- a. Dextrocardia
- b. Pneumothorax
- c. Pneumomediastinum
- d. Pulmonary hamartoma

423. The CXR shows

- a. Meniscus sign
- b. Consolidation lower lobe
- c. Bilateral pneumothorax
- d. Pulmonary artery hypertension

NEPHROLOGY

424. What is the most common cause of death in patients of G6PD deficiency? *(Recent Pattern Question 2018)*

- a. Low oxyhemoglobin values
- b. Acute renal failure
- c. Sequestration crisis
- d. Low oxygen affinity

425. Which of the following is correct about urinary loss in Fanconi syndrome? *(Recent Pattern Question 2017)*

- a. Bicarbonate, Uric acid and Amino-acids
- b. Bicarbonate, Chloride and Amino acids
- c. Bicarbonate, Sugar and Potassium
- d. Bicarbonate, Uric acid and Potassium

426. Which is the Gold standard investigation for Renal Artery Stenosis? *(Recent Pattern Question 2017)*

- a. DTPA
- b. MRA
- c. Doppler
- d. Contrast arteriography

427. Nephrotic syndrome is associated with?

- a. Goodpasture disease *(Recent Pattern Question 2017)*
- b. Membranoproliferative glomerulonephritis
- c. Membranous glomerulopathy
- d. Berger disease

428. Broad casts are seen in? *(Recent Pattern Question 2016)*

- a. Chronic renal failure
- b. Chronic glomerulonephritis
- c. Minimal change disease
- d. Membranous nephropathy

429. Streptococcal skin infection is followed by episode of hematuria and hypertension. All are needed for diagnosis EXCEPT? *(Recent Pattern Question 2016)*

- a. Serum C3
- b. ASO
- c. Anti DNA-ase B
- d. CRP

430. Salt losing nephritis is? *(Recent Pattern Question 2016)*

- a. Interstitial nephritis
- b. Glomerulonephritis
- c. Lupus nephritis
- d. IgA nephropathy

431. Cockcroft gault formula is used for calculation of

(Recent Pattern Question 2016)

- a. GFR
- b. Microalbuminuria
- c. Serum anion gap
- d. Urinary anion gap

432. A 70-year-old patient develops pneumonia and sepsis and has renal failure with BP 70/50. Best drug used is?

(Recent Pattern Question 2016)

- a. Adrenaline
- b. Phenylephrine
- c. Norepinephrine
- d. Ephedrine

433. All are true about most common cause of nephrotic syndrome in children?

- a. It is not associated with hypertension
- b. Minimal change disease in children <10 year
- c. Massive Proteinuria >3.5 gm%/24 Hours
- d. Low Complement Levels

434. Drug helpful in Chronic kidney disease?

- a. Beta blocker
- b. Amlodipine
- c. ACE inhibitor
- d. Telmisartan

435. Which of the following will have a contrast nephropathy?

- a. Diabetes nephropathy
- b. Hypertension
- c. Malignant hypertension
- d. Hypertensive Glomerulosclerosis

436. Potassium excretion is caused mainly by?

- a. Spironolactone
- b. Frusemide
- c. Thiazide
- d. Aldosterone

437. ACE inhibitors are contraindicated in all EXCEPT?

- a. Bilateral renal artery stenosis
- b. Chronic renal failure
- c. Pregnancy
- d. Hyperkalemia

438. Patient on insulin in CKD stage 4. What is the dose adjustment of insulin required?

- a. Increased insulin
- b. Decreased insulin
- c. Normal insulin
- d. Add DPP-4 inhibitors

439. Which of the following helps most in nephrolithiasis?

- a. Low sodium diet
- b. Low calcium diet
- c. High sodium diet
- d. Low citrate diet

440. Absolute indication for hemodialysis is?

- a. Hypertension
- b. Hypokalemia
- c. Pericarditis
- d. Metabolic alkalosis

441. Most common cause of glomerulonephritis?

- a. P.S.G.N
- b. Diabetes mellitus
- c. Autosomal dominant Polycystic kidney disease
- d. Crescentic Glomerulonephritis

442. All are true about GFR EXCEPT?

- a. 30-40% decrease after 70 years of age
- b. Best estimated by Creatinine clearance
- c. CKD is defined as GFR < 30 ml/min/1.73 m² for 4 weeks
- d. GFR is dependent on height in children

**443. Membranous Glomerulopathy is seen in?**

- a. Diabetes
- b. HTN
- c. Renal failure
- d. Malignancy

444. Positive dipstick for RBC with Red color urine and clear supernatant after centrifugation is due to:

- a. Porphyria
- b. Hematuria
- c. Hemolysis
- d. Rhabdomyolysis

445. RBC cast is present in:

- a. Acute tubular nephritis
- b. Acute glomerulonephritis
- c. Acute Pyelonephritis
- d. Acute interstitial nephritis

446. Oliguric renal failure is due to all EXCEPT:

- a. Diabetic nephropathy
- b. Fanconi syndrome
- c. Multiple myeloma
- d. Aminoglycosides

447. Which of the following Microorganism is incriminated in infection after Hemodialysis?

- a. Chlamydia
- b. Gram positive
- c. Gram negative
- d. Anaerobes

448. Gross hematuria is seen in:

- a. IgA nephropathy
- b. Minimal change disease
- c. Chronic renal failure
- d. Nephritic syndrome

449. Xantho-granulomatous infection is caused by:

- a. Nephrolithiasis
- b. Urinary obstruction
- c. Proteus Mirabilis
- d. All of the above

450. Hypokalemia is seen in:

- a. RTA- I
- b. RTA- II
- c. RTA- III
- d. RTA- IV

451. Acute renal failure results in:

- a. Hyperkalemic alkalosis
- b. Hypokalemic alkalosis
- c. hyperkalemic acidosis
- d. Hypokalemic acidosis

452. All of the following causes acute renal failure EXCEPT:

- a. Pyelonephritis
- b. Snakebite
- c. Rhabdomyolysis
- d. Analgesic nephropathy

453. Which of these is correct about Struvite stones?

- a. Present in alkaline urine
- b. Most common kidney disease
- c. Are Calcium pyrophosphate stones
- d. Most common kidney stones

454. All are seen in Nephrotic syndrome EXCEPT:

- a. Atherosclerosis
- b. Thrombo-embolism
- c. Hypertension
- d. Lipiduria

455. Red cell cast are more common with

- a. Acute tubular necrosis
- b. Nephrotic syndrome
- c. Nephritic syndrome
- d. Interstitial nephritis

456. Interstitial nephritis is common with

- a. NSAID
- b. Black water fever
- c. Rhabdomyolysis
- d. Tumor lysis syndrome

457. Which of the following does not cause Polyuria:

- a. Interstitial nephritis
- b. Hypokalemia
- c. A.D.H insufficiency
- d. Rhabdomyolysis

458. Triad of Hematuria, hypertension and edema are a feature of?

- a. Acute glomerulonephritis
- b. Acute pyelonephritis
- c. Chronic glomerulonephritis
- d. Renal cell carcinoma

459. Type of glomerulopathy in HIV positive patient is?

- a. Focal segmental glomerulosclerosis
- b. Diffuse glomerulosclerosis
- c. Membranous glomerulopathy
- d. Mesangio-proliferative glomerulonephritis

460. Hemodialysis can be performed for long periods from the same site due to?

- a. Arteriovenous fistula reduces bacterial contamination of site
- b. Arteriovenous fistula results in arterialization of vein
- c. Arteriovenous fistula reduces chances of graft failure
- d. arteriovenous fistula facilitates small bore needles for high flow rates

461. Chronic hemodialysis in ESRD patient is done?

- a. Once per week
- b. Twice per week
- c. Thrice per week
- d. Daily

INFECTION

462. Which of the following is a good prognosis determining step in septic shock? (Recent Pattern Question 2018-19)

- a. Adequate IVF
- b. Adequate vasopressor
- c. Adequate IVF plus Vasopressor
- d. Time between hypotension and introduction of antibiotic

463. Rapid diagnosis of rabies is made with?

(Recent Pattern Question 2018-19)

- a. Skin biopsy with fluorescent antibody testing
- b. Rabies virus specific antibodies
- c. Inoculation in mouse
- d. Corneal impression smear

464. Recurrent Neisseria meningitis episodes are caused by deficiency of? (Recent Pattern Question 2018-19)

- a. C5-C9 deficiency
- b. IgA deficiency
- c. CD4 cell deficiency
- d. Perforin deficiency

465. In fever of unknown origin, how many times blood sample should be drawn?

(Recent Pattern Question 2018-19)

- a. 2
- b. 3
- c. 4
- d. 5

466. A 6-year child presents with low grade fever for 7 days and on examination has enlarged cervical lymph nodes with a palpable spleen tip. He was given ampicillin followed by development of extensive rash all over the body. Diagnosis is? *(Recent Pattern Question 2018-19)*

- a. Infectious mononucleosis
- b. Scarlet fever
- c. Kawasaki
- d. Hodgkin's Lymphoma

467. Correct about initiating treatment in AIDS patient

(Recent Pattern Question 2018-19)

- a. No cut off of CD4 count required for initiation of treatment
- b. CD4 count < 200/cu.mm required for initiation of treatment
- c. CD4 count <350/cu.mm required for initiation of treatment
- d. CD4 count <500/cu.mm required for initiation of treatment

468. Which of the following is correct about differential leucocyte count in late catarrhal stage of pertussis?

(Recent Pattern Question 2018)

- a. Neutropenia
- b. Eosinophilia
- c. Monocytosis
- d. Lymphocytosis

469. Which is the drug of choice for prophylaxis of meningococcal meningitis in pregnancy:

(Recent Pattern Question 2018)

- a. Penicillin
- b. Ceftriaxone
- c. Rifampicin
- d. Ampicillin

470. In a diagnosed lepromatous leprosy patient, the treatment was started. After intake of drug skin lesions and fever develop within few days. Which type of hypersensitivity reaction leads to this manifestation?

(Recent Pattern Question 2018)

- a. Type 4
- b. Type 3
- c. Type 2
- d. Type 1

471. What is the incubation period of hepatitis B?

(Recent Pattern Question 2018)

- a. 1–30 days
- b. 15–45 days
- c. 45–180 days
- d. 2 weeks–6 months

472. Which of the following is an initial presentation of HIV infection when ART is not started?

(Recent Pattern Question 2018)

- a. Primary CNS lymphoma
- b. Kaposi sarcoma
- c. Bacterial pneumonia
- d. Extrapulmonary tuberculosis

473. The most important parameter to monitor dengue haemorrhagic fever is? *(Recent Pattern Question 2017)*

- a. Platelet count
- b. Haemoglobin
- c. Total leucocyte count
- d. Haematocrit

474. Causative agent for hand-foot-mouth disease is?

(Recent Pattern Question 2017)

- a. Enterovirus
- b. Cocksackie
- c. Adenovirus
- d. Hepatitis C

475. DOC for actinomycosis? *(Recent Pattern Question 2016)*

- a. Penicillin
- b. Ceftriaxone
- c. Chloroamphenicol
- d. Moxifloxacin

476. Best treatment for Swine flu is

(Recent Pattern Question 2016)

- a. Oseltamivir
- b. Indinavir
- c. Abacavir
- d. Zanamavir

477. Rickettsia is treated in all ages by which drug?

(Recent Pattern Question 2016)

- a. Doxycycline
- b. Penicillin
- c. Macrolides
- d. Quinolones

478. Empirical antibiotic regimen in suitable community acquired pneumonia in previously health adults?

(Recent Pattern Question 2016)

- a. Amoxicillin + Clavulanate
- b. Azithromycin
- c. Ceftriaxone
- d. Moxifloxacin

479. Mad cow disease is due to?

- a. Protein misfolding
- b. Bacterial
- c. Viral
- d. Spirochete

480. Sputum smear is diagnostic if?

- a. >25 neutrophils and >10 squamous epithelial cells
- b. <25 neutrophils and <10 squamous epithelial cells
- c. >25 neutrophils and <10 squamous epithelial cells
- d. <25 neutrophils and >10 squamous epithelial cells

481. Meningitis bacteria are normally present in?

- a. Nasopharynx
- b. Skin
- c. Genitals
- d. Lower G.I.T

482. Quadrivalent Meningococcal vaccine is not used for?

- a. Serotype A
- b. Serotype B
- c. Serotype C
- d. Serotype Y

FLUIDS AND ELECTROLYTES

483. Which of these has no role in treatment of dangerous hyperkalemia? *(Recent Pattern Question 2018)*

- a. Injecting calcium chloride
- b. Salbutamol
- c. Hemodialysis
- d. IV soda-bicarbonate

484. High anion gap acidosis is seen in all EXCEPT:

(Recent Pattern Question 2018)

- a. Lactic acidosis
- b. Diarrhea
- c. Acute renal failure
- d. Salicylate poisoning

485. Anion gap is increased in all EXCEPT:

(Recent Pattern Question 2018)

- a. Renal tubular acidosis
- b. Diabetic ketoacidosis
- c. Acute tubular necrosis
- d. Ethylene glycol poisoning

486. In which of the following condition is blood osmolality increased:

(Recent Pattern Question 2018)

- a. Diarrhea
- b. SIADH
- c. Psychogenic polydipsia
- d. Cerebral toxoplasmosis

487. Which is correct about a female with chronic vomiting?

(Recent Pattern Question 2018)

- a. Hypokalemic hypochloremic metabolic alkalosis
- b. Hypokalemic hyperchloremic metabolic alkalosis
- c. Hypokalemic hypochloremic metabolic acidosis
- d. Hypokalemic hyperchloremic metabolic acidosis

488. Normal anion gap is seen in?

(Recent Pattern Question 2017)

- a. Renal tubular acidosis
- b. Diabetic Keto-acidosis
- c. Hyper-alimentation
- d. Acute tubular necrosis

489. Increased anion gap is seen in?

(Recent Pattern Question 2017)

- a. Starvation
- b. Renal tubular acidosis
- c. Diarrhoea
- d. Fistula

490. In a patient who was brought to casualty after RTA with pulse rate 108, SBP 80. Which fluid is to be given ideally?

- a. Plasma
- b. Normal saline
- c. Blood
- d. 5% dextrose

491. All are seen in Hypokalemia EXCEPT?

- a. U wave in ECG
- b. Tall T wave in ECG
- c. ST Depression
- d. Prolonged QU interval

492. Which of the following presents with hypokalemia and metabolic acidosis?

- a. Diarrhea
- b. Vomiting
- c. Nasogastric suction
- d. Conn's syndrome

493. Seborrheic dermatitis, cellulitis, alopecia and apathy is seen in?

- a. Pyridoxine deficiency
- b. Biotin deficiency
- c. Riboflavin deficiency
- d. Vitamin A deficiency

494. Normal anion gap is seen in:

- a. Diabetic ketoacidosis
- b. Chronic renal failure
- c. Renal tubular acidosis
- d. Methanol toxicity

495. Normal anion gap is seen in:

- a. Diabetic ketoacidosis
- b. Lactic acidosis
- c. Starvation ketoacidosis
- d. Renal tubular acidosis

496. Widened anion gap is caused by all EXCEPT:

- a. Lactic acidosis
- b. Diarrhea
- c. Diabetic keto-acidosis
- d. Methanol poisoning

497. Hyponatremia causes all EXCEPT:

- a. Seizure
- b. Increased plasma osmolality
- c. Brain hemorrhage
- d. Central pontine myelinosis

498. Chvostek's sign is elicited by:

- a. Facial nerve stimulation by tapping over the parotid
- b. BP cuff in arm for 5 minutes
- c. Tapping over extensor pollicis brevis
- d. Tapping over flexor retinaculum

499. Which can be given immediately in hemorrhagic stroke?

- a. Packed RBC
- b. Colloids
- c. Blood transfusion
- d. Hypertonic fluids

500. Women working in hot environment & drinking lots of water without intake of salts are liable to develop

- a. Heat hyperpyrexia
- b. Heat cramps
- c. Heat stroke
- d. Heat encephalopathy

501. Hypocalcemia will not lead to?

- a. Bone fractures
- b. Tetany
- c. QT prolongation
- d. Osteoporosis

502. After Road traffic accident a patient presented to casualty with vitals showing BP of 90/60 mm Hg with heart of 56 bpm. Which kind of shock occurs?

- a. Cardiogenic
- b. Neurogenic
- c. Distributive
- d. Hypovolemic shock

503. Following stays least in plasma?

- a. Renin
- b. Cortisol
- c. aldosterone
- d. Norepinephrine

MISCELLANEOUS

504. Black Hairy Tongue is seen in? (Most Recent Question 2019)

- a. Elongation of filiform papillae
- b. Elongation of circumvallate papillae
- c. Carcinoma tongue
- d. Hyperplastic candidiasis

505. What is the site of intramuscular injection in gluteal area?

(Recent Pattern Question 2017)

- a. Upper outer
- b. Upper inner
- c. Lower outer
- d. Lower inner

506. Angiography of CCA is shown with an arrow mark at branch of ECA. Identify the vessel?

(Recent Pattern Question 2017)

- a. Superior thyroid artery
- b. Facial artery
- c. Thyrocervical trunk
- d. Lingual artery

507. During cannulation at internal jugular vein, which is the most likely complication?

- a. Pneumothorax
- b. Ventricular tachycardia
- c. Pulmonary thrombo-embolism
- d. Arterial puncture

508. Severe combined immunodeficiency is seen with?

- a. Pre B Cell
- b. Pre T Cell
- c. Both
- d. NK Cell

509. Which of the following is *not* involved in Buerger disease?

- a. Nerve
- b. Lymphatics
- c. Small Artery
- d. Vein

510. APACHE II score involves all EXCEPT?

- a. GCS
- b. Arterial PH
- c. Mean BP
- d. Serum amylase

511. In Buerger disease which is the site of pain?

- a. Calf pain
- b. Foot pain
- c. Hand pain
- d. Thigh pain

512. Central line is not put in?

- a. External Jugular Vein
- b. Internal Jugular Vein
- c. Femoral vein
- d. Subclavian vein

513. Rectal temperature in hypothermia should be < than _____ degree Celsius?

- a. 35
- b. 35.5
- c. 36
- d. 36.5

514. Which of the following is most common cancer leading to death?

- a. Lung cancer
- b. Oral cancer
- c. Skin cancer
- d. Prostate cancer

515. All are true regarding Leptospirosis EXCEPT:

- a. Water contamination by Rat urine
- b. Jaundice
- c. Uraemia
- d. Drug of choice is ciprofloxacin

516. Defective DNA repair is seen in all EXCEPT?

- a. Xeroderma pigmentosum
- b. Friedreich's ataxia
- c. Werner syndrome
- d. Bloom syndrome

517. Which is incorrect about Paget's disease?

- a. Bone pain
- b. Elevated alkaline phosphatase
- c. Bisphosphonates are used
- d. Low output cardiac failure

518. What is the etiology behind Mycosis fungoides

- a. Viral Infection
- b. Bacterial Infection
- c. Fungal Infection
- d. Malignancy

519. Chemotherapeutic agent acting as an Immunomodulator

- a. Lenalidomide
- b. Cisplatin
- c. Irinotecan
- d. Mycophenolate

520. Marker test for vertical transmission of HIV

- a. p24 antigen
- b. Serum ELISA
- c. Western blot
- d. Immunoblot

521. Case of 30 year chronic smoker male, visited your clinic with this condition. Diagnosis:

- a. Diabetic gangrene
- b. Buerger's disease
- c. Atherosclerotic plaque
- d. Septic foot

522. A 20-year-old boy after Road Traffic Accident with CT Abdomen. The patient is having abdominal distention and no urine output. Likely cause is?

- a. Spleen rupture
- b. Bladder rupture
- c. Renal shutdown
- d. Pneumothorax

523. What is shown in the image below?

- a. CT scan
- b. MRI scan
- c. Digital X-ray
- d. Bone Scintigraphy

524. Brodie Tredelenburg test is done for?

- a. Sapheno-femoral incompetence
- b. Deep Vein thrombosis
- c. Varicose veins
- d. Superficial migratory thrombophlebitis

525. Myelin figures in necrosis is due to?

- a. Loss of glycogen
- b. Dilated mitochondria
- c. Phospholipid precipitates
- d. Pyknosis

BOARD REVIEW QUESTIONS

- 526. Which drug is usually not preferred in treatment of HIV with TB?**
a. Efavirenz b. Lamivudine
c. Stavudine d. Nevirapine
- 527. Pancoast's triad includes all of the following EXCEPT:**
a. Shoulder pain b. Horner's syndrome
c. Hemoptysis d. Atrophy of hand muscles
- 528. Most sensitive investigation for cystic fibrosis is?**
a. CT scan b. Ultrasound
c. Sweat electrolytes d. Tomogram
- 529. ECG changes in Hypokalemia are?**
a. Tall T wave b. Large P wave
c. Short QT interval d. Presence of U waves
- 530. Drug of choice for American trypanosomiasis is?**
a. Miltefosine b. Amphotericin
c. Antinomy d. Nifurtimox
- 531. Hemiballismus is due to lesion of?**
a. Contralateral thalamus
b. Contralateral subthalamus
c. Ipsilateral thalamus
d. Ipsilateral subthalamus
- 532. Investigation of choice for diagnosis of Epilepsy is?**
a. EEG b. CT scan
c. MRI d. CSF investigation
- 533. Elevated JVP is seen in**
a. Cor pulmonale b. Pneumonia
c. ARDS d. Pleural effusion
- 534. Which of the following is seen in sarcoidosis:**
a. Hypercalcemia b. Hypocalcemia
c. Hyperphosphatemia d. Hypophosphatemia
- 535. Sequel of rheumatic heart disease in a 5 year old child is:**
a. Mitral stenosis b. Mitral regurgitation
c. Tricuspid stenosis d. Tricuspid regurgitation
- 536. Aldosterone is secreted by**
a. Pituitary b. Zonaglomerulosa
c. Zona fasciculata d. Adrenal medulla
- 537. Glucose fever is seen due to:**
a. Adrenal disease b. Diabetes mellitus
c. Glucagonoma d. Hyperthyroidism
- 538. Duke score is used for?**
a. Infective endocarditis
b. Stable angina
c. Unstable angina
d. Esophageal varices grading
- 539. Priapism is called**
a. Involuntary erection
b. Involuntary painful erection >2 hours
c. Persistent painful erection for >4 hours
d. Persistent non tender erection >4 hours
- 540. Which of the following drugs used for Diabetes Mellitus causes lactic acidosis:**
a. Phenformin b. Metformin
c. Glipizide d. Pioglitazone
- 541. CURB 65 criteria include all EXCEPT:**
a. Age is always more than or equal to 65 years
b. Respiratory rate more than 30/min
c. Systolic Blood pressure is more than 90 mm Hg
d. BUN level is >7 mmol/L
- 542. Most common type of emphysema is:**
a. Panacinar emphysema
b. Irregular emphysema
c. Centriacinar emphysema
d. Paraseptal emphysema
- 543. Not a diagnostic criteria for rheumatoid arthritis?**
a. Rheumatoid nodules
b. RA factor
c. Anti-cyclic citrullinated phospholipid antibody
d. PIP, MCP, Wrist arthritis
- 544. Broadbent sign is seen in**
a. Acute pericarditis
b. Constrictive pericarditis
c. S.L.E
d. Libman sacks endocarditis
- 545. Weight gain is seen in all except**
a. Hypothyroidism b. Insulinoma
c. Type 2 diabetes mellitus d. Carcinoid syndrome
- 546. Drug of choice for focal seizure is:**
a. Carbamazepine b. Valproate
c. Ethosuximide d. Clobazam
- 547. Which is not a feature of SLE?**
a. Serositis b. Synovitis
c. Arthritis d. Low complement level
- 548. Metabolic acidosis is seen in?**
a. Raised ICT b. Hypotension
c. Status asthmaticus d. Conn syndrome
- 549. Hypokalemia is seen in:**
a. RTA-1 b. RTA-2
c. RTA-3 d. RTA-4
- 550. Acute renal failure results in:**
a. Hyperkalemic alkalosis b. Hypokalemic alkalosis
c. Hyperkalemic acidosis d. Hypokalemic acidosis
- 551. Hemolytic anemia is associated with the following gall stones:**
a. Pigmented b. Mixed
c. Cholesterol d. None
- 552. Cell of origin of epileptic seizures is**
a. Pyramidal cells b. Schwann cells
c. Oligodendrocytes d. Stellate cells

- 553. Most common tumour to metastasize to spine is**
 a. Carcinoma lung b. Carcinoma breast
 c. RCC d. Carcinoma prostate
- 554. Bovine cough is seen in**
 a. Croup b. Epiglottitis
 c. Foreign body d. Laryngeal paralysis
- 555. Normal anion gap is seen in:**
 a. Diabetic ketoacidosis b. Lactic acidosis
 c. Starvation ketoacidosis d. Renal tubular acidosis
- 556. Berry sign is?**
 a. Obliteration of carotid pulse
 b. Dancing carotid artery
 c. Carotid thrill
 d. Carotid artery bruit
- 557. SIADH leads to?**
 a. Hyponatremia b. Hypernatremia
 c. Hypokalemia d. Hyperkalemia
- 558. Myelopathy does not occur in**
 a. Tabes dorsalis b. Syringomyelia
 c. Polyneuritic leprosy
 d. Sub-acute combined demyelination of cord
- 559. Drug of choice for exercise induced asthma is?**
 a. Inhaled steroids b. Salmeterol
 c. Formoterol d. Ketotifen
- 560. What is not reabsorbed from PCT of kidney:**
 a. Glucose b. Bicarbonate
 c. Calcium d. Phosphate
- 561. Hyperkalemia is seen with**
 a. RTA 1
 b. RTA 2
 c. RTA 4
 d. Nephrogenic diabetes insipidus
- 562. Most common cause of stroke is**
 a. Carotid artery atherosclerosis
 b. Hypertension
 c. Trauma
 d. Cyanotic heart disease
- 563. What is not a feature of Millard gubler syndrome?**
 a. Ptosis b. Squint
 c. Facial weakness d. hemiparesis
- 564. Most common cause of death in the world is:**
 a. CAD b. Stroke
 c. Accident d. Infection
- 565. Bulging anterior fontanelle in a neonate with vacant stare is suggestive of diagnosis of?**
 a. Neonatal meningitis
 b. Intra-ventricular haemorrhage
 c. Hydrocephalus
 d. Status marmoratus
- 566. Vascular dementia is seen in**
 a. Parkinsonism b. Alzheimer's
 c. Lacunar stroke d. Huntington's chorea
- 567. Most common part of heart involved in carcinoid syndrome**
 a. Inflow Right side b. Inflow left side
 c. Outflow left side d. All of the above
- 568. Which is the best test for pheochromocytoma**
 a. 24 hour urinary VMA
 b. Plasma fractionated metanephrine levels
 c. Plasma catecholamines
 d. MIBG scan
- 569. IOC for Cushing syndrome**
 a. Low dose dexamethasone suppression test
 b. High dose dexamethasone suppression test
 c. Plasma ACTH
 d. Plasma CRH
- 570. All of the following drugs are useful in preventing post prandial rise of sugar EXCEPT**
 a. Sitagliptin b. Canagliflozin
 c. Acarbose d. Repaglinide
- 571. Most common type of epilepsy in children is:**
 a. Subtle seizure b. Absence seizure
 c. Benign rolandic epilepsy d. Grand mal epilepsy
- 572. What is the duration of symptoms for generalised convulsive status epilepticus**
 a. 5 minutes b. 15 minutes
 c. 30 minutes d. 60 minutes
- 573. Word salad is a feature of**
 a. Lesion in inferior frontal gyrus
 b. Lesion in superior frontal gyrus
 c. Lesion in superior temporal gyrus
 d. Lesion in inferior temporal gyrus
- 574. Most common cause of death in Subarachnoid haemorrhage is:**
 a. Rebleeding b. Vasospasm
 c. Re-rupture d. Dyselectrolytemia
- 575. Most common site of Hemorrhagic stroke?**
 a. Parenchyma b. Internal capsule
 c. External capsule d. Interventricular
- 576. Blast crisis is seen in?**
 a. ALL b. AML
 c. CML d. CLL
- 577. Radiation causes all blood cancers EXCEPT?**
 a. ALL b. AML
 c. CML d. CLL
- 578. All are features of blood cancer EXCEPT**
 a. Sternal tenderness
 b. Anemia
 c. Marrow hypoplasia
 d. Hyperleucocytosis
- 579. First hormone to be supplemented in Sheehan syndrome**
 a. Cortisol b. GH
 c. Thyroxine d. Estrogen

- 580. Weight gain with Cushingoid appearance with proximal myopathy occurs due to?**
a. Oat cell cancer of lung
b. Iatrogenic steroids
c. TB of adrenals
d. Waterhouse freidschen syndrome
- 581. Which is not included in the triad of Parkinsonism?**
a. Masked facies
b. Resting tremors
c. Bradykinesia
d. Cog wheel rigidity
- 582. Dementia pugilistica is characterised by development of**
a. Extradural haemorrhage
b. Epi-dural haemorrhage
c. Cortical atrophy
d. Fine tremors of tongue
- 583. Fasciculations are seen in?**
a. Motor neuron disease
b. Stroke
c. Paralysis agitans
d. Pseudo-tumour cerebri
- 584. Not involved in Gullian-Barre syndrome?**
a. Motor involvement
b. Sensory involvement
c. Autonomic involvement
d. Bladder and bowel involvement
- 585. Heel pad thickness is measured in**
a. Myxedema
b. Angioedema
c. Acromegaly
d. Marfan syndrome
- 586. AED stands for?**
a. Automated external defibrillator
b. Automatic external defibrillator
c. Automatic electrical defibrillator
d. Automated electrical defibrillator
- 587. Most common cause of Hyperparathyroidism is?**
a. Parathyroid adenoma
b. Parathyroid hyperplasia
c. Thyroid carcinoma
d. Medullary carcinoma thyroid
- 588. Ipsilateral third nerve lesion & contralateral hemiplegia is seen in?**
a. Weber syndrome
b. Parinaud syndrome
c. Foville syndrome
d. Wallenburg syndrome
- 589. Whole thickness of bowel is involved with skin lesions in?**
a. Crohn's disease
b. Ulcerative colitis
c. Irritable bowel disease
d. Both crohn's and ulcerative colitis
- 590. Most common site of ulcerative colitis is?**
a. Rectum
b. Caecum
c. Small intestine
d. Appendix
- 591. Treatment of choice for Hepatorenal syndrome is?**
a. ACE inhibitors
b. Calcium channel blockers
c. Peritoneal dialysis
d. Liver transplant
- 592. Most common cause of upper GI bleed is?**
a. Esophageal varices
b. Gastric erosion
c. Peptic ulcer
d. Mallory weiss tear
- 593. Most common primary site for congenital tuberculosis is?**
a. Lungs
b. Lymph nodes
c. Liver
d. Skin
- 594. Most common renal condition in HIV patient is?**
a. Membranoproliferative glomerulonephritis
b. Focal segmental glomerulosclerosis
c. Membranous glomerulonephritis
d. Diffuse proliferative glomerulonephritis
- 595. Acute endocarditis with abscess is most commonly associated with?**
a. Listeria
b. Staphylococcus
c. Streptococcus
d. Enterococcus
- 596. Early loss of bladder control is seen in?**
a. AMLS
b. Conus medullaris
c. Caudal equine
d. Guillain barre syndrome
- 597. Parkinsonism is associated with which metal?**
a. Mg
b. Se
c. Mn
d. Mo
- 598. CNS tumor which is most commonly associated with HIV?**
a. Lymphoma
b. Glioma
c. Astrocytoma
d. Medulloblastomas
- 599. Burst suppression EEG pattern is seen in?**
a. Herpes simplex encephalitis
b. Absence seizures
c. Myoclonic epilepsy
d. Hypothermia
- 600. Auer rods are seen in which subtype of AML?**
a. M0
b. M1
c. M3
d. M5
- 601. Cystatin C is used for?**
a. Diagnosis of acute renal failure
b. Transplant survival
c. Sepsis
d. Pancreatitis
- 602. Increased VMA is seen in?**
a. Pheochromocytoma
b. Tyrosinemia
c. Parkinsonism
d. Phenylketonuria
- 603. A 20-year-old girl presents with pain in abdomen and purpuric rash all over the body, most probable diagnosis is?**
a. HUS
b. Kawasaki disease
c. ITP
d. HSP
- 604. Wide fixed split S2 is seen in?**
a. ASD
b. VSD
c. TOF
d. TAPVC
- 605. Which of the following is not seen in hypothyroidism?**
a. Edema
b. Cold skin
c. Diastolic hypertension
d. Atrial fibrillation

- 606. Best marker of iron deficiency anemia is?**
 a. Serum iron
 b. Serum ferritin
 c. Total iron binding capacity
 d. Transferrin saturation
- 607. Schilling test is done for?**
 a. Vitamin B12 deficiency
 b. Folic acid deficiency
 c. Vitamin B6 deficiency
 d. Vitamin D deficiency
- 608. Burkitt's lymphoma is due to which virus?**
 a. EBV
 b. HTLV-1
 c. HHV-8
 d. Adenovirus
- 609. Conventional site for taking biopsy in secondary amyloidosis is?**
 a. Liver
 b. Kidney
 c. Rectum
 d. Abdominal fat aspirate
- 610. Most common cause of death in primary amyloidosis is?**
 a. Respiratory failure
 b. Cardiac failure
 c. Renal failure
 d. Septicemia
- 611. Treatment for restless leg syndrome is?**
 a. Ropinirole
 b. Haloperidol
 c. Carbamazepine
 d. Gabapentin
- 612. Cranial nerve most commonly involved in cranial aneurysms?**
 a. 3rd nerve
 b. 4th nerve
 c. 5th nerve
 d. 6th nerve
- 613. Hemiplegia is most commonly due to Occlusion of?**
 a. Middle Cerebral Artery
 b. Basilar artery
 c. Vertebral artery
 d. Anterior cerebral artery
- 614. Most common site of Hypertensive intracerebral bleed is?**
 a. Pons
 b. Putamen
 c. Frontal lobe
 d. Thalamus
- 615. Broca's aphasia is seen due to lesion in?**
 a. Precentral gyrus
 b. Inferior frontal gyrus
 c. Superior temporal gyrus
 d. Inferior temporal gyrus
- 616. Wernicke's aphasia is seen due to lesion in?**
 a. Precentral gyrus
 b. Inferior frontal gyrus
 c. Superior temporal gyrus
 d. Inferior temporal gyrus
- 617. Central pontine myelinolysis is seen with rapid correction of?**
 a. Hypermagnesemia
 b. Hyponatremia
 c. Hyper kalemia
 d. Hypokalemia
- 618. Drug of choice for acute exacerbation of ulcerative colitis is?**
 a. Sulfasalazine
 b. Mesalazine
 c. Steroids
 d. NSAID's
- 619. Muller's sign is seen in?**
 a. Mitral stenosis
 b. Aortic stenosis
 c. Mitral regurgitation
 d. Aortic regurgitation
- 620. Restrictive cardiomyopathy is seen in?**
 a. Amyloidosis
 b. Fatty change of heart
 c. Viral myocarditis
 d. Doxorubicin toxicity
- 621. ASO titre is diagnostic in?**
 a. SAGE
 b. Rheumatoid arthritis
 c. Infective endocarditis
 d. Acute rheumatic fever
- 622. Acute chest syndrome is caused by?**
 a. Sickle cell anemia
 b. Pneumonia
 c. Acute myocardial infarction
 d. Penetrating chest trauma
- 623. Enzyme missing in refsum's disease is?**
 a. Sphingomyelinase
 b. Phytanoyl-CoA α -hydroxylase
 c. Alpha-galactosidase-A
 d. N-acetylglucosaminidase
- 624. First line drug used for painful diabetic neuropathy is?**
 a. Carbamazepine
 b. Duloxetine
 c. Venlafaxine
 d. EMLA
- 625. Artery involved in 3rd cranial nerve lesion?**
 a. Anterior communicating
 b. Posterior communicating
 c. Posterior cerebral
 d. Anterior cerebral
- 626. Dose of anti-D in idiopathic thrombocytopenic purpura?**
 a. 75 mg/kg
 b. 150 mg/kg
 c. 200 mg/kg
 d. 300 mg/kg
- 627. Acute kidney injury in RIFLE criteria is?**
 a. Urine output <0.5 ml/kg/h for >8 hours
 b. Urine output <0.5 ml/kg/h for >12 hours
 c. Urine output <0.3 ml/kg/h for >24 hours
 d. Anuria for >12 hours
- 628. Antibody responsible for photosensitivity in SLE is?**
 a. Anti-Sm
 b. Anti-Ro
 c. Antihistone
 d. Anti-La
- 629. Most common cause of renal artery stenosis above 50 years of age is?**
 a. Atherosclerosis
 b. Fibromuscular dysplasia
 c. Takayasu arteritis
 d. RCC
- 630. Least commonly affected site in arterial thromboembolism is?**
 a. Liver
 b. Kidney
 c. Heart
 d. Brain
- 631. Most common lymph node involved in Hodgkin's lymphoma is?**
 a. Inguinal
 b. Cervical
 c. Axillary
 d. Subclavian

632. Takayasu arteritis mainly affects?

- a. Pulmonary artery
- b. Celiac artery
- c. Subclavian artery
- d. SMA

633. Which among the following is true about iron deficiency anemia?

- a. Increased ferritin
- b. Increased TIBC
- c. Increased saturation
- d. Macrocytic hypochromic anemia

634. Drug of choice for Madura mycosis is?

- a. Imipenem
- b. Dapsone
- c. Itraconazole
- d. Amikacin

635. Antihypertensive used in angina pectoris is?

- a. Alpha blocker
- b. Beta blocker
- c. Calcium channel blockers
- d. ACE inhibitors

636. Most common cause of intraventricular bleed is?

- a. SDH
- b. EDH
- c. SAH
- d. Parenchymal bleed

637. FEV1/FVC is decreased in?

- a. Asthma
- b. Kyphosis
- c. Scoliosis
- d. Fibrosis

638. Most common complication of cardiac catheterization?

- a. Arrhythmia
- b. Hypertension
- c. Vascular bleeding
- d. Contrast reaction

639. Specific antibody for SLE is?

- a. Anti sm antibodies
- b. Anti-ds DNA antibodies
- c. Anti-Histone antibodies
- d. Anti Ro (SS-A) antibodies

640. Pulsus bigeminy is seen in?

- a. Digitalis
- b. Beta blockers
- c. ACE inhibitors
- d. Calcium channel blockers

641. Drug of choice in post diabetic peripheral neuropathy?

- a. Pregabalin
- b. Amitriptyline
- c. Carbamazepine
- d. Valproate

642. Judkins technique is used for?

- a. Central venous line placement
- b. Coronary arteriography
- c. Renal angiography
- d. Chest tube insertion

643. Carcinoid of heart presents as?

- a. Aortic stenosis
- b. Tricuspid regurgitation
- c. Mitral stenosis
- d. Aortic regurgitation

644. Most common mode of spread of congenital tuberculosis is?

- a. Lymphatics
- b. Hematogenous
- c. Local spread
- d. None

645. Which ion channel is affected in hypokalemic periodic paralysis?

- a. K+
- b. Na+
- c. Cl-
- d. Ca²⁺

646. Gaisbock syndrome is known as?

- a. Primary familial polycythemia
- b. High-altitude erythrocytosis
- c. Spurious polycythemia
- d. Polycythemia vera

647. In case of chest pain with pericarditis and pericardial effusion, pain is referred by?

- a. Phrenic nerve
- b. Vagus nerve
- c. Trigeminal nerve
- d. None

648. Most common cause of dilated cardiomyopathy is?

- a. Alcohol
- b. Viral infection
- c. Pregnancy
- d. Metabolic disease

649. Osborne waves in ECG is seen in?

- a. Hypothyroidism
- b. Hypothermia
- c. Hypocalcemia
- d. Hypercalcemia

650. Most common LMN cause of facial nerve palsy is?

- a. Trauma
- b. Bell's palsy
- c. Infections
- d. Vascular causes

651. Aphasia which affects the arcuate fibres is called?

- a. Global aphasia
- b. Anomic aphasia
- c. Conduction aphasia
- d. Broca's aphasia

652. Koenen's tumor are seen in?

- a. Neurofibromatosis
- b. Tuberous sclerosis
- c. Sturge weber syndrome
- d. Tuberculosis

IMAGE-BASED QUESTIONS

653. Test shown is:

- a. Card Test
- b. Froment's Sign
- c. Pointing index
- d. Pen Test

654. Diverticulosis appearance on barium enema as shown is called:

- a. Saw tooth appearance
- b. Cork screw appearance
- c. Bird of prey appearance
- d. Claw sign

655. A 65-year-old diabetic with extensive sweating and dizziness?

- a. Hypoglycemia
- b. Hypoglycemic Unawareness
- c. Anterior wall MI
- d. Inferior wall MI

656. A 35-year-old lady has been diagnosed as having anxiety neurosis by her psychiatrist. She came to you for second opinion. Comment on the diagnosis based on ECG?

- a. Sinus tachycardia
- b. WPW syndrome
- c. Multifocal atrial tachycardia
- d. Atrial fibrillation

659. What ECG finding is shown here?

- a. Hyperacute T-wave
- b. T-wave alternans
- c. T-wave inversion
- d. Artefact

657. A 60-year-old patient is having recurrent syncopal attacks post myocardial infarction. The ECG shows?

- a. Accelerated idioventricular rhythm
- b. Ventricular bigeminy
- c. Mobitz II heart block
- d. Wenckebach phenomenon

660. What ECG finding is shown here?

- a. T-wave inversion
- b. Artifact
- c. Premature ventricular complexes
- d. Positive U waves

658. Which of the following finding is shown in the chest leads?

- a. Myocardial ischemia
- b. Myocardial injury
- c. Digoxin
- d. Digoxin toxicity

661. A 1-year-old child with CHD is on heart failure treatment. The ECG shows all EXCEPT?

- a. Ventricular bigeminy
- b. Heart rate of 60 bpm approximately
- c. ST depression
- d. U wave

662. A 65-year-old man is brought with complaints of breathlessness and chest pain for 18 hours. ECG was done. Which of the following is incorrect?

- a. Normal sinus rhythm
- b. Normal axis
- c. ST elevation in V2-V4
- d. Premature ventricular contractions

664. A 50-year-old woman with rheumatic heart disease is on medication for heart disease. She feels unwell for most part of the day. Which of the following medicine is responsible for the ECG changes shown below?

- a. ACE inhibitor
- b. Diuretics
- c. Ivabradine
- d. Digoxin

663. A 10-year-old child of valvular heart disease on heart failure treatment, has the following ECG tracing. What is the diagnosis?

- a. Tall tented T wave
- b. Ventricular bigeminy
- c. Non paroxysmal atrial tachycardia with irregular AV block
- d. Non paroxysmal atrial tachycardia with regular AV block

665. A 25-year-old woman presents with complaints of recurrent episodes of sudden onset palpitations. What does her ECG tracings show?

- a. Atrial flutter
- b. Atrial bigeminy
- c. PSVT
- d. Sinus tachycardia

666. A 65-year-old pensioner in ESI dispensary complains of exercise intolerance. On auscultation a systolic murmur grade 3 is heard. What does the ECG show?

- a. Normal tracing
- b. Left ventricular hypertrophy
- c. Atrial fibrillation
- d. Left bundle branch block

667. Identify the ECG given in the figure below?

- a. Normal sinus rhythm
- b. Paroxysmal supraventricular tachycardia
- c. Atrial fibrillation
- d. Ventricular fibrillation

668. In the ECG shown below which drug will not be given?

- a. Amiodarone
- b. Adenosine
- c. Diltiazem
- d. Beta blocker

669. 65-year-old elderly male has history of sweating and chest pain for last 24 hours with the following ECG. Which of the following is not given in managing the patient?

- a. Aspirin
- b. Statin
- c. Thrombolytic therapy
- d. Morphine

670. A 52-year-old male diabetic patient presents with palpitations to the AIIMS emergency. Urgent ECG was performed. What is the immediate next step in the management?

- a. Electrical cardioversion
- b. Amiodarone
- c. Adenosine
- d. Primary PCI

671. A 75-year-old male patient presents to the AIIMS emergency with retrosternal chest pain for 6 hours. The following ECG was done. What will be the primary management of the patient?

- a. Primary PCI
- b. Thrombolysis
- c. Abciximab
- d. Low molecular weight heparin

672. For calculation of rate related (corrected) QT interval, QT interval is divided by \sqrt{X} ?

- a. 1
- b. 2
- c. 3
- d. 4

673. The marked part of the ECG points to which phase of cardiac action potential?

- a. Phase 0
- b. Phase 1
- c. Phase 2
- d. Phase 3

674. What does the following ECG show?

- a. Osbourne wave
- b. Delta wave
- c. Hockey stick sign
- d. Epsilon wave

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) 9T

Ref: Harrison 20th ed. pg. 3183 and NCBI Bookshelf

- Opening eyes on command = 3
- Moving limbs/obeying commands = 6
- Intubated = T
- The total score is 9T

The maximum score in intubated patient can be 10T and minimum as 2T.

Extra Mile

Glasgow coma scale- P

The GCS-P is calculated by subtracting the Pupil Reactivity Score (PRS) from the Glasgow Coma Scale (GCS) total score:

- GCS-p GCS - PRS
- The Pupil Reactivity Score is calculated as follows:

Pupils unreactive to light - Pupil Reactivity Score

- Both pupils - 2
- One pupil - 1
- Neither pupil - 0

2. Ans. (c) Generalized paresis

Ref: 5-minute Neurology, Consult ed. pg. 32

Postural tremor occurs when limb is positioned against gravity. It is seen in choices A, B and D. General **paresis** is a late manifestation of neurosyphilis and is characterized by delusion of grandiosity.

Mnemonic

P: Personality

A: Affect

R: Reflexes (Hyperactivity)

E: Argyll Robertson Pupil

S: Sensorium (hallucinations, delusions)

I: Intellect deterioration

S: Speech defects

Extra Mile

Classification of tremors and their characteristics and treatment

TABLE : Classification of tremors and their characteristics and treatment

Type of Tremor	Frequency	Occurrence	Etiology	Treatment
Postural tremor	5–9 Hz	When limb is positioned against gravity	Physiologic tremor, essential tremor, alcohol or drug withdrawal, metabolic disturbances, drug-induced tremor, psychogenic tremor	Beta blockers, primidone (Mysoline), acetazolamide (Diamox), clonazepam (Klonopin), botulinum toxin, brain gabapentin (Neurontin), deep stimulation thalamotomy
Rest tremor	3–6 Hz	When limb is fully supported against gravity and the muscles are not voluntarily activated	Parkinson's disease, multiple systems atrophy, progressive supranuclear palsy, drug-induced tremor, rubral tremor, psychogenic tremor	Levodopa- carbidopa (Sinemet), anticholinergics and other antiparkinsonian agents, deep brain stimulation, pallidotomy, thalamotomy
Action tremor+	3–10 Hz	During any type of movement	Cerebellar lesions, rubral tremor, psychogenic tremor	Wrist weights, isoniazid

3. Ans. (a) **Viruses**

Ref: Harrison 20th ed. pg. 2851

The leading cause of fulminant diabetes is viral insult that damages the beta cells of pancreas and can lead to development of type 1 diabetes mellitus.

4. Ans. (d) **Foot**

Ref: Harrison 20th ed. pg. 2642

- The distribution of joint involvement in diabetic neuropathy is tarsal and tarsometatarsal joints of foot.
- In tabes dorsalis knees, hips and ankles are most commonly affected
- In syringomyelia, Glenohumeral joint, elbow and wrist are involved.

Extra Mile

TABLE: Disorders associated with neuropathic joint disease

Diabetes mellitus	Amyloidosis
Tabes dorsalis	Leprosy
Meningomyelocele	Congenital indifference to pain
Syringomyelia	Peroneal muscular atrophy

5. Ans. (a) **Regular**

Ref: CMDT 2019, pg. 1256

- Immediately after initiation of fluid replacement, regular insulin can be given intravenously in loading dose of 0.1 unit/kg as a bolus to prime the tissue insulin receptors.
- Subsequently IV infusion of insulin at 0.1 units/kg/ Hour are continuously infused or given hourly as an intramuscular injection is sufficient to replace the insulin deficit in most patients.

6. Ans. (a) **Glargine**

Ref: CMDT 2019, pg. 1238

Glargine is called peak-less insulin. It acts after 0.5 hour and has a flat curve with effective duration of 24 hours.

Insulin preparations	Onset of action	Peak action	Effective duration
Insulins lispro, aspart, ¹ glulisine	5-15 minutes	1-1.5 hours	3-4 hours
Human regular	30-60 minutes	2 hours	6-8 hours
Human NPH	2-4 hours	6-7 hours	10-20 hours
Insulin glargine	0.5-1 hour	Flat	~24 hours
Insulin detemir	0.5-1 hour	Flat	17 hours

Contd...

Insulin preparations	Onset of action	Peak action	Effective duration
Insulin degludec	0.5-1.5 hours	Flat	More than 42 hours
Technosphere inhaled insulin	5-15 minutes	1 hour	3 hours

¹Insulin aspart formulated with niacinamide has ~10 minutes faster onset of action.

7. Ans. (a) **Bitemporal hemianopia**

Ref: Harrison, 20th ed. pg. 2676

Physical findings most commonly encountered in patients with hyperprolactinemia are galactorrhea and, in the case of prolactinomas, visual-field defects. Choices B, C and D are not physical findings but symptoms.

Notice the position of optic chiasma with respect to anterior pituitary in the line diagram shown here.

8. Ans. (a) **Weber syndrome**

Ref: Harrison 20th ed. pg. 191

Weber syndrome occurs due to occlusion of posterior cerebral artery P1 segment. It leads to compromise of oculomotor nerve and crus cerebri. Due to involvement of crus cerebri corticospinal pathway is affected. Since the corticospinal pathway crosses over at the lower border of medulla contralateral hemiplegia occurs.

Brain stem stroke always leads to crossed hemiplegia.

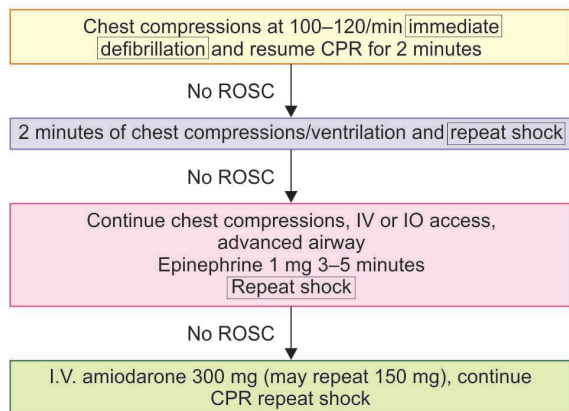

CARDIOLOGY9. Ans. (d) **Intravenous access followed by Immediate defibrillation**

Ref: Harrison, 20th ed. pg. 2064

One cycle of CPR is for 2 minutes and chest compressions are given @100-120/min. intravenous access is done after defibrillation and not before. Hence Choice D is wrong.

Ventricular fibrillation of pulseless ventricular tachycardia

10. Ans. (b) Myocardial ischemia

Ref: Harrison, 20th ed. pg. 1680

The ECG shows heart rate of 70/min with T wave inversion noted in leads V1 to V4. This indicates possible myocardial ischemia. Choice A and D are ruled out as there is no ST elevation. Pulmonary embolism leads to $S_1Q_3T_3$ pattern and in this case limb leads are not seen.

11. Ans. (c) Lasix, Nitrates and morphine

Ref: Harrison, 20th ed. pg. 1771

The CXR shows evidence of bat wing oedema which is seen with Acute decompensated CHF which is managed by LMNOP: Lasix, Morphine, Nitrates, Oxygen and Positioning of the patient.

12. Ans. (a) Peripheral Pulmonic stenosis

Ref: Harrison, 20th ed. pg. 1674

Continuous murmurs are seen in:

- Peripheral pulmonic stenosis
- Coarctation of aorta
- Patent ductus arteriosus
- Rupture of sinus of Valsalva
- Mammary souffle
- Venous Hum

13. Ans. (b) Decrease in systolic blood pressure 20 mm Hg within 3 min of postural change

Ref: AHA clinical Cardiac Consult pg. 280

Orthostatic hypotension is defined as decrease of BP > 20 mm Hg systolic and Diastolic > 10 mm Hg accompanied with symptoms of cerebral hypoperfusion.

14. Ans. (a) Start thrombolysis

Ref: Harrison, 20th ed. pg. 3081, 3087

The patient has presented with features of right sided cortical stroke leading to focal deficits on the left side. How to Interpret the normal CT head given in the question?

Haemorrhagic stroke is ruled out

- Most importantly CT scan showing no haemorrhage or oedema >1/3 of MCA territory is an indication for thrombolysis (Table 420-1 20th edition Harrison)

- In this scenario, the patient is treated as a case of ischemic stroke and managed with thrombolysis. The cut off for management of Thrombolysis is >4.5 hours from symptom onset.
- The closest choice is choice B which is used for management of Transient Ischemic attack. As per the definition of TIA symptoms resolve within 24 hours and most cases within one hour (Page 3087). TIA usually resolves before presenting to the physician.
- Choice C, BP should not be lowered in CNS events as it maintains brain perfusion. Only if BP is >185/110 mm Hg that lowering of BP should be done before initiating thrombolysis.

15. Ans. (d) Intravenous Procainamide

Ref: Harrison, 20th ed. pg. 1741

Anti-dromic tachycardia implies conduction via the accessory pathway in Wolf Parkinson White syndrome and retrograde conduction via the bundle of His. DOC for management of acute episode in WPW is procainamide and to prevent episodes of fast conduction flecainide is given. Since patient is hemodynamically stable DC shock is ruled out.

16. Ans. (a) Treadmill

Ref: Harrison, 20th ed. pg. 1742

- Wolf Parkinson White syndrome has an accessory pathway called Bundle of Kent that bypasses the normal conduction system in the heart. The faster conduction in these patients leads to complaints of tachycardia, dizzy spells and recurrent syncopal episodes.
- Choice B is correct as for these patients Holter monitoring (continuous ECG monitoring using a device worn by the patient for 24 hours) should be done to identify the tendency for arrhythmias.
- Choice C is correct as Beta blockers can control the fast beating ventricular rate.
- Choice D is correct as Procainamide slows the conduction via bundle of Kent leading to current to go via normal route and termination of a tachycardia episode.

17. Ans. (d) 1-minute gap between 2 shocks

Ref: AHA 2015 Guidelines

The time lag between two Defibrillation shocks is 2 minutes during which CPR is continued at a rate of 30:2.

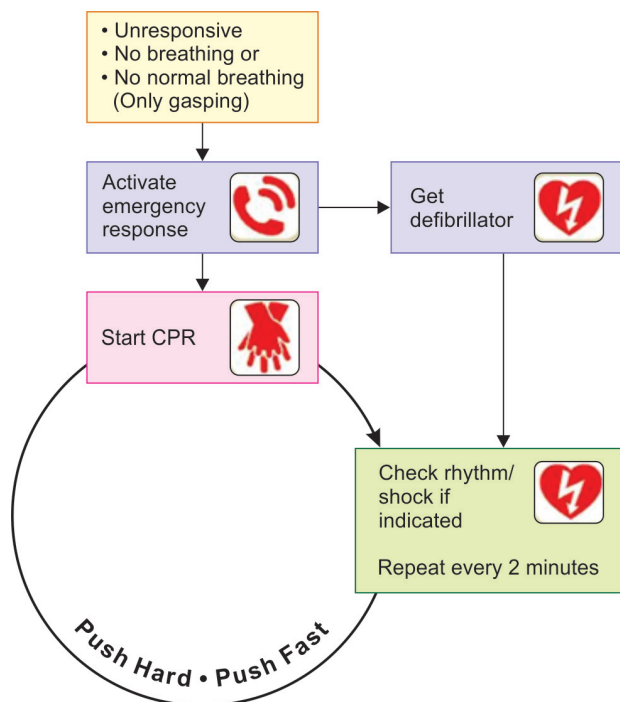

Figure: Simplified adult BLS algorithm

18. Ans. (d) Infective endocarditis

Ref: Harrison 20th ed. pg. 925

615

Major Criteria

- Blood culture positive for IE
 - Typical microorganisms consistent with IE from separate blood cultures
 - Viridans streptococci; *Streptococcus bovis*, HACEK group, *Staphylococcus aureus*, or
 - Community-acquired enterococci, in the absence of a primary focus
 - Microorganisms consistent with IE from persistently positive blood cultures, defined as follows:
 - At least two positive blood cultures of blood samples drawn > 12 h apart; or
 - All of three or a majority of ≥4 separate cultures of blood (with first and last sample drawn at least 1 h apart)
 - Single positive blood culture for *Coxiella burnetii* or antiphase I IgG antibody titer >1:800
- Evidence of endocardial involvement
- Echocardiogram positive for IE (TEE recommended in patients with prosthetic valves, rated at least “possible IE” by clinical criteria, or complicated IE [paravalvular abscess]; TTE as first test in other patients), defined as follows:
 - Oscillating intracardiac mass on valve or supporting structures, in the path of regurgitant jets, or implanted material in the absence of an alternative anatomic explanation; or
 - Abscess; or
 - New partial dehiscence of prosthetic valve
- New valvular regurgitation (worsening or changing or pre-existing murmur not sufficient)

Minor criteria

- Predisposition, predisposing heart condition or injection drug use
- Fever, temperature >38°C
- Vascular phenomena, major arterial emboli, septic pulmonary infarcts, mycotic aneurysm, intracranial hemorrhage, conjunctival hemorrhages, and janeway lesions
- Immunologic phenomena: Glomerulonephritis, Osler nodes, Roth's spots and rheumatoid factor
- Microbiological evidence: Positive blood culture but does not meet a major criterion as noted previously (excluding single positive cultures for coagulase-negative staphylococci and organisms that do not cause endocarditis) or serologic evidence of active infection with organisms consistent with IE
- Echocardiographic minor criteria eliminated

19. Ans. (a) False elevation of BP

Ref: AHA BP Measurement Guidelines

During BP recording the cuff should cover 80% of arm circumference. In case the BP cuff is undersized it will over estimate the BP value while an over sized cuff will under estimate the actual BP values.

FMGE Solutions Screening Examination

American Heart Association guidelines for in-clinic blood pressure measurement

616

Recommendation	Comments
Patient should be seated comfortably, with back supported, legs uncrossed, and upper arm bared.	Diastolic pressure is higher in the seated position, whereas systolic pressure is higher in the supine position
	An unsupported back may increase diastolic pressure; crossing the legs may increase systolic pressure
Patient's arm should be supported at heart level.	If the upper arm is below the level of the right atrium, the readings will be too high; if the upper arm is above heart level, the readings will be too low.
	If the arm is unsupported and held up by the patient, pressure will be higher.
Cuff bladder should encircle 80 percent or more of the patient's arm circumference.	An undersized cuff increases errors in measurement
Mercury column should be deflated at 2 to 3 mm per second.	Deflation rates greater than 2 mm per second can cause the systolic pressure to appear lower and the diastolic pressure to appear higher

20. Ans. (b) HDL

Ref: Harrison, 20th ed. pg. 1851

High density lipoprotein plays a role in reverse cholesterol transport from tissues and is cardioprotective in nature.

21. Ans. (c) Persistent Chest pain with ST elevation >90 minutes after thrombolysis

Ref: Harrison, 20th ed. pg. 1879

Rescue PCI should be done in case of failure of reperfusion which is defined as Persistent Chest pain and ST segment elevation >90 minutes.

Extra Mile

Primary PCI is done in cases of STEMI and should have a door to device time of less than 90 minutes.

Delayed PCI is done in cases of NSTEMI and has no time guidelines unlike above subtypes.

PCI with drug eluting stents is used in cases of single and double vessel disease in case of chronic stable angina.

Window period for thrombolysis in STEMI is 12 hours

22. Ans. (d) Atrial fibrillation

Ref: Harrison 19th ed. P 444

- Normally JVP falls with inspiration.
- Choice A, Constrictive pericarditis is characterized by presence of calcification around the ventricles. Hence the compliance of heart is reduced and it cannot accommodate blood. This leads to elevated JVP on inspiration.
- Choice B, restrictive cardiomyopathy is characterized by poor heart function and leads to reduced compliance of heart. This explains the rise of JVP with inspiration.
- Choice C, complete heart block is characterized by no conduction at level of AV nodes. This leads to A:V dissociation and presence of giant a waves on JVP. Hence JVP will rise with inspiration.
- Choice D is characterized by twitching of atria and absence of a waves on JVP. Hence JVP cannot rise on inspiration.

23. Ans. (b) Atrial depolarization with A-V conduction

Ref: Harrison 19th ed. P 1451

P wave	Atrial depolarization
PR interval	Atrial depolarization and AVN conduction
Q	Septal activation
QRS	Ventricular depolarization
QT	Ventricular repolarization plus ventricular repolarization

24. Ans. (b) Left ventricular hypertrophy

Ref: Harrison 19th ed. P 1658-59

- Pulmonary artery hypertension is due to constriction of pulmonary bed secondary to chronic hypoxia.
- Interstitial lung disease leads to lung shrinkage, and mitral stenosis due to pulmonary edema leads to hypoxia. Hence PAH will develop.
- Cor-pulmonale is right sided heart failure due to pulmonary artery hypertension. Leading cause of Cor-pulmonale is COPD.

25. Ans. (a) B₁ deficiency

Water hammer pulse is seen in high output cardiac failure caused by wet beri-beri. The development of CHF can explain the pedal/periorbital edema of the patient.

26. Ans. (a) Prolonged QT

QT interval shows an inverse relation with values of calcium and magnesium.

Must know information about QT interval

- 360–440 msec (9–10 small, squares)
- Measured in lead II or V5–V6

QT prolongation	QT shortening
<ul style="list-style-type: none"> • Hypocalcemia • Hypomagnesemia • Hypokalemia (prolonged QU interval) • Class IA and III drugs • Subarachnoid hemorrhage • Long QT syndrome • Romano ward syndrome 	<ul style="list-style-type: none"> • Hypercalcemia • Digoxin • Congenital short QT syndrome

27. Ans. (a) Internal mammary artery

Long-term patency rates are considerably higher for internal mammary and radial artery implantations than for saphenous vein grafts. In patients with left anterior descending coronary artery obstruction, survival is better when coronary bypass involves the internal mammary artery rather than a saphenous vein.

28. Ans. (b) ASD

PDA	Narrow split S2
ASD	Wide fixed S2
TOF	Single S2
VSD	Wide variable split S2

29. Ans. (a) Tall tented T wave

The earliest ECG finding of hyperkalemia is tall tented T wave.

Serum potassium	ECG changes
5.5–6.5 mM	Tall peaked T waves
6.5–7.5 mM	Loss of P waves
7–8 mM	Wide, qRS, PR prolongation
>8 mM	Sine wave pattern

Treatment

Intervention	Lowering of potassium	During	Comments
Calcium gluconate or calcium chloride	No change in potassium levels	Effect starts in 1–3 minutes and lasts for 30–60 minutes	Reduces excitability of heart and is the drug of choice
Insulin drip (most effective drug to lower K ⁺ concentration)	0.5–1.5 mmol/L	4–6 hours	Redistribution of potassium by sending potassium inside cells
Parenteral or nebulized salbutamol	0.5–1.0 mmol/L	Full effect takes up to 24 hours	Sorbitol in enema omitted in post-operative patients due to increased incidence of sorbitol-induced colonic necrosis
Hemodialysis		(Most effective method to lower potassium)	Refractory life threatening hyperkalemia failing to respond to conventional measures

FMGE Solutions Screening Examination

618

30. Ans. (b) PSVT

- The heart rate is 150 bpm
- Axis is normal
- P waves are absent with narrow complex QRS
- ST segment depression is noted in lead II
- The diagnosis is PSVT

31. Ans. (a) QT = 0.04 sec

Normal QT interval is 360-440 milli-seconds (Average 400 msec). The QT interval is written wrongly as 0.04 seconds where as it is 0.4 seconds.

32. Ans. (c) Atenolol

ACE \ominus are used to prevent ventricular remodelling in chronic CCF. β blockers like carvedilol metoprolol and bisoprolol reduce myocardial oxygen consumption. Atenolol is not useful in chronic CCF.

Drugs used in chronic CHF with EF <40%

Diuretics
Furosemide
Hydrochlorothiazide
Metolazone
Angiotensin converting enzyme inhibitors
Captopril
Enalapril
Lisinopril
Ramipril
Antiotensin receptor blockers
Valsartan
Candesartan
Irbesartan
Losartan
β receptor blockers
Carvedilol
Bisoprolol
Metoprolol Succinate

Contd...

Additional therapies

Spironolactone
Eplerenone
Combination of hydralazine/isosorbide dinitrate
Fixed dose of hydralazine/isosorbide dinitrate digoxin

33. Ans. (a) Diuretics

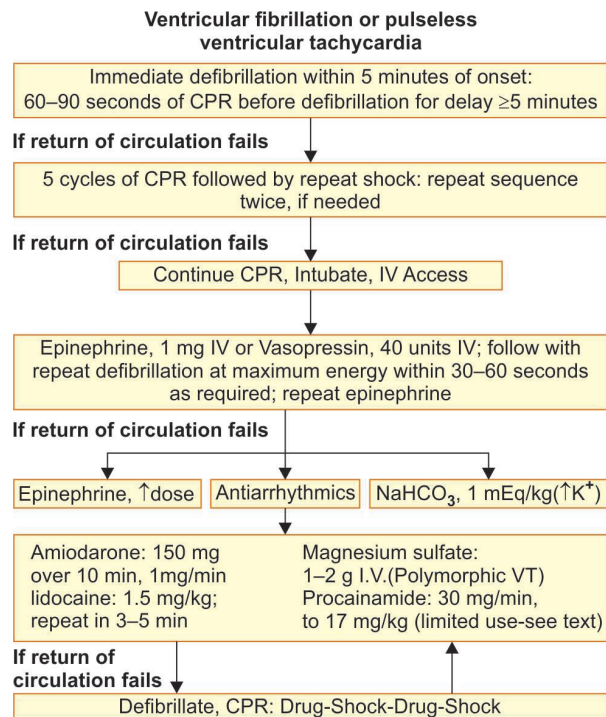

- The heart rate is about 70 bpm and axis is normal.
- P, PR interval and QRS complex is of normal duration.
- Lead II and chest lead V3 shows T wave inversion with presence of U waves suggestive of hypokalemia.
- Choice B and C lead to Hyperkalemia and tall tented T waves whereas in the ECG given the T waves are inverted.
- Choice D is ruled out as bradycardia is not present.

34. Ans. (d) Ventricular Tachycardia (VT)

The image shows a broad complex QRS suggestive of diagnosis of ventricular tachycardia.

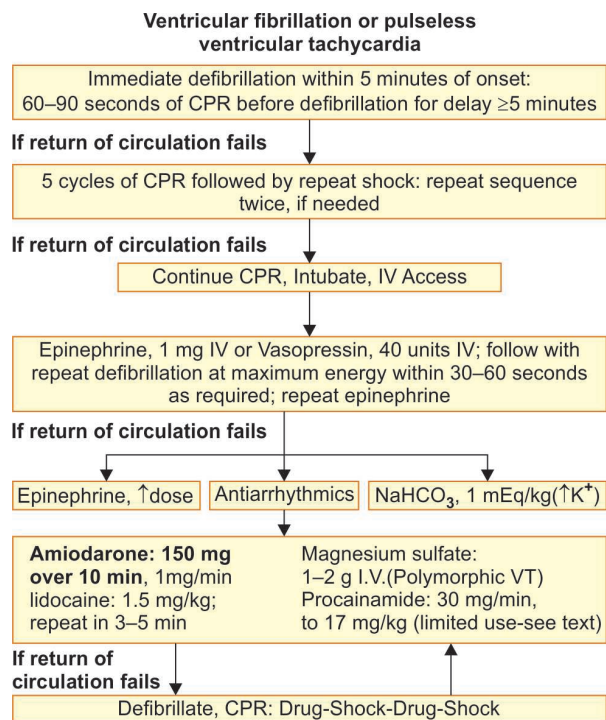

35. Ans. (d) Given along with adrenaline

Ref: AHA 2015 Guidelines

36. Ans. (c) **Amiodarone**

Ref: AHA 2015 Guidelines

37. Ans. (b) **Cardiac tamponade**

Ref: Harrison, 19th ed. pg. 1573

JVP Findings

JVP Waves	Findings Constrictive pericarditis	Findings Cardiac tamponade
X wave	Prominent	Prominent
Y wave	Prominent	Absent ^a

38. Ans. (a) **Atrial fibrillation**

Ref: Harrison, 19th ed. pg. 1487-88

- Beta blockers, nondihydropyridine calcium channel blockers (e.g., verapamil or diltiazem), and digitalis

40. Ans. (b) **Inferior to rib****Causes of inferior rib notching**

- Arterial: Aortic coarctation, aortic thrombosis, pulmonary-oligemia/AV malformation, Blalock Taussig shunt, Tetralogy of fallot, absent pulmonary artery and pulmonary stenosis.
- Venous: AV Malfomations of chest wall, superior vena cava or other central venous obstruction.
- Neurogenic: Intercoastal neuroma, Neurofibromatosis type 1, poliomyelitis.
- Osseous: Hyperparathyroidism, Thalassemia

Causes of superior rib notching

- Poliomyelitis
- Osteogenesis Imperfecta
- Neurofibromatosis
- Marfan's syndrome
- Collagen vascular disease
- Hyperparathyroidism.

glycosides are useful in slowing the ventricular rate of patients with AF.

- Digitalis, because left ventricular muscle function usually is normal in mitral stenosis, the use of digitalis is of little benefit to patients in sinus rhythm. In patients in atrial fibrillation, however, digitalis is used to slow ventricular rate. A rapid ventricular rate in mitral stenosis shortens diastole, thereby reducing left ventricular filling, which, in turn, further increases left atrial pressure and reduces cardiac output. β -Blockers and diltiazem or verapamil may be added to digoxin if further heart rate control is necessary.

39. Ans. (a) **Right 2nd intercostal, low pitch murmur**

Ref: Harrison, 19th ed. pg. 144B

- Aortic stenosis is the most common cause of a mid-systolic murmur in an adult.
- The murmur of AS is low to medium pitch and rasping or harsh in character.
- It is usually loudest to the right of the sternum in the second intercostal space (aortic area) and radiates into the carotids.
- Mid-systolic murmurs begin at a short interval after S_1 , end before S_2 , and are usually crescendo-decrescendo in configuration.

- Transmission of the mid-systolic murmur to the apex, where it becomes higher-pitched, is common (Gallavardin effect). This can cause misdiagnosis with murmurs of mitral regurgitation.

41. Ans. (d) **Troponin I**

Ref: Braunwald, 8th ed. Table 50-4

Biomarker	Range of Times to Initial Elevation (hr)	Mean Time to Peak Elevations (Nonreperfused)	Time to Return to Normal Range
Frequently Used in Clinical Practice			
MB-CK	4–6	24 hours	48–72 hours
cTnI	3	24 hours	5–10 days
cTnT	3	12 hours–2 days	5–14 days
Infrequently Used in Clinical Practice			
Myoglobin	1–4	6–7 hours	24 hours

42. Ans. (a) **Cardiac Tamponade**

Ref: Harrison, 18th ed. chapter 238

Beck's triad is a collection of three medical signs associated with acute cardiac tamponade, an emergency condition wherein fluid accumulates around the heart and impairs its ability to pump blood. The signs are:

1. Low arterial blood pressure
2. Distended neck veins
3. Distant, muffled heart sounds.

Constrictive pericarditis can present with hypotension and congested neck veins but muffled heart sounds are not present. Auscultatory finding heard is pericardial shock.

43. Ans. (a) **Fibrates**

Ref: Harrison, 19th ed. pg. 2449

- The *fibrates*, or *fibric acid derivatives*, act in part to stimulate the activity of peroxisome proliferator-activated receptors (PPARs), which are involved in fatty acid breakdown. *The main action of fibrates is to lower triglyceride levels (by 35 to 50 percent). Fibrates also raise serum high density lipoprotein (HDL) by 15 to 25 percent. Fibrates are the drugs of choice when treating isolated elevated triglycerides.*
- *Niacin*, fibrates, and prescription omega-3 fatty acids are approved for the treatment of patients with hypertriglyceridemia.
- *Statins* (or HMG-CoA reductase inhibitors) are a class of cholesterol lowering drugs that inhibit the enzyme HMG-CoA reductase which plays a central role in the production of cholesterol.
- *Ezetimibe* inhibits the absorption of cholesterol from the small intestine and decreases the amount of cholesterol normally available to liver cells, leading them to absorb

more from circulation and thus lowering levels of circulating cholesterol.

44. Ans. (d) **Platypnea**

Ref: Harrison, 19th ed. pg. 1992

- Platypnea-orthodeoxia is a striking clinical syndrome characterized by *dyspnea and deoxygenation accompanying a change to a sitting or standing from a recumbent position.*
- In orthopnea (reverse findings are seen) the dysnea is seen in supine position and reduces in sitting position. It is usually due to acute CHF and bilateral diaphragmatic hernia.

Causes of Platypnea

- ASD or PFO with position-dependent shunting
- Other Cardiac conditions
 - Atrial Myxoma^Q
 - Constrictive pericarditis
 - Aortic aneurysm
- Pulmonary
 - Multiple pulmonary emboli
 - Pulmonary emphysema
 - Radiation-induced bronchial stenosis
 - Hepatopulmonary syndrome^Q
 - Amiodarone toxicity of the lungs
 - Pulmonary A-V communications
 - Fat embolism syndrome
- Autonomic
 - Parkinson disease
 - Bilateral thoracic sympathectomy
- Abdominal
 - Hepatic cirrhosis
 - Ileus

45. Ans. (b) Cardiac Biomarkers

Ref: Harrison, 19th ed. pg. 1580

- Cardiac markers are used in the diagnosis and risk stratification of patients with chest pain and suspected acute coronary syndrome (ACS).
- The cardiac troponins, in particular, have become the cardiac markers of choice for patients with acute coronary syndrome which includes NSTEMI.
- *However in chronic Stable angina the symptoms arise on exertion/emotion or post-prandially and have characteristic ST segment depression on exercise testing. Cardiac biomarkers are normal as no cell death occurs in this case.*

46. Ans. (a) Aortic regurgitation

Ref: Harrison, 19th ed. pg. 411

Duroziez's sign is seen in severe aortic regurgitation, gradual pressure over the femoral artery leads to a systolic and diastolic bruit. The systolic murmur is heard best when the proximal femoral artery is compressed and the diastolic when the distal femoral artery is compressed.

47. Ans. (c) Erythema Marginatum

Ref: Harrison, 19th ed. pg. 2149

Morning stiffness is seen in Rheumatoid arthritis, while the question is on Rheumatic fever. Erythema Marginatum is a major Jones criteria for diagnosis of Rheumatic Fever.

Revised Jones criteria (2015 update)	
A. Diagnosis	
For all patient populations with evidence of preceding gas infection Initial ARF – 2 Major or 1 major plus 2 minor Recurrent ARF- 2 Major or 1 major and 2 minor or 3 minor	
B. What are major criteria?	
Low-risk populations	Moderate-and high-risk population
<ul style="list-style-type: none"> • Carditis <ul style="list-style-type: none"> ▪ Clinical and/or subclinical carditis • Arthritis <ul style="list-style-type: none"> ▪ Polyarthritits only • Chorea • Erythema marginatum 	<ul style="list-style-type: none"> • Carditis <ul style="list-style-type: none"> ▪ Clinical and/or subclinical carditis • Arthritis <ul style="list-style-type: none"> ▪ Monoarthritis or polyarthritits ▪ Polyarthralgia • Chorea • Erythema marginatum

Contd...

Revised Jones criteria (2015 update)

• Subcutaneous nodules	• Subcutaneous nodules
C. What are the minor criteria	
Low-risk populations	Moderate-and high-risk population
• Polyarthraigia	• Monoarthralgia
• Fever ($\geq 38.5^{\circ}$)	• Fever ($\geq 38^{\circ}\text{C}$)
• ESR ≥ 60 mm in 1st hour and/or CRP ≥ 3.0 mg/d	• ESR ≥ 30 mm/h and /or CRP ≥ 3.0
• Prolonged PR interval, after accounting for age variability (unless carditis is a major criterion) in all population	

48. Ans. (a) Staphylococcus aureus

Ref: Harrison, 19th ed. pg. 816

- Overall *S. aureus* infection is the most common cause of IE, including Prosthetic Valve Endocarditis, acute Infective Endocarditis, and IVDA(Intravenous drug Abuse) Infective Endocarditis.
- The mortality rate of *S. aureus* IE is 40-50%.

49. Ans. (b) Autoimmune

- Post-MI pericarditis following myocardial infarction is called Dressler syndrome and is an *autoimmune process*.
- *It also seen* as an unusual complication after percutaneous procedures such as coronary stent implantation, after implantation of epicardial pacemaker leads and transvenous pacemaker leads, and following blunt trauma, stab wounds, and heart puncture.

50. Ans. (a) Coarctation of aorta

Ref: Harrison, 19th ed. pg. 1525

- Coarctation of Aorta is most common cause of rib notching. It Usually involves the posterior 4th - 8th Ribs.
- *Collateral flow* bypassing the aortic constriction to reach the abdomen and lower extremities comes almost entirely from the two *subclavian arteries* via the thyrocervical, costocervical, and *internal mammary arteries* and their subdivisions to the *posterior intercostals* and then into the descending aorta.
- The large volume of blood traversing this route, and increased pulsation of the *intercostal arteries*, leads to erosion of lower border of ribs.

**51. Ans. (c) Anti-hypertensive drugs**

Ref: Harrison, 19th ed. pg. 1622

The question is incomplete but none the less asks about diastolic hypertension which can be a presentation of essential hypertension. Hence to reduce the diastolic overload of the heart, anti-hypertensive drugs are required for this case.

Causes of Isolated Diastolic Hypertension are

- Essential hypertension
- Hypothyroidism
- Conn syndrome

52. Ans. (d) Lisinopril

Ref: Harrison, 19th ed. pg. 1623, 18th ed. ch. 247

- ACEIs attenuate the development of left ventricular hypertrophy, improve symptomatology and risk of death from CHF, and *reduce morbidity and mortality rates in post-myocardial infarction patients.*
- *Similar benefits in cardiovascular morbidity and mortality rates in patients with CHF have been observed with the use of ARBs.*
- ACEIs provide better coronary protection than do calcium channel blockers, whereas calcium channel blockers provide more stroke protection than do either ACEIs or beta blockers.

53. Ans. (b) Resistance to 3 or more anti-hypertensive drugs including thiazides

Ref: Harrison, 18th ed. chapter 247

- *Resistant hypertension* refers to patients with blood pressures persistently >140/90 mm Hg despite taking three or more antihypertensive agents, including a diuretic, in a reasonable combination and at full doses.
- Resistant or difficult-to-control hypertension is more common in patients >60 years than in younger patients.
- Resistant hypertension may be related to:
 - “Pseudoresistance” (high office blood pressures and lower home blood pressures), nonadherence to therapy
 - Identifiable causes of hypertension (including obesity and excessive alcohol intake)

54. Ans. (d) Shock

Ref: Harrison, 18th ed. chapter 233 and 238

- The CXR shows increased CT ratio which points to probable diagnosis of Dilated cardiomyopathy
- Patients dilated cardiomyopathy are predisposed to development of arrhythmia.
- Since atrial fibrillation is common, embolic stroke can occur and can lead to development of sudden death.

55. Ans. (b) QRS complex

Ref: Harrison, 19th ed. pg. 1489

- The origin of premature beats/ventricular extra systoles in the ventricle at sites remote from the Purkinje network produces slow ventricular activation and a wide QRS complex that is typically >140 ms in duration.
- Ventricular premature complexes are common and increase with age and the presence of structural heart disease.

56. Ans. (a) Right atrium (RA)

Ref: Chapter 227, Harrison, 18th ed.

NORMAL JVP = 5-8 CM OF WATER

- Elevated JVP is indicative of right sided CHF
- Kussmaul sign is seen in constrictive pericarditis
- *Kussmaul sign is not seen in cardiac tamponade*
- Canon a waves are seen AV dissociation/ventricular tachycardia/junctional tachycardia

57. Ans. (a) Benign hypertension

Ref: Robbins, 8th ed. chapter 10

- **Hyaline arteriolosclerosis**, the vascular lesion associated with hypertension, is both more prevalent and more severe in diabetics.
- It takes the form of an *amorphous, hyaline thickening of the wall* of the arterioles, which causes narrowing of the lumen.
- It is encountered frequently in elderly patients, whether normotensive or hypertensive, hyaline arteriolosclerosis is more generalized and more severe in patients with hypertension.

58. Ans. (b) Left atrium

Ref: Robbins, 8th ed. Chapter 11

Mural endocardial lesions can be seen as *MacCallum* plaques in rheumatic heart disease. These plaques appear as map-like areas of thickened, roughened, and wrinkled part of the endocardium in the left atrium. They are *caused by regurgitant jets of blood flow, due to incompetence of the mitral valve.*

59. Ans. (b) Complete heart block

Ref: Harrison, 18th ed. chapter 227

- The ‘a’ wave reflects right atrial contraction and occurs just after the electrocardiographic P wave, preceding the first heart sound (S₁).
- The a wave is not present with atrial fibrillation.

- Canon *a* wave occurs with
 - Atrioventricular (AV) dissociation/complete heart block due to right atrial contraction against a closed tricuspid valve.
 - Wide complex tachycardia like ventricular tachycardia
- A prominent *a* wave is seen in patients with reduced right ventricular compliance like Right ventricular failure.

60. Ans. (d) Marfan syndrome

Ref: Harrison, 19th ed. pg. 2512

- Etiology of an aneurysm may affect the incidence of dissections. Atherosclerosis, when advanced, typically results in medial and adventitial fibrosis, which hampers the development of dissections. *Dissections are common in Marfan syndrome, idiopathic T.A.A (thoracic aorta aneurysm).*

61. Ans. (c) Purkinje fibres have the slowest conduction

Ref: Harrison, 19th ed. pg. 265e-12

- Purkinje fibers have the fastest speed of conduction of 4 metres/second.
- The dominant pacemaker is the SAN due to its automaticity and the lowest RMP of all the pacemakers.

62. Ans. (a) Atrial fibrillation

Ref: Harrison, 19th ed. pg. 1443-1444

- A wave in JVP is due to atrial contraction. In atrial fibrillation, since the atria are twitching, the power of atria is reduced to a level that a wave would be absent.
- Heart block will have large a waves.
- Tricuspid Regurgitation has absent x and large v waves.
- Constrictive Pericarditis has a large y descent.

63. Ans. (b) Junctional tachycardia

Ref: Harrison, 19th ed. pg. 1480

Atrial fibrillation	Absent 'a' waves
Junctional tachycardia	The AVN node becomes the dominant pacemaker and simultaneously depolarizes the Atria and ventricles. Hence the AV valves might not be open and hence the atria will contract against the closed AV valves resulting in very large a waves
Constrictive pericarditis	Due to impaired compliance of ventricles, rapid ventricular filling occurs leading to steep y
Cardiac tamponade	Absent y waves

64. Ans. (c) Duration of mid-diastolic murmur

Ref: Harrison, 19th ed. pg. 1539

- Severity of mitral Stenosis implies that the mitral valve orifice has become smaller in size. This implies that the blood will take longer time to go from left atrium to left ventricle. This implies the LENGTH Of murmur will increase.

65. Ans. (d) Chest compressions

Ref: Harrison, 19th ed. pg. 1768

- According to AHA 2015 guidelines, the basic life support entails C_A_B and a shift from ABC protocol. Therefore the first thing to be done is chest compressions@100 times per minute. The depth of sternal depression should be 2 inches (5 cm)
- ALSO remember that in Advance cardiac life support the drugs used are epinephrine, vasopressin and amiodarone. ATROPINE has been withdrawn and this is a change from 2005 guidelines.

66. Ans. (d) Atrial depolarization

ECG finding	Significance
P wave	Atrial Depolarization
QRS	Ventricular depolarization
T wave	Ventricular repolarization
U wave	Delayed repolarization of papillary muscles
PR interval	Spread of impulse from SAN to AVN
ST segment	Iso-electric segment

67. Ans. (a) Tall tented T waves

Ref: Harrison, 19th ed. pg. 310

Serum potassium > 5.5 mEq/L is associated with repolarization abnormalities:

- Peaked T waves (usually the earliest sign of hyperkalemia)
- *Serum potassium > 6.5 mEq/L is associated with progressive paralysis of the atria.*
- P wave widens and flattens
- PR segment lengthens
- P waves eventually disappear

Serum potassium >7.0 mEq/L is associated with conduction abnormalities and bradycardia:

- Prolonged QRS interval with bizarre QRS morphology
- High-grade AV block with slow junctional and ventricular escape rhythms, followed by sine wave appearance.

Serum potassium level of $> 9.0 \text{ mEq/L}$ causes cardiac arrest due to:

- Asystole
- Ventricular fibrillation

68. Ans. (d) Treatment with steroids is necessary

- Dressler syndrome is post MI pericarditis/Pleuritis and is characterized by autoimmunity causing damage to the heart. The resultant inflammation causes chest pain in these patients upto 6 weeks of a preceding myocardial inflammation. The investigations show ECG evidence of pericarditis with ST elevation with concavity in upwards direction. The CPKMM levels are normal. The treatment of these patients shall be aspirin 650 mg TID.

69. Ans. (b) Hypertension

Ref: Harrison, 19th ed. pg. 1640

- 70% cases of aortic dissection occur due to hypertension. The tear occurs in tunica media and causes a tearing pain in the chest with maximum intensity in interscapular area. The IOC for aortic dissection is trans-esophageal echocardiography > MRI chest.
- Marfan syndrome also can present with aortic dissection, which in fact is the leading cause of death in these patients. Syphilis involves the arch of aorta and causes an aneurysm that can rupture any day.

70. Ans. (a) Troponin I

Ref: Harrison, 19th ed. pg. 1600

- The best test for diagnosis of MI is troponin I which can be quantified as value more than 0.04 ng/dl after 3 hours of onset of myocardial infarction.

Remember TROPONIN-I can be false positive in the following cases

Cardiac causes	Noncardiac causes
Cardiac contusion resulting from trauma	Pulmonary embolism

Contd...

Cardiac causes	Noncardiac causes
Cardiac surgery	Severe pulmonary hypertension
Cardio eversion	Renal failure
Endomyocardial biopsy	Stroke, subarachnoid hemorrhage
Acute and chronic heart failure	Infiltrative disease, e.g, amyloidosis
Aortic dissection	Cardiotoxic drugs

71. Ans. (d) Warfarin

Ref: AHA 2016 update: Secondary prevention of MI

- Aspirin and clopidogrel have been shown to reduce mortality due to MI.
- Statins regress atherosclerosis and β blockers due to oxygen conserving action will prevent future episode of MI.
- Warfarin is not routinely used in post MI Patients.

72. Ans. (a) Aortic stenosis

Ref: Harrison pg. 19th ed. pg. 1529

- Reverse split S2 implies aortic valve closes very late to a level that it closes after the pulmonic valve closure (Normally aortic valve closes first and then pulmonic valve).
- **This occurs in severe aortic stenosis** where the valvular obstruction makes the work of left ventricle harder. The longer ejection time leads to delayed closure of aortic valve. Due to this delayed closure the split becomes narrowed
- In mitral stenosis loud S1 is seen. In pulmonary artery hypertension loud P2 is seen. In pulmonic stenosis single S2 is seen.

73. Ans. (d) Wide QRS complex

Ref: Harrison, 19th ed. pg. 310

ECG Findings of Hyperkalemia

- The first ECG finding in hyperkalemia is tall tented T waves followed by slowing of depolarization of heart.
- This results in prolonged PR interval with QRS widening.
- Subsequently the P waves start becoming smaller.
- Sine wave pattern leading to ventricular fibrillation/ diastolic arrest of heart.

74. Ans. (d) **Alcohol**

Ref: Harrison, 19th ed. pg. 95e-5

- Alcohol in mild amounts has been shown to have beneficial effect on heart. All of you would have heard and read about benefits of red wine.
- Studies have shown chlamydia as incriminating factor for atherosclerosis and so does poor dental hygiene.

75. Ans. (a) **Cardiophrenic angle**

Ref: Harrison, 19th ed. pg. 1719

Most common site of pericardial cyst is cardiophrenic angle.

Extra Mile

- **Anterior mediastinal tumors** are **thymoma, lymphoma, pheochromocytoma**,
- **Posterior mediastinal tumors** are **neurogenic tumors** (20% of mediastinal tumors).
- **Middle mediastinal tumors** are pericardial cyst, bronchogenic cyst, thyroid mass, tracheal tumors.

76. Ans. (a) **Total anomalous pulmonary venous connection**

Ref: Nelson, 18th ed. / ch 431

Conditions	Radiological findings
Total anomalous pulmonary venous connection	Figure of 8 or snowman heart
Transposition of great arteries	Egg on side appearance
TOF	Boot shaped heart
Ebstein anomaly	Box shaped heart

77. Ans. (b) **Aortic regurgitation**

Ref: Harrison, 19th ed. pg. 1534

Pulse pressure is SBP – DBP. In aortic stenosis or mitral stenosis SBP is low leading to reduction of pulse pressure. In tricuspid stenosis since the blood flow into right side of heart is reduced, so is left side inflow and therefore reduction in SBP.

Other Changes in Pulse Pressure Include

- Increased pulse pressure: Aortic regurgitation, Aortic sclerosis
- Decreased pulse pressure: Aortic stenosis, Mitral stenosis
- Increased diastolic pressure: Mitral stenosis
- Decreased diastolic pressure: Aortic regurgitation, Patent ductus arteriosus

Causes of wide pulse pressure

- | | |
|---|---|
| <ul style="list-style-type: none"> • Atherosclerosis • Arteriovenous fistula • Chronic aortic regurgitation • Thyrotoxicosis • Fever • Anemia • Pregnancy | <ul style="list-style-type: none"> • Anxiety • Heart block • Aortic dissection • Endocarditis • Raised intracranial pressure |
|---|---|

78. Ans. (a) **Junctional rhythm**

Ref: Harrison, 19th ed. pg. 1443-44

- In Junctional rhythm the inherent AV node is the dominant pacemaker that causes simultaneous activation of atria and ventricles. Normally the Atria contract before the ventricles. Therefore in JUNCTIONAL RHYTHM atria will contract against the closed tricuspid and mitral valves leading to a very large a wave referred to as canon a waves.

REMEMBER the traditional question on canon a waves is related to complete heart block.

JVP findings	Conditions
Absent a waves	Atrial fibrillation
Canon a waves	Complete heart block, junctional rhythm, A-V dissociation
Large a waves	Tricuspid stenosis, pulmonic stenosis, pulmonary artery hypertension.

79. Ans. (c) **Venous insufficiency**

Ref: Harrison, 19th ed. pg. 253

- Edema is defined as a palpable swelling caused by an increase in interstitial fluid volume. The most likely cause of leg edema in patients over age 50 is venous insufficiency.
- The most important cause of unilateral pedal edema is also venous insufficiency which must be evaluated using a Doppler exam.

80. Ans. (b) **Diastolic dysfunction**

Ref: Harrison, 19th ed. pg. 1568

- HOCM stands for Hypertrophic Obstructive Cardiomyopathy and is seen in young male athletes.
- Hypertrophic cardiomyopathy is characterized by diastolic dysfunction, attributed to the hypertrophy, fibrosis, and intraventricular gradient when present.
- Asymmetrical septal hypertrophy and hypertrophy of left ventricular wall leads to decrease in LV cavity size.

Clinical Features

1. Dyspnea (MC symptom)
2. Effort intolerance

FMGE Solutions Screening Examination

3. Sub endocardial ischemia leading to angina
4. Sudden death in HOCM is seen in young male players due to ischemic *ventricular fibrillation*.
5. Narrow split S₂ is seen.

Treatment

- Propranolol (decrease heart rate, decrease O₂ consumption) and Verapamil

Extra Mile

Drugs C/I in HOCM : Furosemide, ACE Inhibitors, Digoxin, NTG as they will all decrease pre-load, which will lead to decrease flow to right and then left side of heart leading to Decreased SBP

81. Ans. (b) Atropine

Ref: AHA 2010 Guidelines; Management of Cardiac Arrest

82. Ans. (b) Cardiac abnormality

Ref: Harrison, 19th ed. pg. 96e-1t

- **Vitamin B1** deficiency causes Beri-Beri which is of two types- WET BERI-BERI having cardiac failure and DRY BERI-BERI causing CNS problems like Wernicke encephalopathy and Korsakoff psychosis.
- Gingival bleeding and delayed wound healing (choice A) is seen with scurvy. Memory loss is seen with niacin deficiency.

83. Ans. (d) Anaphylaxis

Ref: Harrison 19th ed. pg. 2116

The life-threatening anaphylactic response of a sensitized human appears within minutes after systemic exposure to specific antigen and is manifested by:

- Respiratory distress due to laryngeal edema
- Intense bronchospasm
- Vascular collapse, or by shock without antecedent respiratory difficulty.
- Cutaneous manifestations exemplified by pruritus and urticaria with or without angioedema are characteristic of such systemic anaphylactic reactions.
- Gastrointestinal manifestations include nausea, vomiting, crampy abdominal pain, and diarrhea.

84. Ans. (c) Serum tryptase

Ref: Harrison 19th ed. pg. 2116

- Elevations of tryptase levels in serum implicate mast cell activation in a systemic reaction and are particularly informative for anaphylaxis with episodes of hypotension during general anesthesia or when there has been a fatal outcome.
- However, because of the short half-life of tryptase, elevated levels are best detected within 4 hours of a systemic reaction

- Immunoassays using purified antigens can demonstrate the presence of specific IgE in the serum of patients with anaphylactic reactions, and intracutaneous skin testing may be performed after the patient has recovered to elicit a local wheal and flare in response to the putative antigen.

85. Ans. (c) Atherosclerosis

Ref: Harrison 19th ed. pg. 1639

- Abdominal aortic aneurysms <4.0 cm may affect 1–2% of men older than 50 years.
- *At least 90% of all abdominal aortic aneurysms >4.0 cm are related to atherosclerotic disease, and most of these aneurysms are below the level of the renal arteries.*
- Prognosis is related to both the size of the aneurysm and the severity of coexisting coronary artery and cerebrovascular disease.
- *The risk of rupture increases with the size of the aneurysm: the 5-year risk for aneurysms <5 cm is 1–2%, whereas it is 20–40% for aneurysms >5 cm in diameter (remember the percentage asked)*
- Abdominal aortic aneurysm commonly produces no symptoms. It is detected on routine examination as a palpable, pulsatile, expansile, and non-tender mass.
- Some patients complain of strong pulsations in the abdomen; others experience pain in the chest, lower back, or scrotum. Aneurysmal pain is usually a harbinger of rupture and represents a medical emergency.

86. Ans. (d) Calcium chloride

Ref: Harrison, 19th ed. pg. 312

- In a clinical setting of hyperkalemia in 1 year old child, cardiac arrhythmias associated with hyperkalemia include sinus bradycardia, sinus arrest, slow idioventricular rhythms, ventricular tachycardia, ventricular fibrillation, and asystole.
- Intravenous calcium serves to protect the heart while measures are taken to correct hyperkalemia.
- Calcium raises the action potential threshold and reduces excitability without changing the resting membrane potential. By restoring the difference between the resting and threshold potentials, calcium reverses the depolarization blockade caused by hyperkalemia.
- *The recommended dose of treatment of hyperkalemia is 10 mL of 10% calcium gluconate (3–4 mL of calcium chloride), infused intravenously over 2 to 3 min with cardiac monitoring.*
- The effect of the infusion starts in 1–3 min and lasts 30–60 min; the dose should be repeated if there is no change in ECG findings or if they recur after initial improvement.

87. Ans. (c) 12–18 months

Ref: Harrison, 19th ed. pg. 1567

- Amyloid involvement of the heart is seen, especially in the elderly population.

- Recent data suggests that life expectancy has increased from 6 to 16-20 months in the most common subtype, AL amyloid.
- Gold standard diagnostic test for restrictive cardiomyopathy is right-ventricular biopsy, which demonstrates positivity for Congo Red staining.

88. Ans. (a) CCTA

Ref: Harrison, 19th ed. pg. 270e-4

- *Coronary lesions prone to rupture* and subsequent development of MI have different morphology compared with stable plaques, and *can be evaluated by CCTA* to identify vulnerable plaques before they lead to clinical events. Large plaque volume, low CT attenuation, napkin-ring sign and spotty calcification are all associated with a high risk of acute cardiovascular events in patients.
- Coronary angiography is used to detect percentage of blockage in coronary artery.

NEUROLOGY

89. Ans. (a) Order CT scan

Ref: Harrison, 20th ed. pg. 2072

- Choice C is ruled out since no features of raised ICP are given.
- Choice D is ruled out since BP lowering is done in case of CNS events if the BP >185/110 mm Hg. Moreover, CT is required for diagnosis of a CNS event. At lower BP values, reducing BP would be counterproductive and can lower Brain perfusion.
- Now we have to choose between the two choices CT scan and blood glucose.
- As per the algorithm of management of an unconscious patient, blood sugar levels should be checked first.
- In any unconscious patient of diabetes mellitus, status of blood sugar should be assessed immediately as hypoglycemia/ hyperglycemia would change the line of management.
- Once these two possibilities are ruled out then CT head is to be performed to rule out a CNS event.
- Page 2072: 20th edition of Harrison quotes “the studies most useful in diagnosis of coma are chemical-toxicologic analysis of blood and urine followed by Cranial CT/MRI, EEG and CSF examination”.

90. Ans. (d) Diplopia

Ref: Harrison, 19th ed. pg. 3120

- Due to rigidity of vocal cords patient speaks slowly and cannot raise his voice. This is choice A hypophonia/soft voice.

- Choice B is correct as patient of PD cannot start a movement like a normal person.
- Choice C is correct and when it involves upper limb it is called cog wheel rigidity and lower limb involvement is called lead pipe rigidity.

Cardinal features	Other motor features	Nonmotor features
Bradykinesia Rigidity Resting Tremor Gait disturbance/ postural instability	Micrographia Masked facies Reduced eye blink Soft voice Freezing	Anosmia Mood disorders, e.g., depression Sleep disturbances Autonomic disturbances Cognitive impairment/dementia

91. Ans. (a) M. Gravis

Ref: Harrison, 20th ed. pg. 3233

- The presence of muscle weakness/fatiguability with *normal reflexes* is a feature of M. Gravis. Due to lesser number of receptors available at NMJ and rundown presynaptic release of Ach, decremental response to repetitive nerve stimulation is a *hallmark* feature of this disease.
- Guillain barre has segmental demyelination of spinal cord and presents with ascending symmetrical paralysis with areflexia.
- Transverse myelitis also presents with ascending paralysis and areflexia due to spinal cord involvement.
- Traumatic neuritis is a LMNL and leads to flaccidity and areflexia.

92. Ans. (a) Subacute combined demyelination of spinal cord

Ref: Harrison, 20th ed. pg. 152

- The question is framed to check whether the student is aware of vitamin deficiencies that lead to reversible dementia. These are B1, B12 and nicotinic acid (pellagra). Since vitamin B12 deficiency also leads to Subacute combined demyelination of spinal cord, the correct answer is choice A.
- Choice B Acute inflammatory demyelinating poly-neuropathy presents as ascending symmetrical flaccid paralysis and is also called Guillain Barre syndrome.
- Choice C is a prion disease and presents as dementia with myoclonic jerks and leads to neuro-degeneration.
- Choice D leads to frontotemporal dementia with inappropriate aggressive behavior.

93. Ans. (d) Gordon reflex

Ref: Oxford Handbook of Neurology, 2nd ed. pg. 605

- Gordon reflex is an alternative method of eliciting the Babinski sign. It presents as extensor plantar response

FMGE Solutions Screening Examination

628

when the calf muscle is squeezed. The clinical sign is used to determine whether a lesion of the pyramidal tract exists. The Gordon reflex is closely associated with the Babinski, Chaddock, and Oppenheim reflexes.

- Choice A is seen in Duchene muscular dystrophy
- Choice B is seen in deep vein thrombosis
- Choice C is alternative method eliciting an extensor plantar by providing *tactile stimulus on shin*.

Alternative methods of eliciting Babinski sign

94. Ans. (a) Abducens

Ref: Harrison, 20th ed. pg. 192

The abducens nerve has the longest subarachnoid course and is therefore the most common cranial nerve involved in case of raised ICP. It is also the most common nerve involved in post lumbar puncture or spinal anesthesia.

Extra Mile

- Cranial nerve with longest intracranial route is trochlear nerve
- Only cranial nerve with crossed origin/only one with dorsal origin is trochlear nerve
- Cranial nerve with longest intra-osseous route is facial
- Cranial nerve with longest route overall is Vagus

95. Ans. (a) Mydriasis

Ref: Harrison 20th ed. pg. 541

Due to damage to sympathomimetic fibers, mydriasis cannot occur in Horner syndrome. It is usually caused by lung cancer which is then called Pancoast tumour of superior sulcus tumour.

Features of Horner syndrome : Mnemonic: SAMPLE

S	Sympathetic nerve fiber injury
A	Anhidrosis
M	Miosis
P	Ptosis
L	Loss of ciliospinal reflex
E	Enophthalmos

96. Ans. (b) Syringomyelia

Ref: Harrison 19th ed. 2654

- Syringomyelia is characterized by dilatation of syrinx leading to compression of lateral spinothalamic pathways.
- This leads to sensory loss in hands that leads to *painless burn* which is not appreciated by the patient.
- Muscle wasting in the lower neck, shoulders, arms and hands with asymmetric or absent reflexes in arms represents expansion of cavity in gray matter of cord.
- Diabetes mellitus leads to neuropathic ulcers involving the sole of foot.
- Mononeuritis multiplex leads to multiple peripheral neuropathies like carpal tunnel syndrome, tarsal tunnel syndrome, meralgia paresthetica occurring simultaneously.

Extra Mile

- Expansion of syrinx can lead to involvement of descending tract of trigeminal nerve leading to cough induced headache.
- Characteristic feature of syringomyelia is dissociative anesthesia.
- IOC for syringomyelia is MRI spine

97. Ans. (d) Inability to recognize face

Ref: Harrison 19th ed. P 182

Prosopagnosia is inability to recognize familiar faces including self-image in the mirror. The affected person can identify a face as a face or a car as a car but cannot tell the person or model of car.

The lesion lies in occipitotemporal area.

98. Ans. (a) Thiamine

Ref: Harrison 19th ed. P 2607

Wernicke's encephalopathy is manifestation of Dry beriberi.

Extra Mile

- Clinical features are (G.O.A) Global Confusion, ophthalmoplegia and ataxia.
- 1st clinical feature to respond to IV thiamine treatment is ophthalmoplegia.
- 1st to be initiated is intravenous thiamine followed by dextrose.
- Dextrose infusion will first lead to worsening of neurological features
- Best test for thiamine deficiency is serum thiamine levels >> RBC transketolase activity

99. Ans. (d) Anomic aphasia

Ref: Harrison 19th ed. P 178

Metabolic encephalopathy leads to anomic aphasia. The presentation is difficulty in naming an object, word finding pauses, and impaired spelling.

Motor aphasia	Lesion in Broca's area
Sensory aphasia	Lesion in Wernicke's area
Conduction aphasia	Lesion in arcus fasciculus

Extra Mile

Anomic aphasia is also seen in

1. Alzheimer's disease
2. Head trauma
3. Metabolic encephalopathy—Uremic encephalopathy, ammonia intoxication

100. Ans. (b) Fomepizole

Ref: Harrison 19th ed. P 473 e-12

Methanol causes ethanol like CNS depression and increased serum osmolality. Formic acid leads to retinal toxicity and manifests as clouding, spots and blindness.

MANAGEMENT

- Gastric aspiration
- Sodium bicarbonate
- High dose folinic acid
- Fomepizole is the DOC and helps in management of high anion gap metabolic acidosis
- Ethanol can be used in absence of fomepizole and is given via nasogastric tube
- Hemodialysis for enhancing methanol elimination and shortening duration of treatment.

101. Ans. (c) Anterior horn cell disease

Ref: Harrison: 19th ed. P 154

- Anterior horn cell disease involves motor neuron in the ventral horn of spinal cord and hence is an example of lower motor neuron disease.
- Prion particles infect the neurons and lead to corticospinal pathway damage.
- Multiple sclerosis is pure white matter disease characterized by plaques.
- Tuberous sclerosis has subependymal nodules in periventricular location. It presents as epilepsy since birth.

102. Ans. (b) Strep pneumonia

TABLE: Causative agents of meningitis age wise

Neonate	Group B streptococcus (India) Klebsiella > E. coli
Child	Pneumococcus
Adult	Pneumococcus
Adult (epidemic)	Meningococcus

103. Ans. (a) Loss of bladder control

Complete Cord Transection Syndrome

Complete cord transection syndrome results in complete loss of all sensibility and voluntary movement below the level of the

lesion. It can be caused by fracture dislocation of the vertebral column, by a bullet or stab wound, or by an expanding tumor. The following characteristic clinical features will be seen after the period of spinal shock has ended:

- *Bilateral lower motor neuron paralysis and muscular atrophy in the segment of the lesion.* The result from damage to the neurons in the anterior gray column (i.e lower motor neuron) and possibly from damage to the nerve roots of the same segment.
- *Bilateral spastic paralysis below the level of the lesion.* A bilateral Babinski sign is present, and depending on the level of the segment of the spinal cord damaged, bilateral loss of the superficial abdominal and cremaster reflex occurs. All these signs are caused by an interruption of the corticospinal tract on both side of the cord.
- *Bilateral loss of the sensations below the level of the lesion.* The loss of tactile discrimination and vibratory and proprioceptive sensations is due to bilateral destruction of the ascending tracts in the posterior white column. The loss of pain, temperature, and light touch sensations is caused by section of the lateral and anterior spinothalamic tracts on both sides.
- *Bladder and bowel functions are no longer under voluntary control, since all the descending autonomic fibers have been destroyed.*

If there is a complete fracture dislocations at the L2-3 vertebral level (i.e. a level below the lower end of the cord in the adult), no cord injury occurs and neural damage is confined to the cauda equine, and lower motor neuron, autonomic, and sensory fibers are involved.

104. Ans. (b) Thermal sense

Hemisection of spinal cord is called as Brown Sequard syndrome.

Manifestation of Brown Sequard Syndrome

- *Interruption of the lateral corticospinal tracts*—Ipsilateral spastic paralysis below the level of the lesion and Babinski sign ipsilateral to the lesion (abnormal reflexes and Babinski sign may not be present in acute injury)
- *Interruption of posterior white column*—Ipsilateral loss of tactile discrimination, as well as vibratory and position sensation, below the level of the lesion
- *Interruption of lateral spinothalamic tracts*—Contralateral loss of pain and temperature sensation. This usually occurs 2–3 segments below the level of the lesion

105. Ans. (a) Cerebellum

- Pendular knee jerk is seen in cerebellar lesions
- DTR are normal in basal ganglia damage.
- Hung up reflexes are seen in chorea.
- Hung up ankle jerks are seen in hypothyroidism

**Must know points about cerebellar lesions**

- Scanning speech: The words are broken into syllable components (Dysarthria).
- Nystagmus
- Hypotonia
- Pendular knee jerk
- Truncal ataxia:
 - Positive Romberg sign, with *eye open*
- Tests for coordination shows incoordination: There will be dysmetria and dysynergia in the following tests:
 - Finger nose test
 - Balaney's past pointing test
 - Knee heel test
 - Dysdiadochokinesia
- Intention tremor.
- Ataxic gait (Reeling gait)

Site of lesion

- **Cerebellar vermis:** The midline structure is concerned for posture and equilibrium. Lesion at this site causes truncal and gait ataxia.
- **Cerebellar hemispheres:** The smooth conduction of movement (by co-ordinated contraction and relaxation of muscles is controlled by cerebellum. **Lesion in cerebellar hemisphere produces ipsilateral signs.**

106. Ans. (b) Spinocerebellar pathways

- *Unconscious proprioception* is the sensation of limb and joint position and range and direction of limb mediated by (*spinocerebellar pathways and serves as a back up to*) the dorsal column medial lemniscal system.
- Unconscious proprioception involves acquisition and maintenance of skilled motor activities such as walking speaking writing, swallowing, unconscious proprioception.
- *The spinocerebellar pathways, unlike the other sensory pathways follow a two-order neuronal system and do not directly project the cortex.*
- The system consists of three second order fiber tracts ventral spinocerebellar, dorsal spinocerebellar and cuneocerebellar.

107. Ans. (a) M. Gravis

- In M. Gravis, the fundamental defect is a decrease in the number of available AChRs at the postsynaptic muscle membrane. These changes result in decreased efficiency of neuromuscular transmission.
- Therefore, although ACh is released normally, it produces small end-plate potentials that may fail to trigger muscle action potentials.
- The amount of ACh released per impulse normally declines on repeated activity (termed *presynaptic rundown*).
- In the myasthenic patient, the decreased efficiency of neuromuscular transmission combined with the normal

rundown results in the activation of fewer and fewer muscle fibers by successive nerve impulses and hence increasing weakness, or *myasthenic fatigue*.

- This mechanism accounts for the decremental response to repetitive nerve stimulation seen on electrodiagnostic testing.

108. Ans. (a) Tension headache

- Overall the *most common cause of headache is tension headache*.
- Episodic tension headache is usually associated with a stressful event. This headache type is of moderate intensity, self-limited, and usually responsive to non-prescription drugs.
- Chronic tension headache often recurs daily and is associated with contracted muscles of the neck and scalp. This type of headache is bilateral and usually occipitofrontal.
- Most common cause of secondary headache is systemic infection
- Rare cause of primary headache is cluster headache
- Rare cause of secondary headache is brain tumor.

109. Ans. (b) Ophthalmoplegia, ataxia, areflexia

Miller Fisher syndrome presents as:

- Rapidly evolving ataxia
- Areflexia of limbs without weakness
- Ophthalmoplegia often with pupillary paralysis

The MFS variant accounts for <5% of all cases of G.B.S and is strongly associated with antibodies to the ganglioside GQ1b.

110. Ans. (c) TB meningitis

- Contrast-enhanced computed tomography shows tuberculous meningitis demonstrating acute hydrocephalus and meningeal enhancement. Notice the dilated lateral ventricles.
- Diagnostic triad of tubercular meningitis:
 - Basal exudates
 - Infarcts
 - Hydrocephalus

Must know points for tubercular meningitis

- The combination of unrelenting headache, stiff neck, fatigue, night sweats, and fever with a *CSF lymphocytic pleocytosis and a mildly decreased glucose concentration* is highly suspicious for tuberculous meningitis.
- If there is a pellicle in the CSF or a *cobweb-like clot* on the surface of the fluid, AFB can best be demonstrated in a smear of the clot or pellicle

**111. Ans. (c) Caffeine**

Post- lumbar puncture headache usually resolves without specific treatment:

1. Care is largely supportive with oral analgesics like acetaminophen, nonsteroidal anti-inflammatory drugs and anti-emetics.
2. Patients may obtain relief by lying in a comfortable (especially a recumbent or head-down Trendelenburg) position.
3. For some patients, beverages with caffeine can provide temporary pain relief.
4. *For patients with persistent pain, treatment with IV caffeine (500 mg in 500 mL saline administered over 2 hours) is effective.*
5. Alternatively, an epidural blood patch accomplished by injection of 15 mL of autologous whole blood is usually effective.
6. Some clinicians reserve epidural blood patch for patients who do not respond to caffeine, while others prefer to use blood patch as initial management for unremitting post-LP symptoms.

112. Ans. (c) Excision with radiation

- These are highly infiltrative tumors, and the areas of increased T2/FLAIR signal surrounding the main tumor mass contain invading tumor cells.
- Treatment involves *maximal surgical resection followed by partial-field external beam radiotherapy* (6000 cGy in thirty 200-cGy fractions) with concomitant temozolomide, followed by 6–12 months of adjuvant temozolomide.

113. Ans. (a) Neurofibromatosis

NF-1 is diagnosed when *any two of the following seven signs* are present:

1. Six or more café au-lait macules. *Café au-lait spots are the hallmark of neurofibromatosis and are present in almost 100% of patients.*
2. *Axillary or inguinal freckling^Q* consisting of multiple hyperpigmented areas 2–3 mm in diameter.
3. Two or more iris Lisch nodules. Lisch nodules are hamartomas located within the iris and are best identified by a slit-lamp examination.
4. Two or more neurofibromas or one plexiform neurofibroma.
5. Osseous lesion such as sphenoid dysplasia (which may cause pulsating exophthalmos) or cortical thinning of long bones with or without pseudoarthrosis.
6. Optic gliomas are present in ≈15% of patients with NF-1.
7. First degree relative with NF-1.

114. Ans. (d) Semi-purposive and non-repetitive, randomly distributed movements

Lesion	Manifestations	Lesion seen in
Chorea	State of <i>excessive, spontaneous movements, irregularly timed, non-repetitive, randomly distributed and abrupt in character.</i>	Caudate
Atheetosis	Because of the slowness, the movements have a writhing (i.e. squirming, twisting, or snakelike) appearance	Globus pallidus
Hemiballismus	Very severe form of chorea in which the movements have a <i>violent, flinging quality.</i> Ballism has been defined as “continuous, violent, coordinated involuntary activity involving the axial and proximal appendicular musculature such that the limbs are flung about.”	Subthalamic nucleus

115. Ans. (a) Lateral spinothalamic tract**Important tracts**

Posterior/Dorsal column	Joint position, vibration and pressure
Lateral spinothalamic tract	Pain and temperature
Ventral spinothalamic	Pressure, touch
Lateral corticospinal/ pyramidal pathways	Distal limb movements
Vestibulospinal and tectospinal tract	Axial and proximal limb movements

116. Ans. (a) Corticospinal tract

- The corticospinal tract (along with the corticobulbar tract) is the primary pathway that carries the motor commands that underlie voluntary movement.
- The **lateral corticospinal tract** is responsible for the control of the distal musculature and the **anterior corticospinal tract** is responsible for the control of the proximal musculature.
- A particularly important function of the lateral corticospinal tract is the fine control of the digits of the hand.
- The corticospinal tract is the only descending pathway in which some axons make synaptic contacts directly onto alpha motor neurons.
- This direct cortical innervation presumably is necessary to allow the powerful processing networks of the cortex to control the activity of the spinal circuits that direct the exquisite movements of the fingers and hands.

117. Ans. (a) Spine injury evaluation

- *Log rolling* is a method of turning patients to either inspect their backs for *spine injury evaluation* especially in sports related injuries. It will also help to put the patient on long spinal board.
- To log roll a patient, *there should be a minimum of four people*. The objective is to keep the whole spine in alignment. To achieve it the cervical spine is stabilized and the patient is moved with the neck, shoulders and pelvis kept in the same plane.

118. Ans. (b) Lateral displacement of midbrain

- Lateral displacement of the midbrain may compress the opposite cerebral peduncle
- This produces an ipsilateral Babinski's sign and ipsilateral hemiparesis

- Normally in CNS lesion the hemiparesis and Babinski sign is bilateral
- This unusual fact is called as Kernohan-Woltman sign.
- Herniation may also compress the anterior and posterior cerebral arteries as they pass over the tentorial reflections, with resultant brain infarction

119. Ans. (a) 3rd nerve involvement

Ref: Harrison, 19th ed. pg. 1772

- *Uncal transtentorial* herniation refers to impaction of the anterior medial temporal gyrus (the uncus) into the tentorial opening just anterior to and adjacent to the midbrain.
- *The uncus compresses the third nerve as it traverses the sub-arachnoid space, causing enlargement of the ipsilateral pupil (putatively because the fibers subserving parasympathetic pupillary function are located peripherally in the nerve).*

120. Ans. (b) Alzheimer's disease

Ref: Harrison, 19th ed. pg. 2617

- Rivastigmine is a reversible inhibitor of both the acetylcholinesterase and butyrylcholinesterase enzymes.
- It is used for the treatment of Alzheimer's, as well as for the treatment of dementia associated with Parkinson's disease. This drug is available as a skin patch that provides continuous delivery of the drug over 24 hours

121. Ans. (a) Broca's Area

Ref: Harrison, 19th ed. pg. 177

- Broca's area damage is called **expressive aphasia** (non-fluent aphasia).
- Patient has loss of the ability to produce language (spoken or written).
- Patient has insight to his problem and is frustrated.
- Remember: Broca is broke. Speaks broken words.
- Damage to paracentral lobule would lead to loss of control over urination and lead to urge incontinence.
- Damage to insula leads to loss of hand eye coordination and loss of social skills.

122. Ans. (a) Medulla

Ref: Ganong, 25th ed. pg. 525

- Nucleus ambiguus is a group of large motor neurons, situated deep in the medullary reticular formation.
- The nucleus ambiguus contains the cell bodies of nerves that innervate the muscles of the soft palate, pharynx, and larynx which are strongly associated with speech and swallowing.

123. Ans. (a) Superior Temporal Gyrus

Ref: Harrison, 19th ed. pg. 177

- Wernicke's area is located in the posterior section of the superior temporal gyrus (STG) in the dominant cerebral hemisphere (which is the left hemisphere in about 95% of right handed individuals and 60% of left handed individuals).
- Damage caused to Wernicke's area results in receptive, fluent aphasia. This means that the person with aphasia will be able to fluently connect words, but sentences will lack meaning.

124. Ans. (b) Severe disability

Ref: Harrison, 19th ed. chapter 370

- Patients scoring 3 or 4 have an 85% chance of dying or remaining vegetative.

126. Ans. (a) Neuropraxia

Ref: Maheshwari, 5th ed. pg. 69

- In most cases of compressive radial neuropathy, the type of injury is a "neuropraxia" that does not involve damage to the axon.
- Neuropraxia is classified as a *transient conduction block of motor or sensory function without neuronal degeneration*. Therefore, despite decreased motor function, patients with neuropraxia are able to regain normal neurologic function within several weeks to months.
- Posture-induced radial neuropathy, known as *Saturday night palsy*, occurs because of compression of the radial nerve.

	Neurotmesis	Axonotmesis	Neurapraxia
<i>Pathological</i>			
Anatomical continuity	May be lost	Preserved	Preserved
Essential damage	Complete disorganisation, Schwann sheaths preserved ^a	Nerve fibres interrupted	Selective demyelination of larger fibres, no degeneration of axons ^a
<i>Clinical</i>			
Motor paralysis	Complete	Complete	Complete
Muscle atrophy	Progressive	Progressive	Very little
Sensory paralysis	Complete	Complete	Usually much sparing
Autonomic paralysis	Complete	Complete	Usually much sparing
	<i>Electrical phenomena</i>		
Nerve conduction distal to the lesion	Absent	Absent	Absent
Fibrillation	Present	Present	Occasionally detectable
<i>Recovery</i>			
Surgical repair	Essential	Not necessary	Not necessary

127. Ans. (c) 60-80%

Ref: Harrison 18th edition, chapter 381

- The glucose level in CSF is proportional to the blood glucose level and corresponds to 60–70% of the concentration in blood.

Hypoglycorrhachia (low CSF glucose levels) can be caused by

- CNS infections
- Inflammatory conditions
- Subarachnoid hemorrhage

FMGE Solutions Screening Examination

634

- Hypoglycemia
- Impaired glucose transport, increased CNS glycolytic activity
- Metastatic carcinoma.

CSF glucose levels can be useful in distinguishing among causes of meningitis as more than 50% of patients with bacterial meningitis have decreased CSF glucose levels while patients with viral meningitis usually have normal CSF glucose levels.

128. Ans. (d) *Cryptococcus meningitis*

Ref: Harrison 18th edition, Chapter 189

- *C. neoformans* is the leading infectious cause of meningitis in patients with AIDS^Q
- It is the initial AIDS-defining illness in <2% of patients and generally occurs in patients with CD4+ T cell counts <100/ μ L^Q
- Most patients present with a picture of subacute meningoencephalitis with fever, nausea, vomiting, altered mental status, headache, and meningeal signs.
- The CSF profile may be normal or may show only modest elevations in WBC or protein levels and decrease in glucose. The opening pressure in the CSF is usually elevated.
- **The diagnosis of cryptococcal meningitis is made by identification of organisms in spinal fluid with India ink examination or by the detection of cryptococcal antigen.** Blood cultures for fungus are often positive. A biopsy may be needed to make a diagnosis of CNS cryptococcoma.
- Treatment is with IV amphotericin B^Q 0.7 mg/kg daily, or liposomal amphotericin 4–6 mg/kg daily, with flucytosine 25 mg/kg qid for at least 2 weeks and, if possible, until the CSF culture turns negative. This is followed by fluconazole 400 mg/d PO for 8 weeks, and then fluconazole 200 mg/d until the CD4+ T cell count has increased to >200 cells/uL for 6 months in response to cART.

129. Ans. (c) *Gullian Barre syndrome*

Ref: Harrison, 18th ed. Chapter 386

The symmetrical nature of disease favors diagnosis of Guillain-Barre syndrome. The absence of sensory symptoms also makes Transverse myelitis an unlikely diagnosis

	Poliomyelitis	Guillain-Barre syndrome	Transverse myelitis
Fever	Present; may be biphasic	May have a prodromal illness	May have a prodromal illness

Contd...

	Poliomyelitis	Guillain-Barre syndrome	Transverse myelitis
Symmetry	Asymmetric	Symmetrical	Symmetrical
Sensations	Intact; may have diffuse myalgias	Variable	Impaired below the level of the lesion
Respiratory insufficiency	May be present	May be present	May be present
Cranial nerves	Affected in bulbar and bulbospinal variants	Usually affected	Absent
Radicular signs	May be present	Present	Absent
Bladder, bowel complaints	Absent	Transient; due to autonomic dysfunction	Present
Nerve conduction	May be abnormal	Abnormal	Normal
Cerebrospinal fluid	Lymphocytic pleocytosis; normal or increased protein	Albumino-cytologic dissociation	Variable
MRI spine	Usually normal	Usually normal	Characteristic

130. Ans. (b) *Subdural hemorrhage*

Ref: Harrison, 18th ed. chapter 378

- Boxing is a violent sport in which every participant accepts the risk of brain damage or death. This sport has been linked to acute neurological injury and chronic brain damage. The *most common life-threatening injury encountered by its participants is subdural hematoma (SDH)*, and the most feared consequence of chronic insult to the nervous system is dementia pugilistica, or punch drunkenness.

131. Ans. (d) *Sinusitis*

Ref: Harrison, 18th ed. chapter 14

Primary Headache		Secondary Headache	
Type	%	Type	%
Tension –Type	69	Systemic infection	63

Contd...

Primary Headache		Secondary Headache	
Migraine	16	Head injury	4
Idiopathic stabbing	2	Vascular disorders	1
Exertional	1	Subarachnoid hemorrhage	<1
Cluster	0.1	Brain tumor	0.1

132. Ans. (a) Ampicillin

Ref: Harrison, 18th ed. chapter 139

133. Ans. (a) Acyclovir

Ref: Harrison, 18th ed. chapter 381

134. Ans. (c) Measles

Ref: Harrison, 18th ed. chapter 192

135. Ans. (c) Hyperhidrosis

Ref: Harrison, 18th ed. chapter 370

Horner syndrome (Horner's syndrome) results from an interruption of the sympathetic nerve supply to the eye and is characterized by the *classic triad* of *miosis* (i.e., constricted pupil), *partial ptosis*, and *loss of hemifacial sweating* (i.e., anhidrosis)

(Mnemonic: PERFECT M.E.A.L) Clinical features of Horner syndrome

Ptosis

Miosis

Enophthalmos (pseudo)

Anhidrosis

Loss of ciliospinal reflex

ANATOMY OF HORNER SYNDROME

- First-order central sympathetic fibers arise from the posterolateral hypothalamus, descend uncrossed through the midbrain and pons, and terminate in the intermediolateral cell column of the spinal cord at the level of C8-T2 (ciliospinal center of Budge).
- Second-order preganglionic pupillomotor fibers exit the spinal cord at the level of T1 and enter the cervical sympathetic chain, where they are in close proximity to the pulmonary apex and the subclavian artery. (association with pancoast tumor)
- The third-order pupillomotor fibers ascending along the internal carotid artery enter the cavernous sinus.

136. Ans. (b) Peripheral ganglia

Ref: Harrison, 18th ed. chapter 374

Lower motor neurons are motor neurons located in either the *anterior grey column*, *anterior nerve roots* or the *cranial nerve nuclei of the brainstem and cranial nerves with motor function*

Lower motor neurons are classified based on the type of muscle fiber they innervate:

- Alpha motor neurons innervate extrafusal muscle fibers, the most numerous type of muscle fiber and the one involved in muscle contraction.
- Beta motor neurons innervate intrafusal fibers of muscle spindles with collaterals to extrafusal fibers
- Gamma motor neurons innervate intrafusal muscle fibers, which together with sensory afferents compose muscle spindles. These are part of the system for sensing proprioception

137. Ans. (c) Meningioma

Ref: Harrison, 18th ed. chapter 379

- Meningiomas are the most common primary brain tumor, accounting for approximately 32% of the total.
- Overall most common Brain tumour is metastases arising from hematogenous spread from a lung primary.
- The most common sources of brain metastases are lung and breast carcinomas; melanoma has the greatest propensity to metastasize to the brain, being found in 80% of patients at autopsy
- **Remember: Metastasis > meningioma > astrocytoma.**

138. Ans. (c) Hypertension and Bradycardia

Ref: Harrison, 18th ed. chapter 25

- Cushing's reflex is a *hypothalamic response* to brain ischemia wherein the sympathetic nervous system is activated which causes increased peripheral vascular resistance with a *subsequent increase in BP*.
- The *increased BP* then activates the *parasympathetic nervous system* via carotid artery baroreceptors, resulting in *vagal-induced bradycardia*.
- The brain ischemia that leads to Cushing's reflex is usually due to the poor perfusion that results from increased ICP due to head bleeds or mass lesions.
- Cushing's reflex leads to the clinical manifestation of Cushing's triad.
- *Cushing's triad = hypertension, bradycardia, and irregular respirations (Cheyne-Stokes breathing).*
- Cushing's triad signals *impending danger of brain herniation*, and thus, the need for decompression. Consider administering mannitol, hyperventilation, and elevation of the head of bed as temporizing measures

139. Ans. (d) 6th

Ref: Harrison, 19th ed. pg. 209

- In raised intracranial tension the cranial nerves afflicted are the ones which have long intracerebral courses leading to false localizing signs. *Since the 6th cranial nerves emerges straight forwards from the brainstem, while others originate obliquely, the nerve is more liable to the mechanical effects of backward brainstem displacement by ICSOL.*
- Neurological signs have been described as “false localizing” if they reflect dysfunction distant or remote.

140. Ans. (a) Sub-dural hematoma

Lesions	NCCT finding
Sub dural hematoma	Concavo-convex bleed hyper-density
Extra dural hemorrhage	Biconvex /flame shaped hyper-density
Sub arachnoid hemorrhage	Intra-ventricular bleed/blood in sylvian fissure
Intra –parenchymal bleed	Mostly a lesion or hyper-density in basal ganglia secondary to hypertension

141. Ans. (a) Hyperdense biconvex

Ref: Harrison's 17th ed. Ch 364

- **Extradural hemorrhage:** Bleeding occurs between skull and duramatter. Bleeding occurs due to the rupture of Middle meningeal artery. Lucid Interval (Consciousness between two periods of unconsciousness) exists.
- In NCCT it shows hyperdensity which has bi-convex or flame shaped appearance.
- **Treatment:** Burr hole surgery.
- **Subdural hemorrhage:** Occurs due to rupture of Cortical bridging veins. *In NCCT it shows concavo-convex or sickle shaped bleed.*

142. Ans. (a) Insula

Ref: Textbook of Anatomy Vol. 3 by Vishram singh, pg. 391

- *Insula is called Island of Reil or central lobe.*
- The word insula means hidden. *The insula is the submerged portion of cerebral cortex in the floor of lateral sulcus.*
- The insula is divided into 2 regions: Anterior and Posterior by a central sulcus. The anterior region represents 3 or 4 short gyri call *gyri brevia* and posterior region presents 1 or 2 long gyri called *gyri longa*.
- The insulae are involved in consciousness and play a role in diverse functions usually linked to emotion or the

regulation of the body's homeostasis. These functions include perception, motor control, self-awareness, cognitive functioning, and interpersonal experience.

143. Ans. (a) NCCT

Ref: Harrison, 19th ed. pg. 1785

- The basic rule for intra-cranial hemorrhage is to perform NCCT.
- Remember MRI is recommended for ICH >>48 hours.
- NCCT Brain in SAH, shows accumulation of blood in sylvian fissure.
- Drug of choice for management of SAH is nimodipine 60 mg TDS for 3 weeks with complete bed rest.
- Neurosurgical consult is required in case of development of hydrocephalus.

144. Ans. (a) Non fluent speech

Ref: Harrison, 19th ed. pg. 177-178

- **Wernicke's area in the brain (Brodmann area 22) is present** in the posterior part of the superior temporal gyrus of the dominant hemisphere.
- People with (Wernicke's area damage) **receptive aphasia are unable to understand language in its written or spoken form, and even though they can speak with normal grammar, syntax, rate, and intonation, they cannot express themselves meaningfully using language.**
- A patient with Wernicke's aphasia can and may speak a great deal, but he or she confuses sound characteristics, **producing “word salad” in extreme cases.**
- **Paraphasia** is seen in people with wernicke's area damage and it presents like **a syllable from later in the word replaces a syllable from earlier in the word - “papple” for apple or “lelephone” for telephone.** Similarly patient might use the word “plants” for “pants”

Extra Mile

- Wernicke's Area is for understanding of speech = hence lesion results in receptive dysphasia
Broca's Area for expression = hence lesion results in non-fluent aphasia.

145. Ans. (a) Meningioma

Ref: Harrison, 19th ed. pg. 599-600

- Most malignant brain tumor is Glioma (subtype – astrocytoma)
- Most common brain tumor is metastasis to brain (oat cell cancer/breast cancer/malignant melanoma)
- *Most common benign brain tumor is Meningioma*
- IOC for brain tumor is gadolinium enhanced MRI

146. Ans. (a) **Parkinsonism**

Ref: Harrison, 19th ed. pg. 2606

- Lewy bodies are intra-neuronal inclusion bodies in Parkinsonism and in Dementia with lewy body (D.L.B).
- *Hirson bodies are seen in Alzheimer's disease. The intra-neuronal inclusions in AD are known as neurofibrillary tangles.*

147. Ans. (c) **HIV encephalopathy**

Ref: Harrison, 19th ed. pg. 1263

- HIV leads to asymptomatic neurocognitive impairment or HIV-associated dementia.
- Hypoglycemia can lead to neuroglucopenia and seizures
- Hypocalcemia/Tetany leads to laryngospasm. The resultant hypoxia can lead to seizures.
- NCC leads to intracranial calcification and leads to seizures.

148. Ans. (b) **Viral meningitis**

Ref: Harrison, 19th ed. pg. 890

- *The key word in the diagnosis of patient is lymphocytic pleocytosis. Pleocytosis means a dimorphic cell population where first neutrophils and later lymphocytes are predominant*”.
- Harrison states that “As a rule, a lymphocytic pleocytosis with a low glucose concentration should suggest fungal or tuberculous meningitis, or noninfectious disorders (e.g., sarcoid, neoplastic meningitis)”. Where as in this question CSF sugar is normal. Hence the answer is viral meningitis.
- Viral meningitis has typical profile of lymphocytic pleocytosis (25–500 cells/L), a normal protein concentration (20–80 mg/dL), a normal glucose concentration, and a normal or mildly elevated opening pressure (100–350 mm H₂O).

CSF	Normal	Acute bacterial meningitis	Tubercular meningitis	Viral meningitis	Gullian –Barre syndrome	Fungal meningitis
Pressure	50 – 180 mmH ₂ O	Increased	Increased	Increased	Normal	Elevated
Color	Clear	Turbid	Straw	Clear	Normal	Normal
Cells	0-4 lymphocytes/cu.mm	>1000	>100	>25	Normal	25-500
Sugar	2/3 rd of blood sugar	Decreased	Decreased	Normal	Normal	Low
Protein	15-45 mg %	Increased	Increased	Increased	Increased (albumin-cytological disassociation)	Normal/elevated

CSF findings OF VIRAL ENCEPHALITIS IS SAME AS VIRAL MENINGITIS.

149. Ans. (d) **Cerebrospinal fluid reveals a low leukocyte count**

Ref: Harrison 19th ed. / 898-99

Refer to above table

- Tubercular meningitis is seen most often in young children but also develops in adults, especially those infected with HIV.
- Tubercular meningitis results from the hematogenous spread of primary or post primary pulmonary TB.
- The disease often presents subtly as headache and slight mental changes after a prodrome of weeks of low-grade fever, malaise, anorexia, and irritability.
- *In general, examination of cerebrospinal fluid (CSF) reveals a high leukocyte count (up to 1000/μL), usually with a predominance of lymphocytes but sometimes with a predominance of neutrophils in the early stage; a protein content of 1–8 g/L (100–800 mg/dL); and a low glucose concentration.*
- Culture of CSF is diagnostic in up to 80% of cases and remains the gold standard. Polymerase chain reaction

has a sensitivity of up to 80%, but rates of false-positivity reach 10%.

- Imaging studies (CT and MRI) may show hydrocephalus and abnormal enhancement of basal cisterns or ependyma.

150. Ans. (a) **Normal cells with increased protein**

Ref: Harrison, 19th ed. pg. 2694

Refer to above table

- The characterized feature of GBS is albumin-cytological dissociation, characterized by elevated proteins due to autoimmunity while the cell count remains perfectly normal.
- A normal CSF protein level does not rule out GBS, however, as the level may remain normal in 10% of patients. CSF protein may not rise until 1-2 weeks after the onset of weakness.
- Normal CSF cell counts may not be a feature of GBS in HIV-infected patients. CSF pleocytosis is well recognized in HIV-associated GBS.

151. Ans. (a) **Tremors**

Ref: Harrison 19th ed. pg. 2609

- In the early presentation, about 70% patients experience a slight tremor in the hand or foot on one side of the body, or less commonly in the jaw or face. The tremor consists of a shaking or oscillating movement, and usually appears when a person's muscles are relaxed, or at rest, hence the term "resting tremor".
- The tremor of PD can be exacerbated by stress or excitement, sometimes attracting unwanted notice.
- Resting tremor is the earliest and most common symptom of Parkinson's disease.
- The most debilitating feature is Akinesia.
- Non motor symptoms precede motor symptoms.

152. Ans. (a) **Chorea**

Ref: Harrison 19th ed. pg. 2609

Chorea occurs due to lesion of caudate nucleus whereas the disease process in parkinsonism afflicts the substantia nigra.

Cardinal Features	Other Motor Features	Non motor Features
<ul style="list-style-type: none"> • Bradykinesia • Rest tremor • Rigidity • Gait disturbance/ postural instability 	<ul style="list-style-type: none"> • Micrographia • Masked facies (Hypomimia) • Reduced eye blink • Hypo-phonia/soft voice • Dysphagia • Freezing 	<ul style="list-style-type: none"> • Anosmia-earliest feature • Sensory disturbances (e.g., pain) • Mood disorders (e.g., depression) • Sleep disturbances • Autonomic disturbances <ul style="list-style-type: none"> ▪ Orthostatic hypotension ▪ Gastrointestinal disturbances ▪ Genitourinal disturbances ▪ Sexual dysfunction • Cognitive impairment/Dementia

- Parkinson's disease (PD) is the second most common neurodegenerative disease, exceeded only by Alzheimer's disease (AD)

153. Ans. (a) **Anosmia**

Ref: Harrison, 19th ed. pg. 2609

Non-motor symptoms may precede motor symptoms of Parkinson's diagnosis by years. The most recognizable early symptoms include:

- Loss of sense of smell, constipation
- REM behavior disorder
- Mood disorders
- Orthostatic hypotension

Subsequently Motor Features Appear

- Tremors (resting 4-6 Hz)
- Rigidity
- Bradykinesia
- Good Response to levodopa

154. Ans. (a) **Hypotonia**

Ref: Ganong, 25th ed. pg. 110, 233

	LMN	UMN	Extra Pyramidal Damage
TONE	Decreased tone/ flaccidity	Increased spasticity	Decreased rigidity
DTR	Areflexia	Brisk reflex	Normal

Contd...

	LMN	UMN	Extra Pyramidal Damage
SPECIAL FEATURES	Fasciculations + wasting	Babinski's sign + No wasting	Chorea, atehosis, hemiballismus
Superficial reflex	Present	Absent	—
EXAMPLE	Motor neuron disease	Cerebral malaria	Punch drunk syndrome

155. Ans. (b) **Muscle hypertrophy**

Please refer to above explanation

156. Ans. (b) **Tongue deviation to right on protrusion**

Ref: Harrison, 19th ed. Ch 367

Following a lesion of the hypoglossal nucleus or nerve

- ATROPHY of the muscles of the IPSILATERAL one-half of the tongue occurs.
- FASCICULATIONS (tiny, spontaneous contractions) can be seen.
- Upon protrusion, the tongue will deviate TOWARD the side of the lesion (i.e., same side). This is due to the unopposed action of the genioglossus muscle on the

normally innervated side of the tongue (the genioglossus pulls the tongue forward).

- The corticobulbar input to the hypoglossal nucleus arises from motor cortex and is predominantly **CROSSED**. Thus, a lesion in motor cortex will result in deviation of the tongue toward the opposite side or **CONTRALATERAL** to the lesion.

157. Ans. (a) **Acetyl choline esterase in the amniotic fluid**

Ref: Nelson 18th ed. / ch. 592

- Failure of closure of the neural tube allows excretion of fetal substances (α -fetoprotein, acetylcholinesterase) into the amniotic fluid, serving as biochemical markers for a neural tube defect. Prenatal screening of maternal serum for AFP in the 16th to 18th wk of gestation is an effective method for identifying pregnancies at risk for fetuses with neural tube defects in utero.

158. Ans. (a) **Tau protein**

Ref: Harrison, 19th ed. pg. 172t, 175

- Pathologies and dementias of the nervous system such as Alzheimer's disease can result when *tau proteins* become defective and no longer stabilize microtubules properly.
- *Alpha synuclein protein* is seen in parkinsonism.
- *Huntington protein* is related to Huntington disease related to chromosome 4. Protein 14.3.3 is related to prion disease like variant Creutzfeldt Jakob disease.

159. Ans. (b) **Thyroid ophthalmopathy**

Ref: Harrison, 19th ed. pg. 2294-95

- **The question is on unilateral ptosis whereas thyroid ophthalmopathy has PROPTOSIS.**
- In myasthenia gravis, due to anti-Ach-receptor blocking antibodies there is ptosis which can be unilateral or asymmetrical which will again appear unilateral.
- Marfan syndrome has congenital Ptosis.
- Pancoast tumor causes horner syndrome in which unilateral sympathetic chain is compressed leading to Ptosis, Miosis, Anhidrosis, Enophthalmos and loss of Cilio-spinal reflex.

160. Ans. (a) **Uncal herniation**

Ref: Harrison, 19th ed. pg. 1772

- In uncal or mid brain herniation, the raised ICT compresses the same side third cranial nerve while it originates from Edinger -Westphal nucleus. This causes ptosis, diplopia and divergent squint. The reason for unconsciousness can be damage to reticular activating system in the midbrain.

161. Ans. (a) **Putamen**

Ref: Harrison, 19th ed. pg. 2582

- Most common site of brain hemorrhage is Putamen.
- Intra-parenchymal hemorrhage is most lethal and has mortality rate of 40%.
- The IOC is NCCT. For management BP must be controlled which is to maintain a target BP of 160/90.

162. Ans. (a) **Single Fiber E.M.G**

Ref: Harrison, 19th ed. pg. 442e-6

- *Single fiber E.M.G* is the investigation of choice for myasthenia gravis and shows a decremental response
- Anti-acetylcholine receptor blocking antibody TITER is the most specific test for diagnosis of myasthenia gravis. Also remember that *Tensilon test* is a screening test for myasthenia gravis. False positive tensilon test can be seen in motor neuron disease.

163. Ans. (b) **Sub-arachnoid granulations**

Ref: Harrison, 19th ed. pg. 443e-4

- CSF is produced by the choroid villi in the lateral ventricles and third ventricles. The CSF flows via aqueduct of Sylvius to the 3rd ventricle and then via foramen of Munro to the 4th ventricle. The CSF emerges out of Foramen of Luschka and Magendie and accumulates at the base of the skull in basal cisterns.
- This CSF is then reabsorbed via the arachnoid granulations back into the blood stream.
- The CSF is produced at a rate of 20 mL per hour and reabsorbed at the same rate. The total amount of CSF at any point of time is 150 mL.

164. Ans. (d) **Nystagmus**

Ref: Harrison, 19th ed. pg. 2608

- Dementia pugilistica is seen in athletes who participate in body contact sport like martial arts, boxing etc.
- Repeated blows to the head of the athlete over entire career span of the boxer can lead to cortical damage and Parkinson like features. (*Best example to remember this is Muhammad Ali, the greatest boxer of all times, suffers from dementia pugilistica*).
- Nystagmus is not a clinical feature of this disease and is rather seen with vestibular diseases or cerebellar lesions.

165. Ans. (a) **Infarction**

Ref: Bringham Intensive Review of Internal Medicine 2nd ed. pg. 888

- Most common type of stroke is ischemic stroke caused by extracranial and intracranial atherosclerosis.

166. Ans. (a) **Thiamine deficiency**

Ref: Harrison, 19th ed. pg. 2607, 2724

There are six Major Symptoms of Korsakoff's Syndrome

1. Anterograde amnesia
2. Retrograde amnesia
3. Severe memory loss
4. Confabulation
5. Minimal content in conversation
6. Lack of insight or Apathy

Thiamine is essential for the carboxylation of pyruvate and deficiency during this metabolic process is thought to cause damage to the medial thalamus and mammillary bodies of the posterior hypothalamus as well as generalized cerebral atrophy. These brain regions are all parts of the limbic system, which is involved in emotion and memory.

167. Ans. (c) **Finger pads**

Ref: De Jong Neurological Examination, 7th ed. pg. 542

- Two-point discrimination is the ability to discern that two nearby objects touching the skin are truly two distinct points, not one. It is often tested with two sharp points during a neurological examination and is assumed to reflect how finely innervated an area of skin is.
- The maximum sensitivity for this test is in lips and finger tips which can be remembered as the most sensitive areas in the body.

168. Ans. (b) **CT-scan**

Ref: Harrison, 19th ed. pg. 2582

- For evaluation of bleeding in the brain the preferred investigation is CT scan. The bleeding in the brain shows up as hyper-density on CT scan.

169. Ans. (b) **Contralateral subthalamic lesion**

Ref: Harrison, 19th ed. pg. 2623

Lesion	Manifestation
Caudate nucleus	Contralateral chorea
Globus pallidus	Contralateral athetosis
Sub-thalamic nucleus	Contralateral hemiballismus
Cerebellum	Ipsilateral intentional tremors
Internal capsule	Contra-lateral hemiplegia with hemi-anesthesia
Ventral pons	Locked in syndrome

170. Ans. (a) **Basilar artery**

Ref: Harrison, 19th ed. pg. 2573

Basilar artery occlusion	Pontine stroke
Middle cerebral artery	Contralateral hemiplegia
Anterior cerebral artery	Spastic paraplegia
Posterior cerebral artery	Midbrain stroke like weber syndrome
Vertebral artery	Medullary stroke

171. Ans. (a) **Middle cerebral artery**

Ref: Gray's Anatomy, 40th ed. pg. 246

- The Circle of Willis is a part of the cerebral circulation and is composed of the following arteries:
 - Anterior cerebral artery (left and right)
 - Anterior communicating artery
 - Internal carotid artery (left and right)
 - Posterior cerebral artery (left and right)
 - Posterior communicating artery (left and right)
- The basilar artery and middle cerebral arteries, supplying the brain, are not considered part of the circle.*

172. Ans. (c) **Brain hemorrhage due to tear of basilar artery branches**

Ref: Radiology Review Manual, 7th ed. pg. 234

- The classical appearance of a Duret hemorrhage is located in the midline near the ponto-mesencephalic junction.

- Often however, these hemorrhages can be multiple or even extend into the cerebellar peduncles.
- Usually it is seen in patients with severe herniation for 12–24 hours prior to death

173. Ans. (d) Aphasia

Ref: Harrison, 19th ed. pg. 2724

The classic triad of symptoms found in Wernicke's encephalopathy is:

- Global Confusion
- Ophthalmo-plegia (Most commonly affecting the lateral rectus muscle).
- Ataxia

For diagnosis: Thiamine can be measured using an erythrocyte transketolase activity assay or by activation by measurement of in vitro thiamine diphosphate levels.

174. Ans. (a) Non- fluent aphasia

Ref: Harrison, 19th ed. pg. 177-78

- Broca's area is present in inferior frontal gyrus and is responsible for fluency, syntax and expression of speech and damage to this area causes loss of ability to express self and thereby development of non-fluent aphasia.
- Word salad is seen in patients with damage to Wernicke's area (Area responsible for comprehension).
- Anomia is seen in global aphasia where both Broca and Wernicke area are damaged.
- Apraxia is seen in patients with damage to non dominant parietal lobe.

175. Ans. (a) 3rd nerve

Ref: Harrison, 19th ed. pg. 1784-85

- Most common cranial nerve affected in unruptured berry aneurysm is the 3rd cranial nerve which will present as ipsilateral ptosis, and strabismus.

176. Ans. (d) Tongue protusion

Ref: Harrison, 19th ed. pg. 2537-38

Functions of the Glossopharyngeal Nerve

- Receives general sensory fibers from the tonsils, the pharynx, the middle ear and the posterior 1/3 of the tongue.
- Receives visceral sensory fibers from the carotid bodies, carotid sinus.
- Receives special sensory fibers from the posterior one-third of the tongue
- Supplies parasympathetic fibers to the parotid gland via the otic ganglion.

- Supplies motor fibers to stylopharyngeus muscle, the only motor component of this cranial nerve.
- Contributes to the pharyngeal plexus.

Testing of 9th Nerve

1. Testing the gag reflex using a wooden spatula
2. Asking the patient to swallow or cough
3. Evaluating for speech impediments.
4. Test the posterior one-third of the tongue with bitter and sour substances to evaluate for impairment of taste.

177. Ans. (a) Gag reflex

Ref: Harrison, 19th ed. pg. 2537-38

Damage to the vestibulocochlear nerve may cause the following symptoms:

- Hearing loss
- Vertigo
- False sense of motion
- Loss of equilibrium (in dark places)
- Nystagmus
- Motion sickness
- Gaze-evoked tinnitus

The gag reflex has the following pathway

- The sensory limb is mediated predominantly by CN IX (glossopharyngeal nerve)
- The motor limb by CN X (Vagus nerve).

The gag reflex involves a brisk and brief elevation of the soft palate and bilateral contraction of pharyngeal muscles evoked by touching the posterior pharyngeal wall.

178. Ans. (c) Parietal lobe

Ref: Harrison, 19th ed. pg. 209

Performing Mathematical calculations is a function of parietal lobe. Damage to the left hemisphere of this lobe will result in problems in mathematics, long reading, writing, and understanding symbols. The parietal association cortex enables individuals to read, write, and solve mathematical problems.

179. Ans. (a) Myasthenia gravis

Ref: Harrison, 19th ed. pg. 2701

- Myasthenia gravis is characterized by eye muscle weakness, ptosis and diplopia. In contrast all myopathies have proximal weakness (exception being Myotonic dystrophy).

180. Ans. (b) 24 hours

Ref: Harrison, 19th ed. pg. 2568, 17th ed. Ch. 364

- The standard definition of TIA requires that all neurologic signs and symptoms resolve within 24 hours

FMGE Solutions Screening Examination

regardless of whether there is imaging evidence of new permanent brain injury; stroke has occurred if the neurologic signs and symptoms last for >24 hours.

181. Ans. (b) 1st order neurons releasing nitric oxide

Ref: Vascular Medicine, 3rd ed. pg. 84

182. Ans. (c) Enlargement of lateral and third ventricle

Ref: Harrison, 19th ed. pg. 174

- Aqueduct of sylvius connects the third ventricle to the fourth one. Therefore the obstruction to this area will not only cause enlargement of third ventricle but will also dilate the lateral ventricles proximal to the obstruction.

ENDOCRINOLOGY

183. Ans. (a) Impaired glucose tolerance

Ref: Harrison, 20th ed. pg. 2850

Value given	Normal value	Interpretation
120 mg%	<100 mg%	Elevated
140 mg%	<140 mg%	Border line
6.1%	<5.6%	Elevated to Impaired glucose tolerance range

Please note that normal HbA1c is <5.6% and values of 5.7 to 6.4% is impaired glucose tolerance.

Type of diabetes	Normal glucose tolerance	Hyperglycemia			
		Pre-diabetes		Diabetes mellitus	
		Impaired fasting glucose or impaired glucose tolerance	Not insulin requiring	Insulin required for control	Insulin required for survival
Type 1					
Type 2					
Specific types					
Gestational diabetes					
Time (years)					
FPG	<5.6 mmol/L (100 mg/dL)	5.6–6.9 mmol/L (100–125 mg/dL)	≥7.0 mmol/L (126 mg/dL)		
2-h PG	<7.8 mmol/L (140 mg/dL)	7.8–11.0 mmol/L (140–199 mg/dL)	≥11.1 mmol/L (200 mg/dL)		
HbA1C	<5.6%	5.7–6.4%	≥6.5%		

184. Ans. (b) Coxsackie B virus

Ref: Harrison, 20th ed. pg. 2851

Fulminant diabetes is an autoimmune form of diabetes which has been noted in Japan. It occurs due to viral insult

to pancreas. The viruses incriminated are Coxsackie, Enterovirus and rubella.

185. Ans. (a) pH

Ref: Harrison 19th ed. P 2418

- Type 1 diabetes mellitus is characterized by insulinopenia. The low insulin levels will lead to ketoacidosis. Hence when insulin is administered the ketone production will stop and pH of patient will rise to normal values.
- Increase in breathing rate/Kussmaul breathing will occur with worsening of diabetic ketoacidosis. On insulin administration respiratory rate will normalize. Hence choice B is wrong.
- On insulin administration glucose levels will come back to normal and glucosuria will disappear. Hence choice C is wrong.
- Due to solute diuresis (sugar rich urine) in diabetes mellitus urine osmolality is >300 mOsm. It will normalize on treatment. Hence Choice D is wrong.

186. Ans. (d) Carcinoid syndrome

Ref: Harrison 19th ed. P 415e-2

TABLE: A comparison of syndromes of obesity—Hypogonadism and mental retardation

	Syndrome		
Feature	Prader-Willi	Laurence-Moon-Biedl	Carpenter's
Inheritance	Sporadic; two-thirds have defect	Autosomal recessive	Autosomal recessive
Stature	Short	Normal; infrequently short	Normal
Obesity	<ul style="list-style-type: none">• Generalized• Moderate to severe• Onset 1–3 years	<ul style="list-style-type: none">• Generalized• Early onset, 1–2 years	Truncal, gluteal
Craniofacies	<ul style="list-style-type: none">• Narrow bifrontal diameter• Almond shaped eyes^q• Strabismus-V-shaped mouth• High-arched palate	Not distinctive	<ul style="list-style-type: none">• Acrocephaly• Flat nasal bridge• High-arched palate

187. Ans. (d) **Vitamin D deficiency**

Ref: Harrison 19th ed. P 2494 and 426e-2

- Choice A, Paget's disease has increased bone remodeling leading to disproportionate rise of SAP with *normal* serum calcium and phosphate.
- Choice B, osteoporosis has *normal* values of calcium, phosphate and SAP.
- Choice C, primary hyperparathyroidism leads to *increase* in value of serum calcium due to increased bone resorption. The increased PTH leads to loss of phosphate in urine of patient leading to *low* phosphate levels.
- Choice D, vitamin D deficiency leads to low serum calcium values. The resultant low calcium leads to secondary increase of PTH. This increased PTH explains the urinary loss of phosphate and low phosphate levels. The increased bone turnover leads to elevated SAP. Hence in this condition *both calcium and phosphate are low and SAP is elevated*.

188. Ans. (a) **Head trauma**

Ref: Harrison 19th ed. P 2281

Syndrome of Inappropriate Anti-Diuretic Hormone is seen with following CNS causes:

1. Head trauma
2. Amyotrophic lateral sclerosis
3. Agenesis of corpus callosum
4. *Brain abscess*
5. *Cerebral toxoplasmosis*
6. Delirium tremens
7. GBS
8. Hydrocephalus/*Tubercular meningitis*
9. Multiple sclerosis
10. *Bronchial adenoma, Ca lung, carcinoid tumor*

Note: Important causes are italicized

189. Ans. (d) **Atrial fibrillation**

Ref: Page 469, SRB Surgery, 5th ed.

TABLE: Differences in primary and secondary thyrotoxicosis

	Primary (Grave's disease)	Secondary
Neck swelling	Diffuse smooth bilateral involvement	Large nodular involvement
Eye signs and exophthalmos	More common	Not seen
Cardiac features	Resting tachycardia	Atrial fibrillation
Age group	Young	Older
Presentation	Entire gland is overactive and no pre-existing goiter is present	The inter-nodular tissues are overactive and it occurs in setting of pre-existing multinodular goiter.

190. Ans. (b) **5 years**

ADA recommends the following ophthalmologic examination schedule:

1. Individuals with *type 1 DM* should have an initial eye examination *within 5 years of diagnosis*
2. Individuals with *type 2 DM* should have an initial eye examination *at the time of diabetes diagnosis*
3. Women with DM who are pregnant or contemplating pregnancy should have an eye examination prior to conception and during the first trimester
4. If eye exam is normal, repeat examination in 2–3 years may be appropriate.

Screening guidelines for other complications

1. The ADA recommends *annual screening for distal symmetric neuropathy* beginning with the initial diagnosis of diabetes and annual screening for autonomic neuropathy 5 years after diagnosis of type 1 DM and at the time of diagnosis of type 2 DM.
2. An annual microalbuminuria measurement (albumin-to-creatinine ratio in spot urine) is advised in individuals with type 1 or type 2 DM *Screening for microalbuminuria should commence 5 years after the onset of type 1 DM and at the time of diagnosis of type 2 DM.*
3. Regardless of protein excretion results, the GFR should be estimated using the serum creatinine in all patients on an annual basis.

191. Ans. (d) **Aquaporin 2**

The defect in nephrogenic DI is in the collecting duct where V2 receptor/aquaporin-2 receptors are exhibiting resistance. An important cause of receptor resistance is lithium.

192. Ans. (a) **CTLA-4**

Ref: Harrison, 19th ed. pg. 2403

- Polymorphism in promoter region of insulin gene, CTLA-4 contributes to susceptibility to type 1 diabetes mellitus.
- The most common cause of type 1 diabetes mellitus is autoimmunity. Most patients have DR3 and/or DR4 haplotype.
- Haplotype DQA1*0301 is strongly associated with type 1 DM
- Concordance of type 1 DM in identical twin is 40–60%
- Chances of type 1 DM if single parent has type 1 DM is only 3–4%.

193. Ans. (a) **Non-functioning adenoma**

Ref: Page 2265, Harrison:19th ed. and pg. 611: UICC Manual of Oncology, 2015 edition

- The majority of pituitary adenomas (33–40%) are clinically non-functioning and produce no distinct clinical hypersecretory syndrome.

- Most of them arise from gonadotrope cells and may secrete small amounts of alpha- and beta-glycoprotein hormone subunits or, very rarely, intact circulating gonadotropins.
- The most common secretory adenoma is prolactinoma.
- The least common secretory adenoma is TSH secreting tumours. The UICC manual of oncology 2015 edition mentions it as rare (<1%). This is followed by LH/FSH secreting tumor whose prevalence is mentioned as 1%.

194. Ans. (b) Chromosome 12

The most common type of MODY is due to defect on chromosome number 12 and the gene involved is HNF-1 alpha.

MODY, caused by mutations in:

1. HNF-4 α (MODY1)
2. Glucokinase (MODY2)
3. HNF-1 α (MODY3)
4. IPF-1 (MODY4)
5. HNF-1 β (MODY5)
6. Neuro D1 (MODY6)

195. Ans. (b) 2 hour value = 180 mg%

TABLE: Criteria for the Diagnosis of Diabetes Mellitus

- Symptoms of diabetes plus random blood glucose concentration ≥ 11.1 mmol/L (200 mg/dL) or
- Fasting plasma glucose ≥ 7.0 mmol/L (126 mg/dL) or
- A1C $> 6.5\%$ or
- Two-hour plasma glucose ≥ 11.1 mmol/L (200 mg/dL) during an oral glucose tolerance test

196. Ans. (a) Cerebral edema

- The Major nonmetabolic complication of DKA therapy is cerebral edema, which most often develops in children as DKA is resolving.
- Precipitating events leading to D.K.A:
 1. Infection
 2. Myocardial infarction
 3. Venous thrombosis
 4. Upper gastrointestinal bleeding
 5. Acute respiratory distress syndrome

197. Ans. (d) ACTH

Ref: Harrison, 19th ed. pg. 401e-4

The precursor molecule of ACTH is pro-opio-melanocortin (P.O.M.C). This P.O.M.C breaks down to produce ACTH and MSH (melanocyte stimulating hormone). In conditions like primary addison disease P.O.M.C is elevated. The resultant increase in MSH leads to hyperpigmentation.

198. Ans. (a) Sodium increase

Ref: Harrison, 18th ed. / ch 344

- In hyperosmolar coma seen with diabetes mellitus, Serum sodium concentration is usually decreased because of the osmotic flux of water from the intracellular to the extracellular space in the presence of hyperglycemia.
- Hence *sodium* and *blood sugar* follow *inverse relation* in diabetes mellitus

Extra Mile

Diagnostic criteria for nonketotic hyperglycaemic hyperosmotic syndrome (HHS)

- Profound dehydration (decreased skin turgor, postural changes in blood pressure and pulse rate)
- Neurological symptoms (ranging from mental confusion to coma)
- Plasma glucose levels > 600 mg/dL (36 mmol/L)
- Plasma osmolality (Posm) > 310 mOsm/kg
- Arterial pH > 7.3
- Plasma bicarbonate levels > 15 mmol/L
- Normal anion gap (< 14 mEq/L)
- Absence of ketones

199. Ans. (a) Sensory polyneuropathy

Ref: Harrison, 19th ed. pg. 2426, 2682

- *Most common form of diabetic neuropathy is distal symmetric polyneuropathy.*
- *Most frequently presents with distal sensory loss.*
- Symptoms may include a sensation of numbness, tingling, sharpness, or burning that begins in the feet and spreads proximally.
- Neuropathic Pain typically involves the lower extremities, is usually present at rest, and worsens at night.
- Physical examination reveals sensory loss, loss of ankle reflexes, and abnormal position sense.

200. Ans. (c) P.C.O.D.

Ref: Harrison 19th ed. pg. 331, 332

- Testosterone is the most important androgen in both men and women.
- In women, testosterone is produced primarily through peripheral conversion of androstenedione (50 percent) with the remainder of production concentrated in the ovary (25 percent) and adrenal cortex (25 percent).
- *In women, abnormally high levels of testosterone have been associated with hirsutism and polycystic ovary syndrome.*
- Granulosa-theca cell tumors, more commonly known as granulosa cell tumors, belong to the sex cord-stromal category.
- They commonly *produce estrogen*, and estrogen production often is the reason for early diagnosis.

201. Ans. (c) **Myasthenia Gravis**

Ref: Harrison, 18th ed. chapter 386, table 386-3

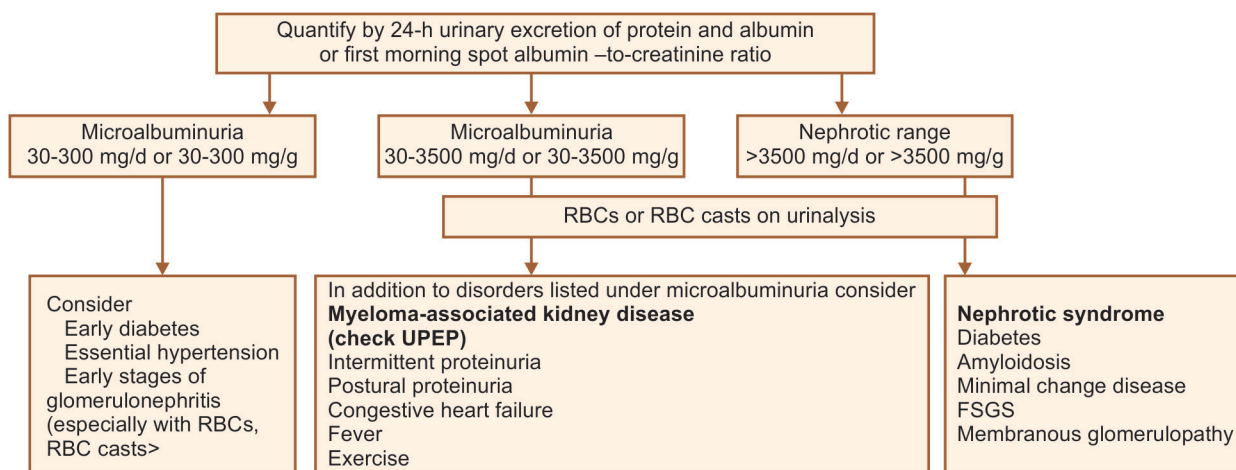

Disorders associated with Myasthenia Gravis

Disorders of the thymus: Thymoma, thymic hyperplasia

Other autoimmune disorders: Hashimoto's thyroiditis, Graves' disease, rheumatoid arthritis, lupus erythematosus, skin disorders, family history of autoimmune disorder

202. Ans. (d) **Urine albumin > 30 mg/dL**

Ref: Harrison, 18th ed. chapter 44

203. Ans. (d) **Aldosterone**

Ref: Harrison, 18th ed. chapter 277

204. Ans. (c) **Relaxin**

Ref: Harrison, 18th ed. chapter 338

- Relaxin is produced mainly by the corpus-luteum, and it rises to peak within 14 days of ovulation, and then declines in the absence of pregnancy, resulting in menstruation.
- In the first trimester of pregnancy, levels rise and additional relaxin is produced by the decidua.
- Peak level of Relaxin is reached during the 14 weeks of the first trimester and at delivery.
- It is known to mediate the hemodynamic changes that occur during pregnancy, such as increased cardiac output, increased renal blood flow, and increased arterial compliance. It also relaxes other pelvic ligaments. It is believed to soften the pubic symphysis.

205. Ans. (b) **Zona glomerulosa**

Ref: Harrison's, 18th ed. Ch 336

- Adrenal gland is divided into adrenal cortex and adrenal medulla, the cortex is further sub-divided into 3 parts, listing them from outside to inside for production of different hormones.

- **Zona Glomerulosa:** Mineralocorticoids
- **Zona Fasciculata:** Glucocorticoids
- **Zona Reticularis:** Sex Steroids

Extra Mile

Aldosterone	: ↑Conn's ↓ Addisons
Cortisol	: ↑Cushing syndrome
Sex Steroids hyperplasia	: ↑Congenital adrenal ↓Hypogonadism
Medulla Tumor	: Pheochromocytoma

206. Ans. (d) **Addison disease**

Ref: Journal, Indian Academy of Clinical Medicine,
Vol. 13, No. 1 Jan-March, 2012, pg. 72-3

- It is known that if glucose infusion is given without glucocorticoid in patients with Addison's disease, they may develop high fever (glucose fever). The exact reason is not specified in textbooks.

**207. Ans. (d) Metabolic alkalosis**

Ref: Harrison, 19th ed. pg. 2324

- Addison disease in India is most commonly caused by tuberculosis.

Clinical Features of Addison's

- Hypotension
- Salt wasting and salt craving
- Hypotension fatigue dizziness/ pre-syncope
- Hyponatremia
- Hyperkalemia^Q
- Metabolic acidosis^Q
- Hyperpigmentation-on palmar creases/sole creases/previous scars/areola/oral cavity

Investigations

- Non contrast CT abdomen for adrenal damage
- Investigation of choice- Cosyntropin test (ACTH stimulation test)

Treatment

- Drug of choice is hydrocortisone (life-long support)
 - If asked DOC of Addisonian crisis: i.v. hydrocortisone
- Remember** metabolic alkalosis is seen with CONN syndrome.

208. Ans. (b) Amenorrhea

Ref: Harrison, 19th ed. pg. 2267

- Most common symptom in females with prolactinoma (after galactorrhea) is menstrual - abnormalities.
- Most common symptom in men is: loss of libido followed by headache.

209. Ans. (c) Coarctation of aorta

Ref: Harrison, 19th ed. pg. 1620

The most common congenital cardiac malformations in Turner syndrome is Bicuspid Aortic valve and Coarctation of Aorta.

210. Ans. (d) Hypoparathyroidism

- The inferior notching of ribs is seen due to pulsation of collaterals in coarctation of aorta.
- Taussig bing operation is done for tetralogy of fallot and is a shunt surgery where the shunt pulsations can cause inferior rib notching.
- Remember:** Inferior rib notching (*Roesler sign*)
 - Enlarged collateral vessels -Coarctation of the aorta
 - Interrupted aortic arch
 - Subclavian artery obstruction-Takayasu disease
 - Blalock-Taussig shunt: Involves only upper 2 rib spaces
 - AVM of the chest wall

- SVC obstruction with enlarged venous collaterals
- Neurogenic tumours - schwannoma (usually single)
- Neurofibromatosis type 1 (rarely can be superior if neurofibroma is very large)
- Superior notching of ribs is seen in Marfan syndrome, rheumatoid arthritis, SLE and hyperparathyroidism.**

211. Ans. (d) Weight gain

Ref: Harrison, 19th ed. pg. 152

- T3 and T4 have sympatho-mimetic activity and they affect basal metabolic rate. Hence in thyrotoxicosis the increase in BMR will lead to weight loss. The sympatho-mimetic activity leads to anxiety palpitations and tachycardia.

212. Ans. (c) Prader Willi syndrome

Ref: Harrison, 19th ed. pg. 415e-4

Adrenal insufficiency	Salt and water loss leads to weight loss
Pseudo-hypoparathyroidism	PTH receptor defect leads to hypocalcemia and hyperphosphatemia
Soto syndrome	<ul style="list-style-type: none">Soto's syndrome aka cerebral gigantism is a rare genetic disorder characterized by excessive physical growth during the first 2 to 3 years of life. Obesity is however not seen.Patients with Soto's syndrome tend to be large at birth and are often taller, heavier, and have macrocephaly.

PRADER WILLI SYNDROME

- Neonatal hypotonia with normal growth immediately after birth
- Small hands and feet, mental retardation
- Hypogonadism
- Some have partial deletion of chromosome 15 and loss of paternally expressed genes
- Hyperphagia leading to severe childhood obesity; ghrelin paradoxically elevated.

213. Ans. (d) Smoking is a risk factor

Ref: Harrison, 19th ed. pg. 2392

- The prevalence of obesity is same for men and women at 36%.
- Prevalence increases with age.
- Genetic pre-disposition plays an important role.
- Smoking predisposes to obesity.

BMI (kg/m ²)	Weight status	BMI percentile for children	Weight status
<18.5	Underweight	<5th percentile	Underweight
18.5–24.9	Normal weight	5th–84th percentile	Normal weight
25–29.9	Overweight	85th–94th percentile	At risk for overweight
30–34.9	Obese	≥95th percentile	Overweight
35–39.9	Moderately obese		
40–49.9	Morbid obesity		
≥50	Super morbid obesity		

214. Ans. (a) Serum fructosamine

Ref: Evidence Based Diabetes Care, 2nd ed. pg. 229

- Serum fructosamine is a retrospective test that determines fluctuations in blood sugar in the previous 2–3 weeks.
- In contrast glycosylated hemoglobin gives fluctuations in blood sugar value over the previous 6–8 weeks.
- **Also remember:** severity of bronze diabetes is determined by GLYCATED albumin.

215. Ans. (a) Phenformin

Ref: KD Tripathi 7th ed. pg. 275

- Phenformin was withdrawn from the market as it causes lactic acidosis
- Metformin is the drug of choice for management of type 2 diabetes mellitus with obesity. *Metformin also causes lactic acidosis of given in renal failure (diabetic nephropathy) patients.*
- Rosiglitazone was withdrawn as it causes coronary artery thrombosis
- Pioglitazone has a black box warning as it causes bladder cancer.

216. Ans. (a) Metformin

Ref: Harrison, 19th ed. pg. 2413–14

- Drug of choice for obese type 2 diabetes mellitus is metformin. This drug increases the peripheral utilization of sugar by sensitizing the receptors. The fall in HbA1c is 1–2%.

217. Ans. (c) < 180 mg/dL

Ref: Harrison, 18th ed. ch. 344

TABLE: Treatment goal for adults with diabetes

Parameters	Goal
HbA1C	<7%
Preprandial capillary plasma glucose	70–130 mg/dL

Contd...

Parameters	Goal
Peak post prandial capillary plasma glucose	<180 mg/dL
Blood pressure	<130/80
LIPIDS	
LDL	<70 mg/dL
HDL	>40 mg/dL in men >50 mg/dL in women
Triglycerides	<150 mg/dL

218. Ans. (b) Dilutional hyponatremia

Ref: Harrison, 19th ed. pg. 303–304

- Diabetes insipidus has either low levels of vasopressin or it is not able to act. Therefore these patients pass a large amount of dilute urine (Polyuria and resultant polydipsia develops). The result is that due to loss of water from body these patients will develop relative hypernatremia.
- **The diagnostic test is water deprivation test**

Drugs

- NEUROGENIC diabetes insipidus is treated with desmopressin nasal spray.
- Nephrogenic diabetes insipidus is treated with thiazide diuretics.
- **Remember:** Dilutional hyponatremia is seen with S.I.A.D.H.

219. Ans. (c) Relative hypernatremia

Ref: Harrison 19th ed. pg. 2280

- SIADH is characterized by gain of water and hence dilutional hyponatremia sets in. The gain of water explains low uric acid.
- Since in SAIDH most of the water is reabsorbed via the CD, the low urine output prompts a physician to possibility of renal parenchymal disorder for which KFT must be done and must be normal to consider diagnostic possibility of SIADH.

220. Ans. (a) Insulinoma

Ref: Harrison, 19th ed. pg. 569

- Whipple's triad is used for diagnosis of insulinoma. The findings seen are:
 1. Fasting hypoglycemia (sympathomimetic symptoms)
 2. Relief of symptoms with oral/IV sugar
 3. Rebound hypoglycemia
- IOC for insulinoma is 72 hour prolonged fasting test^Q
- Imaging modality is P.E.T scan^Q
- **Drug of choice is Octreotide > diazoxide**

FMGE Solutions Screening Examination

221. Ans. (a) **24-hour urinary 5H.I.A.A.**

Ref: Harrison, 19th ed. pg. 564-65

- 5-HIAA is the major urinary metabolite of serotonin, a ubiquitous bioactive amine. Serotonin, and consequently 5-HIAA, are produced in excess by most carcinoid tumors, especially those producing the carcinoid syndrome of flushing, hepatomegaly, diarrhea, bronchospasm, and heart disease.

222. Ans. (b) **Serotonin**

Ref: Harrison, 19th ed. pg. 564-65

- Argentaffin cells in Carcinoid produce 5HT derivatives like serotonin. Epinephrine and norepinephrine are produced by chromaffin cells which are seen in pheochromocytoma.

223. Ans. (c) **TSH**

Ref: Harrison, 19th ed. pg. 2289

- Best test for diagnosis of hypothyroidism is T.S.H (Thyroid Stimulating Hormone).
- TSH can also be used for monitoring response to treatment.

224. Ans. (b) **Excessive iodine**

Ref: Harrison, 19th ed. pg. 2285, 2297

- Excess iodide transiently inhibits thyroid iodide organification, a phenomenon known as the Wolff-Chaikoff effect.
- Thyroid hormone synthesis becomes excessive as a result of increased iodine exposure (Jod-Basedow phenomenon which is opposite of Wolf Chaikoff effect.)
- Iodine deficiency increases thyroid blood flow and upregulates the iodine trapping, stimulating more efficient iodine uptake.
- Ingestion of excess thyroid hormone or thyroid tissue is known as thyrotoxicosis factitia. In the first and second statements of this explanation iodine intake was affected but in Throtoxicosis factitia is due to the ingestion of hormone.

225. Ans. (d) **Menorrhagia**

Ref: Harrison, 19th ed. pg. 2293

- Thyrotoxicosis is characterized by increased sympathomimetic action causing palpitations, anxiety and increased BMR causing weight loss. The menstrual abnormality in Grave's disease is oligo-menorrhoea.
- REMEMBER. Weight gain with menorrhagia is seen in hypothyroidism.
- Weight gain with hirusutism with oligomenorrhoea is seen in Cushing syndrome.

226. Ans. (d) **Myxoedema**

Ref: Harrison, 19th ed. pg. 2289

Choices	Logic
Grave's	Cytokines appear to play a major role in thyroid-associated ophthalmopathy. There is infiltration of the extraocular muscles by activated T cells; the release of cytokines such as IFN-alpha and TNF results in fibroblast activation and increased synthesis of glycosaminoglycans that trap water, thereby leading to characteristic muscle swelling
Sarcoidosis	Approximately 20% of patients with ophthalmic findings of sarcoid have soft tissue involvement of the orbit or lacrimal gland and present as a mass lesion with proptosis, ptosis, or ophthalmoplegia
Pituitary apoplexy	Pituitary adenoma if a Macro-adenoma or is associated with pituitary apoplexy can lead to Proptosis

227. Ans. (b) **Lower esophageal web**

Ref: Harrison, 19th ed. pg. 237

- Plummer Vinson syndrome is a premalignant condition characterized by upper esophageal web plus Koilonchya and iron deficiency anemia. These patients also complain of a burning sensation on the tongue and oral mucosa, and atrophy of lingual papillae produces a smooth, shiny, red dorsum of the tongue.

228. Ans. (a) **Hyperglycemia**

Ref: Harrison 19th ed. pg. 2257-58

- From late in the first year until mid teens, poor growth and/or shortness is the hallmark of childhood GH deficiency.
- It tends to be accompanied by delayed physical maturation so that bone maturation and puberty may be delayed by several years.
- Severe GH deficiency in early childhood also results in slower muscular development, so that gross motor milestones may be delayed.
- Some severely GH-deficient children have recognizable, cherubic facial features characterized by maxillary hypoplasia and forehead prominence. These children have a high pitched voice and are stunted. GH deficiency is associated with hypoglycemia. In contrast gigantism or acromegaly is associated with impaired glucose tolerance.

229. Ans. (d) **Hyperphosphataemia**

Ref: Harrison 19th ed. /96e-7

- Vitamin D deficiency will lead to Hypocalcemia. This will result in secondary increase in PTH.

- This PTH will now act on proximal convoluted tubule to *cause loss of phosphate*. The increased bone turnover will cause increase in serum alkaline phosphate.
- Important calcium/phosphate and SAP fluctuations which are asked (especially those in bold).

Condition	Rickets	Hyperparathyroidism	Osteoporosis ^q	Paget disease	Chronic renal failure ^q
Serum calcium	Less	Increased	Normal	Normal	Less
Serum phosphate	Less	Less	Normal	Normal	Increased
SAP	Increased	Increased	Normal	Disproportionate Increased	Increased
PTH	Increasing	Increased	Normal	Normal	Increased

230. Ans. (a) Hypophosphatemia

Refer to above table

231. Ans. (c) Diarrhea

Ref: Harrison, 19th ed. pg. 2342

- Hyperparathyroidism leads to increase PTH. PTH increases serum calcium by increasing dietary absorption of vitamin D3. It also ensures that the proximal convoluted tubule start losing phosphate in urine leading to decreased serum phosphate.
- The increase serum calcium leads to deposition in kidney parenchyma forming calcium phosphate stones. The increased level of calcium also leads to constipation. Therefore abdominal pain are a feature of hyperparathyroidism. Renal Colic is due to stones and severe constipation. *Diarrhea is not seen with hypercalcemia/hyperparathyroidism.*

232. Ans. (c) Somatostinoma

Ref: Harrison, 19th ed. pg. 570

- In Secretory diarrhea, the epithelial cells' ion transport processes are turned into a state of active secretion. Now *since somatostatin is the inhibitory hormone of the GIT therefore secretory diarrhea cannot be seen* and rather constipation is seen.

234. Ans. (a) Metabolic acidosis

11 beta hydroxylase deficiency, is characterized by:

- Mineralocorticoid excess and hence hypertension can be seen
- *Mineralocorticoid excess leads to hypokalemia and metabolic alkalosis.*
- Glucocorticoid deficiency leads to hypoglycemia plus excess of ACTH leads to hyperpigmentation around genitals
- Excess of adrenal androgens leads to Virilization.

Variant	Gene	Impact on steroid synthesis	Diagnostic marker in serum (and urine)
21-Hydroxylase deficiency (21OHD)	CYP21A2	Glucocorticoid deficiency, mineralocorticoid deficiency, adrenal androgen excess	17-Hydroxyprogesterone

Contd...

Causes of Secretory Diarrhea

- The most common cause of acute-onset secretory diarrhea is a bacterial infection of the gut.
- Features of secretory diarrhea include a high purging rate, a *lack of response to fasting*, and a normal stool ion gap (i.e., 100 mOsm/kg or less), indicating that nutrient absorption is intact.

Causes of Secretory diarrhea

1. Zollinger Ellison syndrome
2. VIPoma
3. Glucagonoma
4. Insulinoma

233. Ans. (d) Gastrochisis

Ref: Chapter 96: Intrauterine Diagnosis of Fetal Disease, Nelson 18th ed.

- All structural defects can be best picked up by antenatal ultrasound whereas chromosomal and genetic aberrations can be picked up by chorionic villus sampling.
- Chorionic villi are tiny finger-shaped growths found in the placenta. The genetic material in chorionic villus cells is the same as that in the baby's cells.
- During CVS, a sample of the chorionic villus cells is taken for biopsy. The chorionic villus cells are checked for problems. The procedure is generally done late in the first trimester, most often between the 10th and 12th weeks.

Ref: Harrison, 19th ed. pg. 2327

Variant	Gene	Impact on steroid synthesis	Diagnostic marker in serum (and urine)
11-Hydroxylase deficiency (11OHD)	CYP11B1	Glucocorticoid deficiency, mineralocorticoid excess, adrenal androgen excess	11-Deoxycortisol
17-Hydroxylase deficiency (17OHD)	CYP17A1	Glucocorticoid deficiency, mineralocorticoid excess, androgen deficiency	11-Deoxycorticosterone
3-Hydroxysteroid dehydrogenase deficiency	HSD3B2	Glucocorticoid deficiency, mineralocorticoid deficiency, adrenal androgen excess	17-Hydroxypregnanolone

HEMATOLOGY

235. Ans. (c) **D.I.C**

Ref: CMDT 2019, pg. 563

As per the question:

Prothrombin time	Increased
Activated partial thromboplastin time	Increased
Platelet count	Reduced (Normal = 1.5–4.5 Lac/cu.mm)
Interpretation	Consumption of clotting factors and platelets seen in Disseminated intravascular coagulation.

- Choice A has non thrombocytopenic purpura due to complement mediated damage to blood vessels. Platelet count is normal in HSP.
- Choice B has recurrent abdominal pain with photo-sensitivity but no bleeding
- Choice D has only low platelet count with normal PT and aPTT

236. Ans. (a) **Fibrin degradation products**

Ref: Harrison, 20th ed. pg. 835

- Fibrin and fibrinogen degradation product (FDP) testing is commonly used to diagnose disseminated intravascular coagulation (DIC).
- The reference range of FDP levels is less than 10 mcg/mL. Level of more than 40 mg/mL is considered critical.
- Choice B and C are deranged in multiple conditions like haemophilia and chronic liver disease and hence are not diagnostic of DIC.
- Choice D, D- Dimer assay is used as a screening test for pulmonary embolism.

Fibrinolytic system and its regulation

237. Ans. (a) **Bone infarction**

Ref: Harrison, 19th ed. P 634

- Sickle cell anemia leads to development of sickling episodes. This leads to vaso-occlusive crisis and bone infarction involving mainly long bones.
- The *hand foot syndrome* is caused by painful infarcts of digits and dactylitis.
- The vaso-occlusive crisis/painful crisis develop suddenly and lead to pain anywhere in the body lasting for weeks.
- Spleen is also destroyed by these cumulative small infarcts by 18–36 months of age.

238. Ans. (a) **Bacterial overgrowth syndrome**

Ref: Harrison 19th ed. P 350e-1

- Schilling test helps in determining etiology of vitamin B₁₂ deficiency.
- Bacterial overgrowth syndrome occurs due to growth of *large intestinal microbiota flora* like bacteroides to *multiply in small intestine*.
- Hence after a course of antibiotics when the flora will die, normal B₁₂ absorption can take place and Schilling's test will become normal.

TABLE: Differential results of the Schilling's test in several diseases associated with cobalamin malabsorption

	58Co-labeled cobalamin	With intrinsic factor	With pancreatic enzymes	After 5 days of antibiotics
Pernicious anemia	Reduced	Normal	Reduced	Reduced
Chronic pancreatitis	Reduced	Reduced	Normal	Reduced
Bacterial overgrowth	Reduced	Reduced	Reduced	Normal
Ileal disease	Reduced	Reduced	Reduced	Reduced

- In chronic pancreatitis, test will become normal with addition of pancreatic supplements.
- In atrophic gastritis, IF supplementation will normalize the Schilling's test.
- If in spite of antibiotics, IF supplementation and pancreatic enzymes the test remains abnormal, it indicates presence of ileal mucosal disease.

239. Ans. (c) Adult T cell leukemia

Human T cell linked virus is related to development of:

- Adult T cell leukaemia
- Tropical spastic paraparesis

Clinical Picture for Adult T cell Leukemia

1. Rapidly progressive skin lesions that mimic mycosis fungoides
2. Pulmonary involvement
3. Hypercalcemia
4. Lymphocytosis with cells containing lobulated or "flower-shaped" nuclei
5. Serum levels of CD25 can be used as a tumor marker.
The cumulative lifetime risk of developing ATL is 3% among HTLV-1 infected patients

Extra Mile

HTLV-I infection is transmitted in three ways:

- Mother to child, especially via breast milk
 - Sexual activity
 - Blood via contaminated transfusions or contaminated needles.
- The virus is most commonly transmitted perinatally. Compared with HIV, which can be transmitted in cell-free form, HTLV-I is less infectious, and its transmission usually requires cell-to-cell contact.

240. Ans. (a) Microcytic Anemia

Ref: Harrison, 19th ed. pg. 640, 645

B12 deficiency is characterised by:

- Loss of vibratory and position sense (Rhomberg sign)
- Abnormal gait
- Dementia
- Impotence
- Loss of bladder and bowel control
- Macrocytic anemia

241. Ans. (b) Megaloblastic anaemia

Ref: Harrison, 19th ed. pg. 81e-3f

The presence of macrocytes with hyper segmented neutrophils confirms the answer as megaloblastic anaemia.

242. Ans. (b) Iron deficiency anemia

Ref: Harrison, 19th ed. pg. 627-28

- Initially the anemia is normocytic normochromic and subsequently hypochromic and microcytic. There is mild to moderate anisocytosis (variation in size) and poikilocytosis (Variation and shape).
- The long, thin elliptocytes of iron deficiency are sometimes referred to as pencil cells.
- Target cells are uncommon and anisochromasia is characteristic. There are two features that can be useful in making the distinction from thalassaemia trait.
- Subsequently there is a fall in the MCV and the MCH and, when it is measured by a sensitive technique, a fall in the MCHC as well.

243. Ans. (a) Age between 1 and 10 years

Ref: Harrison, 19th ed. pg. 699-700

Prognostic factor in acute lymphoblastic leukemia

Excellent prognosis	<ul style="list-style-type: none"> • t(12;21) and TEL-AML1 fusion • Hyperdiploidy and trisomy of specific chromosomes (4, 10 and 17) is associated with an excellent prognosis. • Age >1 years and <10 years
Dismal prognosis	<ul style="list-style-type: none"> • t(9;22) or Philadelphia chromosome and BCR-ABL fusion • Hypodiploidy with chromosome number <45 is associated with a poor prognosis • Age >10 years • WBC >50,000/cu.mm³ • CNS leukemia at presentation

244. Ans. (b) HLA mediated

Ref: Harrison, 18th ed. Chapter 113

- Transfusion-Related Acute Lung Injury (TRALI) is a syndrome characterized by acute respiratory distress following transfusion.
- TRALI usually results from the donor plasma that contains high-titer anti-HLA antibodies that bind recipient leukocytes.
- The leukocytes aggregate in the pulmonary vasculature and release mediators that increase capillary permeability.
- Testing the donor's plasma for anti-HLA antibodies can support this diagnosis.
- The implicated donors are frequently multiparous women, and transfusion of their plasma component should be avoided.
- All plasma-containing blood products have been implicated including rare reports of IVIG and cryoprecipitate.
- Symptoms of TRALI typically develop during, or within 6 hours of a transfusion. Patients present with the rapid onset of dyspnea and tachypnea. There may be associated fever, cyanosis, and hypotension and clinical exam reveals non-cardiogenic pulmonary edema.

245. Ans. (b) Autosomal recessive

Ref: Harrison, 18th ed. Chapter 104

THALASSEMIA SYNDROMES

- The thalassemia syndromes are inherited disorders of alpha- or beta-globin biosynthesis and have autosomal recessive inheritance.
- The most common genetic mutation in thalassemia arises from mutations that derange splicing of the mRNA precursor or prematurely terminate translation of the mRNA.
- Investigation of choice is high performance liquid chromatography

- Treatment of choice is allogenic bone marrow transplantation
- For survival in thalassemia major recurrent packed RBC transfusions are given initially.

246. Ans. (a) Iron deficiency anemia

Ref: Chapter 104: Harrison, 18th ed.

Disease	Serum iron	Serum ferritin	TIBC
Iron deficiency anemia	Decreased	Decreased	Increased
Chronic kidney disease (anemia is due to deficiency of erythropoietin)	Normal	Normal/ decreased if lost in urine due to kidney pathology	Normal
Sideroblastic anemia	Increased	Increased	Decreased
Fanconi anemia (congenital aplastic anemia)	Normal	Normal	Normal

247. Ans. (a) Platelet elevation

Ref: Harrison, 18th ed. chapter 115

Essential thrombocythosis (primary thrombocythemia) is a nonreactive, chronic myeloproliferative disorder in which sustained megakaryocyte proliferation leads to an increase in the number of circulating platelets.

248. Ans. (d) All of the above

Ref: Harrison's, 17th ed. Ch. 109

- Schistocytes are fragmented part of a red blood cells which are typically irregularly shaped, jagged, and have two pointed ends. A true schistocyte does not have central pallor. *They are sometimes referred to as "helmet cells".*
- The presence of schistocytes on the peripheral blood smear suggests red blood cell injury from damaged endothelium **and is a characteristic feature of microangiopathic hemolytic anemia.**

- Microangiopathic hemolytic anemia is an infrequent cause of Coombs-negative intravascular hemolytic anemia, and its causes include:
 1. **Thrombotic thrombocytopenic purpura**
 2. **Hemolytic uremic syndrome**
 3. **Disseminated intravascular coagulation**
 4. Valvular prosthesis

249. Ans. (b) Deficiency is rarely seen, except in infants

Ref: Harrison, 19th ed. pg. 96e-8

- Vitamin-K is a fat soluble compound. It promotes blood clotting by increasing hepatic biosynthesis of prothrombin and other coagulation factors.
- The best sources are green leafy vegetables, liver, cheese, butter and egg yolk. *Deficiency, usually seen only in neonates, in disorders of absorption or during antibiotic therapy is characterized by hemorrhage.*
- *Warfarin acts by inhibiting Vitamin K*, and does not causes deficiency of the same.
- Factor VII is the first to reduce, since it has shortest half life.

250. Ans. (a) Pigmented

Ref: Harrison, 19th ed. pg. 2078

- Pigmented gall stones have composition of Calcium Bilirubinate and are seen in hemolytic anemia like hereditary spherocytosis, sickle cell anemia.

251. Ans. (c) Meth-hemoglobinaemia

Ref: Harrison, 19th ed. pg. 636

- Sickle cell anemia has a pediatric presentation.
- Hemolytic anemia will cause pallor and not brown discoloration of blood.
- In G6PD in event of intravascular hemolysis the hemoglobinuria will cause a black urine. Therefore by exclusion the answer is meth-hemoglobinaemia.

252. Ans. (c) Donor serum is tested against recipient packed cells

Ref: Harrison, 19th ed. pg. 138e-2

Cross-matching blood is performed prior to a blood transfusion in order to determine if the donor's blood is compatible with the blood of an intended recipient, or to identify matches for organ transplantation.

253. Ans. (c) Chronic liver disease

Ref: Harrison, 19th ed. pg. 405

- Dengue hemorrhagic fever has thrombocytopenia so bleeding time is increased.
- Von willebrand disease has deficiency of vWf which acts as an adhesive and glues the platelet to the damaged vessel wall. Hence the platelets are not able to glue on to the bleeding site and the bleeding time is increased.

- Bernard soulier is a platelet function defect of Ib/IIa receptor defect which leads to defective platelet adhesion and thereby an increased bleeding time.
- In chronic liver disease, the clotting factor 7 (shortest half life) depletes very fast leading to prolongation of PROTHROMBIN TIME.

254. Ans. (a) +4 degree Celsius

Ref: Harrison, 19th ed. pg. 138e-6

Blood is stored in blood bank at 4 degrees Celsius. This results in decrease in metabolic rate of RBC and their cellular requirements. Hence the advantage is that the shelf life of blood in blood bank is 21–42 days. (Average of 35 days as best answer in MCQ).

- Cryoprecipitate is stored at minus 20 degree Celsius.
- In contrast platelets are stored in blood bank at room temperature with average of +20–24 degree Celsius.

255. Ans. (c) Chronic myeloid leukemia

Ref: Harrison, 19th ed. pg. 672

The following are Myelo-proliferative disorders:

1. Polycythemia vera
2. Chronic myeloid leukemia
3. Essential thrombocytosis
4. Myelofibrosis
5. Systemic mastocytosis
6. Chronic eosinophilic leukemia

256. Ans. (a) H. Influenza

Ref: Harrison, 19th ed. pg. 484, 652

- Spleen protects from capsulated organisms and hence protects from infection from organisms like *pneumococcus*, *meningococcus*, *hemophilus influenza*.
- Vaccination against these organisms must be done 4 weeks before planned splenectomy.

257. Ans. (a) Imatinib mesylate

Ref: Harrison, 19th ed. pg. 102e-3

- Imatinib mesylate is an inhibitor of tyrosine kinase which is used for treatment of the following cancers
 - Chronic myeloid leukemia
 - Gastro-intestinal stromal tumors
 - Systemic mastocytosis

258. Ans. (a) Long arm of chromosome 9 and long arm of chromosome 22

Ref: Harrison, 19th ed. pg. 101e-3

- The exact chromosomal defect in Philadelphia chromosome is a *translocation*, between the long arms of chromosome 22 and 9. The result is that a fusion gene is created by *juxta positioning* the *Abl1* gene on chromosome

9 (region q34) to a *part of the BCR* (“breakpoint cluster region”) *gene on chromosome 22 (region q11)*.

- The significance of knowing this information is that this chromosome defect causes activation of an enzyme by the name of tyrosine kinase which provides energy to the cancer cells to divide uncontrollably.

259. Ans. (a) Macrocytic anemia

Ref: Harrison, 19th ed. pg. 637

- Thalassemia major is a hemolytic anemia where defective RBC's are produced resulting in transfusion dependency since the defective RBC's are destroyed by the spleen. *These defective RBC in blood circulation are referred to as target cells on a peripheral smear.*
- The type of anemia seen is referred to as **Microcytic Hypochromic anemia**.
- The Hematopoiesis that occurs in liver and spleen in these patients is referred to as extramedullary hematopoiesis and is responsible for spleno-hepatomegaly in these patients.

260. Ans. (d) Cirrhosis

Ref: Harrison, 19th ed. pg. 739

- In cirrhosis of the liver the production of all clotting factors will be reduced and therefore in these patients bleeding diathesis is seen.
- In pregnancy the elevated fibrinogen levels will lead to hyper-coagulable state.
- In abruption placentae the retro-placental clot formation implies the same hypercoagulability.
- In MI the preceding plaque fissure results in development of increased clotting tendency.

261. Ans. (a) Hereditary spherocytosis

Ref: Harrison, 19th ed. pg. 651

- In hereditary spherocytosis, the RBCs have a tendency to be trapped and destroyed in splenic sinusoids. The main features of this disease include anemia, reticulocytosis, jaundice, and splenomegaly. Hence elective splenectomy would be the treatment of choice for this condition.

262. Ans. (a) C.M.L.

Ref: Harrison, 19th ed. pg. 324, 634

Priapism is characterized by prolonged, painful and irreducible erection, not resulting in ejaculation. It is an emergency with a poor prognosis, as the risk of impotence is 50%.

Causes of Priapism

- Sick cell anemia
- Chronic myelogenous leukemia, Chronic lymphocytic leukemia, and acute lymphoblastic leukemia. The hyper-leukocytosis leads to increased viscosity of blood and resultant priapism
- Drugs

263. Ans. (a) **B cell tumor**

Ref: Harrison 19th ed. / 706

- Hairy cell leukemia is a B cell tumor disease that presents in older males.
- Usual presentation involves pancytopenia with splenomegaly.
- The malignant cells appear to have “hairy” projections on light and electron microscopy and show a characteristic staining pattern with *tartrate-resistant acid phosphatase*.
- Bone marrow is typically not able to be aspirated, and biopsy shows a pattern of fibrosis.
- Patients with this disorder are prone to unusual infections, including infection by *Mycobacterium avium* intracellularly, and to vasculitic syndromes.
- Hairy cell leukemia is responsive to chemotherapy with interferon, pentostatin, or *cladribine*, with the latter being the usually preferred treatment.

GASTROINTESTINAL TRACT

264. Ans. (a) **Small intestinal mucosal biopsy**

Ref: Harrison, 20th ed. pg. 2253

- The clinical presentation given is of malabsorption syndrome and is confirmed with small intestinal mucosal biopsy.
- Choice B allows the diagnosis or exclusion of pancreatic exocrine insufficiency, which can be caused by chronic pancreatitis, cystic fibrosis, pancreatic tumour.
- Choice C is done for picking up sugar in stool of osmotic diarrhea patient
- Choice D is done for Hirschsprung's disease.

265. Ans. (c) **Directly related to duration of disease**

Ref: Harrison, 20th ed. pg. 2275

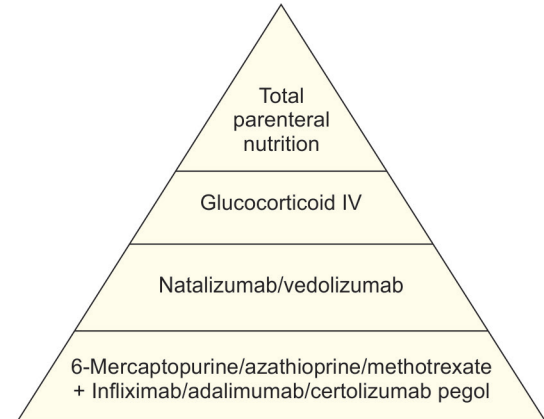

- The risk of neoplasia in UC is increased with *duration* and *extent of disease*.
- Incidence is 2% at end of 10 years and a huge 18% at end of 30 years. The risk is 1.5-2 times higher than general population.
- Choice A is wrong as UC is a premalignant condition.
- Choice B is wrong as smoking has no bearing on development of colorectal cancer in ulcerative colitis.
- Choice D is wrong as disease should be present for long duration to lead to development of malignancy. Annual biopsy is recommended for patients with extensive colitis persisting for 10-12 years.

266. Ans. (c) **Budesonide**

Ref: Harrison: 19th ed. P 1963

Mild to Moderate Crohn's Disease

Moderate to Severe Crohn's Disease

267. Ans. (a) **Occurs along structures derived from foregut**

Ref: Harrison 19th ed. P 537

- Carcinoid tumor can occur at sites derived from foregut, midgut and hindgut.
- The most common site is bronchus which is derived from foregut.
- In the GIT, common sites are ileum, rectum and appendix.
- Most intestinal carcinoids are asymptomatic and are of *low* malignant potential.
- Bronchial carcinoid can *present* as flushing episodes with secretory diarrhea.
- Elevated VMA levels are found in neuroblastoma and *not* pheochromocytoma^Q.

268. Ans. (b) 5-Hydroxyindole acetic acid

Carcinoid tumour produces 5HT derivatives like serotonin and histamine. The degradation of these leads to elevated levels of Urinary 5-Hydroxyindole acetic acid.

Investigations used for diagnosis

1. Urinary 5-HIAA levels
2. Plasma neuropeptide K
3. Serum chromogranin A

Must know points about carcinoid tumor

Name	Biologically Active Peptide(s) Secreted	Tumor location in GIT	Malignant, %	Associated with Multiple Endocrine Neoplasia	Main symptoms/signs
Carcinoid syndrome	Serotonin Tachykinins, Prostaglandins	Midgut (75–87%) ^a Foregut (2–33%) Hindgut (1–8%) Unknown (2–25%)	95–100	Rare	Diarrhea (32–84%) ^a Flushing (63–75%) Pain (10–34%) Asthma (4–18%) Heart disease (11–41%)

269. Ans. (c) Intestinal metaplasia Type 3

- Serial endoscopic examinations of the stomach in patients with atrophic gastritis have documented replacement of the usual gastric mucosa by intestinal type cells. This process of *intestinal metaplasia* may lead to cellular atypia and eventual neoplasia.
- Gastric cancer is associated with blood group A.
- Gastric adenocarcinomas may be subdivided into two categories: a *diffuse type*, in which cell cohesion is absent, so that individual cells infiltrate and thicken the stomach wall without forming a discrete mass; and an *intestinal type*, characterized by cohesive neoplastic cells that form gland like tubular structures.
- Diffuse cancers have defective intercellular adhesion, mainly as a consequence of loss of expression of E-cadherin. Intestinal-type lesions are frequently ulcerative, more commonly appear in the antrum and lesser curvature of the stomach, and are often preceded by a prolonged precancerous process, often initiated by *Helicobacter pylori* infection.

270. Ans. (a) Stomach

- Up to 70% of GIST arise in the stomach and remaining in small bowel.
- Most exhibit an exophytic growth pattern growing across the bowel wall.
- Mucosal ulceration occurs in large aggressive tumors.
- It is the *most common mesenchymal neoplasm of the gastrointestinal tract*.
- It arises from the intestinal cells of cajal which are called pacemaker cells of intestine.
- They express *cKIT (CD117)* which is a tyrosine kinase growth factor receptor
- Imatinib mesylate is used for treatment.

271. Ans. (a) Antiendomysial antibody

The clinical diagnosis is celiac sprue.

Serum antibodies seen in celiac sprue are:

- The antiendomysial antibody has the antigen recognized by the antiendomysial antibody is tTG, which deaminates gliadin.
- *Choice C, antiepidermal tissue transglutaminase antibody is seen in Dermatitis herpetiformis* which is a papulo-vesicular eruption caused by ingestion of gluten. It is characterized by the deposition of IgA in the dermal papillae.
- *Choice D, antimitochondrial antibody is seen in primary biliary cirrhosis.*

272. Ans. (a) B₁₂

- Cobalamin deficiency may cause a bilateral peripheral neuropathy or degeneration (demyelination) of the posterior and pyramidal tracts of the spinal cord. This explains the presence of sensory ataxia in the patient.
- The patchy loss of papillae points to diagnosis of geographical tongue consistent with vitamin B₁₂ deficiency. Hence cobalamin/B₁₂ estimation should be done.
- Cobalamin can be measured by an automated enzyme-linked immunosorbent assay (ELISA). Normal serum levels range from 118–148 pmol/L (160–200 ng/L). In patients with megaloblastic anemia due to cobalamin deficiency, the level is usually <74 pmol/L (100 ng/L).

273. Ans. (b) Intestinal biopsy

Ref: Harrison, 19th ed. pg. 1938

- *A small intestinal biopsy is essential in evaluation of a patient with documented steatorrhea or chronic diarrhea lasting for >3 months.*

FMGE Solutions Screening Examination

656

- Endoscopy is done and is a preferred method for obtaining biopsy material from proximal small intestinal mucosa.
- **Choice A** is ruled out due to false negative D-xylose test and ease of obtaining small intestinal biopsy after endoscopy.
- **Choice C** is used for evaluation of celiac sprue and is not the first test to be done.
- **Choice D** is not available in United States or India.

274. Ans. (a) **B₁₂ estimation**

- The patient has macrocytic anemia with loss of tongue papillae suggestive of vitamin B₁₂ deficiency. The loss of papillae leads to beefy bald tongue.

275. Ans. (a) **Stomach**

- Cushing's ulcer is a gastroduodenal ulcer produced by elevated intracranial pressure caused by an intracranial tumor, head injury or other space-occupying lesion.
- The ulcer, usually single and deep, may involve the esophagus, stomach, and duodenum.
- Increased intracranial pressure may affect different areas of the hypothalamic nuclei or brainstem leading to overstimulation of the vagus nerve or paralysis of the sympathetic system. Both of these circumstances increase secretion of gastric acid and the likelihood of ulceration of gastroduodenal mucosa.

276. Ans. (b) **Ileum**

Ref: Harrison, 18th ed. Table 350-3

Site	Percentage of site
Bronchus, lung, trachea	27.9
Midgut	
Jejunum	1.8
Ileum	14.9
Meckel's diverticulum	0.5
Appendix	4.8
Colon	8.6
Liver ovary	0.4
Testis	1.0
Hindgut	<0.1
Rectum	13.6

277. Ans. (a) **Serum lipase**

Ref: Harrison, 19th ed. pg. 2100

- The cardinal symptom of acute pancreatitis is abdominal pain, which is characteristically dull, boring, and steady.
- *Elevated lipase levels are more specific to the pancreas than elevated amylase levels. Lipase levels remain high for 12 days. In patients with chronic pancreatitis (usually*

caused by alcohol abuse and question mentions that the patient is back from a party), lipase levels may be elevated in the presence of a normal serum amylase level

- Usually, the pain is sudden in onset and gradually intensifies in severity until reaching a constant ache.
- *The pain radiates directly through the abdomen to the back in approximately one half of cases.*
- Fever (76%) and tachycardia (65%) are common abnormal vital signs; hypotension may be noted
- Abdominal tenderness, muscular guarding (68%), and distention (65%) are observed in most patients; bowel sounds are often diminished or absent because of gastric and transverse colonic ileus; guarding tends to be more pronounced in the upper abdomen
- Lipase has a slightly longer half-life and its abnormalities may support the diagnosis if a delay occurs between the pain episode and the time the patient seeks medical attention.

278. Ans. (a) **24-hour pH monitoring**

Ref: Harrison 19th ed. pg. 261-2

- Ambulatory 24-hour pH monitoring is the criterion standard in establishing a diagnosis of GERD, with a sensitivity of 96% and a specificity of 95%. It quantifies the gastroesophageal reflux and allows a correlation between the symptoms of reflux and the episodes of reflux.
- However the diagnosis can be established on basis of Upper Gastrointestinal endoscopy with esophageal manometry.
- Oesophageal pH < 4.0, for 4 hrs/day is diagnostic of GERD.

279. Ans. (a) **Wheat**

Ref: Harrison, 19th ed. pg. 1940

- Coeliac disease is caused by a reaction to gliadin found in wheat, oats, rye and Barley. Upon exposure to gliadin, there is production of anti-tissue transglutaminase antibody which cross-reacts with small-bowel tissue, causing an inflammatory reaction.
- This leads to villous atrophy and leads to osmotic diarrhea.

280. Ans. (a) **Metaplasia**

Ref: Robbins, 8th ed. chapter 15

- Categories in ulcerative colitis, include indefinite for dysplasia, low-grade dysplasia, and high-grade dysplasia. It may be difficult to distinguish dysplasia from the reactive/reparative atypia that occurs after periods of disease activity.
- These diagnoses must be made with caution, because the implications for the patient are serious. Low-grade dysplasia warrants consideration for colectomy, whereas

high-grade dysplasia or carcinoma is an indication for colectomy

- Dysplasia is defined as an unequivocal neoplastic alteration of colonic epithelium. It may consist of architectural disorganization of colonic crypts, cytologic atypia (including nuclear hyperchromasia), pseudostratification, pleomorphism, clumped chromatin, and prominent nucleoli, with increased mitotic activity, particularly in the upper portion of the crypts.

281. Ans. (a) Duodenum with fast clearance

Ref: Harrison, 18th ed. Chapter 103

- Iron absorbed from the diet from the duodenum or released from stores circulates in the plasma bound to transferrin.
- The turnover of transferrin-bound iron is very rapid typically 60-90 min.
- Because almost all of the iron transported by transferrin is delivered to the erythroid marrow, the clearance time of transferrin-bound iron from the circulation is affected most by the plasma iron level and the erythroid marrow activity.
- When erythropoiesis is markedly stimulated, the pool of erythroid cells requiring iron increases and the clearance time of iron from the circulation decreases. The half-clearance time of iron in the presence of iron deficiency is as short as 10-15 minutes.

282. Ans. (a) Ceftriaxone

Ref: Harrison 19th ed. and Multiple Infectious Disease Journals

Location	Severity	First-line antibiotics	Second-line antibiotics
South-East Asia	Uncomplicated	Cefixime PO	Azithromycin PO
	Complicated	Ceftriaxone IV or Cefotaxime IV	Aztreonam IV or Imipenem IV

283. Ans. (d) Blood culture

Ref: Harrison 18th ed. Chapter 153

- The definitive diagnosis of enteric fever requires the isolation of *S. typhi* or *S. paratyphi* from blood, bone marrow, other sterile sites, rose spots, stool, or intestinal secretions.

For diagnosis in the first week

- Sensitivity of **blood culture** is only 40–80%, probably because of high rates of antibiotic use in endemic areas and the small quantities of *S. typhi* (i.e., <15 organisms/mL).

- **Bone marrow culture** is 55–90% sensitive, and, unlike that of blood culture, its yield is not reduced by up to 5 days of prior antibiotic therapy.
- Culture of **intestinal secretions (best obtained by a noninvasive duodenal string test)** can be positive despite a negative bone marrow culture.

284. Ans. (a) Barium enema- Pipe stem colon

Ref: Internal Medicine Guide 2e/36

Lead pipe appearance of colon is the classical barium enema finding in chronic ulcerative colitis. There is complete loss of haustral markings in the diseased section of colon, and the organ appears smooth walled and cylindrical.

285. Ans. (b) Multiple air fluid level- adhesions and bands

Ref: Manual of Emergency Medicine, 5th ed. pg. 247

- In X-ray you can see that due to intestinal obstruction secondary to adhesions or bands, the loops proximal to the point of obstruction will become dilated and fluid-filled and are usually greater than 2.5-3 cm in size
- Loops of small bowel in a *step-ladder* configuration from the left upper to the right lower quadrant are seen.
- Mostly fluid-filled loops of bowel may demonstrate a *string-of-beads sign* caused by the small amount of visible air in those loops

286. Ans. (a) CBD dilation on ERCP

Ref: Cleveland Internal Medicine Case Reviews, 5th ed. pg. 93

You can see the endoscope in left top half and right 5 o'clock position which is radiopaque. It is advanced into D2 from where the ampulla of Vater is located. The probe is advanced and dye injected which shows dilatation of whole biliary tree. A stricture is also noted proximal to which the biliary pathway is advanced.

287. Ans. (a) 24-hour pH monitoring

Ref: Harrison, 19th ed. pg. 261-62

- 24-hour pH monitoring is done for GERD.
- Components of 24-hour pH monitoring:
 - Percent total time pH < 4
 - Percent upright time pH < 4
 - Percent supine time pH < 4
 - Number of reflux episodes
 - No. of reflux episodes in 5 minutes
 - Longest reflux episode (minutes)

Remember: This method is also used for detection of *laryngoesophageal reflux* that causes asthma, laryngospasm.

288. Ans. (c) Colon cancer

Ref: Gastrointestinal Oncology, 2nd ed. pg. 24

- Aspirin has been shown to reduce the risk of colorectal cancer in latest studies in JAMA in September 2013. How

FMGE Solutions Screening Examination

658

it works is a matter of research but has shown a reduction in mortality.

289. Ans. (c) Premalignant

Ref: Harrison, 19th ed. pg. 1903

- **Zenker's diverticulum**, aka **pharyngoesophageal diverticulum** is a diverticulum of the mucosa of the pharynx, just above the cricopharyngeal muscle. It is a false diverticulum.
- Pharyngo-oesophageal wall herniates through the point of least resistance (known as Killian's triangle).
- Zenker diverticulum often causes clinical manifestations such as dysphagia, and sense of a lump in the neck, regurgitation, cough, halitosis, infection, involuntary gurgling noises when swallowing.

290. Ans. (a) Crohn's disease

Ref: Harrison, 19th ed. pg. 1951-52

CD is a transmural process. Endoscopically, aphthous or small superficial ulcerations characterize mild disease; in more active disease, stellate ulcerations fuse longitudinally and transversely to demarcate islands of mucosa that frequently are histologically normal.

This "cobblestone" appearance is characteristic of CD, both endoscopically and by barium radiography

Ulcerative colitis	Crohn disease
Only colon involved	Panintestinal
Continuous inflammation extending proximally from rectum	Skip-lesions with intervening normal mucosa
Inflammation in mucosa and submucosa only	Transmural inflammation
No granulomas	Noncaseating granulomas
Perinuclear ANCA (pANCA) positive	ASCA positive
Bleeding (common)	Bleeding (uncommon)
Fistulae (rare)	Fistulae (common)

291. Ans. (d) Invasion of lymph nodes seen

Ref: Harrison, 19th ed. pg. 1951

- Crohn's disease is an inflammatory bowel disease in which all the layers of intestine are involved. It involves both the small as well as large intestine.
- Most common part involved is the ileo-caecal area and skip lesions are common with normal areas interspersed. Invasion of lymph nodes is a feature of malignancy and can be easily excluded.

292. Ans. (a) Ulcerative colitis

Ref: Harrison's, 17th ed. Ch. 289

- In ulcerative colitis there is loss of haustrations, and edema of mucosa gives lead pipe appearance.

293. Ans. (c) Toxic megacolon

Ref: Harrison's, 17th ed. Ch. 289

- Crohn's disease is a chronic, recurrent disease characterized by patchy transmural inflammation involving any segment of the gastrointestinal tract from the mouth to the anus **but most common site is Ileum**.
- Crohn's disease is one of the two main forms of Inflammatory bowel disease and is also known as Granulomatous colitis.
- **Earliest manifestation is Aphthous ulcers.**
- Skip lesions, stricture formation, string sign of Kantor is also seen.
- **Hallmark feature of Crohn's** is fistula formation.
- **Cobble stone appearance is seen** on X-ray.
- **Note:** Toxic mega colon can be seen in Crohn's disease but more commonly is seen in Ulcerative colitis.

294. Ans. (a) Ulcerative colitis

Ref: Harrison 19th ed. pg. 1952-53

EPIDEMIOLOGY OF IBD

	Ulcerative colitis	Crohn's disease
Male/female ratio	1:1	1.1–1.8:1
Smoking	May prevent disease	May cause disease
Oral contraceptives	No increased risk	Odds ratio 1.4
Appendectomy	Protective	Not protective
Monozygotic twins	6% concordance	58% concordance
Dizygotic twins	0% concordance	4% concordance

295. Ans. (a) Adenocarcinoma

Ref: Harrison's, 17th ed. Ch. 286

- Metaplastic columnar epithelium develops during healing of erosive esophagitis with continued acid reflux since columnar epithelium is more resistant to acid-pepsin damage than is squamous epithelium.
- The metaplastic epithelium has different epithelial types, including goblet cells and columnar cells.
- Finding intestinal metaplasia with goblet cells in the esophagus is diagnostic of Barrett's esophagus; this type of mucosa is thought to be at risk of cancer

296. Ans. (c) Carcinoid tumor

Ref: Harrison 19th ed. pg. 1039-1040

- *H. pylori* is gram negative bacteria, non sporing, micro aerophilic, extra cellular bacteria. *H. pylori* releases urease enzyme which converts urea to ammonia. Ammonia stimulates G cells of stomach which in turn stimulates parietal cells and cause secretion of HCl à Hyperchlorhydria. This acid travels into stomach & duodenum and causes **peptic ulcers**.

- *H. pylori* is a type I carcinogen, which, if present in stomach for long term can cause cancer called MALTOMA (Mucosa Associated Lymphoid Tumor), which is a B-type NHL.

Extra Mile

- MC site of duodenal ulcer in duodenum: D1
- Peptic ulcer refractory to PPI treatment is seen in Zollinger Ellison Syndrome
- IOC for *H. pylori*: Urease test (invasive procedure)
- Urea breath test: test for eradication of infection
- S. Elisa: Screening test for *H. Pylori*

297. Ans. (a) **Campylobacter**

Ref: Harrison, 19th ed. pg. 266

- Diarrhea, the leading cause of illness in travelers, is usually a short-lived, self-limited condition; however, 40% of affected individuals need to alter their scheduled activities, and another 20% are confined to bed.
- The most frequently identified pathogens causing travelers' diarrhea are
 1. Toxigenic *Escherichia coli* and Enteroaggregative *E. coli* (Most common but not in choices)
 2. In Southeast Asia *Campylobacter* infections appear to predominate
 3. *Salmonella*, *Shigella*
 4. Rotavirus
 5. Norovirus has caused numerous outbreaks on cruise ships
 6. Except for giardiasis, parasitic infections are uncommon causes of travelers' diarrhea.
- A growing problem for travelers is the development of antibiotic resistance among many bacterial pathogens. Examples include strains of *Campylobacter* resistant to quinolones and strains of *E. coli*, *Shigella*, and *Salmonella* resistant to trimethoprim-sulfamethoxazole

HEPATOLOGY

298. Ans. (a) **SGOT**

Ref: Harrison, 20th ed. pg. 2337

Child Pugh Classification

Points	1	2	3
Encephalopathy	None	Minimal	Advanced (coma)
Ascites	Absent	Controlled	Refractory
Bilirubin (mmol/L)	<34	34–51	>51
Albumin (g/L)	>35	28–35	<28
Prothrombin (sec)*	<4	4–6	>6

*International normalized ratio

Note: The Child-Pugh score is calculated by adding the scores for the five factors and can range from 5 to 15. The resulting Child-Pugh class can be A (a score of 5–6), B (7–9), or C (≥ 10). Decompensation indicates cirrhosis, with a Child-Pugh score of ≥ 7 (class B). This level has been the accepted criterion for listing a patient for liver transplantation

299. Ans. (a) **Budd Chiari syndrome**

Ref: Harrison, 20th ed. pg. 2410

Budd chiari syndrome leads to occlusion of hepatic veins and leads to post hepatic cause of portal hypertension.

Pre-hepatic causes	Hepatic causes	Post hepatic causes
Portal vein thrombosis Splenic vein thrombosis Massive splenomegaly (Banti's syndrome)	Presinusoidal <ul style="list-style-type: none"> • Schistosomiasis • Congenital hepatic fibrosis Sinusoidal <ul style="list-style-type: none"> • Cirrhosis—many causes • Alcoholic hepatitis Postsinusoidal <ul style="list-style-type: none"> • Hepatic sinusoidal obstruction (venoocclusive syndrome) 	Posthepatic <ul style="list-style-type: none"> • Budd-Chiari syndrome • Inferior vena caval webs • Cardiac causes <ul style="list-style-type: none"> ▪ Restrictive cardiomyopathy ▪ Constrictive pericarditis ▪ Severe congestive heart failure

- Choice B, Banti's disease is fibro-congestive splenomegaly and is a pre-hepatic cause of portal HTN
- Choice C and D are also prehepatic causes of portal hypertension.

Extra Mile

Clinical Features of portal Hypertension

Caput medusae

✓ ABCDE

A: Ascites
 B: Bleeding (hematemesis, piles)
 C: Caput medusae
 D: Diminished liver
 E: Enlarged spleen

**300. Ans. (b) Metabolic syndrome**

Ref: Harrison, 19th ed. P 2452

Metabolic syndrome is the most common cause of non-alcoholic fatty liver disease.

It is a lifestyle disease characterized by centripetal obesity, increased blood pressure, impaired glucose tolerance and hypertriglyceridemia.

CAUSES OF NONALCOHOLIC FATTY LIVER

1. Metabolic syndrome^a (MC cause)
2. Reye syndrome
3. Pregnancy
4. Drugs
5. Kwashiorkor

301. Ans. (c) Trientine

- The drug of choice for Wilson disease is zinc acetate but it is **not** a chelator.
- The chelator for zinc is trientine. Earlier d-penicillamine was used but not used new due to toxicity.
- For initial medical therapy of patients with hepatic decompensation, a chelator (trientine is preferred) plus zinc is recommended zinc should not, however, be ingested simultaneously with trientine, because it will chelate zinc and form therapeutically ineffective complexes; administration of the two drugs should be separated by at least one hour.
- For initial neurologic therapy, tetrathiomolybdate is the drug of choice because of its rapid control of free copper, preservation of neurologic function, and low toxicity. penicillamine and trientine should be avoided because they each have a high risk of worsening the neurologic condition.

302. Ans. (d) Liver copper

Investigations for Wilson disease and their relative importance

Test	Usefulness
Serum ceruloplasmin	+
KF rings	++
24-h urine Cu	+++
Liver Cu	++++

303. Ans. (a) Triglycerides

The intracellular triglyceride accumulation is expressed histologically as microvesicular steatosis.

304. Ans. (d) Hepcidin

Ref: Chapter 162, Goldman and Cecil Textbook of Medicine, 24th ed.

- Hepcidin is a 25 amino acid peptide and central regulator of iron homeostasis through its effects on iron

homeostasis through its effects on intestinal absorption, macrophage recycling of iron from senescent RBC and iron metabolism from hepatic stores. Thus hepcidin affects all major sites of iron metabolism.

- Hematopoiesis occurs in marrow cords, essentially loose arrangement of cells in dilated sinus area between the arterioles that feed the bone and the venous sinus that returns blood to efferent veins. Erythropoiesis occurs in erythroid islands.

305. Ans. (b) Zinc

Ref: Harrison, 18th ed. Chapter 360

Disease status	First choice
Initial hepatic	
Hepatitis or cirrhosis without decompensation	Zinc
Hepatic decompensation	
Mild	Trientine and zinc
Moderate	Trientine and zinc
Severe	Hepatic transplantation
Initial neurologic/psychiatric	Tetrathiomolybdate and zinc
Maintenance	Zinc

306. Ans. (a) Hippocampus

Ref: Harrison, 18th ed. Chapter 357

Organs Involved in Hemochromatosis are:

- Liver (first organ to be affected) = 95%
- Excessive skin pigmentation
- Diabetes mellitus (bronze diabetes)
- Arthropathy
- Cardiac involvement (restrictive cardiomyopathy)
- Pituitary involvement (leading to hypopituitarism and hypogonadism) = mentioned in textbook as endocrine involvement.

307. Ans. (c) Hepatitis C

Ref: Harrison, 18th ed. Chapter 306

- Chronic hepatitis follows acute hepatitis C in 50–70% of cases; chronic infection is common even in those with a return to normal in aminotransferase levels after acute hepatitis C, adding up to an 85% likelihood of chronic HCV infection after acute hepatitis C.

308. Ans. (d) Estrogen

Ref: Harrison, 18th ed. chapter 311

- The hyperdynamic circulatory state of portal hypertension is associated with a dilated, vascular periphery. This is driven by an excess of systemic nitric oxide and estrogen.

- When these telangectasias occur in the palms, it frequently manifests as a diffuse Palmar erythema.
- This is because the skin on the thenar and hypothenar prominences is thicker and the ectatic vessels are deeper within the dermis.
- Ectatic blood vessels commonly form, and are often noted atop the chest, neck and face. These are referred to as 'spider telangectasias' because they fill centrifugally (like legs of a spider) after the center is blanched.
- Palmar erythema can also be seen in pregnancy, polycythemia, thyrotoxicosis, rheumatoid arthritis, excema, psoriasis and even normal individuals

Extra Mile

Signs of Liver Cell Failure

1. The liver and spleen may be enlarged, with the liver edge being firm and nodular
2. Scleral icterus
3. Palmar erythema
4. Spider angiomas
5. Parotid gland enlargement
6. Digital clubbing
7. Muscle wasting, or the development of edema and ascites.
8. Men may have decreased body hair and gynecomastia as well as testicular atrophy, which may be a consequence of hormonal abnormalities or a direct toxic effect of alcohol on the testes.
9. In women with advanced alcoholic cirrhosis, menstrual irregularities usually occur, and some women may be amenorrheic.

309. Ans. (b) Acute cholangitis

Ref: Harrison, 18th ed. Chapter 311

Acute cholangitis	<ul style="list-style-type: none"> • The characteristic presentation of acute cholangitis involves biliary pain, jaundice, and spiking fevers with chills (Charcot's triad). • ERCP with endoscopic sphincterotomy is safe and the preferred initial procedure for both establishing a definitive diagnosis and providing effective therapy. • Blood cultures are frequently positive, and leukocytosis is typical.
Acute Cholecystitis	<ul style="list-style-type: none"> • Attack of biliary pain that progressively worsens. Approximately 60–70% of patients report having experienced prior attacks that resolved spontaneously. • As the episode progresses, however, the pain of acute cholecystitis becomes more generalized in the right upper abdomen, which may radiate to right shoulder.
Acute viral hepatitis	<p>This is the closest differential diagnosis and is ruled out because of the following points mentioned below.</p> <ul style="list-style-type: none"> • The <i>prodromal symptoms</i> like anorexia, nausea and vomiting, fatigue, malaise, arthralgias, myalgias, headache, photophobia, pharyngitis, cough, and coryza may precede the onset of jaundice by 1–2 weeks.

Cotnd...

- The nausea, vomiting, and anorexia are frequently associated with alterations in olfaction and taste.
- A *low-grade fever* between 38° and 39°C (100°–102°F) is more often present in hepatitis A and E than in hepatitis B or C, except when hepatitis B is heralded by a serum sickness–like syndrome.
- Dark urine and clay-colored stools may be noticed by the patient from 1–5 days before the onset of clinical jaundice

310. Ans. (d) 8 weeks

Ref: Harrison, 19th ed. pg. 2018

- It is sub-divided into “*fulminant hepatic failure*”, which requires onset of encephalopathy within 8 weeks and Subfulminant which leads to encephalopathy after 8 weeks but before 26 weeks.
- Acute liver failure is a broad term that encompasses both fulminant and subfulminant.

311. Ans. (d) Hep E

Ref: Harrison, 19th ed. pg. 152e-2t, 0215

- Most common cause of fulminant hepatitis in pregnancy is HEV
- Most common cause of viral hepatitis in India overall = Hepatitis A
- Most common cause of blood transfusion associated hepatitis = HBV
- Most common viral hepatitis in India in children= HAV
- Most common viral hepatitis in India in adults= HEV
- Most common cause of FULMINANT hepatic failure= toxins> Hepatitis D.

312. Ans. (d) IgM anti- HbcAg

Ref: Harrison, 19th ed. pg. 2017-18

- In most cases, serologic markers of infection and antigenemia appear 1–3 mo after birth, suggesting that transmission occurred at the time of delivery; virus contained in amniotic fluid or in maternal feces or blood may be the source.
 - Most common mode of acquisition, is during delivery.
 - HBsAg is the 1st serologic marker of infection to appear and is found in almost all infected persons; its rise closely coincides with the onset of symptoms.
 - Because HBsAg levels fall before symptoms wane, IgM antibody to HBcAg (anti-HBc IgM) helps to identify acute infection, as it rises early after infection and remains positive for many months before being replaced by anti-HBc IgG, which persists for years.
 - Anti-HBc is the most valuable single serologic marker of acute HBV infection because it is present almost as early as HBsAg and continues to be present later in the course of the disease when HBsAg has disappeared

**313. Ans. (b) Cirrhotic ascites**

Ref: Harrison, 19th ed. pg. 286-87

- Diuretics that block aldosterone receptors in the distal convoluted tubule are preferred because of the presence of hyperaldosteronism in patients with cirrhosis.
- Spironolactone is useful in CHF but not in hypertrophy of heart. It is also useful in transudative pleural effusion
- ACE inhibitors and CCB are used in renal artery stenosis.

314. Ans. (c) >20 mm Hg

- Intra-abdominal hypertension is defined as a pressure over 12 mm Hg in adults. However, if the pressure continues to rise over 20 mm Hg and organs begin to fail, the syndrome has now progressed to the end stage of the highly fatal process termed abdominal compartment syndrome.
- **Causes of primary (acute) abdominal compartment syndrome include the following:**
 - Penetrating trauma
 - Intraperitoneal hemorrhage
 - Pancreatitis
 - External compressing forces (debris from a motor vehicle collision or after an explosion)
 - Pelvic fracture
 - Rupture of abdominal aortic aneurysm
 - Perforated peptic ulcer

IAP can be easily monitored by measuring bladder pressure. Measurement of intraluminal bladder pressure

315. Ans. (b) Evaluation of left atria and left Atrial appendage thrombus

Ref: Harrison, 19th ed. pg. 270e-2

- Trans-esophageal echocardiography is better than transthoracic echocardiography as it is better able to evaluate the left Atrial thrombus and left Atrial appendage. Therefore in patients of atrial fibrillation of long standing duration for evaluation of clots in left atrium, trans-esophageal echocardiography is done.

316. Ans. (a) Enteric fever

Ref: Harrison, 19th ed. pg. 1050-51

Clinical features of Typhoid fever begin 7-14 days after ingestion

- Fever pattern is stepwise, characterized by a rising temperature over the course of each day that drops by the subsequent morning.

- Over the course of the first week of illness, gastrointestinal manifestations of the disease develop. These include diffuse abdominal pain and tenderness and, in some cases, fierce colicky right upper quadrant pain.
- The individual then develops a dry cough, dull frontal headache, delirium, and an increasingly stuporous malaise.
- The patient develops rose spots, which are salmon-colored, blanching, truncal, Maculo-papules usually 1-4 cm wide and fewer than 5 in number; these generally resolve within 2-5 days.

RHEUMATOLOGY**317. Ans. (a) Shrinking Lung syndrome**

Ref: Harrison, 20th ed. pg. 2520

The most common lung manifestation of SLE is pleuritis with or without pleural effusion. It may respond to NSAIDs or may require steroids. Life threatening manifestations include interstitial inflammation and shrinking lung syndrome.

318. Ans. (a) SLE

Ref: Harrison, 20th ed. pg. 2518

- ANA > reference value is the first immunological manifestation mentioned in SLICC criteria for diagnosis of SLE. It is not a criterion for diagnosis of the remaining rheumatological diseases mentioned in choices b, c and d.
- This test is positive in 95% cases at the onset of disease and the remaining patients turn positive within one year of disease onset.
- ANA testing using immuno-fluorescent antibodies is more reliable than ELISA.

319. Ans. (b) Non-tender, located on extensor surface and seen with arthritis

Ref: Harrison, 20th ed. pg. 2528-2529

Rheumatic nodules are the most common extra-articular feature of rheumatoid arthritis and consists of non-tender nodules on extensor surface of joints.

320. Ans. (b) Uric acid in synovial fluid

Ref: Harrison 19th ed. P 2223

- Since 50% of patients with acute gouty attack have normal serum uric acid levels, the best test to confirm the diagnosis is joint aspiration uric acid crystals.
- Under microscope, needle shaped MSU crystals are seen both intracellularly and extracellularly.
- With compensated polarized light, crystals are brightly birefringent with negative elongation.
- The clinical presentation is dramatic with overnight development of red inflamed 1st MTP joint.
- Anti CCP antibodies are used for diagnosis of rheumatoid arthritis.

321. Ans. (d) Naproxen

Ref: Harrison 19th ed. P 2234

- The mainstay of treatment is administration of NSAIDs. The most effective drugs are those with short half-life including indomethacin, naproxen, ibuprofen, diclofenac and celecoxib.
- Glucocorticoids are given IM or orally and are highly effective in poly-articular gout.

Extra Mile

NSAID contraindicated in acute gout is aspirin.

322. Ans. (a) Takayasu's arteritis

Diagnosis of Takayasu's arteritis should be suspected strongly in a patient who develops:

1. A decrease or absence of peripheral pulses, this disease is hence called pulseless disease
2. Unequal blood pressure between left and right arm
3. Arterial bruits.
 - It is an inflammatory and stenotic disease of medium- and large-sized arteries characterized by a strong

predilection for the aortic arch and its branches. For this reason, it is often referred to as the *aortic arch syndrome*

- Most common vessel involved is left subclavian artery followed by common carotid artery.
- The diagnosis is confirmed by arteriography

Extra Mile

Clinical Manifestations of Takayasu's Arteritis

Artery	Percent of arteriographic abnormalities	Potential clinical manifestations
Subclavian	93	Arm claudication, Raynaud's phenomenon
Common carotid	58	Visual changes, syncope, transient ischemic attacks, stroke
Abdominal aorta	47	Abdominal pain, nausea, vomiting
Renal	38	Hypertension, renal failure

323. Ans. (a) ASO

- Evidence of an antecedent Group A Streptococcal infection is usually based on elevated or increasing serum antistreptococcal antibody titers.
- As most cases do not have a positive throat swab culture or rapid antigen test, serologic evidence is usually needed.
- The most common serologic tests are the antistreptolysin O (ASO) and anti-DNase B (ADB) titers
- If only a single antibody is measured (usually antistreptolysin O), only 80–85% of patients with acute rheumatic fever have an elevated titer.

**324. Ans. (c) Exudative pleural effusion****Lung Disease in Rheumatoid Arthritis**

- Most common pulmonary manifestation is pleural involvement leading to pleural friction rub and effusion. This is due to inflammatory breakdown of pulmonary nodules.
- *Pleural effusions tend to be exudative with increased numbers of monocytes and neutrophils.*
- Interstitial lung disease. Pulmonary function testing shows a restrictive pattern (e.g. reduced total lung capacity) with a reduced diffusing capacity for carbon monoxide (DLCO).
- Caplan's syndrome is characterized by the development of nodules and pneumoconiosis following silica exposure.

325. Ans. (a) Behçet's disease*Ref: Harrison, 19th ed. pg. 2194*

- Although Behçet's disease is classified among the vasculitides laboratory diagnostic does not include regularly autoantibodies associated with vascular manifestations of systemic autoimmune diseases.
- The autoantigens for pemphigus vulgaris and pemphigus foliaceus are desmoglein 3 and desmoglein 1, respectively.
- *The anti-desmoglein 1 antibodies in pemphigus foliaceus and anti-desmoglein 3 antibodies in pemphigus vulgaris are pathogenic.*
- *Anti-tissue transglutaminase antibodies are pathogenic for celiac disease.*
- Anti-nuclear antibody is seen in SLE
- Causes of Aphthous Ulcers:

Infections:

- Viral (Herpes, CMV, EBV, HIV)
- Fungal (Candida)
- Bacterial (Vincent's infection, syphilis)

Dermatological:

- Pemphigus, pemphigoid, lichen planus

Drug :

- Chemotherapy drugs
- Erythema multiforme, Stevens-Johnson syndrome

Systemic diseases:

- Behçet's syndrome, SLE

Nutritional:

- Vitamin deficiency (Vitamin B and C), iron deficiency

Neoplasia:

- Leukemia, squamous cell carcinoma, Kaposi's sarcoma

Gastrointestinal:

- Crohn's disease, celiac disease

Traumatic

- Dentures

Chemical or thermal burns:

- Corrosives, hot liquids

326. Ans. (a) IgA*Ref: Harrison, 18th ed. Chapter 326*

- The Presumptive pathogenic mechanism for Henoch-Schönlein purpura is immune-complex deposition.

- IgA is the antibody class most often seen in the immune complexes and has been demonstrated in the renal biopsies of these patients.
- A number of inciting antigens have been suggested including upper respiratory tract infections, various drugs, foods, insect bites, and immunizations.

327. Ans. (a) SLE*Ref: Harrison, 18th ed. chapter 319*

- An LE cell is a neutrophil or macrophage that has phagocytized (engulfed) the denatured nuclear material of another cell
- LE cell testing was once performed to diagnose systemic lupus erythematosus (SLE) but has been replaced for this purpose by antinuclear antibody testing.
- The LE cell reaction is positive in 50%–75% of individuals with acute disseminated lupus.
- Positive reactions are also seen in rheumatoid arthritis, chronic hepatitis (lupoid), scleroderma, dermatomyositis, polyarteritis nodosa, acquired hemolytic anemia, and Hodgkin disease.

328. Ans. (b) c-ANCA*Ref: Harrison, 18th ed. Chapter 326:*

- c-ANCA = Wegener granulomatosis/Granulomatosis with angitis
- p-ANCA
 - Microscopic polyangitis
 - Primary sclerosing cholangitis
 - Churg strauss syndrome

The terminology of *cytoplasmic ANCA* (cANCA) refers to the diffuse, granular cytoplasmic staining pattern observed by immunofluorescence microscopy when serum antibodies bind to indicator neutrophils. Proteinase-3, a 29-kDa neutral serine proteinase present in neutrophil azurophilic granules, is the major cANCA antigen.

329. Ans. (b) Anti GBM antibody*Ref: Harrison, 18th ed. Chapter 283*

- Patients who develop autoantibodies directed against glomerular basement antigens frequently develop a glomerulonephritis termed *antiglomerular basement membrane (anti-GBM) disease*. When they present with lung hemorrhage and glomerulonephritis, they have a pulmonary-renal syndrome called *Goodpasture's syndrome*.

Extra Mile

- Good's syndrome is a Thymoma with immunodeficiency
- It is a cause of combined B and T cell immunodeficiency in adults.
- The clinical characteristics of Good's syndrome are increased susceptibility to bacterial infections with encapsulated organisms and opportunistic viral and fungal infections.
- The most consistent immunological abnormalities are hypogammaglobulinaemia and reduced or absent B cells.

330. Ans. (b) Sarcoidosis

Ref: Harrison, 19th ed. pg. 237, 417

Painful ulcers in mouth

- Aphthous ulcers
- Behcet disease
- Denture stomatitis
- Thermal burns
- Tuberculosis
- Herpes
- Carcinoma tongue
- Arsenic poisoning

331. Ans. (d) Female is symptomatic

Ref: Harrison, 19th ed. pg. 462e-5

- Duchenne's muscular dystrophy is an X-linked recessive condition where boys suffer from disease while girls are carriers. **The protein defective is dystrophin** due to defect of dystrophin gene on chromosome Xp.21.
- Boys present between 3-5 years of age with clumsy gait and history of recurrent falls. The gait is peculiar and is known as **waddling gait**. Most children become wheel chair bound by 12-15 years of age. **Gower sign** is a characteristic feature characterized by child getting up gradually.
- On physical examination pseudo-hypertrophy (called so because of the physical appearance) but actually has fat deposition around the muscles. The weakness of respiratory muscles results in **recurrent pneumonia that ultimately results in mortality**.

Investigations

1. CPK MM
2. EMG and nerve conduction velocity
3. Muscle biopsy and western blot analysis of tissue specimen

332. Ans. (a) Duchenne muscular dystrophy

Please refer above question

333. Ans. (a) D.I.P

Ref: Harrison, 19th ed. pg. 2142

- Rheumatoid arthritis characteristically causes swelling of small joints in the hand like the P.I.P, M.C.P and the wrist joint bilaterally.
- Isolated D.I.P joint involvement is seen in psoriatic arthropathy.
- D.I.P joint involvement is also seen with osteo-arthritis but the involvement is with pain at the base of thumb. Knee joint is the commonest joint involved in these patients.

334. Ans. (a) Both lung and kidney is involved

Ref: Harrison, 19th ed. pg. 2183-84

According to the American College of Rheumatology accepted classification criteria for Wegener's, two or more positive criteria have a sensitivity of 88.2% and a specificity of 92.0% of describing Wegener's.

- **Nasal or oral inflammation:**
 - Painful or painless oral ulcers or
 - Purulent or bloody nasal discharge
- **Lungs:** Abnormal chest X-ray with:
 - Nodules,
 - Infiltrates or
 - Cavities
- **Kidneys:** Urinary sediment with:
 - Microhematuria or
 - Red cell casts
- **Biopsy:** *Granulomatous inflammation*
 - Within the arterial wall or
 - In the perivascular area

335. Ans. (d) Sero-negative arthritis

Ref: Harrison, 19th ed. pg. 2136

- Patients of rheumatoid arthritis harbor an antibody by the name of anti - C.C.P (cycliccitrulline phospholipid antibodies).
- The rheumatoid nodules in these patients can compress on various peripheral nerves leading to mono-neuritis multiplex. The joints are damaged with peri-articular erosions and osteoporosis.
- **The characteristic joint involvement is P.I.P, M.C.P and the wrist joint bilaterally.**

Sero-negative arthritis is a broad term and included within the group are the entities psoriatic arthritis, Reiter's syndrome, enteropathic arthritis, reactive arthritis, ankylosing spondylitis, undifferentiated seronegative arthritis, Whipple's disease, arthritis associated with pustular acne, post-intestinal bypass arthritis, and several forms of HIV associated arthritis.

336. Ans. (a) Hypercalcemia

Ref: Harrison, 19th ed. pg. 313, 2208

- Hypercalcemia is seen with sarcoidosis as the granulomas present in this disease synthesize vitamin D3. This increases the amount of absorption of calcium from the intestine and leads to hypercalcemia.

337. Ans. (b) Mitral regurgitation

- In rheumatic heart disease, the damage to chordae tendinae by inflammatory aschoff nodules results in development of mitral regurgitation in pediatric presentation.
- The most common valve involvement >18 years of age is mitral stenosis
- Remember that pulmonic valve is not involved in rheumatic etiology

338. Ans. (d) **ASO titer**

Ref: Harrison, 19th ed. pg. 2151

Modified Jones Criteria

Low-risk populations	Moderate-and high-risk populations
<ul style="list-style-type: none"> Carditis <ul style="list-style-type: none"> Clinical and/or subclinical carditis Arthritis <ul style="list-style-type: none"> Polyarthritis only 	<ul style="list-style-type: none"> Carditis <ul style="list-style-type: none"> Clinical and/or subclinical carditis Arthritis <ul style="list-style-type: none"> Monoarthritis or polyarthritis Polyarthralgia
Chorea	Chorea
Erythema marginatum	Erythema marginatum
Subcutaneous nodules	Subcutaneous nodules

Minor Criteria

Low-risk populations	Moderate and high-risk populations
<ul style="list-style-type: none"> Polyarthralgia Fever ($\geq 38.5^\circ$) ESR > 60 mm in 1st hour Prolonged PR interval, after accounting for age variability (unless carditis is a major criterion) in all population. 	<ul style="list-style-type: none"> Monoarthralgia Fever ($> 38^\circ\text{C}$) ESR ≥ 30 mm/h and/or CRP ≥ 3.0
Supporting evidence of a preceding streptococcal infection within the last 45 days	<ul style="list-style-type: none"> Elevated or rising antistreptolysin O or other streptococcal antibody, or A positive throat culture, or Rapid antigen test for group A streptococcus, or Recent scarlet fever

339. Ans. (c) **Deforming arthritis**

Ref: Harrison, 19th ed. pg. 2151

Please refer to above question

The arthritis in rheumatic arthritis is migratory polyarthritis involving the large joints and is NON erosive arthritis.

344. Ans. (a) **X linked**

Ref: Harrison's 17th ed. Ch.

Disorder	Enzyme Def:	Inheritance	Neurologic	Ophthalmo-logic	Hematologic	Unique features
Hurler syndrome	α -L-Iduronidase	AR	Mental retardation +	Corneal clouding	Vacuolated lymphocytes	Coarse facies, cardiovascular involvement, joint stiffness, wide spaced teeth
Hunter syndrome	Iduronate sulfatase (ET)	X-linked	Mental retardation, less in mild form	Retinal degeneration, no corneal clouding	Granulated lymphocytes	Coarse facies, cardiovascular, joint stiffness, distinctive pebbly skin lesions

340. Ans. (b) **History of sore throats**

Ref: Harrison, 19th ed. pg. 2151

Refer above

- History of sore throats is not a component of Jones criteria.

341. Ans. (d) **Ankylosing spondylitis**

Ref: Harrison 19th ed. pg. 377e-5

- SSA autoantibodies** (also called **anti-Ro**, or the combination **anti-SSA/Ro** or **anti Ro/SSA autoantibodies**) are anti-nuclear auto-antibodies that are associated with many autoimmune diseases, such as systemic lupus erythematosus, neonatal lupus and primary biliary cirrhosis. Also, they are often present in Sjögren's syndrome and sarcoidosis as well.
- Presence of Anti-SSA/Ro in pregnant women with SLE is associated with an increased risk of neonatal lupus Erythematosus in the child.

342. Ans. (c) **Anti-smith antibody**

Test Description

- ANA Screening test has sensitivity 95% not diagnostic without clinical features
- Anti-dsDNA Antibody: High specificity, sensitivity only 70% and levels are variable based on disease activity
- Anti-Sm antibody: Most specific antibody for SLE
- AntiSSA (Ro) or Anti-SSB (La) Present in 15% of patients with SLE and other connective tissue disease such as Sjögren syndrome
- Lupus anticoagulant
- Direct Russell viper venom test to screen for inhibitors in the clotting cascade in antiphospholipid antibody syndrome
- Direct Coombs test
- Anti-histone: Drug-induced lupus (e.g with procainamide or hydralazine)

343. Ans. (d) **Mixed connective tissue disorder**

Ref: Harrison, 19th ed. pg. 2165

- Anti-Rho or SS-A antibodies are seen in SLE, Sjogren syndrome and can be transmitted across the placenta resulting in neonatal lupus which presents as complete heart block.
- Mixed connective tissue disorder is associated with U1 R.N.P. (Ribo-Nucleo-protein antibody).*

- Both have hepatosplenomegaly and skeletal dysplasia
- In Hurler syndrome, death usually occurs by 10 years because of respiratory infection and heart failure.

345. Ans. (b) IgA, C3

Ref: Harrison, 19th ed. pg. 2190

- Henoch Schonlein purpura is a small-vessel vasculitis in which complexes of immunoglobulin A (IgA) and C3 are deposited on arterioles, capillaries, and venules.
- As with IgA nephropathy, serum levels of IgA are high in HSP.
- IgA nephropathy has a predilection for young adults while HSP is more predominant among children. Further, IgA nephropathy typically only affects the kidneys while HSP is a systemic disease.
- HSP involves the skin and connective tissues, scrotum, joints, gastrointestinal tract and kidneys.
- **Investigation:** IgA levels high, platelet count normal and skin biopsy (IOC).
- **Treatment:** Steroids

346. Ans. (d) Microscopic polyangitis

Ref: Harrison, 19th ed. pg. 2186

- MPA is characterized by pauci-immune, necrotizing, small vessel vasculitis without clinical or pathological evidence of granulomatous inflammation
- The family of vasculitic granulomatoses comprise
 1. Wegener's granulomatosis^Q
 2. Churg-Strauss syndrome^Q
 3. Polyarteritis nodosa^Q
 4. Bronchocentric granulomatosis
 5. Giant cell arteritis^Q
 6. Systemic lupus erythematosus.

347. Ans. (a) Gout

Ref: Harrison, 19th ed. pg. 2233-34

- In approximately 40% of cases, the gouty erosions have a raised margin or lip that radiologically is referred to as *Martel's hook* or *Martel's Sign*. No loss of bone density is expected
- The osteological signs of gout can be located on the joint surfaces, around the joint itself, or even at a distance from the joint.
- Lesions from gout have a diagnostic appearance on radiographs that radiologists refer to as a "punched out" appearance, and which can be seen as crescent-shaped erosions, with smooth, well remodelled margins, on dry bone
- Lesions vary in size, are usually rounded or oval, and may have a sclerotic border.

348. Ans. (a) SLE

Ref: Harrison, 19th ed. pg. 2126-27

The diagnosis is based on joint pain in fever with rash and photosensitivity. Rheumatoid arthritis involves the small joints symmetrically and does not have presence of Rash.

The diagnostic criteria for SLE are as follows:

- Rash Fixed erythema, over the Malar Eminences
- Erythematous circular raised patches with adherent keratotic scaling and follicular plugging; atrophic scarring may occur
- Photosensitivity Exposure to UV light causes rash
- Oral ulcers Includes oral and nasopharyngeal ulcers
- Synovitis/Non-erosive arthritis of two or more peripheral joints
- Serositis: Pleuritis or pericarditis documented by ECG or rub or evidence of effusion
- Renal disorder Proteinuria >0.5 g/day or 3+, or cellular casts
- Neurologic disorder Seizures or psychosis without other causes
- Hematologic disorder Hemolytic anemia or leukopenia
- Immunological criteria like positive CRP, low C3, ELISA cardiolipin antibody
- ANA positivity

349. Ans. (d) Secondary amyloidosis

Ref: Harrison, 19th ed. pg. 719, 723, 2458

- Reactive amyloid A (AA) amyloidosis, one of the most severe complications of RA, is a serious, potentially life-threatening disorder caused by deposition of AA amyloid fibrils in multiple organs. These AA amyloid fibrils derive from the circulatory acute-phase reactant serum amyloid A protein (SAA), and may be controlled by treatment
- The introduction of biological therapies targeting specific inflammatory mediators revolutionised the treatment of rheumatoid arthritis (RA). Targeting key components of the immune system allows efficient suppression of the pathological inflammatory cascade that leads to RA symptoms and subsequent joint destruction.
- Milk alkali syndrome occurs due to abuse of calcium containing anta-acids leading to hypercalcemia

350. Ans. (b) HL ADR 4

Ref: Harrison, 19th ed. pg. 372e-1

HLA allele	Diseases with increased risk
HLA-B27 ^a	Ankylosing spondylitis Post-gonococcal arthritis Acute anterior uveitis
HLA-B47	21-hydroxylase deficiency
HLA-DR2 ^a	Systemic lupus erythematosus
HLA-DR3	Autoimmune hepatitis Primary Sjogren syndrome Diabetes mellitus type 1 Systemic lupus erythematosus

Contd...

HLA allele	Diseases with increased risk
HLA-DR4 ^Q	Rheumatoid arthritis Diabetes mellitus type 1
HLA-DR3 and – DR4 ^Q combined	Diabetes mellitus type 1
HLA-DQ2 and HLA-DQB	Celiac disease

351. Ans. (b) Rheumatoid arthritis*Ref: Harrison, 19th ed. pg. 2144-45*

- Minocycline, gold salts, enicillamine, azathioprine, and cyclosporine have all been used for the treatment of RA with varying degrees of success; however, they are used sparingly now due to their inconsistent clinical efficacy or unfavorable toxicity profile.

Drugs used in Rheumatoid arthritis

1. Hydroxychloroquine—preferred in pregnancy
2. Leflunomide
3. Methotrexate—preferred drug
4. Abatacept
5. Anakinra
6. Rituximab

RESPIRATORY SYSTEM**352. Ans. (a) Distal bronchiectasis***Ref: Harrison 20th ed. pg. 1535*

Allergic bronchopulmonary aspergilloma is related to development of *Central bronchiectasis*.

It is seen in asthmatics and is associated with increase of IgE.

Predisposing conditions

- Bronchial asthma, cystic fibrosis

Obligatory criteria

- Elevated serum total IgE levels (>1000 IU/ml)
- Elevated serum IgG and/or IgE against *A. fumigatus*

Other criteria (at least three of five)

- Immediate type I reaction to *A. fumigatus* antigen
- Presence of serum *A. fumigatus* precipitins
- Transient and/or permanent chest radiographic opacities
- Eosinophil count >1000 cells/ml in peripheral blood
- Central bronchiectasis on HRCT chest

353. Ans. (a) Pneumothorax*Ref: Harrison, 20th ed. pg. 853*

Leading cause of respiratory distress post subclavian central line access is puncture of lung leading to traumatic pneumothorax.

COMPLICATIONS OF CENTRAL VENOUS CATHETERIZATION**Immediate**

- Bleeding
- Arterial puncture
- Arrhythmia
- Air embolism
- Thoracic duct injury (with left SC or left IJ approach)
- Catheter malposition
- Pneumothorax or hemothorax

Delayed

- Infection
- Venous thrombosis, pulmonary emboli
- Catheter migration
- Myocardial perforation
- Nerve injury

354. Ans. (a) Pleural fluid protein to serum protein ratio <0.5*Ref: Harrison 19th ed. P 1716*

To differentiate between exudative and transudative pleural effusion, the following criteria known as *Light's criteria* is used:

1. Pleural fluid protein/serum protein >0.5
2. Pleural fluid LDH/Serum LDH >0.6
3. Pleural fluid LDH more than 2/3rd the upper normal limit for serum

Exudative pleural effusion meets at least one of the given criteria while transudative meets none.

355. Ans. (a) Chronic bronchitis*Ref: Harrison 19th ed. 1701*

- Chronic obstructive airway disease leads to development of damage to ciliated columnar epithelium. The resultant stasis promotes low grade infection leading to bronchorrhea. This manifestation is called chronic bronchitis.
- Follicular bronchiolitis is due to hyperplasia of bronchial associated lymphoid tissue (BALT) seen due to collagen vascular disease and immune deficiency states. It mainly involves the lower lobes of lung.
- Desquamative pneumonitis is interstitial lung disease in smokers. It leads to development of pulmonary fibrosis.
- Chemical pneumonitis is due to aspiration of stomach acid and is also known as Mendelson syndrome.

356. Ans. (c) Albumin

- Pleural effusion in TB could be a presentation of primary TB due to sub-pleural location of Gohn's focus or can present as extra-pulmonary TB.
- Gene XPERT is a nucleic acid amplification based test which in a matter of few hours can tell if MTB is present and can also determine resistance.

- The values of LDH are taken in Light's criteria for pleural effusion to determine exudative nature of the fluid
- Adenosine deaminase has 90% sensitivity and 92 % specificity for determining the tubercular nature of fluid.
- The question is based on common sense that albumin values in serum and ascitic fluid are evaluated in patients of ascites.

357. Ans. (a) A.T.T

The CXR shows a miliary picture and ATT must be initiated. Since the child is malnourished and is having Miliary TB, his cell mediated immunity is already reduced. Hence steroids would be contraindicated in this case. The antibiotics would be useful in bacterial pneumonia which is ruled out due to radiological picture.

358. Ans. (d) Lung

Ref: Wintrobe's Clinical Hematology, 13th ed. pg. 1583

- It is seen with hyperleucocytosis with WBC count $> 10^5/\text{cu. mm}$. *Leukostasis affects pulmonary and brain circulation*. The presence of dysnea, tachypnea, lethargy and slurred speech is characteristic.
- WBC counts are in excess of 100,000/cu.mm and lead to leukostatic plugging of the capillaries followed by endothelial damage to blood vessels.
- The mortality occurs due to respiratory failure, intracranial hemorrhage and coma.
- The low PO_2 is due to increased consumption of oxygen by leucocytes.
- It is common with acute leukemia subtypes like acute promyelocytic leukemia, acute monocytic leukemia and T cell type of ALL.
- Treatment is leukapheresis

359. Ans. (c) 5th midaxillary space

- The 5th intercostal space in the mid-axillary line is generally used for most situations. This area is commonly known as the "safe triangle", bordered by the anterior border of latissimus dorsi, the lateral border of the pectoralis major, a line superior to the horizontal level of the nipple and an apex below the axilla

360. Ans. (c) ARDS

Shock Lung/ ARDS is a clinical syndrome caused by diffuse alveolar capillary and epithelial damage. There is usually rapid onset of life-threatening respiratory insufficiency, cyanosis, and severe arterial hypoxemia that is refractory to oxygen therapy and that may progress to multisystem organ failure. The histologic manifestation of ARDS in the lungs is known as *diffuse alveolar damage*.

361. Ans. (a) Staphylococcus aureus

- *S. aureus* is a cause of serious respiratory tract infections in newborns and infants; these infections present as shortness of breath, fever, and respiratory failure.
- Chest X-ray may reveal pneumatoceles (shaggy, thin-walled cavities). Pneumothorax and empyema are recognized complications of this infection.

362. Ans (c) Levofloxacin

Ref: Harrison, 19th ed. pg. 812

Empirical Antibiotic Treatment of Health Care-Associated Pneumonia

Patients without risk factors for MDR pathogens

Ceftriaxone *or*
Moxifloxacin, ciprofloxacin, *or* levofloxacin *or*
Ertapenem

Patients with risk factors for MDR pathogens

- A β -lactam:
Ceftazidime *or* cefepime *or*
Piperacillin/tazobactam, imipenem *plus*
- A second agent active against Gram-negative bacterial pathogens:
Gentamicin *or* tobramycin *or* amikacin *or*
Ciprofloxacin *or* levofloxacin *plus*
- An agent active against Gram-positive bacterial pathogens:
Linezolid *or* Vancomycin

363. Ans. (d) Fat embolism

- In the clinical setting of fracture of long bone and subsequent respiratory distress and development of petechiae satisfies GURD criteria for diagnosis of fat embolism.

The criteria for diagnosing fat embolism are as follows:

Major criteria

- Symptoms and radiologic evidence of respiratory insufficiency
- Cerebral sequelae unrelated to head injury or other conditions
- Petechial rash

Minor criteria are as follows:

- Tachycardia (heart rate >110 beats/min)
- Pyrexia (temperature $>38.5^\circ\text{C}$)
- Retinal changes of fat or petechiae
- Renal dysfunction

Contd...

FMGE Solutions Screening Examination

670

- Jaundice
- Acute drop in hemoglobin level
- Sudden thrombocytopenia
- Elevated erythrocyte sedimentation rate
- Fat microglobulinemia

364. Ans. (b) DU perforation

- The X-ray shows presence of gas under diaphragm, with clinical findings of rebound tenderness and suggestive of DU perforation.

365. Ans. (d) Lesion in the brain

Biot's Breathing: Biot's Breathing is characterized by irregularly irregular breathing with sudden apnea and is seen in CNS lesions and is a sign of increased intracranial pressure.

Kussmaul's Respiration. Kussmaul Breathing is deep rapid respiration in metabolic acidosis and is classically associated with diabetic ketoacidosis

Cheyne-Stokes Respiration. Cheyne-Stokes Respiration is one of increasingly deep respiration followed by a steady diminution of breathing until an apneic episode occurs in neurologic diseases with raised ICP. Obesity may be present. Some patients will show pupillary dilation with rapid breathing and pupillary contraction with apnea.

The differential diagnoses are

- CNS disease
- CHF
- Pneumonia
- Carbon monoxide poisoning
- Medications(eg, morphine).

Apneustic Breathing. Apneustic breathing is seen in severely ill patients with coma. The patient holds his or her breath at the end of inspiration until the Hering-Breuer (carotid body) reflex initiates exhalation. This breathing pattern suggests pontine disease.

366. Ans. (d) CT with IV contrast

Ref: Harrison, 19th ed. pg. 1633-64

- A definitive diagnosis of PE depends on visualization of an intraluminal filling defect in more than one projection.
- Chest CT with contrast has become the main test for diagnosis replacing the older invasive pulmonary angiography.
- Catheter-based diagnostic testing is used in case of an unsatisfactory chest CT and those patients where catheter-directed thrombolysis or embolectomy is planned.

367. Ans. (a) Narcotic over-dosage

- Narcotics cause CNS depression and lead to inability of respiratory centre to respond to increasing carbon dioxide levels.

- Abnormalities of central respiratory drive and reduced central respiratory drive will decrease minute ventilation.

Causes of Reduced Respiratory Drive

- Sedative drugs
- Altered drug metabolism (hepatic/renal failure)
- Iatrogenic drug overdose.
- Head injury, raised intracranial pressure and central nervous system infection
- Severe hypercapnia or hypoxaemia can also depress the respiratory center
- Inadequate ventilation may be caused by reduced respiratory drive, an increase in dead space or an increase in CO₂ production.

368. Ans. (d) Sulfomethoxazole and trimethoprim

Ref: Harrison, 19th ed. pg. 492

- Prophylaxis with trimethoprim-sulfamethoxazole prevents many opportunistic infections, including infection with *P. carinii*, *Toxoplasma gondii*, and community-acquired respiratory, gastrointestinal, and urinary tract pathogens.
- Intolerance of TMP-SMZ is common; desensitization is useful less often in transplant patients than in patients with AIDS.

369. Ans. (a) Pulmonary hamartoma

Ref: Harrison, 19th ed. pg. 515-16

- Popcorn calcification is virtually diagnostic on chest radiographs for *pulmonary hamartoma*.
- It characteristically appears as well-defined, solitary pulmonary nodules; they may show varying patterns of calcification, including an irregular popcorn, stippled, or curvilinear pattern, or even a combination of all 3 patterns.

370. Ans. (b) Alveolar transudate

Ref: Harrison, 19th ed. pg. 1736-38

- ARDS is characterised by high protein pulmonary edema and an exudate. The natural history of ARDS is marked by three phases—exudative, proliferative, and fibrotic—each with characteristic clinical and pathologic features.
- The presence of alveolar and interstitial fluid and the loss of surfactant can lead to a marked reduction of lung compliance.
- Without an increase in end-expiratory pressure, significant alveolar collapse can occur at end-expiration, impairing oxygenation.
- In most clinical settings, positive end-expiratory pressure (PEEP) is empirically set to minimize FIO₂ and maximize PaO₂.
- Diagnostic Criteria for ALI AND ARDS

Oxygenation	Onset	Chest radiograph	Absence of Left Atrial Hypertension
ALI: $\text{PaO}_2/\text{FIO}_2 \leq 300$ mm Hg	Acute	Bilateral alveolar or interstitial infiltrates	PCWP ≤ 18 mm Hg or no clinical evidence of increased left atrial pressure
ARDS: $\text{PaO}_2/\text{FIO}_2 \leq 200$ mm Hg	Acute	Bilateral alveolar or interstitial infiltrates	PCWP ≤ 18 mm Hg or no clinical evidence of increased left atrial pressure

371. Ans. (b) Lung laceration

- The image shows presence of subcutaneous emphysema which is also hinted in line 2 of the question where it mentions crepitus is palpated.
- Chest trauma, a major cause of subcutaneous emphysema, can cause air to enter the skin of the chest wall from the neck or lung.
- Most students mark it as renal shut down which is not the answer because it would not happen within 4 hour of trauma insult.
- Gas gangrene will again take time to develop and would lead to development of crepitus in the injured part.

Causes of subcutaneous emphysema

- Trauma to parts of the respiratory system other than the lungs, such as rupture of a bronchial tube, may also cause subcutaneous emphysema
- May also occur with fractures of the facial bones, neoplasms, during asthma attacks.

When the alveoli of the lung are ruptured, as occurs in pulmonary laceration, air may travel beneath the visceral pleura (the membrane lining the lung), to the hilum of the lung, up to the trachea, to the neck and then to the chest wall.

372. Ans. (d) Increased prostaglandins

Ref: Harrison, 19th ed. pg. 1680

- Aspirin-sensitive asthma is associated with severe rhinosinusitis and recurrent nasal polyposis.
- The complex pathogenesis of aspirin-sensitive asthma involves chronic eosinophilic inflammatory changes, with evidence of increased mast cell activation.
- Aspirin-sensitive asthma is an underdiagnosed condition affecting up to 20% of the adult asthmatic population.
- It is associated with more severe asthma, requires increased use of inhaled and oral corticosteroids, more presentations to hospital and a risk of life-threatening reactions with aspirin.
- The cyclo-oxygenase pathways play a major role in the respiratory reactions that develop after aspirin ingestion.

373. Ans. (c) Low flow oxygen

Ref: Harrison, 19th ed. pg. 1707, 1740

- In COPD, Ventilation/perfusion matching leads to under-ventilated lung which usually has low oxygen content. This leads to localized vasoconstriction limiting blood flow to that lung tissue.
- Supplemental oxygen abolishes this constriction, leading to improved ventilation/perfusion matching.
- High flow oxygen is not tolerated as it leads to crusting, dryness and epistaxis.
- The treatment is guided by PaO_2 which should be maintained at 60 mm Hg or so (SaO_2 of 85-90%). During the period of exercise, sleep or other activities, the flow rate may be increased by another 1-2 L/min.
- While continuous therapy is required for patients who show hypoxaemia at rest, intermittent treatment during specific periods may be used for patients who demonstrate intermittent hypoxaemia

374. Ans. (a) Duration of smoking

Though this is a highly debatable topic most search results and discussion with faculty and google books (IASLC Textbook of Prevention and Early Detection of Lung Cancer) mention *duration of smoking* to be more important than the number of cigarettes smoked.

375. Ans. (b) Decreased CO_2

Ref: Harrison, 19th ed. pg. 1731-32

- Hyperventilation leads to carbon dioxide washout. It is usually a feature of type 1 respiratory failure.
- Type 1 respiratory failure is defined as a low level of oxygen in the blood (hypoxemia) without an increased level of carbon dioxide in the blood (hypercapnia), and the PaCO_2 may be normal or low.
- It is typically caused by a ventilation/perfusion (V/Q) mismatch; the volume of air flowing in and out of the lungs is not matched with the flow of blood to the lungs. The basic defect in Type 1 respiratory failure is failure of oxygenation characterized by:

P_aO_2	Decreased (<60 mm Hg)
P_aCO_2	Normal or Decreased (<50 mm Hg)
$\text{P}_{\text{A-a}}\text{O}_2$	Increased

376. Ans. (b) Bacterial pneumonia

The image in PA view shows well defined homogenous opacity suggestive of lobar pneumonia.

377. Ans. (a) Right pleural effusion

The image shows presence of Hemi-thorax and tracheal shift to contralateral (left) side. This is suggestive of massive pleural effusion.

378. Ans. (a) **Sarcoidosis**

Ref: Harrison, 19th ed. pg. 2206

Löfgren syndrome symptoms consist of fever, bilateral hilar lymphadenopathy (BHL), and polyarthralgias

379. Ans. (a) **Asbestosis**

Ref: Harrison, 19th ed. pg. 1689

- Working with asbestos is the most common risk factor for mesothelioma.
- Indeed, the relationship between asbestos and mesothelioma is so strong that many consider mesothelioma a “signal” or “sentinel” tumor.
- In rare cases, mesothelioma has also been associated with irradiation of the chest or abdomen, intrapleural thorium dioxide (thorotrast) as a contrast medium, and inhalation of other fibrous silicates.

380. Ans. (b) **103 mm Hg**

Ref: Harrison, 18th ed. chapter 252

Partial Pressures of blood gases

- Atmosphere: $pO_2 = 160$ mm Hg, $pCO_2 = 0.3$ mm Hg
- Alveolar air: $pO_2 = 105$ mm Hg, $pCO_2 = 40$ mm Hg
- Oxygenated blood: $pO_2 = 100$ mm Hg, $pCO_2 = 40$ mm Hg
- Tissues: $pO_2 = 40$ mm Hg, $pCO_2 = 45$ mm Hg
- Deoxygenated blood: $pO_2 = 40$ mm Hg, $pCO_2 = 45$ mm Hg

Extra Mile

O₂ and CO₂ in blood

- 1.5% O₂ dissolved in blood
- 98.5% O₂ carried by hemoglobin (Hb-O₂)
- Hb can carry up to four molecules of O₂ (four = saturation)
- PO₂ determines Hb saturation
- Also pH, temperature and Pco₂ affects Hb-O₂ binding

381. Ans. (d) **Long acting beta 2 agonist**

Ref: Chapter 254: Harrison, 18th ed.

- LABA improve asthma control and reduce exacerbations when added to ICS, which allows asthma to be controlled at lower doses of corticosteroids.
- LABAs should not be given in the absence of ICS therapy as they do not control the underlying inflammation.
- This observation has led to the widespread use of fixed combination inhalers that contain a corticosteroid and a LABA, which have proved to be highly effective in the control of asthma.

				OCS
		LABA		LABA
ICS		ICS		ICS
Low dose		Low dose		High dose
Short –acting B2-agonist as required for symptom relief				
Mild intermittent	Mild persistent	Moderate persistent	Severe persistent	Very severe persistent

382. Ans. (c) **Pleural effusion**

Ref: Harrison, 18th ed. Chapter 252 and 267

- Severe asthma and pneumonia will require supplemental oxygen so are ruled out.
- Low flow oxygen is mainstay of therapy for Chronic bronchitis.
- Pleural effusion will not be benefitted by supplemental oxygen as lung parenchyma is not involved.

383. Ans. (a) **Centri-acinar emphysema**

Ref: Harrison, 19th ed. pg. 1701

- Centri-acinar lesions are more common in smokers and severe in the upper lobes, particularly in the apical segments.
- In severe centriacinar emphysema the distal acinus also becomes involved, and so, as noted, the differentiation from panacinar emphysema becomes difficult.

384. Ans. (a) **Silicosis**

Ref: Chapter 256: Harrison, 18th ed.

Causes of Miliary Mottling

- Miliary tuberculosis
- Fungal infections
- Varicella pneumonia
- Metastases—miliary metastases like thyroid carcinoma, renal cell carcinoma, breast cancer
- Sarcoidosis
- Pneumoconioses
- Silicosis
- Coal workers pneumoconiosis
- Pulmonary haemosiderosis
- Hypersensitivity pneumonitis
- Langerhans cell histiocytosis (LCH)
- Pulmonary alveolar proteinosis

385. Ans. (c) **Ellis curve**

Ellis curve is seen in pleural effusion. It has a S shaped border in axilla where fluid accumulates in pleural cavity. You can see the transverse border of fluid on right lung field in this X ray. Pneumonia does not have a sharp border.

386. Ans. (d) **Pneumo-mediastinum**

In the area of arrows a *continuous diaphragm sign* is noted. Normally diaphragm is seen below lungs only. This kind of presentation is noted in pneumo-mediastinum.

387. Ans. (c) **Systolic Blood pressure is more than 90 mm Hg**

Ref: Harrison's, 17th ed. Ch. 251

- CURB 65 also known as the CURB criteria is a clinical prediction rule that has been validated for predicting mortality in Community Acquired Pneumonia.

• The CURB-65 criteria includes five variables:

- Confusion
 - Urea >7 mmol/L
 - Respiratory rate ≥ 30 /min
 - Blood pressure, systolic ≤ 90 mm Hg or diastolic ≤ 60 mm Hg; and
 - Age ≥ 65 years
- Each criteria has one point which predicts the mortality in CAP.
- **Score 0:** 30-day mortality rate is 1.5%- can be treated outside the hospital.
 - **Score 2:** 30-day mortality rate is 9.2%, and patients should be admitted to the hospital.
 - **Score 3:** mortality rates are 22% overall; these patients may require admission to an ICU.

388. Ans. (c) **Centriacinar emphysema**

Ref: Harrison, 19th ed. pg. 1701

Emphysema: The abnormal permanent enlargement of air spaces distal to the terminal bronchioles, accompanied by the destruction of the walls and without obvious fibrosis. It begins in the respiratory bronchioles and spreads peripherally.

SMOKING CAUSES intake of TAR which causes \uparrow macrophages in alveolar region. These macrophages secrete enzyme Elastase which causes autodigestion of elastin \rightarrow leading to \downarrow elasticity \rightarrow Emphysema

Centriacinar emphysema is MOST COMMON FORM.

- Associated with smoking
- Usually seen in apices
- **Causes type-I respiratory failure:** $3pO_2$, $3pCO_2$
- **MOST RELIABLE radiographic sign:** Flattening of the diaphragm
- **Symptoms:** Persistent cough, Dyspnea, Wheezing, Chest pain, Fever.
- **Upon examination:**
 - Increased RR
 - BARREL SHAPED CHEST (AP diameter $>$ transverse)
 - No cyanosis
 - Pink puffers

Extra Mile

- Panlobular emphysema: involves entire acinus UNIFORMLY.
- Paraseptal emphysema: involves only distal acinus (*alveolar ducts and sac*). Found near pleura and can result in pneumothorax.
- Irregular or cicatricial: can be either of them.

389. Ans. (a) **Cyanosis**

Ref: Harrison, 19th ed. pg. 1664f

- Emphysema is characterized by damage to respiratory bronchioles **leading to bleb formation**. The air gets trapped in the lungs causing hypoxia. However these patients do not have cyanosis and are called as **PINK PUFFERS**.
- *Cigarette smoking is the most common cause of emphysema* and the type seen is known as centri-acinar emphysema. **These patients develop type 1 respiratory failure** and the resultant hypoxia causes a **barrel shaped chest** in these patients.

390. Ans. (a) **Thrombolytic**

Ref: Harrison, 19th ed. pg. 1634-35

- Anticoagulation with heparin has long been the standard treatment for normotensive patients with pulmonary embolism. By preventing clot propagation, heparin allows endogenous fibrinolysis to occur, with eventual resolution of thromboemboli. Presumably through this mechanism, heparin therapy has been shown to significantly reduce both the incidence of recurrent pulmonary embolism and patient mortality.
- However in the absence of an absolute contraindication, patients with pulmonary embolism induced hypotension or shock are usually treated with thrombolytic agents. The three thrombolytic agents used in treatment of pulmonary embolism- **streptokinase, urokinase and recombinant tissue-type plasminogen activator(rt-PA)**.

391. Ans. (a) **Intravenous tissue plasminogen activator**

Ref: Harrison, 19th ed. pg. 1634-35

- Massive pulmonary embolism is best managed by thrombolysis using tissue plasminogen activator.
- In case thrombolysis is contraindicated then in these patient Fogarty catheter removal of clot in pulmonary artery would be done.
- In submassive pulmonary embolism heparin is used. Chronic pulmonary embolism leading to pulmonary-hypertension (known as *chronic thromboembolic hypertension*) is treated with a surgical Procedure known as a pulmonary thromboendarterectomy

392. Ans. (a) **Allergic Rhinitis Induced Asthma**

ARIA stands for Allergic Rhinitis Induced Asthma

393. Ans. (a) **Streptococcus pneumonia**

- Pneumatocoele often occur as a sequela to acute pneumonia, commonly caused by Staphylococcus aureus.
- Pulmonary pneumatoceles are thin-walled, air-filled cysts that develop within the lung parenchyma. They can be

single emphysematous lesions but are more often multiple. Also occur with other agents, including *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Escherichia coli*, group *Astreptococci*, *Serratia marcescens*, *Klebsiella pneumoniae*, adenovirus, and tuberculosis." Pneumatocele formation is associated with hyperimmunoglobulin E (IgE) syndrome (Job syndrome).

394. Ans. (d) Bronchocele

- A bronchocele is a mucous-filled dilated bronchi surrounded by aerated lung.
- CT chest can identify a bronchocele as a tubular intrapulmonary opacity distinct from vascular shadows
- Their appearance is similar to a "finger in glove" or the shape of the letters V or Y.

395. Ans. (d) Rhinocerebral involvement

Ref: Harrison, 19th ed. pg. 489, 1346

- Rhino-cerebral involvement is seen with mucormycosis in diabetics.
- A rapidly invasive *Aspergillus* infection in the lungs often causes cough, fever, chest pain, and difficulty breathing. Cavity in lungs is usually caused by *A. niger*. *A. fumigatus* can be a normal component of sputums

396. Ans. (a) Eosinophiluria

Ref: Harrison, 19th ed. pg. 1346-47

- A.B.P.A allergic bronchopulmonary *Aspergillosis* is hypersensitivity to the antigens on cell wall of *aspergillus fumigatus*. The clinical profile is an asthmatic patient presenting with passage of brownish plugs in the sputum.
- CXR shows fleeting pulmonary opacities and absolute eosinophil count is increased. Eosinophilia is a feature of asthma anyway but not eosinophiluria
- HRCT shows presence of Central bronchiectasis.
- Treatment of choice for ABPA is steroids.
- **Remember:** Eosinophiluria is a feature of allergic interstitial nephritis.

397. Ans. (b) Cystic fibrosis

Ref: Harrison, 19th ed. pg. 1681, 1686

- Central Bronchiectasis is a classical finding in allergic Bronchopulmonary aspergilloma. It is also documented to be present in cystic fibrosis.
- The cardinal diagnostic tests include an elevated serum level of total IgE (usually >1000 IU/mL), a positive skin-prick test to *A. fumigatus* extract, or detection of *Aspergillus*-specific IgE and IgG (precipitating) antibodies.

398. Ans. (a) HRCT scan

Ref: Harrison, 19th ed. pg. 308e-3f, 1694

- The best test to evaluate the destruction and dilatation of large airways which are filled with pus in Bronchiectasis is HRCT
- CT angiography is preferred for pulmonary embolism
- Pulmonary angiography is done for lung sequestration and is gold standard for pulmonary embolism.

399. Ans. (c) Klebsiella

Ref: Harrison, 19th ed. pg. 1108

- Military mottling or snow storm appearance on CXR is seen in Disseminated TB, Löffler pneumonia, silicosis and chicken pox pneumonia
- *Klebsiella* causes pneumonia and CXR shows bulging fissure sign due to accumulation of pus in interlobar fissure.

400. Ans. (b) Uveitis

Ref: Harrison, 19th ed. pg. 1112, 1119

- Phlyctenular conjunctivitis occurs as hypersensitivity to tuberculosis bacteria.
- Tubercular lymphadenitis is the most common form of extra-pulmonary TB
- Most common cause of Addison disease in India is tuberculosis though on global scale it is autoimmunity being the leading cause.

401. Ans. (b) Liver

- Congenital transmission usually occurs from a lesion in the placenta through the umbilical vein.
- The tubercle bacilli first reach the fetal liver, where a primary focus with periportal lymph node involvement may occur.
- The bacilli in the lung usually remain dormant until after birth, when oxygenation and pulmonary circulation increase significantly.

402. Ans. (b) Oral corticosteroids

Ref: Harrison, 19th ed. pg. 1676

- Severe persistent asthma is managed with L.A.B.A., inhaled high dose steroids and S.A.B.A. as when required Oral steroids are given in very severe persistent asthma.

403. Ans. (a) Pneumococcus

Ref: Harrison 19th ed. pg. 805

Infection	Causative organism
Lobar pneumonia/Community acquired Pneumonia	Pneumococcus
Nosocomial pneumonia	Staph. aureus

Contd...

Infection	Causative organism
HIV associated pneumonia	<i>P. jiroveci</i>
Meningitis adults (sporadic)	<i>Pneumococcus</i>
Meningitis adults (epidemic)	<i>Neisseria meningitides</i>

404. Ans. (a) **Pseudomonas**

Ref: Harrison, 19th ed. pg. 1044-45

- *Pseudomonas aeruginosa* is a Gram-negative, aerobic, rod-shaped and polar-flagella bacterium with unipolar motility.
- The coliforms and proteus are gram negative bacteria and only klebsiella is non-flagellated.
- Furthermore, it is an opportunistic pathogen responsible for ventilator-acquired pneumonia (VAP). VAP due to *P. aeruginosa* is usually multidrug-resistant and associated with severe infection and increased mortality.

405. Ans. (b) **TLC** ↓

Ref: Harrison, 19th ed. pg. 306e-2f

Parameter	Obstructive	Restrictive
FEV1	Reduced	Reduced
TLC	Normal/increased	Reduced
FVC	Reduced	Reduced
FEV1/FVC RATIO	Reduced	Normal/increased
Residual volume	Increased	Decreased

406. Ans. (a) **COPD**

Ref: Harrison, 19th ed. pg. 1731-32

Type 2 respiratory failure occurs as a result of alveolar hypoventilation and results in the inability to eliminate carbon dioxide effectively.

- Increased resistive loads e.g., bronchospasm in COPD
- Loads due to reduced lung compliance [e.g., alveolar edema, atelectasis, intrinsic positive end-expiratory pressure).
- Diminished CNS drive to breathe due to drug overdose, brainstem injury, sleep-disordered breathing, and hypothyroidism.
- Reduced strength can be due to impaired neuromuscular transmission (e.g., myasthenia gravis, Guillain-Barré syndrome, amyotrophic lateral sclerosis, phrenic nerve injury).
- Respiratory muscle weakness (e.g., myopathy, electrolyte derangements, fatigue).
- Loads due to reduced chest wall compliance (e.g., pneumothorax, pleural effusion, abdominal distention), and loads due to increased minute ventilation requirements (e.g., pulmonary embolus with increased dead space fraction, sepsis).

407. Ans. (b) **Pulmonary embolism**

Ref: Harrison, 19th ed. pg. 1631

- The first clinical diagnosis for this case presentation is PE since Venous thromboembolism (VTE), which encompasses deep venous thrombosis (DVT) and pulmonary embolism (PE), is one of the three major cardiovascular causes of death, along with myocardial infarction and stroke.
- **Fracture of femur will lead to immobilization for a long period. Hence PE is all the more likely in this setting.**
- Sudden cardiac death is defined as natural death due to cardiac causes in a person who may or may not have previously recognized heart disease but in whom the time and mode of death are unexpected.

408. Ans. (a) **Pulmonary embolism**

Ref: Harrison's, 19th ed. pg. 1631

- PE is the most common preventable cause of death among hospitalized patients. PE and DVT occurring after total hip or knee replacement is currently taken as unacceptable, and steps are taken to prevent it by giving subcutaneous fondaparinux.
- For patients who have DVT, the most common history is a cramp in the lower calf that persists for several days and becomes more uncomfortable as time progresses. For patients who have PE, the most common history is unexplained breathlessness.

409. Ans. (a) **Pulmonary embolism**

On chest radiography, the Westermark Sign is a wedge shaped opacity due to pulmonary infarction.

Other Signs in Pulmonary Embolism

- Palla Sign
- Hampton Hump Sign
- IOC – Spirometry
- **Gold Standard IOC** – Pulmonary Angiography

410. Ans. (a) **15 mm Hg**

- Pulmonary arterial pressure is about 15 mm Hg, and the pulmonary arterial systolic and diastolic pressures are about 25 and 10 mm Hg, respectively. Pulmonary venous pressure is about 8 mm Hg.

411. Ans. (d) **Acts on Alpha 2 Beta 4 Nicotinic receptor**

Ref: Harrison, 19th ed. pg. 507, 1705

Average cigarette provides 1 mg of nicotine

- Nicotine's mood-altering effects are different by report: in particular it is both a stimulant and a relaxant. First causing a release of glucose from the liver and epinephrine from the adrenal medulla, it causes stimulation.

- By reducing the appetite and raising the metabolism, some smokers lose weight as a consequence. Nicotinic receptors are known as *alpha 4 beta 2 receptors*.
- At low doses, nicotine potently enhances the actions of norepinephrine and dopamine in the brain, causing a drug effect typical of those of psycho-stimulants.

412. Ans. (a) Non small cell lung Ca

Ref: Harrison, 19th ed. pg. 510-511

- Most common cause of hemoptysis is tuberculosis but at 65 years of age it is more likely a presentation of lung cancer.
- Lung cancers can cause hemoptysis but clubbing is seen with non small cell cancer of the lung only. Remember that *clubbing is absent in small cell cancer of the lung*.

413. Ans. (a) Metastasis to lungs

- Metastatic malignant neoplasms are the most common form of secondary lung tumors. Lung metastases are identified in 30-55% of all cancer patients, though prevalence varies based on the type of primary cancer.
- Chest radiography (CXR) is the initial imaging modality used in the detection of suspected pulmonary metastasis in patients with known malignancies. Chest CT scanning without contrast is more sensitive than CXR
- *The most common radiographic pattern of pulmonary metastasis is the presence of multiple nodules, ranging in size from 3 mm to 15 mm or more.*
- *The nodules are more common in the lung bases (owing to higher blood flow than upper lobes) and in the outer third of the lungs in the subpleural region.*
- They are approximately spherical and of varying sizes. Nodules of same size are believed to originate at the same time, in a single shower of emboli from the primary tumor. Nodules that are smaller than 2 cm are usually round and have smooth margins. Larger nodules are lobulated and have irregular margins; they may become confluent with adjacent nodules, resulting in a conglomerate multinodular mass.

414. Ans. (c) Pulmonary hamartoma

- Pulmonary hamartomas, the most common benign tumors of the lung, are the third most common cause of solitary pulmonary nodules.
- Pulmonary hamartomas are usually asymptomatic and are typically discovered as an incidental coin lesion on a routine chest radiograph.
- *On chest X ray pulmonary hamartomas appear as well defined, solitary pulmonary nodules with varying patterns of calcification, including an irregular popcorn, stippled portion. Popcorn calcification is virtually diagnostic.*

415. Ans. (b) Hypercapnia

Ref: Harrison, 19th ed. pg. 1736

- ARDS is characterized by *type 1 respiratory failure* which has only hypoxia but the value of CO_2 is normal. ARDS has non cardiogenic pulmonary edema with normal PCWP.
- PCWP (Normal is 8–12 mm Hg) is increased in Cardiogenic pulmonary edema.
- Remember hypercapnia/hypercarbia is a feature of type 2 respiratory failure.

416. Ans. (d) Benzene

Ref: Harrison, 19th ed. pg. 447t, 663

Cigarette smoke product	Effects on human body
Acetaldehyde/anabasine	Addictive
Benzene	Carcinogenic + Cardio-toxic + reproductive potential toxicity
Benzopyrene	Carcinogenic
Carbon monoxide	Reproductive potential toxicity
Vinyl chloride	Carcinogenic

417. Ans. (a) Liver cancer

- Smoking DOES NOT cause liver cancer and primary brain cancer.
- Kidney and bladder cancer are associated with smoking.

418. Ans. (a) Pneumothorax

A very surprising question included in medicine as nothing is mentioned about this test in most books.

In cases of spontaneous pneumothorax air leaks into the pleural cavity. This air may be reabsorbed but leaves behind a bronchopleural fistula which on autopsy can be picked by “water test”.

This is not a clinical test but done by forensic team post mortem.

Please don't confuse with:

- **Water loading test** is done for SIADH
- **Water deprivation test** is done for diabetes insipidus.

419. Ans. (d) Eosinophilic alveolitis

Ref: Harrison, 19th ed. pg. 1681

Hypersensitivity pneumonitis is seen in conditions like Bagassosis, Farmer's lung. It is a type IV hypersensitivity reaction with normal eosinophil count. The granulomatous involvement of lung explains a reduced DL_{CO} .

420. Ans. (d) Subcutaneous epinephrine

Ref: Harrison, 19th ed. pg. 1680

421. Ans. (a) **Hypertension**

Ref: Harrison, 19th ed. pg. 1724-25

422. Ans. (a) **Dextrocardia**

- Situs solitus is the normal position, and situs inversus is the mirror image of situs solitus.
- Cardiac situs is determined by the atrial location.
- **In situs inversus:**
 - Morphologic right atrium is on the left, and the morphologic left atrium is on the right.
 - Normal pulmonary anatomy is also reversed so that the left lung has 3 lobes and the right lung has 2 lobes.
 - Liver and gallbladder are located on the left
 - Spleen and stomach are located on the right.

423. Ans. (a) **Meniscus sign**

The CXR shows pleural effusion as both Costophrenic and *Cardiophrenic angles are obliterated in a CXR and also notice the smooth concavity of fluid rising up in a S shape.* This differentiates from pneumonia.

NEPHROLOGY424. Ans. (b) **Acute renal failure**

Ref: Harrison 19th ed. P 656

- The *most serious threat* in adult patients of G6PD is development of *acute renal failure*.
- In G6PD, acute hemolytic anemia episode occurs due to exposure to fava beans, infections and drugs. *Due to intravascular hemolysis, hemoglobinuria occurs and causes tubular blockage.* The patient passes dark urine and develops jaundice. The peripheral smear shows bite cells and supravital stain reveals *Heinz bodies*.
- Sequestration crisis is encountered in sickle cell anemia.

425. Ans. (a) **Bicarbonate, uric acid and amino-acids**

Bicarbonate	Urinary bicarbonate loss leads to bicarbonaturia and explains the metabolic acidosis seen in Fanconi's syndrome
Uric acid	Urinary uric acid is derived from tubular secretion, possibly from the S2 segment of the proximal tubule. Overall, 98-100% of filtered urate is reabsorbed; 6-10% is secreted, ultimately appearing in the final urine.
Amino acid	Aminoaciduria is a feature of Fanconi syndrome

426. Ans. (d) **Contrast arteriography**

- DTPA scan showing decreased uptake on affected side with damaged kidney contributing less than 40% of total kidney function is used for diagnosis of RAS.

- Doppler ultrasound of the renal arteries produces reliable estimates of renal blood flow velocity and offers the opportunity to track a lesion over time. Positive studies usually are confirmed at angiography, whereas false-negative results occur frequently, particularly in obese patients.
- Gadolinium-contrast magnetic resonance angiography offers clear images of the proximal renal artery but may miss distal lesions. An advantage is the opportunity to image the renal arteries with an agent that is not nephrotoxic.
- **Contrast arteriography is the "gold standard" for evaluation and identification of renal artery lesions.**

427. Ans. (c) **Membranous glomerulopathy**

Nephrotic range massive proteinuria	Intermediate	Nephritic syndrome haematuria, decreased GFR
FSGS Membranous glomerulopathy Minimal change disease	Membranoproliferative GN Focal proliferative GN IgA nephropathy Idiopathic SLE (Lupus Nephritis) Cryoglobulinemia	Diffuse proliferative GN Crescentic GN

428. Ans. (a) **Chronic renal failure**

- Broad casts are seen in chronic renal failure and occur due to dilated tubules of enlarged nephrons that have undergone compensatory hypertrophy in response to reduced renal mass (i.e. chronic renal failure).

429. Ans. (d) **CRP**

- The clinical diagnosis is post-streptococcal glomerulonephritis.
- The antistreptolysin (ASO), antinicotinamide adenine dinucleotidase (anti-NAD), antihyaluronidase (AHase), and anti-DNAse B are commonly positive after pharyngitis and anti-DNAse B and AHase titers are more often positive following skin infections
- Most patients have marked depression of serum hemolytic component CH50 and serum concentrations of C3
- The decrease in C3 concentration typically occurs before the increase in ASO titers
- Urine sediment has red blood cells, red blood cell casts, white blood cells, granular casts, and, rarely, white blood cell casts
- Dysmorphic red blood cells indicative of glomerular hematuria can usually be detected by performing phase-contrast microscopy.

**430. Ans. (a) Interstitial nephritis**

- Salt losing nephritis is an interstitial nephritis associated with hyponatremia and hypovolemia.
- Glomerulonephritis follows a skin infection or a pyoderma and presents with hypertension and haematuria with sub-nephrotic proteinuria.
- Lupus nephritis presents with haematuria and hypertension in SLE patients and shows wire loop lesions.
- IgA nephropathy is the most common cause of hematuria and presents after 48 hours of a respiratory tract infection.

431. Ans. (a) GFR

Cockcroft-Gault formula is used for calculation of GFR

Creatinine Clearance (mL/min) =

$$\frac{[140 - \text{age (years)} \times \text{weight (kg)} \times [0.85 \text{ if female}]]}{72 \times \text{serum creatinine}}$$

432. Ans. (c) Norepinephrine

Ref: Harrison, 19th ed. pg. 1761

Septic Shock Management

- Initial management of hypotension should include the administration of IV fluids, typically beginning with 1–2 L of normal saline over 1–2 hours.
- To avoid pulmonary edema, the central venous pressure should be maintained at 2–10 cm H₂O.
- The urine output rate should be kept at >0.5 mg/kg/h by continuing fluid administration; a diuretic such as furosemide may be used if needed.
- In about one-third of patients, hypotension and organ hypoperfusion respond to fluid resuscitation; a reasonable goal is to maintain a mean arterial blood pressure of >65 mm Hg (systolic pressure >90 mm Hg).
- *If these guidelines cannot be met by volume infusion, vasopressor therapy is indicated. Titrated doses of norepinephrine or dopamine should be administered through a central catheter.*

433. Ans. (d) Low complement levels

Ref: Harrison, 19th ed. pg. 1841

- Nephrotic syndrome is kidney disease with proteinuria, hypoalbuminemia, and edema. Nephrotic-range proteinuria is 3 grams per day or more. On a single spot urine collection, it is 2 g of protein per gram of urine creatinine.
- *Persistently low C3 levels are indicative of acute Glomerulonephritis.*

- The most common form of nephrotic syndrome in children, minimal change disease presents with normal C₃ levels. Congenital and hereditary focal glomerulosclerosis may result from mutations of genes that code for podocyte proteins, including nephrin, podocin, or the cation channel 6 protein

434. Ans. (c) ACE inhibitor

Ref: Harrison, 19th ed. pg. 2478-79

- ACE inhibitors may slow the progression of renal disease in CRF.
- ACE inhibitor therapy generally lowers systemic blood pressure, does not alter renal function and decreases proteinuria in patients with CRF.
- The reduction in proteinuria appears to be variable and may depend on pre-treatment glomerular haemodynamics and/or the activity of the renin-angiotensin-aldosterone system.

435. Ans. (a) Diabetic Nephropathy

Ref: Harrison, 18th ed. chapter 279

- Iodinated contrast agents used for cardiovascular and CT imaging are a leading cause of AKI. The risk of AKI, or “contrast nephropathy,” is negligible in those with normal renal function but increases markedly in the setting of chronic kidney disease, particularly diabetic nephropathy.
- The most common clinical course of contrast nephropathy is characterized by a rise in SCr beginning 24–48 hours following exposure, peaking within 3–5 days, and resolving within 1 week.
- Contrast nephropathy is thought to occur from a combination of factors
 - Hypoxia in the renal outer medulla due to perturbations in renal microcirculation and occlusion of small vessels
 - Cytotoxic damage to the tubules directly or via the generation of oxygen free radicals, especially since the concentration of the agent within the tubule is markedly increased
 - Management is with N-acetylcysteine and brisk diuresis.

436. Ans. (c) Thiazides

Ref: Harrison, 18th ed. chapter 45

- Diuretics are a particularly common cause due to associated increases in distal tubular Na⁺ delivery and distal tubular flow rate in addition to secondary hyperaldosteronism.
- *Thiazides have an effect on plasma K⁺ concentration greater than that of loop diuretics despite their lesser natriuretic effect.*

- The higher propensity of thiazides to cause hypokalemia may be secondary to thiazide-associated hypocalciuria versus the hypercalciuria seen with loop diuretics

437. Ans. (b) Chronic renal failure

Ref: Harrison, 19th ed. pg. 1816

ACE inhibitors and ARBs inhibit the angiotensin-induced vasoconstriction of the efferent arterioles of the glomerular microcirculation. This inhibition leads to a reduction in both intra-glomerular filtration pressure and proteinuria.

- Adverse effects from these agents include cough and angioedema with inhibitors, anaphylaxis, and hyperkalemia.
- The most common cause of chronic renal failure is diabetic nephropathy and is benefitted by above mentioned effects of ACE inhibitors.
- Choice A bilateral renal artery stenosis leads to hyperkalemia and hence is a contraindication. Choice D is ruled out henceforth.
- Choice C pregnancy, the use of ACE inhibitors has been shown to cause teratogenicity.

438. Ans. (b) Decreased insulin

Ref: Harrison, 18th ed. Chapter 344

- Exogenous insulin is normally metabolized by the kidney. However, when there is impairment of kidney function, the half-life of insulin is prolonged because of lower levels of degradation.
- This necessitates *insulin dose reduction*.
- **Also remember:** The clearance of both sulfonylureas and its metabolites is highly dependent on kidney function. In patients with Stage 3-5 CKD, first-generation sulfonylureas should be avoided. Of the second-generation sulfonylureas, glipizide is recommended because its metabolites are not active, and there is a lower potential for development of hypoglycemia.

439. Ans. (a) Low sodium diet

Ref: Harrison, 19th ed. pg. 1870-71

- Because calcium and sodium compete for reabsorption in the renal tubules, excess sodium intake and consequent excretion result in loss of calcium in the urine. High-sodium diets are associated with greater calcium excretion in the urine.
- Calcium intake in patients with kidney stones should be normal with adequate water intake.

440. Ans. (c) Pericarditis

Ref: Harrison, 19th ed. pg. 1810, 1822

Absolute indication for hemodialysis is uraemic pericarditis followed by uraemic encephalopathy

Indications for emergency dialysis is AEIOU

- A cidosis, especially if severe ($\text{pH} < 7.2$ and refractory to HCO_3^- or unable to give HCO_3^- due to volume overload) or symptomatic (arrhythmias).
- E lectrolytes, especially potassium with EKG changes. Temporize with Ca, D50, insulin, bicarb, kayexalate.
- I ngestions, especially those that cause renal failure such as salicylates or ethylene glycol.
- O verload, i.e. volume overload causing pulmonary edema. Temporize with nitrates and mega doses of Lasix (160–200 mg IV) – push slowly to avoid ototoxicity.
- U remia, i.e. confusion, pericarditis, seizures, platelet dysfunction with severe bleeding, intractable N/V.

When to start dialysis in CKD?

- Dialysis should be instituted whenever the glomerular filtration rate (GFR) is $< 15 \text{ mL/min}$ and there is one or more of the following: symptoms or signs of uraemia, inability to control hydration status or blood pressure or a progressive deterioration in nutritional status.
- In any case, dialysis should be started before the GFR has fallen to $6 \text{ mL/min/1.73 m}^2$, even if optimal pre-dialysis care has been provided and there are no symptoms.

441. Ans. (a) P.S.G.N

Ref: Harrison, 19th ed. pg. 1837

- Acute post-streptococcal glomerulonephritis (PSGN) is the most common type of acute GN. Acute nephritic syndrome is the most serious and potentially devastating form of the various renal syndromes.
- Most often, the patient is a boy, aged 2–14 years, who suddenly develops puffiness of the eyelids and facial edema in the setting of a post-streptococcal infection. The urine is dark and scanty, and the blood pressure may be elevate.
- Rapidly progressive glomerulonephritis (RPGN) is defined as any glomerular disease characterized by extensive crescents (usually $> 50\%$) as the principal histologic finding and by a rapid loss of renal function (usually a 50% decline in the glomerular filtration rate [GFR] within 3 mo) as the clinical correlate.

442. Ans. (c) CKD is defined as $\text{GFR} < 30 \text{ mL/min/1.73 m}^2$ for 4 weeks

Ref: Harrison, 19th ed. pg. 290-91

- CKD is defined as $\text{GFR} < 60 \text{ mL/min/1.73 m}^2$ for 12 weeks/3 months. Hence choice C is wrong.
- The average rate of decline varies, but it averages about $0.8 \text{ mL/min/1.73 m}^2/\text{year}$ after age of 30 years. The decline accelerates after about age 65 to 70.
- In terms of GFR ranges for specific ages, an average 85-year-old male would be expected to have a glomerular

FMGE Solutions Screening Examination

680

filtration rate around 55–60 mL/min/1.73 m², depending on his GFR at age 30. Hence choice A is seen.

- Choice B is correct.

$$C_{CR} = \frac{U_{CR} \times V}{P_{CR}}$$

443. Ans. (d) Malignancy

Ref: Harrison, 18th ed. chapter 283

Cause of Membranous Glomerulopathy

Autoimmune diseases	Infectious diseases	Malignancy
Ankylosing spondylitis Dermatomyositis Hashimoto MCTD Rheumatoid arthritis Sjögren SLE Scleroderma	Filariasis Hepatitis B Hepatitis C Leprosy Malaria Syphilis	Carcinoma (solid organ) ^a Leukemia Lymphoma Melanoma
Drugs Captopril ^a Gold Lithium Penicillamine Probenecid	Miscellaneous De novo in renal allografts Kimura disease Sarcoidosis Sickle cell disease	

444. Ans. (d) Rhabdomyolysis

Ref: Harrison, 19th ed. pg. 1804-05

- A urine dipstick test for blood that has positive findings in the absence of red blood cells (RBCs) suggests myoglobinuria. Myoglobin being a high molecular protein can block kidney tubules leading to acute tubular necrosis.
- In porphyria gross examination of the urine can provide a valuable clue, since urine of porphyria cutanea tarda patients is red to brown in natural light and pink to red in fluorescent light. However since all types of porphyria do not have red color urine, hence it has been kept as second differential diagnosis in this question.
- In hematuria the color of urine is cola color urine.
- In hemolysis state like paroxysmal nocturnal hemoglobinuria the color of urine is brown to black on account of presence of hemoglobinuria.

445. Ans. (b) Acute glomerulonephritis

Ref: Harrison, 18th ed.

Nephritic syndrome	Hematuria, RBC casts Azotemia, oliguria Edema, hypertension
Chronic renal failure	<ul style="list-style-type: none"> • Azotemia for >3 months • Prolonged symptoms or signs of uremia • Symptoms or signs of renal osteodystrophy • Kidneys reduce in size bilaterally • Broad casts in urinary sediment
Nephrotic syndrome	<ul style="list-style-type: none"> • Proteinuria > 3.5 g per 1.73 m² per 24 h • Hypoalbuminemia • Edema • Hyperlipidemia

446. Ans. (d) Aminoglycosides

Ref: Harrison, 18th ed. chapter 280

Aminoglycosides lead to development of non-oliguric renal failure.

Common Causes of Chronic Kidney Disease (Decreasing Order of Prevalence)

- Diabetic glomerular disease
- Glomerulonephritis
- Hypertensive nephropathy
- Primary glomerulopathy with hypertension
- Vascular and ischemic renal disease (Multiple myeloma due to Bence Jones proteins and hypercalcemia)
- Autosomal dominant polycystic kidney disease
- Other cystic and tubulointerstitial nephropathy (fanconi syndrome)

447. Ans. (b) Gram positive organisms

Ref: Harrison, 18th edition, chapter 281

- Hemo-dialysis (HD) catheter-related bloodstream infections (CRBSIs) are a major complication of long-term catheter use in HD. Gram positive organism are seen followed by gram negative organisms.
- Similarly in peritoneal dialysis, the clinical presentation typically consists of pain and cloudy dialysate, often with fever and other constitutional symptoms. The most common culprit organisms are gram-positive cocci, including *Staphylococcus*, reflecting the origin from the skin. Gram-negative rod infections are less common; fungal and mycobacterial infections can be seen in selected patients, particularly after antibacterial therapy.
- In cases where peritonitis is due to hydrophilic gram negative rods (e.g., *Pseudomonas* sp.) or yeast, antimicrobial therapy is usually not sufficient, and catheter removal is required to ensure complete eradication of infection. Non-peritonitis catheter-associated infections (often termed tunnel infections) vary widely

448. Ans. (a) IgA nephropathy

Ref: Harrison's, 17th ed. Ch. 277

- IgA nephropathy also known as Berger's disease. IgA antibodies get deposited in mesangial cells and cause dysfunction of mesangial cells and **lead to microscopic/gross hematuria**.
- It is classically characterized by episodic nature and is one of the most common forms of glomerulonephritis worldwide.
- The two most common presentations of IgA nephropathy are recurrent episodes of macroscopic hematuria during or immediately following an upper respiratory infection in children (Henoch-Schönlein purpura) or asymptomatic microscopic hematuria most often seen in adults.
- **Minimal change disease** or lipoid nephrosis is the most common nephrotic syndrome in children. Presence of abnormal T-cell release cytokines and cause damage to visceral cell damage i.e., effacement of podocyte which leads to massive proteinuria.
- In PSGN the classic presentation is an acute nephritic picture with hematuria, pyuria, red blood cell casts, edema, hypertension, and oliguric renal failure, which may be severe enough to appear as RPGN.

449. Ans. (d) All of the above

Ref: Urologic Emergencies: A Practical Approach, pg. 117-118

- Xantho-granulomatous pyelonephritis (XGP) is the end result of severe, chronic infection of the kidney, seen in ~ 0.6 to 1.4% of renal inflammations.
- **The combination of urinary obstruction, nephrolithiasis, and UTI are important elements in the development of XGP.**
- **Infection is usually secondary to E.coli, or Proteus Mirabilis.**
- Most patients present with recurrent fevers and urosepsis, anemia, and a painful renal mass.
- *Microscopically, there are granulomas and lipid-laden macrophages around the abscess.*

450. Ans. (a) RTA- 1

Ref: Harrison, 19th ed. pg. 332e-7t

- There are three forms of renal tubular acidosis (RTA). Types 1 and 2 may be acquired or primary whereas the **most common form, type 4 RTA**, is usually acquired in association with moderate renal dysfunction and is **characterized by hyperkalemia**.

TYPE-I Distal RTA (dRTA)

- In this type of RTA kidneys are unable to acidify the urine to pH <5.5 in the presence of systemic metabolic

acidosis or after acid loading as a result of *impaired hydrogen ion secretion* or bicarbonate reabsorption in the distal nephron.

- **Other features are: HYPOKALEMIA**, hypocitraturia, hypercalciuria, nephrocalcinosis, and/or nephrolithiasis. Chronic untreated acidosis may cause rickets or osteomalacia.

TYPE-II Proximal RTA (pRTA)

- It is the result of *impaired bicarbonate reabsorption* in the proximal tubular where the bulk of filtered bicarbonate is recovered. It is most often secondary to various autoimmune, drug-induced, infiltrative, or other tubulopathies or a result of tubular injury from inherited diseases.
- **Clinical features are:** Hyperphosphaturia, hyperuricosuria, hypercalciuria, nonselective amino aciduria and glycosuria.

451. Ans. (c) Hyperkalemic acidosis

Ref: Harrison, 19th ed. pg. 1808, 1810

- Acute kidney injury will cause inability to excrete H⁺ and K⁺ both leading to hyperkalemic acidosis.
- The acidosis seen is high anion gap metabolic acidosis.

452. Ans. (d) Analgesic nephropathy

Ref: Harrison, 19th ed. pg. 1861

- AKI is a serious complication of snakebites by the viperidae family.
- Pyelonephritis can be hematogenously acquired and cause extensive necrosis of kidney parenchyma.
- Crush injury or Rhabdo-myolysis can result in myoglobinuria causing blockage of kidney tubules and resultant acute tubular necrosis.

Remember: Analgesic nephropathy causes chronic interstitial nephritis and presents with chronic kidney disease.

453. Ans. (a) Present in alkaline urine

Ref: Harrison, 19th ed. pg. 1871

- These struvite stones are also known as triple-phosphate stone.

Two Conditions Must Coexist for the Formation of Struvite Calculi

- Alkaline urine (pH > 7.2)
- The presence of ammonia in the urine.

454. Ans. (c) Hypertension

Ref: Harrison, 19th ed. pg. 1841

Essential Features of Diagnosis of Nephrotic Syndrome are:

- Proteinuria >3.5 gms/24 hours period

- Hypo-albuminaemia <2.5 gm%
- Edema –peri-orbital edema- pedal edema

Non Essential Features are

- Hyperlipidemia- increased cholesterol and increased triglycerides
- Lipiduria
- Loss of protein C /S /AT III in urine leading to hyper-coagulable state.
- **Hypertension as a feature is mainly seen with NEPHRITIC syndrome.** (Remember Nephritic syndrome has inflammation of kidney blood vessels resulting in vasculitis, reduction in GFR and increase in BP.)

455. Ans. (c) Nephritic syndrome

Ref: Robbins, 8th ed. / Ch. 14

The presence of red blood cells within the cast is always pathological, and is strongly indicative of glomerular damage, which can occur in

- Glomerulonephritis like P.S.G.N, acute glomerulonephritis, R.P.G.N
- Vasculitis, including Wegener's granulomatosis, systemic lupus erythematosus or Goodpasture's syndrome.
- Renal infarction
- Subacute bacterial endocarditis.
- RBCs may appear normally shaped, swollen by dilute urine (in fact, only cell ghosts and free hemoglobin may remain), or crenated by concentrated urine.
- The presence of dysmorphic RBCs in urine suggests a glomerular disease such as a glomerulonephritis. Dysmorphic RBCs have odd shapes as a consequence of being distorted via passage through the abnormal glomerular structure.

456. Ans. (a) NSAID

Ref: Harrison, 19th ed. pg. 1856

Choices B,C,D lead to acute tubular necrosis and hence by exclusion the answer is A.

Causes of Acute Interstitial Nephritis

- Drugs like beta lactams, quinolones, NSAID, COX-2 inhibitors, phenytoin, valproate and P.P.I
- Infections like streptococcus, staphylococcus
- Connective tissue disorder like SLE, Sjogren
- Light chain nephropathy
- Urate nephropathy

Causes of Chronic Interstitial Nephritis

- V.U.R
- Sickle cell disease
- Hypokalemic nephropathy

457. Ans. (d) Rhabdomyolysis

Ref: Harrison, 19th ed. pg. 1804

- Interstitial nephritis is characterized by tubular damage leading to polyuria.
- Rhabdo-myolysis leads to myo-globinuria and blockage of kidney tubules and subsequent reduction of urine output.

458. Ans. (a) Acute Glomerulonephritis

Ref: Robbins, 8th ed. Chapter 14

- Acute glomerulonephritis is characterized by kidney vasculitis and resultant GFR reduction. This causes high renin hypertension to develop in a patient & lead to edema. The swelling presents first in Peri-orbital area followed by swelling around genitals and then swelling around the feet.
- Acute pyelonephritis is characterized by fever, accelerated heart rate, painful urination, abdominal pain radiating to the back, nausea, and tenderness at the costo-vertebral angle on the affected side
- Chronic glomerulonephritis is bilaterally shrunken kidneys.
- Renal cell carcinoma is characterized by unilaterally enlarged kidneys, painless Haematuria.

459. Ans. (a) Focal segmental glomerulosclerosis

Ref: Robbins, 8th ed. Chapter 14

- HIV nephropathy is associated with development of focal segmental glomerulosclerosis. (Also seen with reflux nephropathy). **It is also the commonest cause of nephrotic syndrome in adults.**

460. Ans. (b) Arteriovenous fistula results in arterialization of vein

Ref: Harrison, 19th ed. pg. 1822-23

- The fistula, graft, or catheter through which blood is obtained for hemodialysis is often referred to as a *dialysis access*.
- A native fistula created by the anastomosis of an artery to a vein (e.g., the Brescia-Cimino fistula, in which the cephalic vein is anastomosed end-to-side to the radial artery) results in arterialization of the vein.
- This facilitates its subsequent use in the placement of large needles (typically 15 Gauge) to access the circulation.
- Fistulas have the highest long-term patency rate of all dialysis access options
- The most important complication of arteriovenous grafts is thrombosis of the graft and graft failure, principally due to intimal hyperplasia at the anastomosis between the graft and recipient vein.

- Many patients undergo placement of an arteriovenous graft (i.e., the interposition of prosthetic material, usually polytetrafluoroethylene, between an artery and a vein) or a tunneled dialysis catheter

461. Ans. (c) **Thrice per week**

Ref: Harrison, 19th ed. pg. 1823

For the majority of patients with ESRD, between 9 and 12 hours of dialysis are required each week, usually divided into three equal sessions.

Current Targets of Hemodialysis

- Urea reduction ratio (the fractional reduction in blood urea nitrogen per hemodialysis session) of >65–70%.
- Body water-indexed clearance x time product (KT/V) above 1.2 or 1.05.

Remember: Hypotension is the most common acute complication of hemodialysis. Since the introduction of bicarbonate-containing dialysate, dialysis-associated hypotension has become less common. The management of hypotension during dialysis consists of discontinuing ultrafiltration, the administration of 100–250 mL of isotonic saline or 10 mL of 23% saturated hypertonic saline, or administration of salt-poor albumin.

INFECTION

462. Ans. (c) **Adequate IVF plus vasopressor**

Ref: Harrison, 20th ed. pg. 2050

Saline or balanced crystalloids and nor-epinephrine should be started to obtain a MAP of 65 mm Hg. Vasopressor support is must in patients of septic shock. The preferred vasopressor is nor epinephrine in septic shock and *not* dopamine.

463. Ans. (a) **Skin biopsy with fluorescent antibody testing**

Ref: Harrison, 20th ed. pg. 1488

- Direct fluorescent antibody testing with rabies virus specific antibodies is highly sensitive and specific for detection of rabies virus antigen in tissues. This test can be easily applied to skin biopsy and brain tissue samples.
- Choice B is ruled out as brain is an immune privileged site, serum antibodies may not develop until late in the disease.
- Choice C is not done . Choice D is an outdated method . Corneal impression is obtained by pressing the surface of sterile glass slide gently but firmly onto the cornea.

464. Ans. (a) **C5-C9 deficiency**

Ref: Harrison, 20th ed. pg. 1124

The importance of humoral immunity in defence against *N. meningitidis* infection is best demonstrated by predisposition of persons deficient in terminal component of complement deficiency (C5-C9).

465. Ans. (b) **3**

Ref: Harrison, 20th ed. pg. 115

Three consecutive negative blood cultures is mandatory in definition of F.U.O

Definition of fever of unknown origin

- Fever $\geq 38.3^{\circ}\text{C}$ ($\geq 101^{\circ}\text{F}$) on at least two occasions
- Illness duration of ≥ 3 weeks
- No known immunocompromised state
- Diagnosis that remains uncertain after a thorough history-taking, physical examination, and the following obligatory investigations: Determination of erythrocyte sedimentation rate (ESR) and C-reactive protein (CRP) level; platelet count; leukocyte count and differential; measurement of levels of hemoglobin, electrolytes, creatinine, total protein, alkaline phosphatase, alanine aminotransferase, aspartate aminotransferase, lactate dehydrogenase, creatine, kinase, ferritin, antinuclear antibodies, and rheumatoid factor, protein electrophoresis; urinalysis; blood cultures ($n = 3$); urine culture; chest X-ray; abdominal ultrasonography; and tuberculin skin test (TST) or interferon γ release assay (IGRA).

466. Ans. (a) **Infectious mononucleosis**

Ref: Harrison, 20th ed. pg. 1358

- The key word in the question is development of rash after being given ampicillin. Infectious mononucleosis presents as low-grade fever in first 2 weeks of illness. Most common clinical sign is Lymphadenopathy and pharyngitis. Gradually the spleen enlarges. The morbilliform rash on arms and trunk develops both in patients exposed to penicillin derivatives and those who are not exposed to penicillin. *Atypical lymphocytosis is the blood picture with deranged LFT. Most cases are self-limited.*
- Choice B is ruled out as it responds to ampicillin and does not develop after its administration.
- Choice C should have desquamation with mucocutaneous manifestations.
- Choice D does not have a rash and can't be diagnosed on short history of 7 days

467. Ans. (a) **No cut off of CD4 count required for initiation of treatment**

Ref: www.who.int

The latest guidelines are in favor of initiating ART among all adults living with HIV regardless of WHO clinical stage or at any CD4 cell count.

Extra Mile

2014 CDC Case definition for HIV infection among adolescents and adults

Stage	CD4 Count	CD4%	Clinical evidence
Stage 0	Early HIV infection		
Stage 1	≥ 500 cells/mm ³	≥ 26	No AIDS-defining condition
Stage 2	200-499 cells/mm ³	14-25	No AIDS-defining condition
Stage 3	< 200 cells/mm ³	< 14	or Documentation of AIDS-defining condition

468. Ans. (d) **Lymphocytosis**

Ref: *Harrison 19th ed. P 1023*

Absolute lymphocytosis occurs during *late catarrhal and paroxysmal phases* of pertussis. It correlates with severity of disease.

TABLE: Case definition of pertussis

Acute coughing illness lasting for > 14 days with at least one characteristic pertussis symptom
<ul style="list-style-type: none"> • Paroxysmal cough • Post-tussive vomiting • Inspiratory whoop
Or
Cough lasting for more than 14 days in an outbreak setting

Contd...

471. Ans. (c) **45–180 days**

TABLE: The ABCs of Hepatitis

	Hepatitis A	Hepatitis B	Hepatitis C
Routes of transmission	Ingestion of fecal matter, even in microscopic amounts, from: <ul style="list-style-type: none"> • Close person-to-person contact with an infected person • Sexual contact with an infected person • Ingestion of contaminated food or drinks 	Contact with infectious blood, semen, and other body fluids primarily through: <ul style="list-style-type: none"> • Birth to an infected mother • Sexual contact with an infected person • Sharing of contaminated needles, syringes, or other injection drug equipment 	Contact with blood of an infected person primarily through: <ul style="list-style-type: none"> • Sharing of contaminated needles, syringes, or other injection drug equipment Less commonly through: <ul style="list-style-type: none"> • Sexual contact with an infected person

Contd...

469. Ans. (b) **Ceftriaxone**

Ref: *Harrison 19th ed. P 1003*

- Ceftriaxone used as a single IM or IV injection is highly effective in carriage eradication and can be used for all ages and in pregnancy.
- Ciprofloxacin or ofloxacin is administered by mouth and is not recommended in pregnancy. It is given to household contacts.
- Rifampicin is no longer an optimal agent as it fails to eradicate carriage in 15–20% of cases.

470. Ans. (b) **Type 3**

Ref: *Davidson 22nd ed. P 347; Harrison 19th ed. P 1125*

- The clinical diagnosis of the patient is *type 2 lepra reaction*. The pathogenesis of type 2 lepra reaction is *type 3 hypersensitivity reaction*.
- Type 2 lepra reaction/Erythema Nodosum Leprosum occur *exclusively in patients with lepromatous end of leprosy spectrum*. The most common clinical features are crops of painful erythematous papules that resolve spontaneously in few days to weeks. Concomitant fever, lymphadenitis, neuritis and anemia may develop.
- Type 1 lepra reaction occurs in half of patients with border line forms of leprosy but *not* in patients with pure lepromatous disease. The type of hypersensitivity reaction is type 4 hypersensitivity.

Ref: *Pink Book 2018, CDC Guidelines; Harrison 19th ed. P 2006*

	Hepatitis A	Hepatitis B	Hepatitis C
Incubation period	15–50 days (Average: 28 days)	45–160 days (Average: 120 days)	14–180 days (Average: 45 days)
Symptoms of acute infection	Symptoms of all types of viral hepatitis are similar and can include one or more of the following: • Fever • Fatigue • Loss of appetite • Nausea • Vomiting • Abdominal pain • Gray-colored bowel movements • Joint pain • Jaundice		

472. Ans. (c) Bacterial pneumonia

Ref: Harrison 19th ed. P 1250

- Pulmonary disease is the most frequent complication of HIV infection.
- The most common manifestation of pulmonary disease is pneumonia.
- Three of the 10 most common AIDS defining illnesses are recurrent bacterial pneumonia, tuberculosis and *P. jiroveci* pneumonia.
- Encapsulated organisms like *S. pneumoniae* and *H. influenzae* are responsible for most cases of bacterial pneumonia.

473. Ans. (d) Haematocrit

Ref: WHO Handbook for Management of Dengue Fever

- For monitoring patients of severe dengue haematocrit is performed.
- A rising haematocrit indicates development of dengue shock syndrome
- A falling haematocrit indicates bleeding and need for platelet transfusion in case the platelets are less than 10,000/cu.mm.
- Haematocrit values can be used to monitor fluid resuscitation in patients of dengue.

Dengue without warning signs	Dengue with warning signs		Severe Dengue
Group A May be sent home	Group B Referred for in –hospital care		Group C Require emergency treatment
Patients who do not have warning signs AND Who are able: • To tolerate adequate volume of oral fluids • To pass urine at least once every 6 hours	Patient with any of the following features: • Co-existing conditions such as pregnancy, infancy, old age, diabetes mellitus • Social circumstances such as living alone, living far from hospital	Or Existing warning signs: • Abdominal pain or tenderness • Persistent vomiting • Clinical fluid accumulation • Mucosal bleeding • Lethargy/restlessness • Liver enlargement >2 cm • Laboratory: increase in Hct	Patient with any of the following features • Severe plasma leakage with shock and/or fluid accumulation with respiratory distress • Severe bleeding • Severe organ impairment
Laboratory tests • Full blood count • Haematocrit	Laboratory tests • Full blood Count • Haematocrit		Laboratory tests • Full blood count • Haematocrit • Other organ function tests as indicated

474. Ans. (b) Cocksackie

- Hand-foot-and-mouth disease (HFMD) is an acute viral illness that presents as a vesicular eruption in the mouth, but it can also involve the hands, feet, buttocks, and/or genitalia.
- *Coxsackie virus A type 16 (CVA16)* is the etiologic agent involved in most cases of HFMD, but the illness is also associated with coxsackie virus A5, A7, A9, A10, B2, and B5 strains.
- Initially, macular lesions appear on the buccal mucosa, tongue, and/or hard palate. These mucosal lesions rapidly

progress to vesicles that erode and become surrounded by an erythematous halo.

475. Ans. (a) Penicillin

For treatment of actinomycosis, the IV administration of 18–24 million units of penicillin daily for 2–6 weeks, followed by oral therapy with penicillin or amoxicillin (total duration, 6–12 months), is recommended guideline for serious infections and bulky disease.

**476. Ans. (a) Oseltamivir**

- Laboratory testing has found the H1N1 influenza A (swine flu) virus susceptible to the prescription antiviral drugs oseltamivir and zanamivir. Other antiviral agents (e.g. amantadine, rimantadine) are not recommended because of recent resistance to other influenza strains documented over the past several years.

477. Ans. (a) Doxycycline

- *The drug of choice for the treatment of both children and adults with rocky mountain spotted fever is doxycycline, except when the patient is pregnant or allergic to the drug.*
- Because of the severity of RMSF, immediate empirical administration of doxycycline should be strongly considered for any patient with a consistent clinical presentation in the appropriate epidemiologic setting.
- Treatment with chloramphenicol, a less effective drug, is advised only for patients who are pregnant or allergic to doxycycline.
- Beta-lactam antibiotics, erythromycin, and aminoglycosides have no role in the treatment of RMSF, and sulfa-containing drugs are likely to exacerbate this infection. There is little clinical experience with fluoroquinolones, clarithromycin, and azithromycin, which are not recommended.

478. Ans. (b) Azithromycin

Previously healthy and no antibiotics received in past 3 months	Comorbidities or antibiotics received in past 3 months
Macrolide like clarithromycin or azithromycin Doxycycline	Respiratory fluoroquinolone like moxifloxacin Beta lactam like Amoxicillin/ Clavulanate plus a macrolide

479. Ans. (a) Protein Misfolding

Ref: Harrison, 19th ed. pg. 444e-9

- When a prion enters a healthy organism, it induces existing, properly folded proteins to convert into the misfolded prion form. In this way, the prion acts as a template to guide the misfolding of more proteins into prion form.
- All known mammalian prion diseases are caused by the prion protein, PrP. The endogenous, properly folded form is denoted PrP^C (for *Common* or *Cellular*), whereas the disease-linked, misfolded form is denoted as PrP^{Sc} (for *Scrapie*, after one of the diseases first linked to prions and neurodegeneration.)

- The precise structure of the prion is not known, though they can be formed by combining PrP^C, polyadenylic acid, and lipids in a Protein Misfolding Cyclic Amplification (PMCA) reaction

480. Ans. (c) >25 neutrophils and <10 squamous epithelial cells

Ref: Harrison, 19th ed. pg. 806

- Expectorated sputum is necessarily contaminated by upper respiratory secretions as it passes through the oropharynx and mouth.
- When examining the Gram stain of such a specimen, the examiner should determine whether it is mostly purulent material from the lung or mainly saliva.
- Since squamous epithelial cells line the upper airway but not the tracheo-bronchial tree, their presence indicates that upper airway secretions have contaminated the specimen to some degree.
- *Several criteria have been proposed for determining that a sputum specimen is not excessively contaminated with oropharyngeal flora and is therefore acceptable for culture.*
- *For example:*
 - *Fewer than 10 squamous epithelial cells per field when viewed through a low-power (10x) lens (total magnification 100x) and more than 25 neutrophils per low-power field, or a ratio of neutrophils to epithelial cells greater than 5:1*
- Even if the specimen conforms to those standards, the patient doesn't necessarily have pneumonia.
- That diagnosis depends upon clinical and radiographic information. Patients with viral bronchitis, chronic obstructive lung disease, or tracheal intubation, for example, can have purulent sputum with a predominant organism in the absence of infection of the lung parenchyma.
- In some clearly satisfactory sputum specimens collected from patients with pneumonia due to a single organism (e.g., *Streptococcus pneumoniae*), not only is the infecting organism visible with Gram stain, but often small numbers of other types of bacteria are also present.
- A common mistake is to conclude that the Gram stain shows "mixed flora" and therefore does not help establish a diagnosis.

481. Ans. (a) Nasopharynx

Ref: Harrison's, 19th ed. pg. 997, 999

- *The natural habitat and reservoir for meningococci is the mucosal surfaces of the human nasopharynx and, to a lesser extent, the urogenital tract and anal canal.*
- Approximately 5-10% of adults are asymptomatic nasopharyngeal carriers, but that number increases to as many as 60-80% of members of closed populations (e.g., military recruits in camps).
- The modes of infection include direct contact or respiratory droplets from the nose and throat of infected people.

- The incubation period averages 3–4 days (range 1–10 days), which is the period of communicability.
- Bacteria can be found for 2–4 days in the nose and pharynx and for up to 24 hours after starting antibiotics

482. Ans. (b) Serotype B

Ref: Harrison, 19th ed. pg. 1002

- There are currently three vaccines available in the USA to prevent meningococcal disease, all quadrivalent in nature, targeting serogroups A, C, W-135, and Y.
- Meningococcal polysaccharide or conjugate vaccines provide no protection against serogroup B disease and MenB vaccines provide no protection against serogroup A, C, W or Y disease. For protection against all 5 serogroups of meningococcus it is necessary to receive both vaccines.
- Only recently vaccine targeting serogroup B has also been created and is protein based.

Trade name	Type of vaccine	Serogroups included	Year licensed	Approved ages
Menveo	Conjugate	A, C, W, Y	2010	2 months–55 years
Men Hibrix	Conjugate	C, Y, and Hib	2012	6 weeks–18 months
Tru-menba	Protein	B	2014	10–25 years
Bexsero	Protein	B	2015	10–25 years

FLUIDS AND ELECTROLYTES

483. Ans. (d) IV Soda-bicarbonate

Ref: Harrison 19th ed. P 311

- Intravenous bicarbonate has no role in management of hyperkalemia. It should not be given in the form of intravenous bolus of undiluted ampoules due to risk of development of hypernatremia. Slow infusion in concomitant metabolic acidosis helps by a delayed drop over 4–6 hours.
- Calcium chloride is given to antagonize the effect of potassium on the heart.
- β_2 agonists are useful in case of dangerous hyperkalemia and have additive effect on insulin drip.
- Hemodialysis is the most effective method to treat hyperkalemia.

Extra Mile

The most effective drug required to treat dangerous hyperkalemia is insulin drip

484. Ans. (b) Diarrhea

Ref: Harrison, 19th ed. P 317

ANION GAP

Increased	Normal	Decreased
KULT Ketoacidosis Uremia Lactic acidosis Toxins—ethylene glycol and methyl alcohol poisoning	DR FUSE Diarrhea Renal tubular acidosis type 1, 2, 4 Fistula Ureterosigmoidostomy	Multiple myeloma Nephrotic syndrome

485. Ans. (a) Renal tubular acidosis

Ref: Harrison 19th ed. P 317

Refer to explanation of above question.

486. Ans. (a) Diarrhea

Ref: Harrison 19th ed. P 2275

- In choice B, extra ADH will lead to gain of water and low plasma osmolality. Same would happen in compulsive water drinking in choice C.
- Cerebral toxoplasmosis leads to SIADH and gain of water.
- Diarrhea will lead to water loss and hemoconcentration which can explain increased blood osmolality.

487. Ans. (a) Hypokalemic hypochloremic metabolic alkalosis

Ref: Harrison: 19th ed. P 322

- The repeated vomiting episodes lead to loss of hydrochloric acid. The resultant dehydration triggers activation of RAAS system.
- The elevated aldosterone level lead to excess urinary loss of potassium and hydrogen.
- The resultant manifestation is called hypochloremic hypokalemic metabolic alkalosis.

Extra Mile

- Hypokalemic metabolic acidosis is seen in diarrhea with dehydration.
- Hyperkalemic metabolic acidosis is seen with ureterosigmoidostomy.

488. Ans. (a) Renal tubular acidosis

Normal anion gap (Hyperchloremic Acidosis)	
GI HCO_3^- loss	Colostomy Diarrhea Enteric fistulas Ileostomy Use of ion-exchange resins
Urologic procedures	Uretero-sigmoidostomy Uretero-ileal conduit

Contd...

FMGE Solutions Screening Examination

688

Normal anion gap (Hyperchloremic Acidosis)

Renal HCO_3^- loss	Tubulo-interstitial disease Renal tubular acidosis, types 1, 2, and 4
Ingestions	CaCl_2 Mg sulfate
Parenteral infusion	Arginine lysine Ammonium chloride
Other	Hypoaldosteronism Hyperkalemia Toluene

489. Ans. (a) Starvation

Causes of high anion gap	
Cause	Examples
Ketoacidosis	Diabetes Chronic alcoholism Undernutrition Fasting
Lactic acidosis (from physiologic processes)	Shock Primary hypoxia due to lung disorders Seizures
Lactic acidosis (from exogenous toxins)	Carbon monoxide Cyanide Iron Isoniazid Toluene
Renal failure	—
Toxins metabolized to acids	Alcohol Methanol Ethylene glycol Paraldehyde Salicylates
Rhabdomyolysis	—

490. Ans. (b) Normal Saline

Ref: Harrison, 19th ed. pg. 1749-50

- In controlled hemorrhagic shock (CHS), where the source of bleeding has been occluded, fluid replacement is aimed toward normalization of hemodynamic parameters.
- In uncontrolled hemorrhagic shock (UCHS), in which the bleeding has temporarily stopped because of hypotension, vasoconstriction, and clot formation, fluid treatment is aimed at restoration of radial pulse or restoration of sensorium or obtaining a blood pressure of 80 mm Hg by aliquots of 250 mL of lactated Ringer's solution (hypotensive resuscitation).
- Crystalloid is the first fluid of choice for resuscitation. Immediately administer 2 L of isotonic sodium chloride solution or lactated Ringer's solution in response to shock from blood loss. Fluid administration should continue

until the patient's hemodynamics become stabilized. Because crystalloids quickly leak from the vascular space, each liter of fluid expands the blood volume by 20-30%; therefore, 3 L of fluid needs to be administered to raise the intravascular volume by 1 L.

- Alternatively, colloids restore volume in a 1:1 ratio. Currently available colloids include human albumin, hydroxy-ethyl starch products (mixed in either 0.9% isotonic sodium chloride solution or lactated Ringer's solution), or hypertonic saline-dextran combinations.

491. Ans. (b) Tall T waves in ECG

Ref: Harrison, 19th ed. pg. 307, 310

- The earliest electrocardiogram (ECG) change associated with hypokalemia is a decrease in the T-wave amplitude.
- As potassium levels decline further, ST-segment depression and T-wave inversions are seen, while the PR interval can be prolonged along with an increase in the amplitude of the P wave.
- The U wave is described as a positive deflection after the T wave, often best seen in the mid-precordial leads (e.g., V_2 and V_3). When the U wave exceeds the T-wave amplitude, the serum potassium level is <3 mEq/L.
- In severe hypokalemia, T- and U-wave fusion with giant U waves masking the smaller preceding T waves becomes apparent on the ECG.
- A pseudo-prolonged QT interval may be seen, which is actually the QU interval with an absent T wave.

Severe hypokalemia can also cause a variety of tachyarrhythmias, including ventricular tachycardia/fibrillation and rarely atrioventricular block.

492. Ans. (a) Diarrhea

Ref: Harrison, 18th ed. Chapter 45

Diarrhea	Loss of potassium in stool and hypoperfusion of tissues explains the presence of lactic acid leading to metabolic acidosis
Vomiting	Loss of acid in vomiting leads to metabolic alkalosis
Nasogastric suction	Same as above
Conn syndrome	Hyperaldosteronism will promote acid loss leading to metabolic alkalosis.

Extra Mile

Must know causes of metabolic acidosis = K.U.L.T

K = ketoacidosis due to starvation or diabetic complications

U = uremia

L = Lactic acidosis

T = Toxins (methyl alcohol, ethylene glycol)

493. Ans. (b) Biotin deficiency

Ref: Harrison, 18th ed. Chapter 74

Seborrheic dermatitis is seen with following vitamin deficiency

1. Niacin
2. Riboflavin
3. Pyridoxine
4. Biotin

- Niacin deficiency has 3D = diarrhea, dementia and dermatitis (Not in the choices).
- Vitamin A deficiency has night blindness and eye signs and therefore is ruled out
- Riboflavin deficiency is diagnosed by Magenta tongue, angular stomatitis, seborrhea, cheilosis but does not have alopecia and apathy
- In adults, biotin deficiency results in mental changes (depression, hallucinations), paresthesia, anorexia, and nausea. A scaling, *seborrheic*, and erythematous rash may occur around the eyes, nose, and mouth as well as on the extremities.
- In infants, biotin deficiency presents as hypotonia, lethargy, and *apathy*. In addition, infants may develop *alopecia* and a *characteristic rash* that includes the ears

Extra Mile

Nutrient	Clinical finding
Thiamine	Beriberi: neuropathy, muscle weakness and wasting, cardiomegaly, edema, ophthalmoplegia confabulation
Riboflavin	Magenta tongue, angular stomatitis, seborrhea, cheilosis
Niacin	Pellagra: Pigmented rash of sun-exposed areas, bright red tongue, diarrhea, apathy, memory loss, disorientation
Vitamin B6	Megaloblastic anemia, atrophic glossitic, depression, ↑homocysteine
Vitamin B12	Megaloblastic anemia, loss of vibratory and position sense, abnormal gait, dementia, impotence, loss of bladder and bowel control, ↑homocysteine, ↑methylmalonic acid

494. Ans. (c) Renal tubular acidosis

Ref: Harrison's, 17th ed. Chapter 48

- **Anion gap:** The anion gap is the difference between primary measured cations (sodium Na^+ and potassium K^+) and the primary measured anions (chloride Cl^- and bicarbonate HCO_3^-) in serum.

- So we take value of sodium and from it subtract the value of chloride and bicarbonate.
- **Value of Normal anion gap** = 10 to 12 mmol/L

AG calculated as follows: $\text{AG} = \text{Na}^+ - (\text{Cl}^- + \text{HCO}_3^-)$

Normal anion gap (Mn: FUSED CAR)	Increased anion gap (Mn: MUDPILES)	Decreased anion gap (Mn: BPH-M)
F - Fistula pancreatic U - Ureterosigmoidostomy S - Small bowel fistula E - Extra chloride D - Diarrhea C - Carbonic anhydrase Inhibitor (<i>acetazolamide</i>) A - Adrenal insufficiency R - Renal tubular acidosis	M - Methanol U - Uremia D - DKA/AKA/SKA (<i>diabetic/alcoholic/starvation</i>) P - Paraldehyde / phenformin I - Iron / INH L - Lactic acidosis E - Ethylene glycol S - Salicylates	Bromide intoxication Plasma cell dyscrasia Hypoalbuminemia Monoclonal protein

495. Ans. (d) Renal tubular acidosis

Please refer to above explanation

496. Ans. (b) Diarrhea

Please refer to above explanation

497. Ans. (d) Central pontine myelinolysis

Ref: Harrison's, 17th ed. Ch. 334

- Normal serum sodium concentration: 135-145mEq/L. Hyponatremia is defined as a sodium concentration < 135 mEq/L.
- All patients with hyponatremia have hyperosmolality, unlike hyponatremic patients who can have a low, normal, or high serum osmolality.
- Altered mental status is the most common manifestation, ranging from mild confusion and lethargy to deep coma.
- Hyperthermia, delirium, seizures, and coma may be seen with severe hyponatremia (i.e., sodium < 125 mEq/L). Symptoms in the elderly may not be specific; a recent change in consciousness is associated with a poor prognosis.
- The sudden shrinkage of brain cells in acute hyponatremia may lead to *parenchymal or subarachnoid hemorrhages*.
- **Central pontine myelinolysis** presents most commonly as a complication of treatment of patients with profound, life threatening **hyponatremia** (if hypertonic saline is given too rapidly in a patient in whom hyponatremia has been present for >24-48 hours).

498. Ans. (a) **Facial nerve stimulation by tapping over the parotid**

Ref: Harrison, 19th ed. pg. 315

Hypocalcemia/Tetany is characterized by irritability of nerves. This can be elicited by tapping over the facial nerve when it is entering into the parotid gland. This will cause twitching of facial musculature. The sign is referred to as Chvostek sign.

499. Ans. (d) **Hypertonic fluids**

Ref: Harrison, 19th ed. pg. 1779

Hypertonic 3% saline can be used in Raised ICT

- Osmotic therapy (ie, mannitol, hypertonic saline), barbiturate, anesthesia, and neuromuscular blockage, along with concomitant monitoring of intracranial pressure with intracranial pressure monitor is generally required in order to maintain adequate cerebral perfusion pressure of greater than 70 mm Hg.

500. Ans. (b) **Heat cramps**

Ref: Harrison, 19th ed. pg. 479e-2

Heavy sweating causes heat cramps, especially when the water is replaced without also replacing salt or potassium.

501. Ans. (d) **Osteoporosis**

Ref: Harrison, 19th ed. pg. 2494-95

- **Osteoporosis** is not due to hypocalcemia but is due to imbalance between the osteoclastic activity and osteoblastic activity
- The IOC for osteoporosis is DEXA scan while the DOC is bisphosphonates along with calcitonin nasal spray.
- Hypocalcemia can cause rickets in children or osteomalacia in adults in which the weakened bone is susceptible to fracture.
- If serum calcium becomes less than 7 mg% then it causes tetany.
- The QT interval in ECG is inversely related to calcium levels in the blood.

502. Ans. (b) **Neurogenic**

Ref: Harrison, 19th ed. pg. 1750

- In road traffic accident case there can be poly-trauma which can damage the spine as well. The damage to thoracic spine can destroy the sympatho-mimetic outflow to the heart causing bradycardia with hypotension. In this question if *tachycardia* was given with *hypotension*, the answer would be *hypovolemic shock* secondary to damage to organs like liver and spleen.

503. Ans. (d) **Norepinephrine**

Ref: Harrison, 19th ed. pg. 444e-3t

Molecule	Half life
Renin	80 minutes
Cortisol	100 minutes
Aldosterone	<20 minutes
Nor epinephrine	2–2.5 minutes
Epinephrine	2–3 minutes

MISCELLANEOUS

504. Ans. (a) **Elongation of filiform papillae**

Ref: Harrison, 20th ed. pg. 223

Black hairy tongue shows elongation of filiform papillae which become stained by tea, coffee, tobacco or pigmented bacteria. It is seen in elderly smokers, patients on antibiotics, advanced malignancy.

505. Ans. (a) **Upper outer**

The site is upper outer quadrant to avoid trauma to sciatic nerve.

506. Ans. (b) **Facial artery**

- Superior thyroid artery (Th)
- Lingual artery (LA)
- Facial artery (FA)
- Occipital artery (large arrow)
- Ascending pharyngeal artery (small arrow)
- Internal maxillary artery (IMA)
- Middle meningeal artery (MMA)
- Middle deep temporal artery (DT)
- Superficial temporal artery (STA)

507. Ans. (d) Artery puncture

Complications of Jugular Line Insertion

- Arterial puncture. The subclavian artery cannot be compressed; accordingly, the subclavian approach should be avoided in anticoagulated patients.
- Hematoma usually requires monitoring only.
- Hemothorax
- Catheter-related thrombosis may lead to pulmonary embolism.
- An air embolism may be caused by negative intrathoracic pressure, with inspiration by the patient drawing air into an open line hub.
- Dysrhythmia may occur as a consequence of cardiac irritation by the wire or catheter tip. It can usually be terminated by simply withdrawing the line into the superior vena cava. Placing a central venous catheter without a cardiac monitor is unwise.
- Atrial wall puncture can lead to pericardial tamponade.
- Patients who are allergic to antibiotics may experience anaphylaxis upon insertion of an antibiotic-impregnated catheter.
- Chylo-thorax is a possible complication on the left side.

508. Ans. (c) Both

Ref: Harrison, 19th ed. pg. 2107

X-lined severe combined immunodeficiency	Most cases of SCID are due to mutations in the gene encoding the common gamma chain (Yc) a protein that is shared by the receptors for interleukins IL-2, IL-4, IL-7, IL-9, IL-15. <i>Since the common gamma chain is shared by many interleukin receptors, mutations that result in a non-functional common gamma chain cause widespread defects in interleukin signalling.</i>
Adenosine deaminase deficiency	The second most common form of SCID after X-SCID is caused by a defective enzyme, adenosine deaminase (ADA), necessary for the breakdown of purines. Lack of ADA causes accumulation of dATP. This metabolite will inhibit the activity of ribonucleotide reductase, the enzyme that reduces ribonucleotides to generate deoxyribonucleotides.

509. Ans. (b) Lymphatics

Ref: Schwartz Surgery, 10th ed. pg. 906

- Buerger's disease, also known as thromboangiitis obliterans, is a progressive non-atherosclerotic segmental inflammatory disease that *most often affects small- and medium-sized arteries, veins, and nerves of the upper and lower extremities.*
- Pathologically, thrombosis occurs in small- to medium sized arteries and veins with associated dense polymorphonuclear leukocyte aggregation, micro-abscesses, and multinucleated giant cells.
- The chronic phase of the disease shows a decrease in the hyper-cellularity and frequent recanalization of the vessel lumen. End-stage lesions demonstrate organized thrombus and blood vessel fibrosis.
- Buerger's disease typically presents in young male smokers, with symptoms beginning prior to age 40. Patients initially present with foot, leg, arm, or hand claudication, which may be mistaken for joint or neuromuscular problems.
- Progression of the disease leads to calf claudication and eventually ischemic rest pain and ulcerations on the toes, feet, or fingers.

510. Ans. (d) Serum amylase

Ref: Harrison 19th ed. Chapter 267

- Acute Physiology and Chronic Health Evaluation II is the most commonly used Severity of illness scoring system in America
- Age, type of ICU admission (after elective surgery vs. nonsurgical or after emergency surgery), a chronic health problem score, and 12 physiologic variables (the most severely abnormal of each in the first 24 h of ICU admission) are used to derive a score.
- The predicted hospital mortality is derived from a formula that takes into account the II score, the need for emergency surgery, and a weighted, disease-specific diagnostic category

VITALS

Rectal temperature, °C
Mean blood pressure, mm Hg
Heart rate
Respiratory rate
Arterial pH
Oxygenation levels

LABS

- Serum sodium
- Serum potassium
- Serum creatinine

- Hematocrit
- WBC count, $10^3/\text{mL}$
- Glasgow Coma Score

Points Assigned to Age

Points Assigned to Chronic Health

If patient is admitted after elective surgery

If patient is admitted after emergency surgery or for reasons other than after elective surgery

511. Ans. (a) Calf pain

Ref: Harrison 19th ed. pg. 1645-46

- Claudication in the *arch of the foot* is an early sign and is suggestive of, or even specific to, TAO.
- This condition is a manifestation of infrapopliteal vessel occlusive disease.
- As the disease progresses, **typical calf claudication** and eventually ischemic pain at rest and ischemic ulcerations on the toes, feet, or fingers may develop.
- Ischemia of the upper limbs is clinically evident in 40–50% of patients, but may be detected in 63% of patients by Allen's test and in 91% of patients by arteriogram of the hand and forearm.

Criteria for diagnosis of TAO

- Onset before age 45
- Current (or recent past) tobacco use
- Distal extremity ischemia (infra-popliteal and/or intra-brachial), such as claudication, rest pain, ischemic ulcers, and gangrene documented with non-invasive testing
- Laboratory tests to exclude autoimmune or connective tissue diseases and diabetes mellitus
- Exclude a proximal source of emboli with echocardiography and arteriography
- Demonstrate consistent Arteriographic findings in the involved and clinically non-involved limbs

512. Ans. (a) External jugular vein

The Peripherally Inserted Central Lines sites are

- Subclavian (preferred)
- Internal jugular vein
- Femoral vein
- In critically ill patients, *barotrauma* (pneumothorax) and puncture of an incompressible artery are probably the most common mechanical complications and can be life-threatening.
- Mechanical complications include
 - Pneumothorax
 - Arterial puncture
 - Catheter malposition can have serious consequences. Positioning of the catheter tip in the cardiac silhouette is associated with an increased risk for cardiac tamponade,

ade, and positioning in the subclavian vein with a high risk for thrombus formation in cancer patients.

- Mediastinal haematoma
- Hemothorax
- Injury to adjacent nerves.

- The recent introduction of more flexible catheters and of the J guide-wire insertion method has decreased the rate of severe mechanical complications.

513. Ans. (a) 35 degrees Celsius

Ref: Harrison, 18th ed. Chapter 19

Accidental hypothermia occurs when there is an unintentional drop in the body's core temperature below 35°C (95°F). At this temperature, many of the compensatory physiologic mechanisms that conserve heat begin to fail. *Primary accidental hypothermia* is a result of the direct exposure of a previously healthy individual to cold. The mortality rate is much higher for patients who develop *secondary hypothermia* as a complication of a serious systemic disorder

514. Ans. (a) Lung cancer

Ref: Table 81.1 Harrison, 18th ed.

The most common cancer in the world is lung cancer, and it is the *most common cause of cancer related death*.

515. Ans. (d) Drug of choice is ciprofloxacin

Ref: Harrison, 19th ed. pg. 1145, 1140

Clinical Features

- Symptoms of leptospirosis include high fever, severe headache, chills, muscle aches, and vomiting, and may include jaundice, red eyes, abdominal pain, diarrhea, and rash.
- Initial presentation may resemble pneumonia. The symptoms in humans appear after a 4–14 day incubation period. More severe manifestations include meningitis, extreme fatigue, hearing loss, respiratory distress, azotemia, and renal interstitial tubular necrosis, which results in renal failure and occasionally liver failure (*the severe form of this disease is known as Weil's disease*)

Investigations

- **Diagnosis**—enzyme-linked immunosorbent assay (ELISA) and polymerase chain reaction (PCR).

- Gold standard-The MAT (microscopic agglutination test), a serological test

Treatment

- Doxycycline may be used as a prophylaxis 200–250 mg once a week
- Treatment is a relatively complicated process comprising two main components: suppressing the causative agent and fighting possible complications.
- Effective antibiotics include: Cefotaxime, Doxycycline, Penicillin, Ampicillin, and Amoxicillin.

516. Ans. (b) **Fredereich ataxia**

Ref: Harrison, 19th ed. pg. 2629-30

Xeroderma pigmentosum	Xeroderma pigmentosum, or XP, is an autosomal recessive genetic disorder of DNA repair in which the ability to repair damage caused by ultraviolet (UV) light is deficient.
Werner syndrome	Defect is in WRN gene on chromosome 8 which plays an important role in DNA repair and replication. The clinical presentation is of accelerated ageing WERNER SYNDROME SHOULD NOT BE CONFUSED WITH WERNER SYNDROME which is multiple endocrine neoplasia type 2A.
Bloom syndrome	BLM gene on chromosome 15 results in defective DNA repair. Increased incidence of cancers like leukemia and lymphoma is seen.
Frederich-ataxia	FRAXIN gene, disease of trinucleotide repeats. Friedreich's ataxia is an autosomal recessive inherited disease that causes progressive damage to the nervous system, resulting in symptoms ranging from gait disturbance to dysarthria. HOCM and type 2 diabetes mellitus is associated. Please DON'T CONFUSE WITH DISEASE OF DEFECTIVE DNA REPAIR ATAXIA TELANGIECTASIA.

517. Ans. (d) **Low output cardiac failure**

Ref: Harrison, 19th ed. pg. 426e-1

- Paget disease is a **localized disorder of bone remodeling that typically begins with excessive bone resorption followed by an increase in bone formation.** Therefore, the increase in cardiac output can lead to left ventricular strain and eventually high-output congestive failure.
- Measurement of **serum alkaline phosphatase—in some cases, bone-specific alkaline phosphatase (BSAP)—**can be useful in the diagnosis of Paget disease.
- Most persons with Paget disease are asymptomatic. In these patients, the incidental finding of an elevated serum alkaline phosphatase level or characteristic

radiographic abnormality may lead to detection of the disease. However, when symptoms do occur, **bone pain is the most common complaint.** It may persist or exacerbate during the night.

518. Ans. (d) **Malignancy**

Ref: Harrison, 19th ed. pg. 501f, 707

- Mycosis Fungoides is a Non-Hodgkins lymphoma of T cell variety. It is characterized by skin involvement where a skin biopsy shows findings quizzed in earlier exams by the name of Pautrier's micro-abscess formation.

519. Ans. (a) **Lenalidomide**

Ref: Harrison, 19th ed. pg. 103e-19

Lenalidomide is used as anticancer agent for multiple myeloma and is also an immun-modulator.

520. Ans. (a) **p24 antigen**

Ref: Harrison, 19th ed. pg. 1246-47

- Following HIV infection, the sequences of markers to identify infection in their chronologic order of appearance in serum are: viral RNA followed by p24 antigen and lastly anti-HIV antibody.
- ELISA is positive in all babies born to HIV positive mother, due to transplacental transferrin of anti – HIV antibody.
- About 2 weeks after infection, viremia is thought to increase exponentially and then decline to a steady-state level as the humoral and cell-mediated immune responses control HIV replication. This time interval, the serologic “window period,” is characterized by seronegativity, occasionally detectable antigenemia, viremia (as measured by RNA), and variable CD4 lymphocyte levels. Detection of specific antibody to HIV signals the end of the window period and labels the individual as seropositive.
- The exact time when HIV RNA, antigen, and antibody can be detected depends on several factors, including the test used, individual host responses, and viral characteristics. Viral RNA can be detected within the first 2 weeks using the highly sensitive RT-PCR method. Antigen, although transient, can appear as early as 2 weeks after infection and lasts 3 to 5 months.

521. Ans. (b) **Buerger's disease**

Ref: Vascular intervention: A Clinical approach, pg. 219-221

- Buerger's disease (*NOT berger disease*) is also known as thrombo angitis obliterans. An inflammatory and obliterative disease of blood vessels of the extremities, mainly lower extremities. *Occurring chiefly in smoker young*

FMGE Solutions Screening Examination

694

men and leading to ischemia of the tissues and gangrene.

- Involvement of artery vein and nerve, most commonly involved is tibial artery. Intermittent claudication, pain at rest relieved by dangling legs. *Dry gangrene in toes shows shriveled woody induration.*
- **IOC:** duplex USG (ankle brachial index: 0.5 to 0.9)
- **Treatment:** for Claudication pain, reducing the viscosity of blood **pentoxyphylline** is used. For resting pain, lumbar sympathectomy. If gangrene à Amputation done.

522. Ans. (a) Spleen rupture

The image shows CT abdomen with splenic haemorrhage. The abdominal distention is explained by hemoperitoneum. Due to loss of blood, hypovolemic shock ensues and leads to acute tubular necrosis.

523. Ans. (b) MRI scan

The image shows presence of sagittal view of abdomen MRI scan. The organs of abdomen and muscle planes are well delineated.

CT scan	MRI
Imaging plane: CT images are acquired only in the axial plane. The axial data set can then be used to reconstruct images in other planes, sagittal and coronal are the most common.	Imaging plane: MRI can be acquired in any plane, not just axial
Windows: Images can be "windowed" to bring out different structures, which is a post processing step. For neuroimaging we primarily review images using a "brain window" to look at the parenchyma and ventricular system. We use a bone window to evaluate the osseous structures and air filled cavities including the paranasal sinuses and temporal bone	Sequences: In MR, each different type of image is referred to a sequence. The primary MR sequences include T2, T1, T1 with contrast, Diffusion and FLAIR. Each sequence has to be acquired separately, which means that an MRI will take a lot longer to perform than a CT

Contd...

CT scan

White and black:

You will notice that air within the gut is black
The brain parenchyma has a gray appearance and the skull is bright white

MRI

White and black:

You will notice that the same structure may be bright or dark depending on the type of sequence; CSF for example is bright on T2, but dark on T1. The tissue and imaging characteristics are a lot more complicated than CT

Extra Mile

The patient lies on the table along the direction of the magnetic field. All of the protons within the patient's body align with this main magnetic field. The protons are then excited by an RF (Radiofrequency) pulse which elevates the hydrogen atoms to an excited state. These hydrogen atoms then relax to their normal resting state. However the time that it takes for each hydrogen atom to relax depends on their local tissue environment. Hydrogen atoms in water relax at different rates than hydrogen in soft tissue. It is this difference in relaxation times that enables us to generate an MR image

524. Ans. (a) Sapheno-femoral incompetence

Ref: SRB Manual of Surgery, 4th ed. pg. 228

Brodie-Trendelenburg test is used to detect venous incompetence and to differentiate between perforator and Great saphenous incompetence.

525. Ans. (c) Phospholipid precipitates

- The necrotic cell may have a more glassy homogeneous appearance than that of normal cells, mainly as a result of the loss of glycogen particles.
- *Dead cells may ultimately be replaced by large, whorled phospholipid masses called myelin figures.* These phospholipid precipitates are then either phagocytosed by other cells or further degraded into fatty acids; calcification of such fatty acid residues results in the generation of calcium soaps.

ANSWERS TO BOARD REVIEW QUESTIONS

ANSWERS TO IMAGE-BASED QUESTIONS

653. Ans. (c) **Pointing index**

The image shows presence of point index with lesion of
median nerve. The remaining three choices A, C, D are
seen in ulnar nerve damage.

654. Ans. (a) **Saw tooth appearance**

655. Ans. (c) **Anterior wall MI**

ECG shows presence of ST elevation from V2-V5 diagnostic
of anterior wall MI.

656. (a) **Sinus tachycardia**

Ref: Harrison, 19th ed. pg. 1477

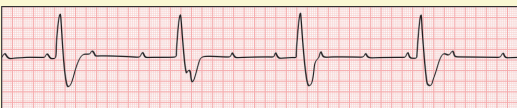

- The ECG shows normal sinus rhythm with heart rate of >100 bpm.
- P waves are normal height and duration. PR interval is 120 msec and QRS duration is 80 msec.
- The findings are diagnostic of sinus tachycardia
- Sinus tachycardia is subdivided into physiological and non-physiological.
- *Inappropriate sinus tachycardia* causes the sinus rate to increase spontaneously at rest or out of proportion to physiological stress or exertion. Affected patients are usually females. Misdiagnosis with anxiety disorder is common.

657. Ans. (c) Mobitz II heart block

Ref: Harrison, 19th ed. pg. 1472

- The ECG shows more P waves than QRS complexes. This suggests a heart block.
- P wave is upright and has a normal morphology. PR interval is 200 msec.
- Dropped beats are present with PR interval remaining the same before the dropped beats.

Comparison of heart blocks

First degree heart block	
	PR interval is prolonged but there are no dropped beats
Mobitz I heart block	
	Progressive increase of PR interval is followed by dropped beat
Mobitz II heart block	
	Sudden dropped beat/s without change in proceeding/subsequent PR interval
Third degree heart block	
	Atrial rate >> ventricular rate Broad complex QRS

658. Ans. (a) Myocardial ischemia

Ref: Harrison, 19th ed. pg. 1455-56

- The T-wave is upright in all leads except aVR and V1. In the strip provided, notice the predominant T-wave inversion in V1-V4. This is seen in myocardial ischemia.

- Diagnosis of myocardial injury needs elevated cardiac biomarkers
- Digoxin leads to ST segment depression
- Digoxin toxicity leads to ventricular bigeminy.

Causes of T-wave inversion:

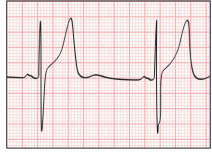

- Normal in children
- Myocardial ischemia
- Bundle branch block
- Ventricular hypertrophy
- Pulmonary embolism
- Hypertrophic obstructive cardiomyopathy
- Raised intracranial pressure

659. Ans. (a) Hyperacute T-wave

Ref: ACLS Study Guide, 5th ed. pg. 229

The ECG shows presence of large T waves.

They are relatively broad, and are not pointed when compared to Tall tented T waves of hyperkalemia.

Hyperkalemia	Hyperacute ischemia	Normal variant
		
Symmetric, narrow-based, pointed, tenting	Symmetric, broad-based, not tented, not pointed QT interval tends to be long	Asymmetric and not narrow

FMGE Solutions Screening Examination

700

660. Ans. (a) T wave inversion

Ref: Braunwald, 10th ed. pg. 146 and Harrison, 19th ed. pg. 1457

Heart rate is 60 bpm with left axis deviation. Deep symmetrical T-wave inversion is noted in the chest leads.

661. Ans. (a) Ventricular bigeminy

Ref: Harrison, 19th ed. Chapter 269e

The ECG strip shows heart rate of approximately 60 bpm. ST segment depression (hockey stick sign) is seen followed by positive deflection of U waves.

Abnormalities of U-wave

Prominent U waves	Inverted U waves
Bradycardia	Myocardial ischemia
Hypokalemia	HTN
Hypocalcemia	Cardiomyopathy
Hypomagnesemia	
Hypothermia	
Raised ICP	
HOCM	
LVH	

662. Ans. (d) Premature ventricular contractions

Ref: Harrison, 19th ed. pg. 1457

The ECG shows normal sinus rhythm with heart rate of 75 bpm with normal axis.

Raised ST segment in lead V2-V4 and inverted T waves in lead I, aVL, V2-V4 are seen.

663. Ans. (b) Ventricular bigeminy

Ref: Practical Cardiology, 2nd ed. pg. 214

Heart rate of the patient is 50 bpm

The tracing shows normal sinus rhythm alternating with premature ventricular contraction. This is diagnostic of ventricular bigeminy which is the most common arrhythmia seen with digoxin toxicity.

664. Ans. (d) Digoxin

Ref: Harrison, 19th ed. pg. 1457

- The ECG shows irregularly irregular heart rhythm with absent P waves. This is diagnostic of atrial fibrillation.
- Also seen is down-sloping ST segment depression pronounced in V2-V3 and in the rhythm strip.
- This patient of rheumatic heart disease is in atrial fibrillation for which she would have been put on digoxin by her physician.

- The combination of extra-cardiac side effects of digoxin and atrial fibrillation hemodynamic effects would explain the general unwell being of the patient.
- ACE inhibitor can lead to hyperkalemia and diuretics can lead to hypokalemia. However ECG changes of potassium deficit/excess are not seen.

665. Ans. (c) PSVT

Ref: Harrison, 19th ed. pg. 1480-81

- The findings of the ECG are heart rate of 200 bpm. P waves are not visible.
- The axis is normal with narrow qRS complexes.
- This could either be junctional tachycardia or atrio-ventricular nodal re-entrant tachycardia.
- Taking into consideration the age of the patient the incidence of junctional tachycardia can explain the patient experiencing multiple episodes in the past.

666. Ans. (b) Left ventricular hypertrophy

Ref: Harrison, 19th ed. pg. 1454

- The ECG shows normal sinus rhythm with heart rate of 50 bpm
- The axis is normal
- R wave height in lead V5 is 30 mm and S wave depth in lead V1 is 20 mm
- The sum of the two exceeds the set criteria for LVH mentioned below
- Inverted T waves are seen in I, aVL, V5-V6
- Echocardiography is needed to confirm aortic stenosis which is causing left ventricular hypertrophy in this patient.

Voltage criteria for LVH

Precordial leads = $SV_1 + RV_5$ or $RV_6 > 35$ mm

Limb leads = $RaVL + SV_3 > 20$ mm in women and > 28 mm in men

Not very accurate in obese and athletes

667. Ans. (c) Atrial fibrillation

Ref: Harrison, 19th ed. pg. 1485

The ECG shows a variable heart rate due to RR interval. The P waves are not seen and QRS complex is normal duration.

668. Ans. (b) Adenosine

Ref: Harrison, 19th ed. pg. 1487

- Serious rhythm degeneration and even death can occur when adenosine is inadvertently given to patients of atrial fibrillation/flutter. This is since the concealed accessory pathway with become unmasked.
- As adenosine will increase the AV nodal delay the accessory pathway will lead to conversion of atrial fibrillation to ventricular fibrillation. This is because the current will now travel preferentially via the accessory pathway.

- In atrial flutter, since the accessory pathway does not have decremental property, the 2:1 conduction will occur at rate of 1:1 leading to rapid clinical decompensation.

669. Ans. (c) Thrombolytic therapy

Ref: Harrison, 19th ed. pg. 1595

- The following ECG shows heart rate of 80 bpm with normal axis. P wave is normal with normal duration QRS seen after each P wave. T waves are hyper-acute in leads V2-V5 with simultaneous presence of ST segment elevation in chest leads V2-V5.
- This is diagnostic of STEMI involving anterior wall and the vessel blocked in left anterior descending artery.
- The symptoms of chest pain and diaphoresis are explained by the ECG findings of the pain.
- Now ideal treatment of STEMI is PCI or thrombolysis.
- Since PCI is not in choices we need to consider thrombolysis for the patient but it is *indicated only within 12 hours of onset of MI*.
- In this question the patient presented late and hence we will treat with aspirin to prevent future MI episode, Statin to stabilize the vulnerable plaques and morphine to calm the patient and reduce pulmonary edema.
- E.C.G changes in acute infarction

ECG findings of ischemia	ECG finding of injury	ECG findings of cell death
Tall wide (peaked) T wave T wave inversion	ST elevation (Pardee sign)	<ul style="list-style-type: none"> • Pathological Q wave

ST Elevation MI Management:

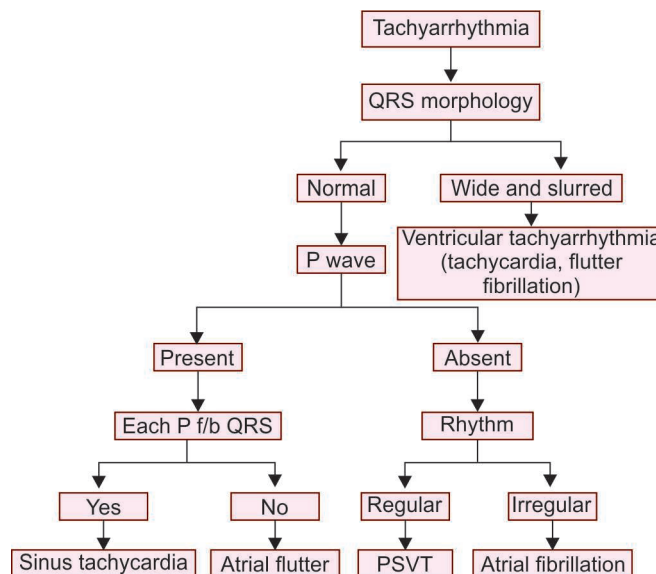

- Nitrates
- Morphine
- Oxygen
- Aspirin
- Start adjunctive treatment
- Beta Blockers (IV)
- Nitroglycerine (IV)
- Heparin (IV)
- Reperfusion therapy is the definitive treatment of choice if patient present <12 hours.
 - Thrombolysis (Streptokinase) Door to needle time < 30 minutes
 - Early primary PCI (Cath lab equipped hospital) Door to balloon time < 90 minutes

670. Ans. (c) Adenosine

Ref: Harrison, 19th ed. pg. 1479

- The ECG is showing heart rate of 200/min.
- Axis is normal.
- Rhythm is regular with absence of P waves.
- Narrow complex QRS (<0.08 sec) is present. P waves buried in the preceding T wave.

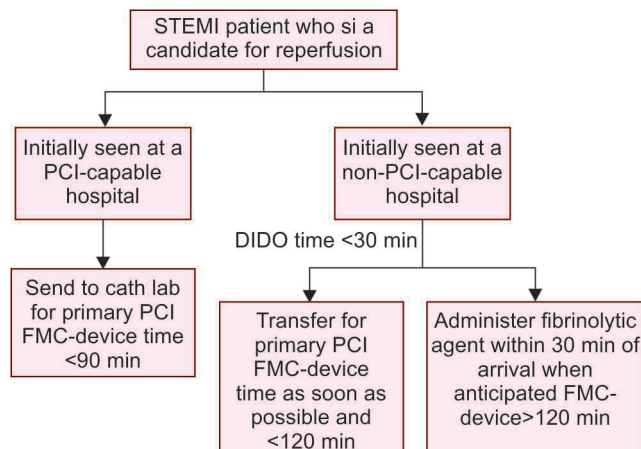

- This is seen in paroxysmal supraventricular tachycardia.
- The first line management is adenosine 6 mg intravenously.
- In case the patient is having hemodynamic compromise, electrical cardioversion needs to be done.

671. Ans. (a) Primary PCI

Ref: Figure 295-4, Harrison, 19th ed. pg. 1604

- The ECG shows heart rate of about 120/min.
- T wave inversion is present from V2-V6
- ST segment elevation >2 mm in noted from V4-V6 exhibiting the traditional Pardee sign
- STEMI is best managed with primary PCI with first medical contact to device time to be kept <90 minutes
- If the patient is seen in non PCI capable hospital DIDO time should be less than 30 minutes for thrombolysis.

- The patient can be transferred from non PCI capable hospital to PCI capable hospital in case the first medical contact to device time is less than 120 minutes.

FMGE Solutions Screening Examination

702

- In the question there is no mention of any PCI/ non PCI capable hospital.
- Due to paucity of transport facilities in India, the concept of transfer from non PCI to PCI capable centre with performance of PCI within 120 minutes looks impossible.

672. Ans. (d) 4

Ref: Harrison, 19th ed. pg. 1451

- Corrected QT is defined as QT interval divided by $\sqrt{R-R}$ interval
- R-R interval in ECG is 4.

Markings in the ECG given:

1. is PR interval
2. is PJ interval
3. is ST segment
4. is RR interval

673. Ans. (c) Phase 2

Ref: Harrison, 19th ed. pg. 1451

- The marked part of the ECG is the isoelectric ST segment which corresponds to the plateau, phase 2 of cardiac action potential
- The rapid upstroke (phase 0) action potential corresponds to onset of QRS.

- Plateau (phase 2) corresponds to isoelectric ST segment.
- Active repolarization (phase 3) corresponds to inscription of T-wave.

674. Ans. (c) Hockey stick sign

Ref: Practical Cardiology, 2nd ed. pg. 125

The image shows rhythm strip exhibiting a variable heart rate with ST segment depression. P-wave is absent with narrow complex. The patient was probably having atrial fibrillation and was started on digoxin which resulted in ST segment depression highlighted below.

Surgery

MOST RECENT QUESTIONS 2019

1. A patient presented to emergency after RTA with multiple rib fractures. He is conscious, speaking single words. On examination, respiratory rate was 40/min and BP was 90/40 mm Hg. What is the immediate next step?
 - a. Urgent IV fluid administration
 - b. Intubate the patient
 - c. Chest –ray
 - d. Insert needle in 2nd intercostal space
2. Correct procedure of inserting Nasogastric tube is.
 - a. Supine with neck flexed
 - b. Supine with neck extended
 - c. Sitting with neck flexed
 - d. Sitting with neck extended
3. A 7-day old infant presents with bilious vomiting and gross abdominal distention with absent bowel sounds. X ray abdomen shows multiple gas filled loops. Diagnosis is?
 - a. Hirschsprung disease
 - b. Congenital Hypertrophic pyloric stenosis
 - c. Duodenal atresia
 - d. Malrotation of gut
4. Meconium ileus is a presentation seen in which of the following diseases?
 - a. Mucoviscidosis
 - b. Hirschsprung disease
 - c. Ileal atresia
 - d. Congenital aganglionosis
5. Which is the first investigation to be done in case of Neonate presenting with frothiness in mouth and dyspnoea?
 - a. Bronchoscopy with injection of methylene blue
 - b. NG Tube insertion and CXR to check position of tube
 - c. CT chest
 - d. Endoscopy
6. Calculate the GCS of a patient exhibiting eye opening on pain, conscious but confused and cannot tell time and exhibits flexion on painful noxious stimuli to the arm.
 - a. 8
 - b. 9
 - c. 10
 - d. 11
7. A 27-year-old woman presents with 26 weeks of gestation with a thyroid lesion which is found to be papillary carcinoma of thyroid. Which is the best treatment for this patient?
 - a. Thyroid ablation using radioactive Iodine
 - b. Total thyroidectomy
 - c. Observation
 - d. Hemi-thyroidectomy
8. Which ulcer is likely to develop in a long standing chronic venous ulcer?
 - a. Marjolin ulcer
 - b. Aphthous ulcer
 - c. Bazin ulcer
 - d. Arterial ulcer
9. Most appropriate management of recurrent keloid is?
 - a. Excisional surgery
 - b. Intramarginal excision followed by radiation
 - c. Cryosurgery
 - d. Silicone gel sheeting
10. Seat Belt injury leads to?
 - a. Splenic laceration
 - b. Splenic contusion
 - c. Gut ischemia
 - d. Mesenteric adenitis
11. Which complication is seen after Varicose vein stripping procedure?
 - a. Neuralgia
 - b. Deep vein thrombosis
 - c. Acrocyanosis
 - d. Telangiectasia
12. Which of the following is not scanned by FAST USG?
 - a. Pericardium
 - b. Pleural cavity
 - c. Spleen
 - d. Liver
13. A 40-year-old man is suffering from heaviness in scrotum. A bag of worms feel is observed on scrotal examination and the swelling is seen to reduce in supine position. What is the best treatment?
 - a. Suction drainage
 - b. Varicocelelectomy
 - c. Jaboulay procedure
 - d. Herniotomy
14. Prophylactic antibiotics to minimise SSI are given_____?
 - a. 60 minutes before skin incision
 - b. 1-3 hours before skin incision
 - c. At time of surgical incision
 - d. Night before surgery for peaking of effect

15. Which procedure is done in case of Ranula management?

- a. Incision and drainage b. Aspiration
- c. Excision d. Sclerosant injection

16. Which of the following is best for diagnosis of pheochromocytoma?

- a. 24-hour urinary Vaniyl Mandelic acid
- b. 24-hour urinary Fractionated Metanephrine
- c. 24-hour Urinary Hydroxy indole acetic acid
- d. 24-hour Urinary Hydroxy tryptamine

17. Which Instrument is shown below?

- a. Artery forceps b. Kocher forceps
- c. Allis forceps d. Babcock forceps

18. Which instrument is shown below?

- a. Tongue depressor b. Doyen retractor
- c. Self-retaining retractor d. Langenbeck's retractor

19. Comment on the diagnosis?

- a. Sebaceous cyst
- b. Implantation dermoid
- c. Angular dermoid
- d. Lipoma

20. Comment on the diagnosis

- a. Lipoma b. Encephalocele
- c. Cystic hygroma d. Lymphadenopathy

21. What is the location of Killian dehiscence?

- a. Below Superior constrictor
- b. Below Inferior constrictor
- c. Below cricopharyngeal muscle
- d. Below upper 1/3rd of smooth muscle of oesophagus

22. Which organ has highest chances of Graft rejection response?

- a. Cornea b. Gut
- c. Liver d. Skin

23. In hypovolemic shock which organ should be assessed for determining under-perfusion?

- a. Kidney b. Heart
- c. Lung d. Liver

GASTROINTESTINAL TRACT

24. MC immediate complication of splenectomy?

(Recent Pattern Question 2018-19)

- a. Haemorrhage
- b. Fistula
- c. Bleeding from gastric mucosa
- d. Pancreatitis

25. Best treatment strategy for Anal cancer?

(Recent Pattern Question 2018-19)

- a. Chemoradiation b. Surgery
- c. Radiation d. Chemotherapy

26. Which is false about Crohn's disease?

(Recent Pattern Question 2018-19)

- a. No occurrence after surgery
- b. Aphthous ulcer
- c. Skip lesions
- d. Fistula formation

27. Which of the following is not done in Carcinoma oesophagus?

(Recent Pattern Question 2018-19)

- a. Biopsy b. pH-metry
- c. CT chest d. PET scan

28. A 30-year-old man presents with a four days history of right iliac fossa pain. USG image is shown below. Which is the best management algorithm?

(Recent Pattern Question 2018-19)

- a. Ochsner-Sherren regimen
- b. Urgent appendicectomy
- c. Extraperitoneal drainage and parenteral antibiotics
- d. Per cutaneous drainage and parenteral antibiotics

29. Comment on the diagnosis of a film shown of a 65-year-old man with acute abdomen.

(Recent Pattern Question 2018-19)

- a. Ileocolic intussusception
- b. Sigmoid volvulus
- c. Toxic megacolon
- d. Colocolic intussusception

30. Surgery is indicated in Ulcerative Colitis in all except?

(Recent Pattern Question 2018-19)

- a. Toxic megacolon
- b. Colonic perforation
- c. Colonic obstruction
- d. Refractory fistula

31. Which is the most common site of the carcinoma of the esophagus?

(Recent Pattern Question 2018)

- a. Lower 1/3rd
- b. Middle 1/3rd
- c. Upper 1/3rd
- d. GE junction

32. A 9-month-old child presents with excessive cry, right iliac fossa sausage lump and blood in stools. What is the best treatment?

(Recent Pattern Question 2018)

- a. IVF-antibiotic-NG tube
- b. IVF-antibiotic-air enema
- c. IVF-antibiotics-barium enema
- d. IVF-antibiotics-warm saline enema

33. Metastatic liver disease is found in ____% of patients undergoing surgery for primary colorectal cancer?

(Recent Pattern Question 2018)

- a. 10%
- b. 15%
- c. 33%
- d. 75%

34. Which is the most common cause of hypergastrinemia?

(Recent Pattern Question 2018)

- a. Postvagotomy
- b. After intake of PPI
- c. Resection of small intestine
- d. Atrophic gastritis

35. What prefix symbol is used to describe the administration of neo-adjuvant treatment given in colorectal cancer?

(Recent Pattern Question 2017)

- a. h
- b. p
- c. y
- d. z

36. A 20-year-old patient presents with RIF pain and fever. USG is shown in image. Diagnosis is?

(Recent Pattern Question 2017)

- a. Acute appendicitis
- b. Intussusception
- c. Volvulus
- d. Intestinal obstruction

37. Gastric Outlet Obstruction leads to?

(Recent Pattern Question 2017)

- a. Hypochloremic metabolic alkalosis
- b. Hyperchloremic metabolic acidosis
- c. Hyponatremic metabolic alkalosis
- d. Hyponatremic metabolic acidosis

38. Dysphagia lusoria is due to? (Recent Pattern Question 2017)

- a. Aberrant blood vessel
- b. Esophageal diverticulum
- c. Duodenal obstruction
- d. Gastric outlet obstruction

39. Which is the most common site of origin of peritoneal deposits? *(Recent Pattern Question 2016)*

- a. Stomach cancer
- b. Colorectal cancer
- c. Pancreatic cancer
- d. Ovarian cancer

40. What does the arrow in the given CT abdomen show?

(Recent Pattern Question 2016)

- a. Left adrenal gland
- b. Pancreas
- c. Lesser omentum
- d. Epiploic foramen

41. Which of the following is associated with Gardner syndrome? *(Recent Pattern Question 2016)*

- a. Retinoblastoma
- b. Neuroblastoma
- c. Desmoid tumor
- d. Dermoid cyst

42. Hypertrophic pyloric stenosis presents at

(Recent Pattern Question 2016)

- a. 3 day
- b. 3 weeks
- c. 3 month
- d. 3 years

43. A 40-year-old chronic alcoholic presents with distended abdomen, hematemesis and fresh blood in stool. On examination huge ascites and distended veins over abdominal wall are noted. Most likely cause of hematemesis is? *(Recent Pattern Question 2016)*

- a. Esophagitis
- b. Esophageal varices
- c. Esophageal cancer
- d. Erosion of gastroduodenal artery

44. A 30-year-old known alcoholic presents to the emergency with massive Upper GIT bleeding. On examination pulse = 110/min and BP = 80/60. First step to be taken is?

- a. Cold saline lavage *(Recent Pattern Question 2016)*
- b. Immediate BT
- c. Transfer for urgent sclerotherapy
- d. Large bore cannula for IVF

45. Which is the rarest position of appendix?

(Recent Pattern Question 2016)

- a. Retro-caecal
- b. Post-ileal
- c. Post-ileal
- d. Para-caecal

46. Which is the best way to diagnose lower small intestine obstruction? *(Recent Pattern Question 2016)*

- a. Pain abdomen
- b. Multiple air fluid levels
- c. Profuse bilious vomiting
- d. Feculent vomiting

47. What is the location of first constriction of esophagus from the incisor tooth?

- a. 15 cm
- b. 18 cm
- c. 25 cm
- d. 40 cm

48. Which is the best investigation for dysphagia?

- a. Enteroscopy
- b. Barium swallow
- c. Barium enema
- d. Barium meal follow through

49. What is incorrect about Zenker's diverticulum?

- a. Regurgitation of previous day food
- b. Halitosis
- c. Located at Killian triangle
- d. Metabolic alkalosis

50. Achalasia Cardia presents with all EXCEPT?

- a. Halitosis
- b. Regurgitation of previous day's food
- c. Dysphagia (liquids > solids)
- d. Corkscrew esophagus

51. Achalasia cardia presents with all EXCEPT:

- a. Increased lower esophagus sphincter tone
- b. Normal peristalsis
- c. Dilatation proximally
- d. Malignancy

52. Dysphagia mainly for liquids is seen with

- a. Achalasia cardia
- b. Zenker diverticulum
- c. Barrett esophagus
- d. Diffuse esophageal spasm

53. Lower esophageal sphincter tone is due to

- a. Vasoactive intestinal peptide
- b. Nitrous oxide
- c. Acetylcholine
- d. Pancreatic polypeptide

54. Pseudo-achalasia is seen with

- a. Chagas disease
- b. Scleroderma
- c. Tumor infiltration
- d. Diffuse esophageal spasm

55. Which Metaplasia occurs in lower esophagus in a smoker?

- a. Gastric metaplasia
- b. Goblet cells intestinal metaplasia
- c. Esophageal metaplasia
- d. Intestinal dysplasia

56. Which of the following is more prone to Carcinoma?

- a. Barrett esophagus
- b. Boerhaave syndrome
- c. Mallory Weiss tear
- d. Esophageal varices

57. Scoring of esophageal reflux is done by?

- a. Ranson score
- b. Gleason score
- c. Alvarado score
- d. De Meester scoring

58. Which is the best investigation for detecting esophageal perforation?

- a. CXR
- b. CT chest
- c. Upper G.I. endoscopy
- d. CT chest with contrast

59. A patient presented to you after assault and penetrating knife injury to abdomen. X-ray shows gas under the diaphragm. Most common organ damaged in this case is:

- a. Spleen
- b. Intestine
- c. Liver
- d. Lung

60. Para-esophageal hernia is best diagnosed by:

- a. Chest X-ray
- b. Barium study
- c. CT scan
- d. Endoscopic ultrasound

61. To differentiate malignancy from benign lesion in GIT.

What is the investigation of choice?

- a. USG
- b. Biopsy
- c. Endoscopy
- d. P.E.T scan

62. Dysphagia lusoria is due to:

- a. Aberrant right subclavian artery
- b. Aberrant left subclavian artery
- c. Aberrant internal carotid artery
- d. Aberrant innominate artery

63. Boerhaave syndrome is

- a. Spontaneous Rupture of esophagus
- b. Traumatic rupture of esophagus
- c. Tear at gastro-esophageal junction
- d. Foreign body esophagus

64. Which is the most important factor for development of appendicitis and its complications?

- a. Bacterial proliferation
- b. Age
- c. Increased dietary fiber
- d. Bowel lumen obstruction

65. Mc-burney's point is

- a. 1/3rd distance from left anterior superior iliac spine
- b. 2/3rd distance from the anterior superior iliac spine
- c. 1/3rd distance from the umbilicus to ASIS
- d. 1/3rd distance from right anterior superior spine

66. A 25-year-old young male presented with a tender mass in right iliac fossa. On physical examination he has pain and fixed flexed hip. Diagnosis is?

- a. Psoas abscess
- b. Appendicitis
- c. Amoeboma
- d. Ileocaecal TB

67. Which is the best guide to finding appendix intra operatively?

- a. Locate ileo-cecal junction
- b. Locate the blind tube of appendix
- c. Locate the anterior taenia of the caecum
- d. Locate the mesenteric supply

68. Identify the structure shown in the given picture

- a. Appendix
- b. Meckel diverticulum
- c. Diverticulosis
- d. Ligament of Treitz

69. What will be the location of appendix in silent appendix?

- a. Pelvic
- b. Preileal
- c. Retro-caecal
- d. Pelvic

70. MANTREL score is done for

- a. Acute appendicitis
- b. Acute pancreatitis
- c. Acute cholecystitis
- d. Acute salpingitis

71. In a child which of the following diseases is misdiagnosed as appendicitis?

- a. Gastroenteritis
- b. Lymphadenitis
- c. Intussusception
- d. All of the above

72. Ochsner sherren regimen is used for management of:

- a. Appendicular mass
- b. Appendicular abscess
- c. Appendicitis
- d. Peritonitis following appendicitis

73. What is true about Carcinoid tumor:

- a. Always benign
- b. Kulchitsky cell tumor
- c. Present with paroxysmal hypertension
- d. Punch biopsy is diagnostic

74. Carcinoid tumor is seen most commonly in?

- a. Ileum
- b. Rectum
- c. Appendix
- d. Duodenum

75. What is incorrect about peritonitis?

- a. Most common cause is P.U.D
- b. Bile causes more damage than blood in peritoneum
- c. X-ray abdomen shows Gas under diaphragm
- d. Absence of free gas rules out peritonitis

76. Which is the most common organism seen in gastrointestinal perforation peritonitis?

- a. Staph aureus
- b. Pneumococcus
- c. Anaerobic streptococcus
- d. Coagulase-negative staphylococci

77. Non-intestinal peritonitis in females is caused by:

- a. E. coli
- b. Klebsiella
- c. Chlamydia
- d. Bacteroides

78. Which is the most common tumor of retro-peritoneum?

- a. Stroma
- b. Sarcoma
- c. Teratoma
- d. Retro-teratoma

79. Which is the most common presentation of retroperitoneal tumor?

- a. Abdominal pain
- b. Hydronephrosis
- c. Constipation
- d. Abdominal lump

80. Adult patient developing intussusception is due to?

- a. Carcinoid tumor
- b. Mesenteric insufficiency
- c. Villous adenoma
- d. Bariatric surgery

81. All are true about intestinal obstruction radio-graphically EXCEPT?

- a. Supine abdominal film is done
- b. More than 2 air fluid levels
- c. Small intestine dilation >3 cm
- d. Pneumatosis intestinalis

82. **Best treatment protocol of a Enterogenic cyst?**
 - a. Enucleation
 - b. Resection with intestine part
 - c. Aspiration with marsupialization
 - d. Observe
83. **On removing whole colon (total colectomy) what will be the most common complication?**
 - a. Anastomotic leak
 - b. Dys-electrolytemia
 - c. Death
 - d. Fulminant sepsis
84. **Which of the following is NOT seen in pyloric stenosis:**
 - a. Projectile vomiting
 - b. Paradoxical aciduria
 - c. Bilious vomiting
 - d. Metabolic acidosis
85. **Congenital pyloric stenosis presents with?**
 - a. Hypokalemic metabolic acidosis
 - b. Hypokalemic metabolic alkalosis
 - c. Hyperkalemic metabolic acidosis
 - d. Hyperkalemic metabolic alkalosis
86. **In Hypertrophic pyloric stenosis, which of the following is seen?**
 - a. Metabolic acidosis
 - b. Metabolic alkalosis
 - c. Metabolic alkalosis with paradoxical bicarbonaturia
 - d. All of above
87. **Which of the following polyp is least likely to turn malignant?**
 - a. Inflammatory polyp
 - b. Familial Adenomatous Polyposis
 - c. Hamartomatous polyp
 - d. Hyperplastic polyp
88. **All are surgical indications in Crohn's disease EXCEPT:**
 - a. Colonic obstruction
 - b. Refractory fistula
 - c. Massive hemorrhage
 - d. Toxic megacolon
89. **A child is passing blood with act of defecation. The probable diagnosis is**
 - a. Juvenile rectal polyp
 - b. Adenomatous polyposis
 - c. Rectal ulcer
 - d. Post Surgery
90. **Earliest complication of ileostomy is:**
 - a. Obstruction
 - b. Necrosis
 - c. Diarrhea
 - d. Prolapse
91. **Post resection of terminal ileum, deficiency of which of the following vitamins is seen along with Steatorrhea?**
 - a. B12
 - b. B9
 - c. C
 - d. B6
92. **Denver shunt is used in**
 - a. Ascites
 - b. Dialysis
 - c. Raised ICP
 - d. Headache
93. **ROME II criteria is for?**
 - a. IBS
 - b. Colonic cancer
 - c. Ulcerative colitis
 - d. Colonic hemangioma
94. **What is the cause of chronic tropical pancreatitis?**
 - a. Parasitic infection
 - b. Malnutrition
 - c. Idiopathic
 - d. Genetic
95. **Severity of pancreatitis can be best assessed by?**
 - a. Serial Serum amylase
 - b. Stool trypsin levels
 - c. RANSON Score
 - d. ARDS development
96. **Which is not included in APACHE score?**
 - a. Serum bilirubin
 - b. GCS score
 - c. pH of blood
 - d. Age of patient
97. **What is the most common complication after ERCP?**
 - a. Acute pancreatitis
 - b. Pseudo-pancreatic cyst
 - c. Chronic pancreatitis
 - d. Necrotizing pancreatitis
98. **Lisch nodule is seen in?**
 - a. Neurofibromatosis
 - b. Multiple endocrine neoplasia 2A
 - c. Turcot syndrome
 - d. Familial adenomatous polyposis
99. **In case of annular pancreas, what is the surgery of choice?**
 - a. Duodeno-duodenostomy
 - b. Duodeno-jejunostomy
 - c. Pancreato-jejunostomy
 - d. Porto-enterostomy
100. **Not a early post-operative complication of splenectomy is?**
 - a. Thrombocytosis
 - b. Splenosis
 - c. Sub diaphragmatic abscess
 - d. Pulmonary complications
101. **Which of the following is a side effect of vagotomy?**
 - a. Delayed gastric emptying
 - b. Gastric atony
 - c. Diarrhea
 - d. All of the above
102. **Pseudo obstruction of intestine is also known as**
 - a. Hartmann's syndrome
 - b. Ozili's syndrome
 - c. Ogilvie's syndrome
 - d. Mirizzi syndrome
103. **What is the most common site of gastric ulcer?**
 - a. Duodenal cap
 - b. Lesser curvature
 - c. Second part of duodenum
 - d. Greater curvature
104. **Posterior perforation of ulcer in Antral canal will lead to fluid deposition in?**
 - a. Greater Omentum
 - b. Right Sub-phrenic abscess
 - c. Sub-hepatic space
 - d. Lesser sac
105. **Purtscher's Retinopathy is due to:**
 - a. Acute pancreatitis
 - b. Chronic pancreatitis
 - c. Meckel's diverticulum
 - d. Diverticulitis
106. **What is the etiology of type-A gastritis?**
 - a. Hypersensitivity reaction I
 - b. Autoimmune
 - c. Bacterial
 - d. Viral
107. **What is the most common location of lymphoma in the G.I.T?**
 - a. Stomach
 - b. Ileum
 - c. Mesentery
 - d. Colon
108. **Sister Mary Joseph nodule is commonly seen with:**
 - a. Ovarian CA
 - b. Colon CA
 - c. Pancreatic CA
 - d. Stomach CA

- 109. Krukenburg tumor originates from:**
 a. Liver b. Stomach
 c. Ovary d. Gallbladder
- 110. Angiodysplasia is seen in:**
 a. Stomach of adult b. Jejunum of a child
 c. Left side of the colon d. Right side of the colon
- 111. Which of the following is *not* a type of mesenteric cyst?**
 a. Mesothelial b. Enterogenous
 c. Chylolymphatic d. Epidermoid
- 112. What is the most common type of mesenteric cyst?**
 a. Simple (mesothelial cyst) b. Chylolymphatic cyst
 c. Enterogenous d. Dermoid
- 113. Immunoproliferative lymphoma presents with?**
 a. Obstruction b. Peritonitis
 c. Chronic diarrhea d. Tenesmus
- 114. Which of following is used for initial management of rectal prolapse in children?**
 a. Digital positioning b. Transanal surgery
 c. Injection sclerotherapy d. Resection rectopexy
- 115. Which is not a cause of acute anal pain?**
 a. Thrombosed hemorrhoids
 b. Acute anal fissure
 c. Fistula in ano
 d. Perianal abscess
- 116. Which of the following is seen in case of fistula-in-ano?**
 a. Purulent discharge with bleeding
 b. Serous discharge with bleeding
 c. Painful bleeding with constipation
 d. Painless bleeding with constipation
- 117. Goodsall's rule in fistula-in-ano is used for distinguishing:**
 a. High and low fistula
 b. Anterior and posterior fistula
 c. External and internal fistula
 d. Lateral and medial fistula
- 118. Which is the most common cancer of anus?**
 a. Adenocarcinoma b. Squamous cell CA
 c. Basal cell CA d. Melanoma
- 119. Which is the most common cancer of anus?**
 a. Squamous b. Basaloid
 c. Cuboidal d. Cloacogenic
- 120. Anal cancer is associated with**
 a. Human papilloma virus b. EBV
 c. HTLV-1 d. Polyoma virus
- 121. What is the most common site of metastases of carcinoma rectum?**
 a. Lung b. Liver
 c. Brain d. Vertebra

- 122. The following image shows**

- a. Rectal prolapse b. Fistula in ano
 c. Perianal abscess d. Rectal cancer
- 123. MC complication after hemorrhoidectomy?**
 a. Prolapse b. Urine retention
 c. Fecal incontinence d. Bleeding
- 124. What is incorrect about anal canal?**
 a. 1/3rd above dentate line and 2/3rd below the dentate line
 b. Extraperitoneal
 c. Anoderm is painful
 d. Keratinization
- 125. What is true about Ischiorectal fossa boundaries?**
 a. Anterior border is formed by inferior fascia of urogenital diaphragm.
 b. Superior border is formed by Gluteus Maximus
 c. Lateral border is formed by Levator Ani
 d. Posterior border is formed by obturator internus muscle.
- 126. What is the diagnosis?**

- a. Perforation by Ascariasis
 b. Volvulus by Ascariasis
 c. Ascending cholangitis by Ascariasis
 d. Solitary ascariasis in the bowel

BREAST

127. Dye for Sentinel Lymph node biopsy is injected in which of the following sites? (Recent Pattern Question 2018-19)

- | | |
|-----------|-------------------|
| a. Axilla | b. Tail of spence |
| c. Nipple | d. Areola |

128. Correct description about Paget's disease of breast?

(Recent Pattern Question 2018-19)

- Eczema of skin of nipple
- Eczema of skin of areola
- Mastitis carcinomatosa
- Atrophic scirrhous carcinoma

129. MC benign breast tumour?

(Recent Pattern Question 2018-19)

- | | |
|-----------------|---------------------|
| a. Fibroadenoma | b. Fibroadenosis |
| c. D.C.I.S | d. Phyllodes tumour |

130. Breast triple assessment contains all except?

(Recent Pattern Question 2018-19)

- | | |
|-------------------------|----------------------|
| a. Clinical examination | b. Axillary Sampling |
| c. USG | d. FNAC and biopsy |

131. Which of the following is not an indication for Fibroadenoma surgery? (Recent Pattern Question 2018)

- | | |
|-----------------------|------------------------|
| a. Patient's decision | b. Size more than 5 cm |
| c. Complex type | d. Recurrence |

132. In a breast lump of 4 cm no nodal metastasis is present. Which is the stage of breast cancer?

(Recent Pattern Question 2018)

- | | |
|--------------|-------------|
| a. Stage I | b. Stage II |
| c. Stage III | d. Stage IV |

133. Peau d'orange appearance in breast cancer is seen with which stage of cancer? (Recent Pattern Question 2017)

- | | |
|--------|--------|
| a. T4A | b. T4B |
| c. T4C | d. T4D |

134. Breast cancer more than 5 cm is defined as stage_____

(Recent Pattern Question 2017)

- | | |
|-------|-------|
| a. T1 | b. T2 |
| c. T3 | d. T4 |

135. What is the diagnosis of the mammography report in a 30 year old woman with breast lump felt on self-examination of breast? (Recent Pattern Question 2017)

- | | |
|------------------|--------------------------------|
| a. Fibroadenoma | b. Breast cancer |
| c. Fibroadenosis | d. Brodie's Serocystic disease |

136. Which is the most common quadrant for carcinoma Breast? (Recent Pattern Question 2016)

- | | |
|----------------|----------------|
| a. Lower outer | b. Lower inner |
| c. Upper outer | d. Upper inner |

137. Which is the most common Familial Breast cancer gene? (Recent Pattern Question 2016)

- | | |
|-------------------------|-----------|
| a. BRCA1 | b. BRCA 2 |
| c. Li-Fraumeni syndrome | d. STK 11 |

138. Skin of nipple and areola drains to which lymph node? (Recent Pattern Question 2016)

- | | |
|----------------------|---------------------|
| a. Anterior axillary | b. Supra-clavicular |
| c. Central | d. Infra-clavicular |

139. A 25-year-old female presents with a breast lump and green discharge from inverted nipples. What is the first differential diagnosis? (Recent Pattern Question 2016)

- | | |
|-----------------|--------------------|
| a. Duct ectasia | b. Mastitis |
| c. Carcinoma | d. Paget's disease |

140. Young female with painless, mobile lump of 4 cm in a breast. What is the diagnosis?

- | | |
|-------------------|------------------|
| a. Breast abscess | b. Breast cyst |
| c. Fibroadenoma | d. Peau d'orange |

141. Which breast cancer involves both breasts?

- | | |
|----------------------|-----------------------------|
| a. Lobular carcinoma | b. Mucoïd carcinoma |
| c. Ductal carcinoma | d. Ductal carcinoma in situ |

142. A biopsy of the opposite breast is considered in which of the following types of breast carcinoma?

- | | |
|-----------------------|------------------------|
| a. Comedo carcinoma | b. Medullary carcinoma |
| c. Mucinous carcinoma | d. Lobular carcinoma |

143. What is correct regarding Peau d'orange in breast carcinoma?

- Infiltration of cooper's ligament with cancer cells
- Infiltration of skin of breast with cancer cells
- Associated with lobular carcinoma of breast
- Good prognosis

144. Breast lump in pregnant lady is diagnosed by?

- | | |
|----------------|--------------------|
| a. FNAC | b. Core cut Biopsy |
| c. Mammography | d. MRI |

145. Which is the next investigation to be done for painful breast lump in a lactating woman?

- Mammography
- USG
- MRI
- FNAC

146. All are true about Paget's disease of breast EXCEPT?

- It is often bilateral
- Crusting of areola skin
- Lumpectomy is performed usually
- Paget cells are positive for HER2/neu

147. In breast conservative surgery the healthy margin excised is typically?

- | | |
|---------|---------|
| a. 1 cm | b. 2 cm |
| c. 3cm | d. 4 cm |

148. A 35 year pregnant female came to your clinic with lump as shown in the image. What will be the initial screening method?

- a. USG b. MRI
c. Mammogram d. FNAC
149. Breast cancer is called stage 4 when there is?
- a. Involvement of chest wall
b. Satellite lesion
c. Ulceration of surface skin
d. Spread to adrenal gland
150. As per AJCC breast cancer staging T4 is?
- a. Distant metastasis
b. Satellite lesions
c. Spread to contralateral axillary lymph nodes
d. Sentinel lymph node involvement
151. Which is the most important prognostic factor for carcinoma breast?
- a. HER2/Neu b. Histology grade
c. Tumor staging d. Tumor growth rate
152. What is the probable diagnosis?

- a. Mastitis b. Mondor disease
c. Cystosarcoma phyllodes d. Paget disease
153. Sentinel node biopsy is done for all EXCEPT?
- a. Colon carcinoma b. Ocular cancer
c. Breast cancer d. Malignant melanoma
154. Stage of 3 cm breast cancer involving 4 axillary lymph nodes
- a. Stage I b. Stage II
c. Stage III d. Stage IV
155. A 28-year-old female presents with infiltrating breast carcinoma with 1 cm hard lump. T1-N0-M0. What is the best treatment?
- a. Radical mastectomy b. Simple mastectomy
c. Extended radical mastectomy
d. Super radical mastectomy

THYROID AND SALIVARY GLANDS

156. Sebaceous cyst is not seen in?

(Recent Pattern Question 2018-19)

- a. Back b. Soles
c. Scalp d. Scrotum

157. Patient complains of painless swelling over the face with difficulty in swallowing. The appearance of face is shown. The probable diagnosis is?

(Recent Pattern Question 2018-19)

- a. Acute parotitis b. Cancer of parotid gland
c. Angioedema of face d. Acute Sialpadenitis
158. A 35-year-old lady has presented with a 6-month painless fluctuant, non-transilluminant swelling with a thin watery discharge. Clinical diagnosis is?

(Recent Pattern Question 2019)

- a. Branchial Cyst b. Secondaries
c. TB d. Lymphoma
159. Lid lag sign is also known as:
- (Recent Pattern Question 2018)
- a. Stellwag's sign b. Von Graefe's sign
c. Dalrymple sign d. Mobius sign
160. Which is the most common malignancy of the endocrine system?
- a. Thyroid cancer b. Pancreatic cancer
c. Pituitary adenoma d. Adrenal malignancy
161. Which of the following is the most useful investigation for thyroid function?
- a. TSH b. T3
c. T4 d. Thyroglobulin

- 162. Papillary carcinoma of thyroid is spread via?**
 a. Lymphatic b. Hematogenous
 c. Local spread d. All of the above
- 163. Which iodine isotope is used for thyroid ablation?**
 a. Iodine 131 b. Iodine 123
 c. Iodine 213 d. Iodine 132
- 164. Which is the most common nerve to be damaged in thyroid surgery?**
 a. Recurrent laryngeal nerve
 b. Inferior laryngeal nerve
 c. External branch of superior laryngeal nerve
 d. Internal branch of superior laryngeal nerve
- 165. Which is the tumor marker for medullary carcinoma of thyroid?**
 a. Albumin b. TSH
 c. Thyroglobulin d. Calcitonin
- 166. Which cancer arises from C-cells of thyroid?**
 a. Follicular b. Anaplastic
 c. Papillary d. Medullary
- 167. Which thyroid cancer is associated with radiation exposure?**
 a. Medullary b. Papillary
 c. Follicular d. Anaplastic carcinoma
- 168. Which thyroid tumor has the best prognosis?**
 a. Papillary b. Follicular
 c. Anaplastic d. Medullary
- 169. A male patient with euthyroid state presents with the following condition. What is the diagnosis?**

- a. Thyroglossal cyst b. Multiple nodular goiter
 c. Solitary thyroid nodule d. Toxic nodular goiter
- 170. FNAC can diagnose all of the following thyroid lesions EXCEPT**
 a. Anaplastic carcinoma b. Papillary carcinoma
 c. Follicular carcinoma d. Medullary carcinoma
- 171. Which of the following is not a landmark of facial nerve during superficial parotidectomy?**
 a. Tragus
 b. Mastoid process
 c. Posterior belly of digastric muscle
 d. Zygomatic bone

- 172. Which is the most common parotid gland tumor?**
 a. Warthin's tumor
 b. Mucoepidermoid carcinoma
 c. Pleomorphic adenoma
 d. Adenoid cystic carcinoma
- 173. Nerve invasion is seen in which type of parotid carcinoma?**
 a. Muco-epidermoid carcinoma
 b. Adenoid cystic carcinoma
 c. Malignant mixed tumors
 d. Acinic cell carcinoma
- 174. Warthin's tumor is tumor of which gland?**
 a. Parotid gland b. Submandibular gland
 c. Lingual gland d. Minor salivary glands
- 175. Most commonly salivary gland fistula starts from which gland?**
 a. Parotid gland b. Salivary gland
 c. Submandibular glands d. Sublingual glands
- 176. Salivary gland stone is formed most commonly in:**
 a. Submandibular gland b. Mandibular gland
 c. Sublingual gland d. Parotid gland
- 177. What is the surgery of choice for pleomorphic adenoma?**
 a. Superficial parotidectomy
 b. Total parotidectomy
 c. Radical parotidectomy
 d. Radiotherapy

HERNIA AND HYDROCOELE

- 178. Bell clapper testis predisposes to?**
(Recent Pattern Question 2018-19)
 a. Torsion testis b. Varicocele
 c. Cancer of testis d. Hydrocele
- 179. In NYHUS classification which of these is called Type 3A hernia?**
(Recent Pattern Question 2018)
 a. Femoral b. Direct
 c. Indirect d. Pantaloons
- 180. A 40-year-old patient was being operated for direct hernia. During surgery two sacs were seen. The diagnosis is?**
(Recent Pattern Question 2016)
 a. Pantaloons hernia b. Richter hernia
 c. Spigelian hernia d. Littre hernia
- 181. A 30-year-old obese male patient presents with complete inguinal hernia and on examination doughy consistency is felt with dull note on percussion. This suggests that the contents of the hernia sac contain**
(Recent Pattern Question 2016)
 a. Omentum
 b. Large intestine
 c. Small intestine
 d. Encysted ascitic fluid

- 182. Deep inguinal ring is a defect in aponeurosis of:**
 a. External oblique muscle of abdomen
 b. Internal oblique muscle of abdomen
 c. Transverse abdominis muscle
 d. Transversalis fascia
- 183. A 3-year-old child presents with red scrotal swelling which shows self resolution by next day morning and is maximum in evening with positive transillumination test. What is the diagnosis?**
 a. Scrotal abscess b. Congenital hydrocele
 c. Secondary abscess d. Infantile hydrocele
- 184. Hydrocele in a child is managed by:**
 a. Herniotomy b. Plication of sac
 c. Eversion of sac d. Inversion of sac
- 185. What is not true about hernia in children?**
 a. Conservative Management till patient is asymptomatic
 b. Hernia treatment is done with herniotomy
 c. Absorbable mesh is not used
 d. Long standing hernia decreases chances of incarceration
- 186. The content of Littre's hernia is?**
 a. Omentum
 b. Bladder
 c. Meckel's diverticulum
 d. Part of circumference of intestine
- 187. A 15-year-old male presents with pain in inguinal area and lower abdomen. On examination tenderness over a non-reducible swelling with negative cough impulse is noted. What is the diagnosis?**
 a. Strangulated hernia b. Testicular torsion
 c. Scrotal abscess d. Femoral hernia
- 188. Femoral hernia presents:**
 a. Below and lateral to pubic tubercle
 b. Above and medial to pubic tubercle
 c. Below and medial to pubic tubercle
 d. Above and lateral to pubic tubercle
- 189. All are true about femoral hernia EXCEPT?**
 a. Common in nulliparous women
 b. Lockwood infra-inguinal approach is used
 c. Cough impulse is present
 d. Higher incidence of strangulation than inguinal hernia
- 190. Which hernia has the highest rate of strangulation?**
 a. Direct inguinal hernia b. Indirect inguinal hernia
 c. Femoral hernia d. Incisional hernia
- 191. Which of the following hernia presents as emergency?**
 a. Direct inguinal hernia
 b. Indirect inguinal hernia
 c. Femoral hernia
 d. Incisional hernia
- 192. Double sac hernia is known as:**
 a. Richter hernia
 b. Cooper's hernia
 c. Littre's hernia
 d. Spigelian hernia
- 193. A patient has direct inguinal hernia. On operation intra-operative indirect inguinal hernia is seen. What is the diagnosis?**
 a. Maydl's hernia b. Velpeau hernia
 c. Petit hernia d. Saddle bag hernia
- 194. Meckel's diverticulum forms wall in case of which type of hernia?**
 a. Richter's hernia b. Spigelian hernia
 c. Cooper's hernia d. Littre's hernia
- 195. Spigelian hernia is:**
 a. Hernia through petit triangle
 b. Hernia passing through obturator canal
 c. Hernia through linea alba
 d. Hernia at level of arcuate line
- 196. What is the location of bochdaleck hernia?**
 a. Posterolateral b. Anteroposterior
 c. Anterolateral d. Posteromedial
- 197. A 25-year-old male presents with fever and red, swollen scrotum. Upon examination testis is felt separate from epididymis because of marked swelling in epididymis. What is the diagnosis?**
 a. Testicular torsion b. Fournier's gangrene
 c. Epididymo orchitis d. Testicular cancer
-
- ## UROLOGY
-
- 198. Which of these is the best for management of a 3cm stone in renal pelvis without evidence of hydronephrosis?**
 a. ESWL *(Recent Pattern Question 2018-19)*
 b. PCNL
 c. Antegrade pyeloplasty
 d. Retrograde pyeloplasty
- 199. Germ cell tumour not seen in males:**
(Recent Pattern Question 2018-19)
 a. Choriocarcinoma b. Seminoma
 c. Sertoli cell tumour d. Teratoma
- 200. Cut off for diagnosis of Priapism is?**
(Recent Pattern Question 2018-19)
 a. 1 hours b. 2 hours
 c. 3 hours d. 4 hours
- 201. A person could not pass urine after suffering from pelvic fracture. On examination vitals are stable but bladder is not palpable. What is the probable diagnosis?**
(Recent Pattern Question 2018)
 a. Membranous urethra rupture
 b. Bulbar urethra rupture
 c. Recto-urethral injury
 d. Intraperitoneal rupture of bladder
- 202. The kidney stone whose development is insensitive to pH of urine is:** *(Recent Pattern Question 2018)*
 a. Calcium oxalate b. Triple phosphate
 c. Uric acid d. Cystine

203. A 60-year-old smoker male patient presents with painless gross hematuria for 1 day. IVU shows 1.2 cm filling defect at the lower pole of infundibulum. Which is the next best investigation to be done? *(Recent Pattern Question 2018)*
- Cystoscopy
 - Urine cytology
 - USG abdomen
 - DMSA scan
204. A 70-year-old man after TURP for BPH develops seizures in postoperative state. What is the diagnosis? *(Recent Pattern Question 2018)*
- Water intoxication
 - Anesthetic over-dosage
 - Mismatched blood transfusion
 - Malignant hyperthermia
205. What does the following image show? *(Recent Pattern Question 2017)*

- Misplaced Cu-T 380Ag
 - Fecolith
 - Ureterocele
 - Appendicolith
206. What is the best treatment for metastatic advanced prostate carcinoma? *(Recent Pattern Question 2017)*
- T.U.R.P
 - Androgen ablation
 - Chemotherapy
 - Radical prostatectomy
207. Seminoma spreads by? *(Recent Pattern Question 2016)*
- Hematogenous route
 - Direct route
 - Lymphatics
 - Directly by spermatic cord
208. In a person if testis cancer is suspected, which test is to be done first? *(Recent Pattern Question 2016)*
- Scrotal USG
 - MRI
 - FNAC
 - PET/CT
209. A 28-year-old patient from Bihar presents with on and off pain in right scrotum and then gradual onset swelling develops over the duration of 2 years. Trans illumination test is positive. Top of testis can be reached. The probable diagnosis is? *(Recent Pattern Question 2016)*
- Right hydrocele
 - Right inguinal hernia
 - Right epididymal cyst
 - Right encysted hydrocele of cord
210. A 50-year-old patient complains of pain and swelling in right side scrotum for two days. He tells that this swelling has been gradually increasing in size with a dragging sensation for 2 years. On examination there is a large inguinoscrotal irreducible swelling with extreme tenderness and redness. What is the probable diagnosis? *(Recent Pattern Question 2016)*
- Right hydrocele
 - Right strangulated inguinal hernia
 - Right testicular torsion
 - Right Pyocele
211. A young boy 18 years of age presents with pain in groin for 2 days. On examination the testis seems high and cremasteric reflex is absent. Elevation of testis worsens the pain. What is the probable diagnosis? *(Recent Pattern Question 2016)*
- Right testicular torsion
 - Right strangulated hernia
 - Right inguinal hernia
 - Right epididymo-orchitis
212. Which is the most common type of renal stone?
- Calcium oxalate
 - Triple phosphate
 - Struvite stone
 - Urate stone
213. Which renal stone is radiolucent?
- Uric acid
 - Calcium oxalate
 - Triple phosphate
 - Calcium phosphate
214. Stag horn calculi associated with proteus infection are:
- Uric acid stones
 - Triple phosphate stones
 - Calcium oxalate stones
 - Cystine stones
215. Alkaline urine is seen in:
- Uric acid stone
 - Oxalate stone
 - Triple phosphate stone
 - Cystine stone
216. What is the cause of urinary retention?
- Vaginal fibroid
 - Cervical fibroid
 - Uterine fibroid
 - Subserosal fibroid
217. What is the most useful investigation for calculus in ureteric colic?
- CECT
 - NCCT
 - USG
 - X-ray
218. Transitional cell carcinoma is seen in
- Prepuce
 - Testis
 - Prostate
 - Urinary bladder
219. Which is the most common tumor of urinary bladder?
- Squamous cell cancer
 - Carcinosarcoma
 - Transitional cell cancer
 - Clear cell cancer
220. What is the most common clinical presentation of bladder cancer?
- Painful urinary stasis
 - Painless urinary stasis
 - Painful hematuria
 - Painless hematuria
221. What is the most common clinical subtype of transitional cell carcinoma of bladder?
- Local Metastatic
 - Distant metastasis
 - Superficial
 - Deep
222. All are true about transitional cell cancer of urinary tract EXCEPT:
- Bladder is a frequent site
 - Most common risk factor is smoking
 - Females and males are equally affected
 - Vitamin A is effective against bladder CA

223. Rupture of urethra above the deep perineal pouch causes urine retention in which region?

- a. Medial aspect of thigh b. Scrotum
- c. True pelvis only d. Anterior abdominal wall

224. Which amongst following is the most common cause of UTI?

- a. Instrumentation b. Urethral diverticulum
- c. Bladder stones d. Pregnancy

225. Spider leg sign on IVP suggests?

- a. Renal stone b. Polycystic kidney
- c. Hypernephroma d. Hydronephrosis

226. Adder head appearance on IVP is seen in

- a. Ureteral duplication b. Ureterocele
- c. Ureteric hypoplasia d. Polycystic kidneys

227. Reinke's crystals are seen in?

- a. Leydig cells b. Sertoli cells
- c. Curschmann spirals d. Creola bodies

228. Which is the most common testicular tumor?

- a. Seminoma b. Teratoma
- c. Sertoli cell tumor d. Chorio-CA

229. Which is the first lymph node involved in lymph node metastasis in testicular tumor?

- a. Inguinal b. Para aortic
- c. External iliac d. Internal iliac

230. Which is the most specific marker for prostate cancer?

- a. P.S.A b. P.A.P
- c. Transrectal USG d. N.S.E

231. What is incorrect about PSA?

- a. Liquefaction of seminal coagulum
- b. Produced by both normal cells and malignancy
- c. Increased with prostatitis
- d. Persists in blood even after prostatectomy

232. A 70-year-old man with prostate cancer was given radiotherapy. The recurrence of the cancer is monitored biochemically by

- a. Androgens levels
- b. Prostate specific antigen and carcino-embryonic antigen
- c. Prostate specific antigen only
- d. ALP and CEA

233. Three glass urine test with first glass specimen of urine showing threads is diagnostic of

- a. Urethritis b. Prostatitis
- c. Cystitis d. Epididymitis

234. Prostate cancer spreads to the vertebral column via?

- a. Batson plexus
- b. Inferior hypogastric plexus
- c. Superior hypogastric plexus
- d. All of above

235. What is the indication for Radical prostatectomy?

- a. Localized prostate cancer, life expectancy < 10 years
- b. Localized prostate cancer, life expectancy > 10 years

c. Locally advanced prostate cancer, life expectancy < 10 years

d. Locally advanced disease with extension to lateral pelvic fascia

236. Which of the following is correct about the image given below?

- a. Horse shoe kidney
- b. Undescended left kidney
- c. Congenital absent left kidney
- d. Papillary carcinoma

237. The given picture shows

- a. Renal cell cancer b. Hydronephrosis
- c. Polycystic kidneys d. Nephrolithiasis

238. What does the given picture show?

- a. Foreign body b. Bladder stone
- c. Bladder diverticulum d. Fecolith

239. What is the probable diagnosis?

- | | |
|--------------|--------------------|
| a. Chancroid | b. Carcinoma penis |
| c. Chancre | d. Bowen disease |

240. In carcinoma penis tumor staging, stage III involves:

- Shaft of penis
- Inguinal lymph node metastasis operable
- Inguinal lymph node metastasis inoperable
- Confined to prepuce

241. A 5-year-old child pulls penis skin while urinating. Upon examination there is erythema and edema over the prepuce. What is the diagnosis?

- | | |
|-----------------------------|-------------------|
| a. Hypospadias | b. Urethral Stone |
| c. Posterior urethral valve | d. Phimosis |

242. Chordee is associated with:

- | | |
|---------------|-----------------------------|
| a. Epispadias | b. Hypospadias |
| c. Phimosis | d. Posterior urethral valve |

243. The treatment of balanitis xerotica obliterans (BXO) is

- Chemotherapy
- Circumcision
- Radiotherapy
- Partial amputation of penis

244. Which is a major cause of death in renal transplant patients?

- | | |
|--------------|---------------|
| a. Uremia | b. Malignancy |
| c. Rejection | d. Infection |

HEPATOBIILIARY SYSTEM

245. A 6-year-old child is brought with high fever with rigors for 5 days with pain in right hypochondrium. On examination patient is anicteric and tenderness is noted in Right upper quadrant. What is best investigation for this case? *(Recent Pattern Question 2018-19)*

- USG
- Serology
- SGOT/ LFT
- Contrast CT scan

246. AFP is a tumour marker for which of the following? *(Recent Pattern Question 2018-19)*

- | | |
|---------------|-------------|
| a. HCC | b. RCC |
| c. Oncocytoma | d. Chordoma |

247. Comment on the image shown below.

(Recent Pattern Question 2018-19)

- Percutaneous Transhepatic cholangiogram
- T tube cholangiogram
- E.R.C.P
- HIDA scan

248. Which of the following is correct about Zollinger Ellison syndrome? *(Recent Pattern Question 2018)*

- Associated with MEN1
- Most common site is stomach
- Best test for diagnosis is pentagastrin test
- Metastasis to adjacent gut

249. Which ligament is compressed in the Pringle maneuver? *(Recent Pattern Question 2017)*

- Hepatoduodenal ligament
- Gastroduodenal ligament
- Gastrohepatic ligament
- Lienorenal ligament

250. A patient comes with RUQ pain. The USG image shows? *(Recent Pattern Question 2017)*

- | | |
|-----------------------|--------------------------|
| a. Cholelithiasis | b. Cholecystitis |
| c. Cholangiocarcinoma | d. Porcelain Gallbladder |

251. A 28-year-old man from Bihar develops right hypochondriac pain. USG shows $5 \times 5 \times 4$ cm abscess in left lobe of liver. Hydatid serology is negative. What is the treatment? *(Recent Pattern Question 2016)*

- Anti -Amoebic drugs
- Aspiration + Anti amoebic drugs
- Catheter drainage + Anti amoebic drugs
- Percutaneous aspiration and infusion of scolicalidal agents

- 252. Aflatoxin leads to?** (Recent Pattern Question 2016)
 a. Liver cancer b. Hepatic adenoma
 c. Bladder cancer d. Retinoblastoma
- 253. What is the ideal management of a hemodynamically unstable patient with suspected liver injury?**
 a. Inotropic support (Recent Pattern Question 2016)
 b. Exploratory Laparotomy
 c. Rapid transfusion of fresh blood
 d. Rapid infusion of iv crystalloids
- 254. A 40 year patient is having high grade fever associated with abdominal pain in right upper quadrant, with hepatomegaly and liver dullness on percussion. What is the clinical diagnosis?**
 a. Pyogenic liver abscess b. Amoebic liver abscess
 c. Hydatid cyst d. Neoplastic growth
- 255. Anchovy sauce pus is seen in?**
 a. Amoebic liver abscess b. Pyogenic liver abscess
 c. Hydatid cyst d. Cold abscess
- 256. A patient has obstructive jaundice. USG can tell all of the following EXCEPT?**
 a. Number of stones in CBD
 b. Peritoneal deposits
 c. Size of liver
 d. Extrahepatic versus intrahepatic causes
- 257. The organism associated with fish consumption which causes carcinoma gallbladder**
 a. Clonorchis sinensis
 b. Gnathostoma
 c. Strongyloidosis cantonensis
 d. H. diminuta
- 258. A 30-year-old lady presents with fever and pain in right hypochondrium with presents breath catch up upon palpation. What is the clinical diagnosis?**
 a. Acute pancreatitis b. Acute cholecystitis
 c. Acute appendicitis d. Acute mediastinitis
- 259. Charcot triad is used for**
 a. Acute cholangitis b. Acute cholecystitis
 c. Cholelithiasis d. Gall bladder CA
- 260. Murphy sign is seen in:**
 a. Acute appendicitis b. Acute cholecystitis
 c. Acute pancreatitis d. Acute cholangitis
- 261. Which of the following is Not associated with elevation of Right hemi-diaphragm:**
 a. Amebic abscess b. Pyogenic abscess
 c. Cholecystitis d. Sub diaphragmatic abscess
- 262. Liver biopsy is indicated for diagnosis/evaluation of all EXCEPT?**
 a. Autoimmune hepatitis b. Storage disorders
 c. Hemangioma d. Hepatocellular carcinoma
- 263. Which is the most common benign liver tumor?**
 a. Hemangioma b. Hepatocellular carcinoma
 c. Hepatoma d. Secondaries
- 264. Pringle's maneuver is mainly used to control bleeding from**
 a. IVC b. Hepatic artery
 c. Cystic artery d. Hepatic vein
- 265. What is the true color of cholesterol stone?**
 a. Black b. Dark yellow
 c. Brown d. Pale yellow
- 266. In Hemolytic anemia which stones are commonly seen?**
 a. Pigment stone b. Cholesterol stone
 c. Mixed stone d. All of above
- 267. Aspirin protects against all EXCEPT?**
 a. MI b. Stroke
 c. Colorectal cancer d. Liver cancer

HEAD AND NECK

- 268. All are premalignant conditions of oral cavity except:** (Recent Pattern Question 2018-19)
 a. Chronic hyperplastic candidiasis
 b. Oral submucosal fibrosis
 c. Oral lichen planus
 d. Leukoplakia
- 269. Comment on the diagnosis of this 60 year old man.** (Recent Pattern Question 2018-19)

- a. Basal cell Cancer
 b. Plunging Ranula
 c. Epulis
 d. SCC of lip
- 270. MC subtype of Rodent ulcer is?** (Recent Pattern Question 2018-19)
 a. Superficial spreading b. Acral lentiginous
 c. Nodulocystic d. Pigmented
- 271. Which among the following is the cause of submucosal fibrosis?** (Recent Pattern Question 2018)
 a. Alcohol
 b. Candidiasis
 c. Betel nut chewing
 d. Pan leaf chewing

272. Which nerve is involved in thoracic outlet syndrome?

(Recent Pattern Question 2017)

- a. Pain and paraesthesia in axillary nerve distribution
- b. Pain and paraesthesia in median nerve distribution
- c. Pain and paraesthesia in radial nerve distribution
- d. Pain and paraesthesia in ulnar nerve distribution

273. Pott puffy tumor is seen at? *(Recent Pattern Question 2017)*

- a. Frontal bone
- b. Temporal bone
- c. Occipital bone
- d. Sphenoid bone

274. Cranio-pharyngioma is a brain tumor arising from?

(Recent Pattern Question 2016)

- a. Rathke pouch
- b. Neurohypophysis
- c. Posterior pituitary
- d. Median eminence

275. A biker develops a head injury and non-contrast CT scan shows presence of Lentiform hemorrhage. What is the diagnosis? *(Recent Pattern Question 2016)*

- a. Extradural bleeding
- b. Subdural bleeding
- c. Intraparenchymal bleeding
- d. Intraventricular bleeding

276. Metastasis to neck lymph nodes is from?

- a. Breast cancer
- b. Lung cancer
- c. Adrenal carcinoma
- d. Stomach cancer

277. What is the most common malignant brain tumor?

- a. Astrocytoma
- b. Glioblastoma multiforme
- c. Oligodendroglioma
- d. Ependymoma

278. Stereotactic radiotherapy is used for treatment of?

- a. Brain tumor
- b. Lung carcinoma
- c. Cervical cancer
- d. Renal carcinoma

279. Which of the following tumors is cured by radiation?

- a. Rhabdomyosarcoma
- b. Neuroblastoma
- c. Chloroma
- d. Seminoma

280. Which is the most common secondary malignancy in retinoblastoma?

- a. Ewing's sarcoma
- b. Osteosarcoma
- c. Chondro-sarcoma
- d. Rhabdo-myosarcoma

281. All are seen in Trotters' triad EXCEPT:

- a. Unilateral conductive hearing loss
- b. Ipsilateral earache and facial pain
- c. Ipsilateral paralysis of the soft palate
- d. Seen with juvenile nasopharyngeal angiofibroma

282. What is true about tongue cancer?

- a. Most common type is adenocarcinoma
- b. Cervical lymph node metastasis is universally present
- c. MC site is on Lateral margin
- d. Slurring of speech is a common complaint

283. What is the most common site of tongue cancer?

- a. Base of tongue
- b. Tip of tongue
- c. Lateral margin of tongue
- d. Posterior attachment of tongue

284. What is your diagnosis?

- a. Cleft lip
- b. Cleft palate
- c. Cleft lip and palate
- d. Bifid uvula

285. Secretory sinus in neck, moving upon deglutination:

- a. Branchial sinus
- b. Pilonidal cyst
- c. Thyroglossal fistula
- d. Sublingual dermoid cyst

286. A newborn has a swelling in neck due to soft cystic mass with transillumination test positive. What is the diagnosis?

- a. Potato tumor
- b. Branchial cyst
- c. Cystic hygroma
- d. Carotid body tumor

287. All of the following are true regarding cystic hygroma EXCEPT

- a. Brilliantly transilluminant
- b. Mostly on posterior neck region
- c. Lined by endothelium
- d. Lined by columnar epithelium

VASCULAR SURGERY

288. Most common complication of below knee stripping of Varicose veins is? *(Recent Pattern Question 2018-19)*

- a. Haemorrhage
- b. Thromboembolism
- c. Neuralgia
- d. Infection

289. Which is the most common site of peripheral aneurysm? *(Recent Pattern Question 2018)*

- a. Femoral artery
- b. Radial artery
- c. Popliteal artery
- d. Brachial artery

290. Intermittent claudication is defined as pain _____?

- a. At rest
- b. On first step of walking
- c. Relieved on standing still
- d. Increase on limb dependency

291. Which of the following is the best management for radiation induced occlusive disease of carotid artery?

- a. Low dose aspirin
- b. Carotid angioplasty and stenting
- c. Carotid endarterectomy
- d. Carotid bypass procedure

292. All of the following result after chronic edema to legs EXCEPT?

- a. Marjolin's ulcer
- b. Thickening of skin
- c. Soft tissue infections
- d. Varicose veins

293. Buerger disease affects which layers of artery?
 a. Tunica media b. Tunica adventitia
 c. Tunica intima d. All of above
294. All are true about Buerger disease EXCEPT:
 a. Ulnar artery and peroneal arteries involved
 b. Nerve involvement present
 c. Small acral vessels of limb involvement causes hypohidrosis
 d. Phlebitis migrans
295. Patient presents with varicose vein with sapheno-femoral incompetence with normal perforators. The best management plan is:
 a. Endovascular stripping
 b. Sclero-therapy
 c. Sapheno-femoral flush ligation
 d. Saphenofemoral flush ligation with stripping
296. Thrombo-angitis obliterans involves?
 a. Arteries b. Veins
 c. Nerves d. All of above
297. Hoffman Tinel sign is seen in?
 a. Deep vein thrombosis
 b. Nerve regeneration
 c. Pulmonary embolism
 d. Upper motor neuron lesion

GENERAL SURGERY

298. Which of the following is not a hospital acquired infection? *(Recent Pattern Question 2018-19)*
 a. S.S.I b. S.T.D
 c. U.T.I d. Pneumonia
299. Amount of blood loss in class III circulatory failure/Haemorrhagic shock? *(Recent Pattern Question 2018-19)*
 a. <15% b. 15-30%
 c. 30-40% d. >40%
300. Identify the lesion shown. *(Recent Pattern Question 2018-19)*

- a. Wet gangrene b. Dry gangrene
 c. Frost bite d. Ainhum

301. The following patient has presented after chest trauma. On examination crepitus is felt. The clinical diagnosis is? *(Recent Pattern Question 2018-19)*

- a. Subcutaneous Emphysema b. Gas gangrene
 c. Acute tubular necrosis d. SVC syndrome

302. What is the GCS for a brain dead patient? *(Recent Pattern Question 2018)*
 a. 3 b. 5
 c. 6 d. 8
303. A 50 kg patient has 40% burn of the body surface area. Calculate the ringer lactate solution to be given for 1st 8 hours of fluid. *(Recent Pattern Question 2018)*
 a. 1 L b. 2 L
 c. 4 L d. 8 L
304. Which is the best method to administer oxygen in case of burns of airways? *(Recent Pattern Question 2018)*
 a. Elective intubation b. Mask
 c. Nasal prongs d. Tracheostomy
305. In which of the following conditions is Fogarthy catheter used? *(Recent Pattern Question 2017)*
 a. Acute limb ischemia
 b. Tube thoracotomy with underwater seal
 c. Suprapubic drainage of bladder
 d. Total parenteral nutrition
306. Which of the following needle is used to suture skin? *(Recent Pattern Question 2017)*
 a. Cutting needle
 b. Reverse Cutting needle
 c. Round body needle
 d. Straight needle with eye
307. Shock index is defined as? *(Recent Pattern Question 2017)*
 a. Pulse rate/BP b. BP/Pulse rate
 c. CVP/PCWP d. PCWP/CVP
308. Which is used to control bleeding? *(Recent Pattern Question 2017)*
 a. Pressure b. Packing
 c. Position d. All of the above

309. What is the preferred fluid used in burns after 24 hours?
a. Ringer lactate (Recent Pattern Question 2017)
b. Colloids
c. Hypertonic saline
d. Switch to oral or parenteral nutrition
310. A patient presents with knife stab wound to the Lower neck. Pulse rate is 110/min with BP = 100/70 mmHg. Which is the next step? (Recent Pattern Question 2017)
a. Immediate wound exploration
b. Formal wound exploration in OT in GA
c. Put stent to prevent pneumothorax
d. Urgent angiography
311. A patient with abdominal trauma is brought to casualty. On examination the vitals are stable with no evidence of peritonitis. Next best step is? (Recent Pattern Question 2017)
a. Urgent exploratory laparotomy
b. CT Abdomen
c. F.A.S.T
d. Diagnostic peritoneal lavage
312. Class I haemorrhagic shock is caused by _____ ml loss of blood. (Recent Pattern Question 2017)
a. 750 b. 1000
c. 1500 d. 2000
313. Fogarthy catheter is used in which of the following?
a. Acute limb ischemia (Recent Pattern Question 2017)
b. Suprapubic catheterization of Urinary bladder
c. Deflating sigmoid volvulus
d. Coronary stenting
314. A patient underwent inguinal lymph node dissection and drain was placed. On 10th day severe bleeding occurs. What type of bleeding is this?
(Recent Pattern Question 2016)
a. Reactionary hemorrhage b. Secondary
c. Primary d. Tertiary
315. A 25-year-old Patient with abdominal trauma presents with Hypovolemic shock, and is unresponsive to crystalloids. What is the next step?
(Recent Pattern Question 2016)
a. Albumin b. Colloids
c. Blood transfusion d. Immediate laparoscopy
316. Which is the best parameter to monitor Hypovolemic shock? (Recent Pattern Question 2016)
a. Urine output b. Respiratory rate
c. Blood pressure d. Pulse rate
317. A 25-year-old patient presents in emergency with abdominal trauma. Why is FAST done?
(Recent Pattern Question 2016)
a. Detection of pericardial fluid accumulation
b. Detection of bowel lacerations
c. Detection of Mesenteric Tear
d. Detection of aortic transection
318. Increased cardiac output is seen in which shock?
a. Septic shock b. Anaphylaxis
c. Neurogenic d. Hemolysis
319. What is given immediately in hemorrhagic shock?
a. Packed RBC b. Colloids
c. Crystalloids d. Isotonic fluids
320. Plasma expanders are most useful in which shock?
a. Septic shock b. Vasovagal shock
c. Neurogenic shock d. Cardiogenic shock
321. Neurogenic shock is caused by:
a. Burns b. Dehydration
c. Hemorrhage d. Anesthesia
322. Which is the preferred fluid in a poly-traumatic patient with shock?
a. Ringer lactate b. Normal saline
c. Dextran d. Dextrose-normal saline
323. Which is the first fluid of choice in Hypovolemic shock?
a. Dextran b. Normal saline
c. Dextrose normal saline d. Hartmann solution
324. All are criteria for Systemic inflammatory response syndrome in children EXCEPT:
a. Tachycardia b. Hypotension
c. Fever d. Leukocytosis
325. A new born boy has lumbosacral meningocele and is awaiting surgical repair. The sac is best protected with sterile gauze piece soaked with
a. Mercurochrome b. Tincture benzoin
c. Methylene blue d. Normal saline
326. In 1 mL of 0.9%, normal saline content of Na is:
a. 0.1 mEq b. 0.3 mEq
c. 0.5 mEq d. 10 mEq
327. In 1 mL of 3 percent saline what is the quantity of sodium?
a. 0.5 mEq b. 1 mEq
c. 10 mEq d. 50 mEq
328. In IV fluid what percentage of energy is supplied by glucose when patient is on total parenteral nutrition?
a. 20 b. 30
c. 40 d. 50
329. According to "rule of 9". What is the percentage of burn in hand?
a. 1% b. 5%
c. 9% d. 14%
330. What is the % Body surface area involved in burns of the perineum?
a. 1% b. 3%
c. 5% d. 9%
331. What is the best solution for burns?
a. NS 0.9% b. Ringer's lactate
c. 25% dextrose d. Colloid
332. All are given for management of burns EXCEPT?
a. Hypotonic solutions b. Albumin
c. 25% dextrose d. Hartmann solution/ATLS

- 333. What is the first fluid preferred in a burn patient?**
 a. Crystalloids b. Colloids
 c. Any of above d. Both of above
- 334. All are true about a burn patient EXCEPT:**
 a. Hematemesis
 b. For Head and neck burn exposure treatment done
 c. Stridor can be present
 d. Most common infection is by pseudomonas
- 335. What is the cause of death in 70% burns patient in whom enteral feeding is not given:**
 a. Dehydration b. Malnutrition
 c. Electrolyte imbalance d. Bacterial infection
- 336. A burn patient is brought to emergency. Upon examination he was found dead. What could be the possible cause?**
 a. Sepsis b. Hypoxia
 c. Malnutrition d. Hypovolemia
- 337. Which is true about burn?**
 a. Above 5% of surface area must be involved to produce shock
 b. Inhaled hot gas will not cause supraglottic airway burn and laryngeal edema.
 c. Early elective intubation is safest
 d. If oral fluids are to be used, salt must be avoided
- 338. What is correct about 3rd degree burns?**
 a. Erythema and painful b. Erythema and painless
 c. Painless and cherry red d. Painful and cherry red
- 339. Which virus causes infection in burn patients?**
 a. HSV b. CMV
 c. EBV d. VZV
- 340. What is the cause of death in early period of burns?**
 a. Sepsis b. Shock
 c. Dys-electrolytemia d. ARDS
- 341. Burns present as all of the following EXCEPT**
 a. Sepsis b. Shock
 c. Acute kidney injury d. Air embolism
- 342. Middle area of face fracture (le-fort fracture) is characterized by all EXCEPT**
 a. Proptosis b. Lengthening of face
 c. Enophthalmos d. Ecchymosis
- 343. In Brown-Sequard syndrome ipsilateral loss will be of?**
 a. Pain b. Temperature
 c. Tactile discrimination d. Proprioception
- 344. Blow out injury with ptosis occurs due to damage to?**
 a. Zygomatic arch
 b. Orbital floor
 c. Sphenoid bone
 d. Palantine and maxillary bones
- 345. Fournier gangrene is caused by:**
 a. Clostridium welchii
 b. Clostridium septicum
 c. Anaerobic Streptococcus
 d. Bacillus subtilis
- 346. Continuous burrowing ulcer is caused by?**
 a. Streptococcus Viridans,
 b. Streptococcus Pyogenes
 c. Staphylococcus aureus
 d. Microaerophilic streptococcus
- 347. All of the following are released/increased in surgical stress EXCEPT:**
 a. ADH b. Insulin
 c. ACTH d. Cortisol
- 348. All are true about Keloid EXCEPT:**
 a. May be familial b. Arises on sternum
 c. Subsides Over Time d. Hyperkeratotic
- 349. Which organ is most commonly affected by blunt trauma to abdomen?**
 a. Spleen b. Intestine
 c. Liver d. Mesentery
- 350. Wound dehiscence occurs after how many days following surgery?**
 a. 2–4 days b. Within 2 days
 c. 5–12 days d. >2 weeks
- 351. What does split thickness of skin graft mean?**
 a. Is a skin graft including the epidermis and part of the dermis
 b. Is a skin graft including the epidermis and complete dermis
 c. Is a skin graft including part of the epidermis and part of the dermis
 d. Is a skin graft including part of epidermis and whole of the dermis
- 352. What is a xenograft:**
 a. Transplantation of organs from a 1st degree relative
 b. Transplantation of organs from unrelated donor
 c. Transplantation of tissues from self
 d. Transplantation of living tissues/organs from one species to another
- 353. Fibrosis is seen in all EXCEPT:**
 a. Marjolin's ulcers b. Buruli ulcer
 c. Venous ulcer d. Peptic ulcer
- 354. Carcinoma developed in a scar is called:**
 a. Sarcoma b. Adenocarcinoma
 c. Dermoid tumor d. Marjolin's ulcer
- 355. Osteomyelitis first occurs in:**
 a. Metaphysis b. Epiphysis
 c. Diaphysis d. All of above
- 356. Clean and small wound heals by?**
 a. Primary intention b. Secondary intention
 c. Tertiary intention d. All of above
- 357. Female patient with injury on her scalp, hair was shaved and sutures were put. On which day sutures should be removed?**
 a. 8–10 days b. 2 weeks
 c. 3 weeks d. 1 month

FMGE Solutions Screening Examination

- 358. What is incorrect about Laparoscopy?**
- Smaller incisions
 - Minimal postoperative pain
 - Trocar injury in patients with low body mass index
 - Recovery time is longer
- 359. A guy driving a car fast suddenly slams on the brakes. He was wearing a seat belt. The organ most likely to be affected is:**
- Liver
 - Spleen
 - Mesentery
 - Kidney
- 360. A motor cyclist after multiple trauma is having hypoventilation. What is the cause?**
- Damage to respiratory centre
 - Damage to respiratory apparatus
 - Both
 - None of the Above
- 361. What is the best investigation for a hemodynamically stable patient with blunt abdominal trauma?**
- CECT abdomen
 - MRI abdomen
 - Diagnostic Peritoneal lavage
 - F.A.S.T
- 362. Painful lockjaw is seen in all of the following EXCEPT?**
- Tetany
 - Temporo-mandibular joint abscess
 - Mandibular abscess
 - Odontogenic pulp abscess
- 363. What is the most common site of basal cell carcinoma in lips?**
- Upper lip
 - Central 1/3
 - Lower lip
 - Commissures
- 364. Fracture of neck of fibula leads to which nerve injury?**
- Common peroneal nerve
 - Obturator nerve
 - Genitofemoral nerve
 - Posterior tibial nerve
- 365. What is the most common Nosocomial infection acquired by a patient undergoing surgery?**
- S.I.R.S
 - Surgical site infection
 - Pneumonia
 - Catheter based infection
- 366. Upon aspiration in supine position, food particle goes most commonly to?**
- Right lower lobe superior basal
 - Right lower lobe postero basal
 - Left lower lobe superior basal
 - Left lower lobe postero basal
- 367. What is the management of Epidermoid Carcinoma?**
- 5FU + external beam radiation
 - Mitomycin + External beam radiation
 - External beam Radiation
 - Surgery + Imiquimod
- 368. In TNM staging, N = ?**
- Nature of tumor
 - Number of tumors
 - Number of lymph nodes
 - Metastasis

MISCELLANEOUS

- 369. In TNM staging T indicates. (Recent Pattern Question 2017)**
- Size of tumor
 - Nodal metastasis
 - Distant metastasis
 - Depth of invasion
- 370. A 65-year-old patient presents with low backache and low grade fever. X-ray spine shows. (Recent Pattern Question 2017)**

- Osteomyelitis
 - Osteomalacia
 - Hypoparathyroidism
 - Metastasis
- 371. What is correct regarding descent of testes during fetal stage?**
- Gestational age 1-7 months in abdomen
 - Gestational age 1-7 months in inguinal canal
 - Gestational age 7-9 months in scrotum.
 - Gestational age lies in 7-9 months in abdomen.
- 372. Which is not a derivative of midgut?**
- Appendix
 - Jejunum
 - Ascending colon
 - Descending colon
- 373. All are true about amoebic liver abscess EXCEPT?**
- Sterile pus
 - Amoebae reach the right lobe > left lobe
 - Intercostal tenderness
 - Hepatocellular jaundice
- 374. A 30-year-old patient presents with pain in right hypochondrium for 5 days with soft and tender liver and intercostal tenderness. He complains of catch in breath on inspiration and has a non productive cough. On examination the lung fields are clear, patient looks pale and emaciated. What is the probable diagnosis?**
- Amoebic liver abscess
 - Pyogenic live abscess
 - Hydatid cyst
 - Hepatic adenoma
- 375. Strawberry Gallbladder is seen in?**
- Cholesterosis
 - Porcelain Gall bladder
 - Mirizzi syndrome
 - Wegener's granulomatosis
- 376. All are features of Saint's triad EXCEPT?**
- Gall stones
 - Diverticulitis
 - Hiatus hernia
 - Cholesterosis

377. **Bent inner tube sign is seen in**
 a. Volvulus
 b. Intussusception
 c. Intestinal obstruction
 d. Gastric antral vascular ectasia
378. **Bird beak sign on barium enema is seen in?**
 a. Achalasia cardia b. Sigmoid volvulus
 c. Carcinoma esophagus d. Carcinoma sigmoid colon
379. **All are common causes of ileal obstruction EXCEPT?**
 a. Adhesions b. Obstructed hernia
 c. Stricture d. Hirschsprung's disease
380. **What is the most common site of GIST?**
 a. Stomach b. Liver
 c. Kidney d. Brain
381. **What is the most common site of lymphoma of GIT?**
 a. Stomach b. Duodenum
 c. Ileum d. Colon
382. **The most common cause of intestinal obstruction in infants is?**
 a. Intussusception b. Congenital bands
 c. Necrotising enterocolitis d. Sigmoid volvulus
383. **The vessel which needs to be ligated in a patient with a bleeding peptic duodenal ulcer is?**
 a. Left gastroepiploic artery
 b. Gastroduodenal artery
 c. Left gastric artery
 d. Superior Pancreatico-duodenal artery
384. **All the following are True regarding FAST-EXCEPT?**
 a. It cannot reliably exclude injury in penetrating trauma
 b. It detects free fluid in the abdomen or pericardium
 c. It is accurate in detecting <50 mL of free blood
 d. It is a focused abdominal sonar for trauma
385. **Wolfe Graft is**
 a. Thin split thickness graft
 b. Medium thickness split thickness skin graft
 c. Full thickness skin graft
 d. Thick split thickness skin graft
386. **Pringle maneuver may be required for treatment of?**
 a. Bleeding Esophageal Varices
 b. Mesenteric Ischemia
 c. Injury to Tail of Pancreas
 d. Live Laceration
387. **Optional timing of administration of prophylactic antibiotic for surgical patients is**
 a. One hour prior to induction of anaesthesia
 b. At the induction of anaesthesia
 c. Any time during the surgical procedure
 d. One hour after induction
388. **What is the raw material used in nylon suture?**
 a. Polyester polymer
 b. Polyamide polymer
 c. Polyethylene terephthalate
 d. Polybutylene terephthalate
389. **All the following statements are true regarding torsion of testis EXCEPT**
 a. Anatomical abnormality is unilateral and contralateral testis should not be fixed
 b. Prompt exploration and twisting & fixation is the only way to save the torqued testis
 c. Most common between 10 & 25 years of age
 d. Inversion of testis is the most common predisposing cause
390. **'Fifth vital sign' commonly elicited by anaesthesiologists on surgical patients is:**
 a. FiO_2 b. Pain
 c. Blood pressure d. Core temperature
391. **The most common cancer of oral cavity is**
 a. Adenocarcinoma
 b. Melanoma
 c. Sarcoma
 d. Squamous cell carcinoma
392. **Barrett's esophagus is diagnosed by**
 a. Squamous metaplasia
 b. Intestinal metaplasia
 c. Squamous dysplasia
 d. Intestinal dysplasia
393. **Boerhaave's syndrome is due to?**
 a. Drug induced esophagus perforation
 b. Corrosive injury
 c. Spontaneous perforation
 d. Gastro-esophageal reflux disease
394. **Which one of the following is not a treatment of Gastroesophageal Variceal hemorrhage?**
 a. Sclerotherapy
 b. Sengstaken tube
 c. Trans-jugular intrahepatic Porta-caval shunt
 d. Gastric freezing
395. **"Limey bile" is?**
 a. Present in the CBD
 b. Thin and clear
 c. Like toothpaste emulsion in the gallbladder
 d. Bacteria rich
396. **Major complication of cyst-gastrostomy for pseudo pancreatic cyst is?**
 a. Infection
 b. Obstruction
 c. Fistula d. Hemorrhage
397. **What is Cullen's sign?**
 a. Bluish discoloration of the flanks
 b. Bluish discoloration in the umbilicus
 c. Migratory thrombophlebitis
 d. Subcutaneous fat necrosis
398. **Which organ is most commonly involved in retroperitoneal fibrosis?**
 a. Aorta b. Ureter
 c. Inferior vena cava d. Sympathetic nerve plexus

399. In a case of retro-caecal appendicitis which movement aggravates pain?
 a. Flexion
 b. Extension
 c. Medical rotation
 d. Lateral rotation
400. Anal carcinoma is most common carcinoma of type
 a. Adeno carcinoma
 b. Epidermoid
 c. Mixed
 d. None of the above
401. After esophagectomy the best substitute as conduit is
 a. Stomach
 b. Jejunum
 c. Right colon
 d. Left colon
402. Ranson scoring system is used to predict the severity of
 a. Acute pancreatitis
 b. Acute Cholecystitis
 c. Peritonitis
 d. Appendicitis
403. Surgical excision of the liver metastases is well established if the primary is from?
 a. Carcinoma lung
 b. Colorectal carcinoma
 c. Carcinoma breast
 d. Melanoma

BOARD REVIEW QUESTIONS

404. The minimum number of polyps necessary for a diagnosis of Familial Adenomatous Polyposis (FAP) is
 a. 05
 b. 10
 c. 50
 d. 100
405. Gery turner's sign is seen in
 a. Acute appendicitis
 b. Acute pancreatitis
 c. Acute cholecystitis
 d. Acute hepatitis
406. Splenectomy can lead to
 a. Leucopenia
 b. Thrombocytosis
 c. Thrombocytopenia
 d. Thrombocytopenia and leucopenia
407. Reversed "3" sign on barium studies is seen in which condition?
 a. Ampullary carcinoma
 b. Carcinoma stomach
 c. Carcinoma head of pancreas
 d. Insulinoma
408. The nerve commonly damaged during McBurney's incision is:
 a. Subcostal
 b. Iliohypogastric
 c. 11th thoracic
 d. 10th thoracic
409. Most common site of volvulus is:
 a. Ileum
 b. Appendix
 c. Sigmoid colon
 d. Caecum
410. Villous adenoma presents as:
 a. Hypercalcemia
 b. Hypokalemia
 c. Hyperphosphatemia
 d. All of the above
411. Sister Mary Joseph nodule is most commonly seen with:
 a. Ovarian cancer
 b. Stomach cancer
 c. Colon cancer
 d. Pancreatic cancer
412. Spigelian hernia is:
 a. Hernia passing through the obturator canal
 b. Hernia passing through the linea alba
 c. Hernia through the triangle of petit
 d. Hernia occurring at the level of arcuate line
413. Strangulation most commonly occurs in:
 a. Femoral hernia
 b. Direct inguinal hernia
 c. Indirect inguinal hernia
 d. Lumbar hernia
414. Multiple strictures in intestine are found in :
 a. Radiation enteritis
 b. Duodenal ulcer
 c. Ulcerative colitis
 d. Gastric erosion
415. Colovesical fistula most commonly arises from :
 a. Crohn's disease
 b. Ulcerative colitis
 c. Carcinoma colon
 d. Abdomino-perineal resection
416. Sentinel lymph node biopsy is an important part of the management of which of the following conditions?
 a. Carcinoma prostate
 b. Carcinoma breast
 c. Carcinoma lung
 d. Carcinoma nasopharynx
417. Most important prognostic indicator for breast Carcinoma is:
 a. Age of the patient
 b. Lymph node involvement
 c. Genetic factors
 d. Family history
418. Unilateral breast involvement with scaly skin around the nipple and intermittent bleeding is suggestive of:
 a. Galactocoele
 b. Paget's disease
 c. Eczema
 d. Sebaceous cysts
419. Peau d'orange of breast is due to:
 a. Obstruction of vein
 b. Obstruction of lymphatic ducts,
 c. Obstruction of glandular ducts
 d. Obstruction of arteries
420. Most common type of breast carcinoma is:
 a. Lobular
 b. Sarcoma
 c. Ductal
 d. Granuloma
421. Which type of breast cancer is most likely to be bilateral?
 a. Infiltrating duct carcinoma
 b. Paget's disease of breast
 c. Lobular carcinoma of the breast
 d. Medullary carcinoma of the breast
422. Triple examination includes all EXCEPT:
 a. Clinical examination
 b. Excision biopsy
 c. FNAC
 d. Mammography
423. Metastasis from follicular carcinoma should be treated by:
 a. Radioiodine
 b. Surgery
 c. Thyroxine
 d. Observation
424. Radiation exposure during infancy has been linked to which one of the following carcinoma?
 a. Breast
 b. Melanoma
 c. Thyroid
 d. Lung

- 425. Lateral internal sphincterotomy is useful for:**
 a. Anal fistula b. Anal canal strictures
 c. Hemorrhoids d. Anal fissure
- 426. Erythroplasia of Queyrat occurs in:**
 a. Scrotum b. Testes
 c. Penis d. Bladder
- 427. A 25-year-old man presents with hydrocele on the left side. Associated condition could be a:**
 a. Nephroma b. Hepatic malignancy
 c. Testicular tumor d. Peptide malignancy
- 428. Fournier's gangrene is seen in:**
 a. Scrotum b. Shaft of penis
 c. Base of penis d. Glans penis
- 429. Thimble bladder is seen in:**
 a. Diverticulae b. Bladder stones
 c. Schistosomiasis d. Tuberculosis
- 430. Narrowest part of the urethra is:**
 a. Prostatic urethra b. Bulbar urethra
 c. Penile urethra d. Membranous urethra
- 431. Lord's and Jaboulay's operation is done for:**
 a. Rectal prolapse b. Fistula in Ano
 c. Inguinal hernia d. Hydrocele
- 432. All are causes of bladder cancer EXCEPT:**
 a. Alcohol b. Naphthylamine exposure
 c. Cigarette smoking d. Schistosoma hematobium
- 433. Most common type of hypospadias is:**
 a. Glandular b. Penile
 c. Coronal d. Perineal
- 434. Nissens fundoplication is a first line treatment for?**
 a. GERD b. Hiatus hernia
 c. Esophageal atresia
 d. Congenital hypertrophic pyloric stenosis
- 435. Concentration of Na (mEq/l) in normal saline is?**
 a. 77 b. 109
 c. 130 d. 154
- 436. Lipodermatosclerosis is most commonly seen at?**
 a. Anterior aspect of leg b. Medial aspect of leg
 c. Anterior aspect of thigh d. Posterior aspect of thigh
- 437. Greyish discoloration of flank seen in Acute Pancreatitis is referred to as?**
 a. Cullen's sign b. Grey Turner sign
 c. Balance's sign d. Alvarado's sign
- 438. Interstitial cystitis is also known as?**
 a. Eosinophilic cystitis b. Radiation cystitis
 c. Hunner's cystitis d. Tubercular cystitis
- 439. Antibiotic of choice for lymphedema is?**
 a. Penicillin b. Amikacin
 c. Metronidazole d. Ceftazidime
- 440. Most common subtype of thyroid cancer is?**
 a. Medullary carcinoma b. Papillary carcinoma
 c. Follicular carcinoma d. Anaplastic carcinoma
- 441. Maximum & minimum score in Glasgow coma scale is?**
 a. 15 & 0 b. 14 & 3
 c. 15 & 3 d. 15 & 1
- 442. Alvarado's score is done for?**
 a. Pancreatitis b. Appendicitis
 c. Cholecystitis d. Cholangitis
- 443. Which of the following is not a sign of appendicitis?**
 a. Rovsing's sign b. Murphy's sign
 c. Obturator sign d. Psoas sign
- 444. Most common organism causing appendicitis is?**
 a. Bacteroides b. E.coli
 c. Staphylococcus d. Streptococcus
- 445. Most common site of anorectal abscess is?**
 a. Perianal b. Ischiorectal
 c. Pelvirectal d. Intersphincteric
- 446. Most common site of spleneculi is?**
 a. Omentum b. Splenocolic ligament
 c. Gastrocolic ligament d. Hilum of spleen
- 447. What is the most common presentation of Lobular carcinoma?**
 a. Nipple discharge b. Breast mass
 c. Mammographic calcification
 d. Nipple retraction
- 448. What is most commonly associated with high risk for carcinoma colon?**
 a. Peutz-Jegher syndrome b. Juvenile familial polyposis
 c. Familial adenomatous polyposis
 d. Lynch syndrome
- 449. Which is the least common site for spread of melanoma?**
 a. GIT b. Lungs
 c. Liver d. Renal
- 450. Coronary graft is most commonly taken from?**
 a. Femoral vein b. Saphenous vein
 c. Axillary vein d. Cubical vein
- 451. Sentinel lymph node biopsy was first done in?**
 a. Carcinoma breast b. Carcinoma colon
 c. Carcinoma penis d. Melanoma
- 452. Relative humidity in operation theatre should be maintained at?**
 a. 35-45% b. 45-55%
 c. 55-65% d. 65-75%
- 453. In abdominal aortic aneurysm indication of operation is when size of aneurysm is?**
 a. >4 cm b. >5.5 cm
 c. >6 cm d. 6.6 cm
- 454. Bender grading is used for?**
 a. Subarachnoid hemorrhage
 b. Subdural hemorrhage
 c. Extradural hemorrhage
 d. Parenchymal bleed
- 455. Murphy's Sign is seen in?**
 a. Acute appendicitis b. Acute cholecystitis
 c. Acute Pancreatitis d. Ectopic pregnancy

- 456. Bosniak classification is for?**
a. Renal tuberculosis b. Renal cysts
c. RCC d. VUR
- 457. Most common cause of nephrolithiasis is?**
a. Hypocitraturia b. Hyperoxaluria
c. hyperuricosuria d. Idiopathic hypercalciuria
- 458. Which renal stone is radiolucent?**
a. Calcium oxalate b. Calcium phosphate
c. Uric acid d. Struvite
- 459. Alkalinization of urine helps in dissolution of which type of renal stones?**
a. Calcium oxalate b. Uric acid
c. Cystine d. Struvite
- 460. Renal stone which is formed due to proteus infection is?**
a. Calcium oxalate b. Uric acid
c. Cystine d. Struvite
- 461. In tuberculosis of scrotal contents. Which is the first to get affected?**
a. Testis b. Epididymis
c. Rete testis d. Vas deferens
- 462. Prostatic calculi is made up of?**
a. Calcium carbonate b. Calcium oxalate
c. Calcium phosphate d. Triple phosphate
- 463. What is the treatment of choice of Warthin tumor?**
a. Radical parotidectomy
b. Superficial parotidectomy
c. Superficial parotidectomy with neck dissection
d. Enucleation
- 464. Pancreatic pseudocyst is made up of?**
a. Bacteria b. Pancreatic enzymes
c. Glucagon d. Insulin
- 465. Which is the most common congenital anomaly of pancreas?**
a. Pancreatic divisum b. Accessory pancreas
c. Annular pancreas
d. Developmental pancreatic cysts
- 466. Best definitive investigation for carcinoma breast is?**
a. Biopsy b. FNAC
c. USG d. Mammography
- 467. Best investigation for renal calculi is?**
a. X Ray b. USG
c. CECT d. NCCT
- 468. Saints triad includes all EXCEPT:**
a. Gall stones b. Cholangitis
c. Diverticulosis d. Hiatus hernia
- 469. Which of the following is used in urinary bladder carcinoma?**
a. 5FU b. BCG
c. Cyclophosphamide d. 6 Mercaptopurine
- 470. What is the most common site of Esophageal rupture in Rigid Bronchoscopy?**
a. Cervical region b. Cardiac region
c. Mid esophagus d. GE junction
- 471. Which parotid tumor spreads along nerve sheath?**
a. Pleomorphic adenoma
b. Mucoepidermoid carcinoma
c. Adenoid cystic carcinoma
d. Warthin's tumor
- 472. Which is the most common carcinoma of minor salivary gland?**
a. Pleomorphic adenoma
b. Mucoepidermoid carcinoma
c. Adenoid cystic carcinoma
d. Warthin's tumor
- 473. Burn of head region in a child accounts for what percent of burns?**
a. 10% b. 20%
c. 30% d. 40%
- 474. What is the drug of choice for surgically unresectable renal cell carcinoma?**
a. Sorafenib b. Sunitinib
c. Imatinib d. Cetuximab
- 475. Heller's operation is done for?**
a. Gastric outlet obstruction
b. Achalasia cardia
c. Hiatus hernia d. Esophageal
- 476. Pathological nipple discharge is mostly associated with?**
a. Fibroadenoma b. Duct papilloma
c. Adenocarcinoma d. Lobular carcinoma
- 477. Which is the most common type of hypospadias?**
a. Glandular b. Penile
c. Scrotal d. Perineal
- 478. What is the best treatment of cystic hygroma?**
a. Radiotherapy b. Sclerotherapy
c. Surgical excision d. Chemotherapy
- 479. Which is the most common site of aortic dissection is?**
a. Ascending aorta b. Descending aorta
c. Arch of aorta d. Infrarenal portion of aorta
- 480. In RTA, Injury to aorta causing Aortic rupture is most commonly seen in?**
a. Pedestrian
b. Motorcyclist
c. Car driver
d. Person accompanying car driver
- 481. Which nerve is involved in parotidectomy?**
a. Trigeminal b. Mandibular
c. Auriculotemporal d. Lingual

IMAGE-BASED QUESTIONS

727

482. What does the intraoperative photograph depict?

- a. Transverse colon
- b. Meckel's diverticulum
- c. Intussusception
- d. Fallopian tube

485. All are true about the image shown EXCEPT?

- a. Anti-gravity drainage
- b. Cold abscess
- c. Transillumination test is negative
- d. Rubbery consistency of involved lymph nodes

483. Identify these two surgical instruments.

- a. Thumb forceps & Sponge Holder
- b. Artery Forceps & Needle Holder
- c. Sponge Holder & Allis Forceps
- d. Needle Holder & Ovum Forceps

486. All are true about the image shown EXCEPT?

- a. Acute paronychia
- b. Throbbing pain
- c. Ring block with adrenaline used
- d. I and D by incising the eponychium

484. All are true about the lesion EXCEPT?

- a. Severe itching
- b. Claw like process
- c. Develops at vaccination sites
- d. Collagen bundles are present

487. Comment on image A and B

- a. A=Venous ulcer and B= ischemic ulcer
- b. A=arterial ulcer and B= Venous ulcer
- c. A=neuropathic ulcer and B= arterial ulcer
- d. A=Venous ulcer and B= neuropathic ulcer

488. Identify the type of ulcer shown

- a. Venous ulcer
- b. Arterial ulcer
- c. Neuropathic ulcer
- d. Bazin's ulcer

491. What is correct about the diagnosis?

- a. Thyroglossal cyst
- b. Brachial cyst
- c. Cold abscess
- d. Carotid body tumour

489. During induction of anaesthesia, after giving thiopentone injection a patient develops discoloration of hand. All are true about this condition and its management EXCEPT?

- a. Immediately remove the needle in the vessel
- b. Inject lignocaine
- c. Dilute heparin
- d. Intra-arterial thrombolysis

492. What is true about the image shown?

- a. Carcinoma alveolar margin
- b. Leukoplakia
- c. Hyperplastic candidiasis
- d. Fibrous epulis

490. A patient presents with ulcer at the site of previous burn site. All are true about the lesion EXCEPT?

- a. Painless scar
- b. Cured by surgery
- c. Lymphatic metastasis
- d. Marjolin's ulcer

493. Identify the lesion shown in the figure

- a. Pleomorphic adenoma
- b. Mumps
- c. Retroauricular lymphadenopathy
- d. Sialadenitis

494. All can be seen in this patient EXCEPT

- a. Myxedema
- b. Dalrymple sign
- c. Moist warm hands
- d. Constipation

497. Which triangle is shown here?

- a. Calot's triangle
- b. Gastrinoma triangle
- c. Hesselbach' triangle
- d. Killian's triangle

495. All are true about the patient shown in the image EXCEPT?

- a. Peau d'orange
- b. Ulceration of nipple
- c. Diagnosis depends on HER2 expression
- d. Van Nuys prognostic index

498. A 65-year-old grandmother presents with feculent nasogastric aspirate. What is the diagnosis?

- a. Jejunal obstruction
- b. Ileal obstruction
- c. Diverticulitis
- d. Mesenteric ischemia

496. A 25-year-old shepherd presents with dragging discomfort in right Hypochondrium and on examination shows presence of enlarged liver 5 cm below costal margins. What is the probable diagnosis?

- a. Amoebic liver abscess
- b. Hydatid cyst
- c. Pyogenic liver abscess
- d. Hepatic adenoma

499. The following disease occurs due to all EXCEPT?

- a. Whooping cough
- b. Marasmus
- c. Obstetric trauma
- d. Fistula in ano

500. Which of the following is shown in the image?

- a. Fistula in ano
- b. Pilonidal sinus
- c. Bowen disease
- d. Hidradenitis suppurativa

503. A 25-year-old presents with dragging pain and testicular mass which exhibits a cough expansile impulse. Trans-illumination impulse is negative. What is the diagnosis?

- a. Direct inguinal hernia
- b. Indirect inguinal hernia
- c. Hydrocele
- d. Varicocele

501. Identify the structure held with artery forceps?

- a. Appendix
- b. Meckel's diverticulum
- c. Zenker's diverticulum
- d. Colostomy procedure

504. All are true about the condition shown EXCEPT:

- a. Cysts increase in size with age
- b. Spider leg deformity
- c. Anemia
- d. Low Renin due to pressure atrophy of JG apparatus

502. Which procedure is shown in the image?

- a. Lichtenstein repair
- b. Bassini herniorrhaphy
- c. Shouldice repair
- d. Lord's procedure

505. All are true due to the conditions shown in the figure EXCEPT?

- a. Pain at end of micturition referred to the tip of penis
- b. Holmium laser
- c. Litholapaxy
- d. Painless intermittent hematuria

506. The following image shows presence of?

- a. Posterior urethral valves
- b. Vesico-ureteric reflux
- c. Bladder stone
- d. Bladder rupture

509. The image shows presence of

- a. A = Ventriculoperitoneal shunt, B = Ventriculo-atrial shunt
- b. A = Ventriculo-atrial shunt, B = Ventriculo-peritoneal shunt
- c. A = Denver shunt, B = La Veen Shunt
- d. A = La Veen Shunt, A = Denver Shunt

507. What is incorrect about the image shown?

- a. Gangrene of scrotum
- b. Microaerophilic Hemolytic Streptococci
- c. Seen in low socio-economic background
- d. Can involve skin of penis

510. A 25-year-old patient presents in coma with GCS of 5 and extensor posturing after a bike accident. Which of the following will the best management of the patient?

- a. Hypertonic saline
- b. Thrombolysis
- c. Burr hole surgery
- d. Hemi-Craniectomy

508. The CT chest shows presence of?

- a. Meniscus sign
- b. Crescent sign
- c. Tree in bud sign
- d. Loculated empyema

511. Identify the surgical instrument

- a. Kocher forceps
- b. Allis forceps
- c. Ovum forceps
- d. Artery forceps

512. Identify the instrument shown

- a. Allen forceps
- b. Mosquito forceps
- c. Babcock forceps
- d. Kocher forceps

515. Identify the image shown

- a. Proctoscope
- b. Sigmoidoscope
- c. Anoscope
- d. Colonoscope

513. Identify the instrument shown

- a. Needle holder
- b. Cheatles forceps
- c. Babcock forceps
- d. Kocher forceps

516. Identify the catheter shown in the figure

- a. Malecot catheter
- b. Foley's catheter
- c. Red rubber catheter
- d. Ryle's tube

514. Identify the image shown

- a. Rib Spreader
- b. Self-retaining retractor
- c. Lister Dilator
- d. Male Metallic Catheter

517. Identify the tube shown in the image

- a. Ryle's tube
- b. Malecot's Catheter
- c. Blakemore Sengstaken Catheter
- d. Foley's catheter

518. What is the clinical diagnosis of the patient?

- a. Ranula
- b. Cystic Hygroma
- c. Erythroplakia
- d. Epulis

519. The image shows?

- a. Foley's Catheter
- b. Swan Ganz catheter
- c. Sengstaken Blakemore tube
- d. Endotracheal tube

520. Name the retractor

- a. Deaver retractor
- b. Richardson retractor
- c. Malleable retractor
- d. Goulet

MOST RECENT QUESTIONS 2019

1. Ans. (d) Insert needle in 2nd intercostal space

Ref: Harrison 20th ed. pg. 2009

- The clinical diagnosis based on history of rib fractures, respiratory distress and hypotension is pneumothorax. There can be concomitant hemothorax but treatment of obstructive shock caused by pneumothorax is the immediate step.
- This would be done by inserting a wide bore needle in second intercostal space to reduce the impact of obstructive shock and increase systolic blood pressure.

2. Ans. (c) Sitting with neck flexed

Ref: Oxford Handbook of Clinical Medicine, pg. 773

Nasogastric tube should be inserted in a conscious patient in sitting position with slight flexion of the neck.

Procedure for inserting NG tube

- Examine the patient's nostril to check for septal deviation and identify the more patent nostril
- Instil viscous lidocaine into the patient's nostril
- Estimate the length of insertion by measuring the distance from the tip of the nose, around the ear, and down to just below the left costal margin.
- The estimated length falls in between the 2nd and 3rd pre-printed black lines on the tube
- Position the patient sitting upright with the neck partially flexed. Ask the patient to hold a cup of water in his or her hand and put a straw in his or her mouth with instructions to sip water only when asked to.
- Gently insert the NG tube along the floor of the nose, and advance it parallel to the nasal floor (i.e. directly perpendicular to the patient's head, not angled up into the nose) until it reaches the back of the nasopharynx, where resistance will be met (10-20 cm).
- At this time, ask the patient to sip on the water through the straw and start to swallow.
- Notice the flexion in the neck of the patient while the patient is swallowing water through a straw while the NG is advanced forwards.
- Continue to advance the NG tube until the distance of the previously estimated length is reached.

3. Ans. (d) Malrotation of gut

Ref: page 1994: Bailey and love: 26th edition

- Choice A presents with delayed passage of meconium and is ruled out.
- Choice B presents with non-bilious vomiting and is ruled out.

- Choice C presents with bilious vomiting and does not have any abdomen distention. X-Ray abdomen shows double bubble appearance.
- Choice D presents with bilious vomiting and abdominal distention and multiple gas filled loops.

4. Ans. (a) Mucoviscidosis

Ref: Nelson 20th ed. pg. 1802

- Meconium ileus occurs primarily in new-born infants with cystic fibrosis which is also called mucoviscidosis.
- It is an exocrine gland defect of chloride transport that results in abnormally viscous secretions. The distal 20-30cm of ileum is collapsed and filled of pale stool.
- The proximal bowel is dilated and filled with thick meconium that resembles sticky syrup or glue. The peristalsis fails to propel this viscid material forward and becomes impacted in the ileum.

5. Ans. (b) NG Tube insertion and CXR to check position of tube

Ref: Nelson 20th pg. 1783

- The clinical diagnosis of this neonate with frothing and bubbling at the mouth and nose is esophageal atresia.
- The symptoms worsen with episodes of feeding and aspiration of gastric contents if fistula is present
- In setting of early onset respiratory distress, inability to pass a nasogastric or orogastric tube suggests esophageal atresia.
- Plain X ray will show a coiled feeding tube lying in esophageal pouch and air distended stomach.
- Choice A bronchoscopy with methylene blue is injected into endotracheal tube and dye is observed in oesophagus during forced inspiration to detect orifice of fistula in TEF.
- Choice C and D are not recommended for diagnosis of esophageal atresia.
- Esophagogram can detect a H type of defect shown.

Types of Tracheo-esophageal Fistula

6. Ans. (c) 10

Ref: Harrison 20th ed. pg. 3183

Eye opening to pain = 2

Confused = 4

Flexion on painful noxious stimuli to arm = 4

Score = 10

Eye opening (E)		Verbal response (V)	
Spontaneous	4	Oriented	5
To speech	3	Confused	4
To pressure	2	Words	3
None	1	Sounds	2
		None	1
Best motor response (M)			
Obedient commands	6		
Localizing	5		
Normal flexion	4		
Abnormal flexion	3		
Extension	2		
None	1		

7. Ans. (b) Total thyroidectomy

Ref: Bailey and love 26th ed. pg. 766

- Thyroidectomy during pregnancy has not been associated with adverse maternal or neonatal outcomes. There are no indications for termination of pregnancy.
- Whenever possible, the operation should be performed during the second trimester or after delivery.
- *Thyroid cancer, the most common endocrine malignancy, is often detected in young female patients.* About 10% of thyroid cancers occurring during the reproductive years are diagnosed during pregnancy or in the early post-partum period.
- *Patients with large, locally aggressive or metastatic differentiated thyroid cancer require total thyroidectomy with excision of adjacent structures.* Along with this, nodal surgery is done followed by radioiodine ablation with long term TSH suppression.
- Choice A is ruled out since radioactive iodine is not used in pregnancy
- Choice D is ruled out since total thyroidectomy is done for cancer.

8. Ans. (a) Marjolin ulcer

Ref: Bailey and Love 26th ed. pg. 918

- Marjolin's ulcer is a squamous cell cancer that can develop in chronic long standing venous ulcer.

- Failure to heal an ulcer indicates it may have another coexisting cause like malignancy, Rheumatoid arthritis and arterial ulcer.
- Erythema Induratum of Bazin is a tuberculid showing lobular panniculitis. EIB is classified under cutaneous tuberculosis

9. Ans. (b) Intramarginal excision followed by radiation

Ref: SRB, 5th ed. pg. 12

- Excisional surgery alone has been shown to yield a 45-100% recurrence rate and should very rarely be used as a solitary modality, although excision in combination with adjunct measures can be curative.
- Most studies in which excisional surgery was combined with injected steroids reported a recurrence rate of less than 50%.
- *Surgery followed by adjunctive radiotherapy has obtained recurrence rates of 0-8.6%*

10. Ans. (c) Gut ischemia

Ref: Bailey and Love: 26th ed. pg. 882

Mesenteric tears usually occur due to the shearing force applied on the mesentery, which happens while the movable intestines continue moving with the same speed of the car, although the car is decelerated by the act of the brakes (described in physics as the inertia). These tears can be so trivial that a frank intestinal ischemia would not be apparent immediately. The abdominal wall ecchymosis may lead to misdiagnosis as soft tissue injury.

11. Ans. (a) Neuralgia

Ref: Bailey and Love: 26th ed. pg 912

COMPLICATIONS OF STANDARD VARICOSE VEIN SURGERY

- Infection
- Nerve injury. The incidence of saphenous nerve neuralgia is 7% following LSV stripping to the knee. The incidence of sural nerve neuropraxia and common peroneal nerve injury following SSV surgery is fairly high.

12. Ans. (b) Pleural cavity

Ref: Bailey and Love: 26th ed. pg. 109

FAST looks for fluid in following five areas

- Perihepatic area and hepatorenal space
- Peri-splenic area
- Left and right Pericolic gutters
- Pelvis
- Pericardium

Extra Mile

Focused abdominal sonar for trauma

- It detects free fluid in the abdomen or pericardium
- It will not reliably detect less than 100 ml of free blood
- It does not identify injury to hollow viscus
- It cannot reliably exclude injury in penetrating trauma
- It may need repeating or supplementing with other investigations

13. Ans. (b) Varicocele

Ref: Bailey and Love 26th ed. pg. 1381

The clinical diagnosis of patient is varicocele. The key word is bag of worms feel on scrotal examination. When examined in the erect position, the scrotum on the affected side hangs lower than normal, and on palpation, with the patient standing, the varicose plexus feels like a bag of worms. There may be a cough impulse.

MANAGEMENT

- Operation is not indicated for an asymptomatic varicocele.
- When the discomfort is significant, then embolisation of the gonadal veins is the usual first line intervention.
- If this is not possible, or if the varicocele recurs (as it does in around 20 per cent after embolisation), then *surgical ligation of the testicular veins*/ Varicocele is the appropriate treatment.

14. Ans. (a) 60 minutes before skin incision

Ref: Bailey and Love 26th ed. pg. 248

- The timing of antibiotic administration may vary, but the goal of administering preoperative systemic prophylactic antibiotics is to have the concentration in the tissues at its highest at the start and during surgery.
- The literature supports at least 30 minutes, but no greater than 60 minutes before the skin incision is the optimal timing for the pre-operative administration of most commonly used antibiotics
- The antibiotic used most commonly is cefazolin
- The antibiotic must be stopped within 48 hours of the surgery.

15. Ans. (c) Excision

Ref: Bailey and Love: 26th ed. pg. 725

- Mucous retention cysts develop in floor of mouth either from obstructed minor salivary glands or from sublingual salivary gland.
- The term ranula applies to mucous extravasation cyst that arises from a sublingual gland producing an appearance of a frog belly.

- It can resolve spontaneously or requires formal surgical excision of cyst and affected sublingual gland.
- Incision and drainage results in recurrence.
- Sometimes the cyst may perforate through mylohyoid muscle diaphragm to enter the neck and is called plunging ranula.

16. Ans. (b) 24-hour urinary Fractionated Metanephrine

Ref: Bailey and Love 26th ed. pg. 784

- Catecholamines like nor-epinephrine, epinephrine and dopamine are produced in excess by chromaffin cells of pheochromocytoma.
- The end product of metabolism of these catecholamines is fractionated metanephrine levels.
- Vaniyl mandelic acid levels are used for diagnosis of neuroblastoma.

17. Ans. (a) Artery forceps

Ref: SRB: 5th ed. pg. 1164

The image shows a surgical instrument which has visible transverse serrations in distal blades with a lock in proximal part.

Use

- To catch bleeding points
- To open the fascial planes in different surgeries
- To pass a ligature
- To hold fascial, peritoneum, aponeurosis
- To hold sutures
- To drain an abscess like a sinus forceps

18. Ans. (a) Tongue depressor

Ref: SRB, 5th ed, pg. 1150

The image shows a tongue depressor which can be used for posterior pharyngeal wall visualization to intubation process.

19. Ans. (a) Sebaceous cyst

Ref: SRB: 5th ed, pg. 78

The image shows a sebaceous cyst on the scalp. Other common sites apart from scalp are face and scrotum. It contains a cheesy white material with putty consistency. It is not seen in palms and soles as there are no sebaceous glands.

20. Ans. (a) Lipoma

Ref: SRB: 5th ed, pg. 72

- The image shows a solitary lipoma on dorsum of neck with probably a decubitus ulcer. They are common in males and are common in back, shoulder and upper arm.

- Choice B is seen in pediatric age group and survival upto adult age group is unlikely. Choice C is seen in posterior triangle of neck
- Choice D is unlikely at occiput.

21. Ans. (b) Below Inferior constrictor

Ref: Bailey and Love: 26th ed. pg. 1018

The Killian's dehiscence is located *below inferior constrictor muscle* and above cricopharyngeal muscle. Laimer's triangle lies below cricopharyngeus and above longitudinal muscle of esophagus

22. Ans. (b) Gut

Ref: Bailey and Love: 26th ed. pg. 1429

Progress in small bowel transplantation has lagged behind others since intestinal transplants stimulate a strong graft rejection response *because small intestine contains large amount of lymphoid tissue*. Moreover, ischemia and rejection increase intestinal permeability and allow translocation of bacteria from the lumen of bowel.

23. Ans. (a) Kidney

Ref: Bailey and Love: 26th ed. pg. 18

Urine out-put is a reliable indicator of end organ perfusion. The Brain and heart continue to receive blood supply at the expense of other organs. The Kidney insult in hypovolemic shock indicates decompensation process has started and resuscitative measures are not working.

GASTROINTESTINAL TRACT

24. Ans. (a) Haemorrhage

Ref: Bailey 27th ed. pg. 1186

- Immediate complication is bleeding due to slippage of ligature.
- Gastric dilatation and gastric mucosal damage leading to hematemesis are uncommon complications.
- Fistula can develop due to damage to wall of greater curvature of stomach.
- Damage to tail of pancreas can lead to pancreatitis, localised abscess formation.

25. Ans. (a) Chemoradiation

Ref: SRB 5th ed. pg. 987 and Bailey 26th ed. pg. 1266

- The primary management of anal cancer is by chemoradiotherapy also called Combined Modality Therapy (C.M.T).
- Initially radiotherapy for 3 weeks 3000 rads are given for 3 weeks to the perineum and pelvis.
- The chemotherapy includes a combination of 5FU with mitomycin C or cisplatin.

26. Ans. (a) No occurrence after surgery

Ref: SRB 5th ed. pg. 894

Crohn's disease can recur even after surgical procedures unlike ulcerative colitis where total proctocolectomy cures the disease. Choice B, C and D are characteristic features of Crohn's disease.

TABLE: Difference between Crohn's disease and ulcerative colitis

Crohn's disease	Ulcerative colitis
• It affects ileum and often colon but can involve any part of GIT—rectal sparing is common	• It affects rectum and colon from distal to proximal
• Full thickness—transmural disease	• It affects mucosa and submucosa—not deeper
• Skin lesions are typical	• Skip lesions are not observed
• Granulomatous lesion on histology—deep ulcers; pseudopolyps are not found	• Not a granulomatous lesion—superficial ulcers, pseudopolyps are present
• Stricture and fistula are common	• Narrowing can occur but not very common
• Anal fissure and perianal abscess are more common	• Fissure and perianal disease can occur but not as common as in Crohn's disease
• May mimic appendicitis	• Will not mimic appendicitis
• Bleeding is not common	• Bleeding is common
• Fever is common	• Fever is uncommon
• Mass in RIF is common	• Mass is not a common feature

Contd...

FMGE Solutions Screening Examination

738

Crohn's disease	Ulcerative colitis
<ul style="list-style-type: none"> Anal pathology very common Discontinuous segmental asymmetrical colitis Toxic megacolon is rare Normal vascular pattern Fistula is very common Recurrence is common after resection 	<ul style="list-style-type: none"> Anal pathology is rare Continuous mucosal disease—colitis Toxic megacolon is common Distorted vascular pattern Fistula is uncommon Total proctocolectomy cures the disease

27. Ans. (b) pH-metry

Ref: SRB 5th ed. pg. 806-807

Biopsy will be done for diagnosis while CT chest will let us know the extent of spread of cancer. PET scan is done to evaluate response to therapy. It will also help to know involvement of lymph nodes which may be involved but are not picked up on a CT scan. *There is no role of pH monitoring in diagnosis or determining prognosis of carcinoma esophagus.*

28. Ans. (a) Ochsner-Sherren regimen

Ref: SRB 5th ed. pg. 946

The image shows an appendicular mass where nature has already contained the infection. If disturbed it will cause fecal fistula. Hence a conservative approach will be followed.

MANAGEMENT PROTOCOL OF APPENDICULAR MASS

- Use conservative Ochsner-Sherren regime
 - IV fluid
 - NGT
 - Analgesics
 - Antibiotics—parenteral
 - Mark the limits of the mass on the abdominal wall using a skin pencil
 - Monitor-vital sign, size of the mass, input/output chart
 - Clinical improvement is expected in 24–48 hours

29. Ans. (d) Colocolic intussusception

Ref: SRB 5th ed. pg. 932

The image shows a barium enema showing a claw sign and haustrations point to etiology of colocolic intussusception. The geriatric age group also point to the presentation of same.

Ileocolic intussusception	Sigmoid volvulus	Toxic megacolon
 <p>The classic meniscus sign can be seen as an abrupt cut off of barium flow at junction of colon and ileum.</p>	 <p>The image shows inner tube bent sign diagnostic of sigmoid volvulus. It is called as coffee bean sign and occurs due to anticlockwise rotation of sigmoid colon</p>	 <p>Notice the hugely dilated colonic loops suggestive of toxic megacolon. There is no meniscus sign/Claw sign visualised</p>

30. Ans. (d) Refractory fistula

Ref: Harrison 20th ed. pg. 2274

Fistula formation is a feature of Crohn's disease. Choices A, B and C will necessitate surgery.

INDICATIONS OF SURGERY IN ULCERATIVE COLITIS

Ulcerative Colitis
Intractable disease
Fulminant disease
Toxic megacolon
Colonic perforation
Massive colonic hemorrhage
Extracolonic disease
Colonic obstruction
Colon cancer prophylaxis
Colon dysplasia or cancer

31. Ans. (b) Middle 1/3rd

Ref: SRB 5th ed. P 805

In spite of the controversy about the topic, the correct answer is middle 1/3rd.

Location of cancer esophagus	Incidence
Middle 1/3rd	50%
Lower 1/3rd	33%
Upper 1/3rd	17%

Extra Mile

Esophageal Cancer

- Barrett esophagus predisposes to development of adenocarcinoma.
- Most Common gross presentation is fungating—cauliflower appearance.
- Recent onset dysplasia is the most common presentation; though for dysphagia to develop 2/3rd of lumen should be obliterated.
- Shouldering sign/irregular filling defect is seen on fluoroscopy in barium meal.
- Biopsy is done for histopathological diagnosis and CT chest for staging.

32. Ans. (b) IVF-antibiotic-air enema

Ref: Nelson 20th ed. P 2624;
Bailey and Love 26th ed. P 116

- The clinical presentation is of intussusception and needs urgent hydrostatic reduction.
- Three methods are available for reduction of intussusception by hydrostatic pressure
 - Air enema
 - Microbarium sulfate solution
 - Warm saline
- The complications of all of three methods are gut perforation.
- Gut perforation rate is least with air enema provided that the pressure is kept below 120 cm of water above the level of buttocks. Hence Bailey mentions this method before others and thus this is the best answer.
- The success rate of radiological hydrostatic reduction under fluoroscopy or ultrasonic guidance is approximately 80–95.

33. Ans. (c) 33%

Ref: Bailey and Love 26th ed. P 1164

- Colorectal cancer is the third most common cancer in the world and liver is the most common site of metastasis. The spread occurs via the portal circulation.
- Metastatic liver disease is found in **one third** of patients having surgery for primary colorectal cancer.
- 50% will develop metastasis in case of colorectal carcinoma in due course of time which leads to death.
- Resection and intra-arterial chemotherapy using 5 FU are therapeutic modalities.

34. Ans. (d) Atrophic gastritis

Ref: Harrison 19th ed. P 568

In *atrophic gastritis* the parietal cells are damaged and achlorhydria is present. Hence the feedback mechanism results in increased production of gastrin. It is the most common cause of hypergastrinemia.

Causes of Hypergastrinemia

- Atrophic gastritis/pernicious anemia
- Rebound after use of PPI
- Zollinger Ellison syndrome
- Menetrier's disease

35. Ans. (c) y

Selected Additional Descriptors Encountered in the TNM Classification

m Symbol	The suffix m, in parentheses, is used to indicate the presence of multiple primary tumors at a single site
y Symbol	In those cases in which classification is performed during or following multimodality therapy. The eTNM or pTNM category is identified by a y prefix This convention should typically be used following neoadjuvant therapies and may be most applicable to induction chemotherapy
r Symbol	Recurrent tumors, when classified after a disease free interval, are identified by the prefix r
R-Classification	The absence of presence of residual tumor after treatment is described by the symbol R as follows RX: Presence of residual tumor cannot be assessed R0: No residual tumor R1: Microscopic residual tumor R2: Macroscopic residual tumor

36. Ans. (a) Acute appendicitis

The clinical history and USG image is diagnostic of appendicitis. The appendix lumen is dilated >6 mm and wall is hyperechoic.

Sonographic criteria for acute appendicitis	CT criteria for acute appendicitis
Non compressible appendix of size > 6 mm AP diameter Hyperechoic thickened appendix wall > 2 mm: target sign Appendicolith Interruption of submucosal continuity Peri-appendicular fluid	Thickened caecum funnelling contrast into the orifice of appendix called arrow head sign. Thickened meso-appendix Appendicular phlegmon Fecolith

37. Ans. (a) **Hypochloremic metabolic alkalosis**

- The repeated vomiting episode leads to loss of stomach acid and leads to hypochloreaemia.
- Due to fluid loss renal blood flow falls which explains the positive stimulus for RAAS system.
- The increase aldosterone leads to urinary loss of hydrogen and potassium.
- Hence GOO leads to *hypochloreaemic hypokalemic metabolic alkalosis*.

38. Ans. (a) **Aberrant blood vessel**

- Dysphagia lusoria is due to aberrant right subclavian artery. It is also called *arteria lusoria*, and is one of the most common intrathoracic arterial anomalies.
- Although mostly asymptomatic, the retroesophageal and retrotracheal course of the lusorian artery might result in-

- Unspecific thoracic pain
- Dysphagia
- Dyspnea
- Arterio-esophageal fistula with hematemesis
- Arterio-tracheal fistulae with haemoptysis
- Aneurysmal formation with risk of rupture

39. Ans. (d) **Ovarian cancer**

Ref: Grainger & Allison's Diagnostic Radiology 6th ed. pg. 714

Peritoneal seeding is a common mechanism of metastatic dissemination in advanced gynecological malignancy and GIT malignancy

Peritoneal Carcinomatosis

Site of primary	Percentage
Ovarian cancer	71%
Gastric cancer	17%
Colorectal cancer	10%

- Do remember that if only GIT malignancies are mentioned then the answer is Stomach cancer
- The most common seeding site is pouch of Douglas
- More aggressive neoplasms exhibit peritoneal deposits closer to primary tumor.

40. Ans. (b) **Pancreas**

Remember the marking shown in CT scan Abdomen as this is a favourite question with National Board.

41. Ans. (c) **Desmoid tumor**

Gardner syndrome is occurrence of familial adenomatous polyposis (FAP) with the extra-colonic manifestations. The polyps in FAP can develop adenocarcinoma colon and hence prophylactic colectomy is performed. Other features seen are

1. Desmoids or osteomas can cause parietal lumps, obstruction, and bleeding.
2. Dental abnormalities may develop and may result in jaw pain.
3. Epidermoid cysts may develop, but they manifest as only cosmetic defects.
4. Gastric polyps may manifest as epigastric pain or bleeding.
5. Duodenal polyps may cause pain, bleeding, or jaundice, whereas ileal polyps may cause obstruction.
6. Thyroid carcinoma (papillary carcinoma) may manifest as a neck mass, hoarseness of voice.

Mnemonic

DAISY POTS

Desmoid tumor of abdomen

Polyps

Osteomas

Thyroid cancer

Sebaceous cysts

42. Ans. (b) 3 weeks

Ref: Bailey, 26th ed. pg. 113

- Infantile hypertrophic pyloric stenosis (IHPS) presents with non-bilious projectile vomiting between 2 and 8 weeks of age and is only rarely seen after 13 weeks.
- It is easily distinguished from many other serious causes of vomiting, such as infections because the baby is particularly hungry.
- The non-bilious nature is stressed here to contrast the condition with the bilious vomiting of the potentially life-threatening malrotation and volvulus seen occasionally in neonates.

43. Ans. (b) Esophageal varices

Ref: Bailey, 25th ed. pg. 1043-44

The presence of ascites and dilated veins are suggestive of portal hypertension in a chronic alcoholic. Since patient presents with hematemesis it indicates bleeding esophageal varices for which octreotide infusion should be started with aggressive resuscitation.

44. Ans. (d) Large bore cannula for IVF

Ref: Bailey, 26th ed. pg. 16-17

- The probable clinical diagnosis is portal hypertension with varices
- Volume resuscitation is initiated through large-bore intravenous lines with rapid infusion of either isotonic saline (although care must be taken to avoid hyperchloremic acidosis from loss of bicarbonate buffering capacity and replacement with excess chloride) or a balanced salt solution such as Ringer's lactate (being cognizant of the presence of potassium and potential renal dysfunction).

45. Ans. (b) Post-ileal

Ref: Bailey, 26th ed. pg. 1199

Most common position of appendix is Retro-caecal 74%
Least common position of appendix is Post-ileal variety

46. Ans. (b) Multiple air fluid levels

Ref: Bailey, 26th ed. pg. 1189

- In intestinal obstruction, fluid levels appear later than gas shadows as it takes time for gas and fluid to separate.
- These are most prominent on an erect film. In adults, two inconstant fluid levels—one at the duodenal cap and the other in the terminal ileum—may be regarded as normal.

47. Ans. (a) 15 cm

Bailey and Love, 26th ed. ch. 62/982

The esophagus has 3 constrictions in its vertical course, as follows:

- **The first constriction is at 15 cm from the upper incisor teeth**, where the esophagus commences at the cricopharyngeal sphincter; this is the narrowest portion of the esophagus and approximately corresponds to the sixth cervical vertebra
- **The second constriction is at 25 cm from the upper incisor teeth**, where it is crossed by the aortic arch and left main bronchus.
- **The third constriction is at 40 cm from the upper incisor teeth**, where it pierces the diaphragm; the lower esophageal sphincter (LES) is situated at this level.

48. Ans. (b) Barium swallow

Ref: Bailey & Love, 26th ed. pg. 989

- Dysphagia is difficulty in swallowing. The cause can be esophageal in origin.
- The motility disorders are best evaluated with esophageal manometry.
 - **Barium swallow:** For esophageal diseases
 - **Barium meal follow through:** Small intestine pathology.
 - **Barium enema:** Colonic and rectal diseases

49. Ans. (d) Metabolic alkalosis

Ref: Bailey & Love, 26th ed. pg. 1018

- In Zenker's diverticulum, the contents of stomach are not lost and therefore metabolic alkalosis cannot occur. *Loss of stomach acid in lieu of reverse peristalsis in chronic vomiting leads to metabolic alkalosis.* When there is excessive pressure within the lower pharynx, the weakest portion of the pharyngeal wall balloons out, forming a diverticulum. Uncoordinated swallowing, impaired relaxation of the cricopharyngeus muscle leads to an increase in pressure within the distal pharynx, so that its wall herniates through the point of least resistance (Killian's triangle).

FMGE Solutions Screening Examination

742

- Best investigation for Zenker diverticulum is barium swallow and best treatment is surgical resection.

50. Ans. (d) Corkscrew Esophagus

Ref: Bailey & Love, 26th ed. pg. 1014

- Corkscrew esophagus is seen in diffuse esophageal spasm and not in achalasia Cardia.
- **Diffuse esophageal spasm** is a condition in which uncoordinated contractions of the esophagus occur. These spasms do not propel food effectively to the stomach. It can cause dysphagia, regurgitation and chest pain.
- **Esophageal achalasia** is an esophageal motility disorder involving the smooth muscle layer of the esophagus and the lower esophageal sphincter (LES). It is characterized by incomplete LES relaxation, increased LES tone, and lack of peristalsis of esophagus. Diagnosis is reached with esophageal manometry and barium swallow radiographic studies. Permanent relief is brought by Esophageal dilatation and surgical cleaving of the muscle (Heller myotomy).

51. Ans. (b) Normal peristalsis

Ref: Bailey & Love, 26th ed. Ch. 62/1014

- Achalasia is a rare disease caused by loss of inhibitory ganglion cells within the esophageal myenteric plexus
- It leads to a hypertensive lower oesophageal sphincter (LES) which fails to relax on swallowing.
- *Long-standing achalasia is characterized by progressive dilatation and sigmoid deformity of the esophagus with hypertrophy of the LES.*

Clinical Presentation

- **Progressive dysphagia is the most common presenting symptom. It generally concerns initially liquids and later both liquids and solids from the outset.**
 - **Dysphagia:** Liquids > Solid
- The second most common symptom is the regurgitation of undigested food during or shortly after a meal.

Investigation

- **Screening: Barium study-Bird beak appearance**
- **IOC: Manometry**

Treatment

- **Medical management:**
 - Calcium channel blockers
 - Nitrates
 - Botulinum toxin (*injected into the LES under endoscopic guidance*)

• Surgical management:

- **Harrison states:** “The only durable therapies for achalasia are **pneumatic dilatation** and **Heller myotomy**.”
- **Surgery of choice: Heller’s myotomy**

52. Ans. (a) Achalasia Cardia

Please refer to above explanation

53. Ans. (c) Acetylcholine

Ref: Bailey & Love, 26th ed. pg. 988

There are two types of control of LES via the Myenteric plexus:

- Excitatory (cholinergic) ganglionic neurons
- Inhibitory (nitric oxide) ganglionic neurons

Functionally, inhibitory neurons mediate Deglutitive lower esophageal sphincter (LES) relaxation and the sequential propagation of peristalsis.

54. Ans. (c) Tumor infiltration

Ref: Bailey & Love, 26th ed. pg. 1014

- Tumor infiltration, most commonly seen with carcinoma in the gastric fundus or distal esophagus can mimic idiopathic achalasia.
- The resultant “pseudoachalasia” accounts for up to 5% of suspected cases and is more likely with advanced age, abrupt onset of symptoms (<1 year), and weight loss. Hence, endoscopy should be part of the evaluation of achalasia.

55. Ans. (b) Goblet cells intestinal metaplasia

Ref: Sabiston, 19th ed. pg. 1033-36

- Metaplasia of lower esophagus is usually seen in BARRETT’S Esophagus. This condition arises due to severe reflux esophagitis.
- MC type of metaplasia seen in columnar epithelium is intestinal epithelium (**Intestinal metaplasia**).
- Barrett’s esophagus requires both endoscopically visible segment of columnar lining of distal esophagus and *intestinal metaplasia showing goblet cells on biopsy*
- Barret’s esophagus is a Premalignant condition for adenocarcinoma

56. Ans. (a) Barrett esophagus

Ref: Bailey & Love, 26th ed. ch 62/1000

- Barrett’s metaplasia, endoscopically recognized by tongues of reddish mucosa extending proximally from

the gastroesophageal junction or histopathologically by the finding of specialized columnar metaplasia (*intestinal type with goblet cells*), is associated with at least a 20-fold increased risk for development of **esophageal development of adenocarcinoma**.

57. Ans. (d) De meester scoring

Ranson score	Acute pancreatitis
Gleason score	Prostate cancer
Alvarado score	Acute appendicitis
Di-meester score	GERD

58. Ans. (d) Contrast swallow

Ref: Bailey & Love, 26th ed. pg. 989

- Esophageal perforation causes pleuritic retrosternal pain that can be associated with pneumomediastinum and subcutaneous emphysema.
- Mediastinitis is a major complication of esophageal perforation, and prompt recognition is key to optimizing outcome.
- CT of the chest is most sensitive in detecting mediastinal air, but water soluble contrast (diatrizoate meglumine) will help in determining extravasation.
- *Esophageal perforation is confirmed by a CT with contrast usually Gastrografin followed by thin barium.*
- Treatment includes nasogastric suction and parenteral broad-spectrum antibiotics with prompt surgical drainage and repair in noncontained leaks. Conservative therapy with NPO status and antibiotics without surgery may be appropriate in cases of minor instrumental perforation that are detected early.

59. Ans. (b) Intestine

Ref: Bailey & Love, 26th ed. pg. 973

- Gas under diaphragm sign is seen in case of intestinal perforation. In the above case, patient was stabbed leading to perforation of intestine.
- **MC organ involved in penetrating trauma abdomen:** Intestine.

60. Ans. (b) Barium study

Ref: Bailey & Love, 26th ed. ch. 62/1003

- The symptoms of rolling hernia are mostly due to twisting and distortion of the oesophagus and stomach.
- Dysphagia is common. Chest pain may occur from distension of an obstructed stomach. Classically, the pain is relieved by a loud belch.
- Strangulation, gastric perforation and gangrene can occur.

- The hernia *may be visible* on a plain radiograph of the chest as a gas bubble, often with a fluid level behind the heart.
- **A barium meal is the best method of diagnosis.**
- Symptomatic rolling hernias nearly always require surgical repair as they are potentially dangerous.

61. Ans. (b) Biopsy

Ref: Chapter 91: Harrison, 18th ed.

- Taking multiple biopsies increases the yield. Cytologic examination of tumor brushings complements standard biopsies and should be performed routinely.
- The extent of tumor spread to the mediastinum and para-aortic lymph nodes should be assessed by CT scans of the chest and abdomen and by endoscopic ultrasound.
- Positron emission tomography scanning provides a useful assessment of resectability, offering accurate information regarding spread to mediastinal lymph nodes

62. Ans. (a) Aberrant right subclavian artery

Ref: Bailey & Love, 26th ed. pg. 1022

- During development of aortic arch, if the proximal portion of the right fourth arch disappears instead of distal portion, the *right subclavian artery* will arise as the last branch of aortic arch and is called as aberrant right subclavian artery.
- It then courses behind the esophagus (or rarely in front of esophagus, or even in front of trachea) to supply blood to right arm. This *causes pressure on esophagus and results in dysphagia*. It can sometimes result in upper gastrointestinal tract bleeding

63. Ans. (a) Spontaneous rupture of the esophagus

Ref: Bailey & Love, 26th ed. pg. 992

- Oesophageal rupture in Boerhaave syndrome is thought to be the result of a *sudden rise in internal esophageal pressure produced during vomiting, as a result of neuromuscular incoordination* causing failure of the cricopharyngeus muscle to relax. The syndrome is commonly associated with the consumption of excessive food and/or alcohol as well as eating disorders such as bulimia.
- The *most common anatomical location of the tear in Boerhaave syndrome is at left postero-lateral wall of the lower third of the oesophagus*, 2–3 cm before the stomach
- The most common cause of oesophageal perforation is iatrogenic, which occurs in cervical part of oesophagus.

64. Ans. (d) Bowel lumen obstruction

Ref: Bailey & Love, 26th ed./ch 75 pg. 1201

FMGE Solutions Screening Examination

744

- Obstruction of the appendix lumen has been widely held to be important, and some form of luminal obstruction, either by a faecolith or a stricture, is found in the majority of cases
- Obstruction of the appendiceal lumen seems to be essential for the development of appendiceal gangrene and perforation.

65. Ans. (d) **1/3 rd distance from the right anterior superior spine**

Ref: Bailey & Love, 26th ed. pg. 1203

McBurney's point is the name given to the point over the right side of the abdomen that is *one-third of the distance from the anterior superior iliac spine to the umbilicus*. This point roughly corresponds to the most common location of the base of the appendix where it is attached to the cecum.

66. Ans. (b) **Appendicitis**

Ref: Bailey & Love, 25th ed. pg. 1208

- The most common symptom of appendicitis is abdominal pain. Typically, symptoms begin as periumbilical or epigastric pain migrating to the right lower quadrant (RLQ) of the abdomen.
- *Patients of appendicitis usually lie down, flex their hips, and draw their knees up to reduce movements* and to avoid worsening their pain. Later, a worsening progressive pain along with vomiting, nausea, and anorexia are described by the patient.
- The duration of symptoms is less than 48 hours in approximately 80% of adults but tends to be longer in elderly persons and in those with perforation.

Clinical Signs in Appendicitis

- **Rovsing sign** (RLQ pain with palpation of the LLQ): Suggests peritoneal irritation
- **Obturator sign** (RLQ pain with internal and external rotation of the flexed right hip): Suggests the inflamed appendix is located deep in the right hemipelvis
- **Psoas sign** (RLQ pain with extension of the right hip or with flexion of the right hip against resistance): Suggests that an inflamed appendix is located along the course of the right psoas muscle
- **Dunphy sign** (sharp pain in the RLQ elicited by a voluntary cough): Suggests localized peritonitis
- **Markle sign** (pain elicited in a certain area of the abdomen when the standing patient drops from standing on toes to the heels with a jarring landing): Has a sensitivity of 74%

67. Ans. (c) **Locate the anterior taenia of the caecum**

Ref: Bailey & Love, 26th ed. ch 75/1204

- *Three taeniae coli of the caecum, fuse to form the outer longitudinal muscle coat of the appendix.*

- *During operation, this can be used to find an elusive appendix, as gentle traction on the taeniae coli, particularly the anterior taenia, will lead the operator to the base of the appendix.*

68. Ans. (a) **Appendix**

Ref: Bailey & Love, 26th ed. ch 75/1204

- *The base of the appendix can be identified during surgery by following the convergence of the taeniae coli toward the inferior portion of the cecum, forming a continuous muscular layer surrounding the appendix.*

The position of the appendicular tip is inconstant and can be situated in the following locations:

- **Retrocecal (65%)** – rigidity is often absent, and even application of deep pressure may fail to elicit tenderness (**Silent appendix**)
- Descending pelvic (31%)
- Transverse and retrocecal (2.5%)
- Ascending, paracecal, and preileal (1%)
- Ascending, paracecal, and postileal (0.4%)

69. Ans. (c) **Retro-caecal**

Ref: Bailey & Love, 26th ed. Ch 75/1204

70. Ans. (a) **Acute appendicitis**

Characteristic	Score
M = Migration of pain to the RLQ	1
A = Anorexia	1
N = Nausea and vomiting	1
T = Tenderness in RLQ	2
R = Rebound pain	1
E = Elevated temperature	1
L = Leukocytosis	2
S = Shift of WBCs to the left	1
Total	10
RLQ = right lower quadrant; WBCs = white blood cells	

71. Ans. (d) **All of the above**

Infants	Pre-school Children	School Children
Pyloric Stenosis	Intussusceptions, Meckel's Diverticulitis, Acute Gastroenteritis	The most common mimicker of appendicitis in this population is mesenteric lymphadenitis

Contd...

Adults	Women in their childbearing years	Elderly
Pyelonephritis, Colitis Diverticulitis	(Higher incidence of false-positive diagnoses in this group) Pelvic Inflammatory Disease (PID), Tubo-Ovarian Abscess, Ruptured Ovarian Cyst Or Ovarian Torsion, And Ectopic Pregnancy.	Diverticulitis Bowel Obstruction Malignancies Of The G.I Tract & Reproductive System Perforated Ulcers Cholecystitis

72. Ans. (a) Appendicular mass

Ref: Bailey & Love, 26th ed. pg. 1211

- The appendix that is acutely inflamed may perforate and later wall off from the peritoneal cavity by omentum and adjacent bowel loop to form a tender, palpable right iliac fossa mass. It is a common surgical pathology which occurs in about 2-6% of patients who presented with acute appendicitis. The initial school of thought regards this condition to be managed conservatively, with the famous one being the Ochsner-Sherren regimen. The idea behind this is that, surgery would be hazardous and increase the mortality rate.
- The conservative management of appendicular mass can be summarized by mnemonic "ABCDEF" which is
 - A:** Analgesic, Antibiotic, antipyretic
 - B:** Bed rest
 - C:** Charting (vital sign, size of the mass)
 - D:** Diet (Keep Nil by Mouth)
 - E:** Exploratory laparotomy
 - F:** Fluid maintenance

Three methods are proposed for management of appendicular mass which are:

- Conservative management
- Interval appendectomy
- Early surgical intervention. The selection of methods depends on surgeon preference and patient's condition.

73. Ans. (b) Kulchitsky cell tumor

Ref: Harrison, 18th ed. ch. 350

- Carcinoid tumors arise from argentaffin cells of the crypts of Lieberkühn.
- They are found in distal duodenum to the ascending colon, which are embryologically derived from the midgut.
- More than 50% of intestinal carcinoids are found in the distal ileum, with most congregating close to the ileocecal valve.**
- Most intestinal carcinoids are asymptomatic and of low malignant potential, but invasion and metastases may occur, leading to the carcinoid syndrome.

• Carcinoid tumors are classified as

- Typical carcinoid [Kulchitsky cell carcinoma producing 5-HIAA]
- Atypical carcinoid [producing 5 Hydroxy tryptophan]
- It can be benign or malignant and presents with secretory diarrhea and flushing.
- Diagnosis** is made by Octreoscan and urinary 5 H.I.A.A (Hydroxy-indole- acetic acid) levels.
- Drug of choice** is Octreotide.

74. Ans. (a) Ileum

Ref: Harrison, 18th ed. ch 350

Most common site of carcinoid Tumor: Bronchus > ileum > Rectum > appendix

75. Ans. (d) Absence of free gas rules out peritonitis

- The peritoneum, which is a sterile environment, reacts to various pathologic stimuli with a fairly uniform inflammatory response.
- Primary peritonitis** is most often spontaneous bacterial peritonitis (SBP) caused by chronic liver disease. **Secondary peritonitis** is by far the **most common form of peritonitis** encountered in clinical practice and is most commonly due to PUD. **Tertiary peritonitis** often develops in the absence of the original visceral organ pathology usually in setting of immunocompromised status.
- Chemical (sterile) peritonitis may be caused by irritants such as bile, blood, barium, or other substances or by transmural inflammation of visceral organs (eg, Crohn disease) without bacterial inoculation of the peritoneal cavity. However *bile being alkaline has more irritation than blood.*
- Free air is present in most cases of anterior gastric and duodenal perforation but is much less frequent with perforations of the small bowel and colon and is unusual with appendiceal perforation. Upright films are useful for identifying free air under the diaphragm (most often on the right) as an indication of a perforated viscus.

Remember

- The free gas appears about 1-2 hours after the perforation of bowel
- Absence of free gas in the peritoneal cavity does not necessarily exclude presence of perforation as it is absent in approximately 25 % cases of perforated duodenal ulcer.*

76. Ans. (c) Anaerobic streptococcus

Ref: Harrison, 19th ed. pg. 972

MICROORGANISMS IN PERITONITIS

Gastrointestinal Sources

- Escherichia coli*
- Streptococci (anaerobic)*

- *Bacteroides*
- *Clostridium*
- *Klebsiella pneumoniae*

Other Sources

- *Chlamydia trachomatis*
- *Neisseria gonorrhoeae*
- *Haemolytic streptococcus*
- *Staphylococcus*
- *Streptococcus pneumonia*
- *Mycobacterium tuberculosis* and other spp.
- Fungal infections

77. Ans. (c) Chlamydia*Ref: Harrison, 19th ed. pg. 972***Paths to Peritoneal Infection**

- Gastrointestinal perforation, e.g. perforated ulcer, appendix, diverticulum
- Transmural translocation (no perforation), e.g. pancreatitis, ischaemic bowel
- Exogenous contamination, e.g. drains, open surgery, trauma
- Female genital tract infection, e.g. pelvic inflammatory disease with chlamydia
- Haematogenous spread (rare), e.g. septicaemia

78. Ans. (b) Sarcoma*Ref: Bailey and Love, 26th ed. ch. 61/985*

- One third of malignant tumors that arise in the retroperitoneum are sarcomas, and approximately 15% of soft tissue sarcomas arise in the retroperitoneum.
- Retroperitoneal sarcomas are malignant tumors arising from mesenchymal cells, which are usually located in muscle, fat, and connective tissues. Retroperitoneal sarcomas have varying clinical courses depending on their histologic subtype and grade.

79. Ans. (d) Abdominal lump*Ref: Bailey and Love, 26th ed. ch. 61/985*

- Primary retroperitoneal neoplasms are an extremely rare group of tumors (lymphoma is not included in the definition). **The most common type is soft tissue sarcoma (90%).**
- The commonest age range for presentation is around 40–50 years.
- *Sarcomas that arise in the retroperitoneum most commonly present as an abdominal mass, often without other symptoms.*
- Early satiety, gastrointestinal obstruction or bleeding, lower extremity swelling, or pain are among the first symptoms leading to the discovery of a retroperitoneal sarcoma.
- **Investigation:** CT is the most commonly used tool. MRI can be used for further differentiation, but histology is

always required. Percutaneous biopsy may be undertaken and for assessment of tumor grade.

80. Ans. (c) Villous adenoma*Ref: Bailey & Love, 26th ed. pg. 1184***ADULT INTUSSUSCEPTION**

- Bowel intussusception in adults is considered a rare condition, accounting for 1%-5% of bowel obstruction.
- Adult cases of intussusception are associated with a lead point which is:
 1. Polyp
 2. Submucosal lipoma
 3. Inflammatory bowel disease
 4. Postoperative adhesions
 5. Meckel's diverticulum
 6. Villous adenoma
 7. Metastatic neoplasms
 8. Iatrogenically, due to the presence of intestinal tubes, jejunostomy feeding tubes or after gastric surgery.

Most common cause of pediatric intussusception is Meckel's diverticulum > polyp.

81. Ans. (d) Pneumatosis intestinalis*Ref: Bailey & Love, 26th ed. pg. 1189*

- Plain film radiographs of the abdomen in supine position can be helpful in diagnosing small bowel obstruction.
- An upright chest radiograph is best for ruling out free air under the diaphragm.
- Signs of small bowel obstruction include:
 - Bowel dilatation proximal to the site of obstruction, air-fluid levels
 - Paucity of large bowel gas, bowel wall thickening
 - A fixed loop
 - Ground glass appearance signifying intraluminal fluid.
 - Although the cecum may dilate greatly in chronic obstruction without rupturing, perforation should be suspected whenever this portion of the colon is greater than 10 cm in diameter.
 - Step ladder pattern of air fluid levels.

82. Ans. (b) Resection with intestine part*Ref: Bailey & Love, 26th ed. pg. 903*

- Enterogenous cyst arises from either a diverticulum of the mesenteric border of the intestine that has become sequestered from the intestinal canal during embryonic life or from a duplication of the intestine.
- An enterogenous cyst has a thicker wall than a chylolymphatic cyst and is lined by mucous membrane, sometimes ciliated.
- The content is mucinous and is either colorless or yellowish brown as a result of past haemorrhage. The

muscle in the wall of an enteric duplication cyst and the bowel with which it is in contact have a common blood supply, consequently removal of the cyst always entails resection of the related portion of intestine.

83. Ans. (a) Anastomotic leak

Ref: Bailey & Love, 26th ed. pg. 1150; *Advances in Minimally Invasive Surgery*, 2nd ed. pg. 250

Anastomotic leak is one of the most dreaded early complications of colorectal surgery. The incidence of anastomotic leak following colectomy is generally reported between 2 and 6%. Anastomotic leaks present in one of three ways.

1. Asymptomatic leak
2. Subtle insidious leak
3. Dramatic early leak

The *asymptomatic leak* is incidentally found during endoscopic or radiographic studies. The incidence of radiographically detected leaks is 4-6 times higher than clinically detected leaks. The *subtle insidious leak* can present peri-operatively with nonspecific signs and symptoms common in the post operative period, and occur 5-14 days following surgery. The *dramatic early leak* can present with any combination of acute abdominal pain, distention, fever, tachycardia, diffuse peritonitis, oliguria, or shock within several days of surgery.

84. Ans. (c) Bilious vomiting

Ref: Sabiston, 19th ed. pg. 1841

- In HPS, hypertrophy of the circular muscle of the pylorus results in constriction and obstruction of the gastric outlet.
- Most commonly clinical presentation is seen between 3-6 weeks of life
- **Clinical features:**
- *Projectile nonbilious vomiting*
- Visible gastric peristalsis may be seen as a wave of contraction from the left upper quadrant to the epigastrium
- The infants usually feed vigorously between episodes of vomiting
- **Typical electrolyte abnormality: Hypochloremic, hypokalemic, metabolic alkalosis with paradoxical aciduria.**
- **Remember:** Hypokalemic metabolic acidosis is seen with diarrhea.

Why metabolic alkalosis and paradoxical aciduria?

- Loss of stomach contents will lead to dehydration. This will trigger the R.A.A.S system into an overdrive and lead to release of aldosterone. Since aldosterone leads to potassium and hydrogen loss in the DCT of the kidney,

patient will develop hypokalemic metabolic alkalosis and aciduria (paradoxically)

85. Ans. (b) Hypokalemic metabolic alkalosis

Ref: Bailey & Love, 26th ed. ch 63/1023

86. Ans. (b) Metabolic alkalosis

Please refer to above explanation

87. Ans. (d) Hyperplastic polyp

Ref: Bailey & Love, 26th ed. pg. 1224

Inflammatory polyp	Seen in ulcerative colitis and crohn's disease, and can turn malignant
Familial adenomatous polyposis	<ul style="list-style-type: none"> • <1% of all colorectal cancers. • Autosomal dominant • > 100 colorectal adenomas, caused by germ-line mutations of the tumor suppressor gene APC
Hamartomatous polyp	They are growths, like tumors found in organs as a result of faulty development. Hamartomatous polyps are seen in Peutz-Jegher Syndrome or Juvenile Polyposis Syndrome.
Hyperplastic polyp	Most common colonic polyps <ul style="list-style-type: none"> • Quite small • Composed of cells showing dysmaturation and hyperplasia • No neoplastic potential, but some might have adenomatous changes and should be excised for histopathology.

88. Ans. (d) Toxic megacolon

Ref: Bailey & Love, 26th ed. pg. 1156

Indications for Surgery in Crohn's Disease

- **Small Intestine**
 - Stricture and obstruction unresponsive to medical therapy
 - Massive hemorrhage
 - Refractory fistula
 - Abscess
- **Colon and rectum**
- **Intractable disease**
 - Fulminant disease
 - Perianal disease unresponsive to medical therapy
 - Refractory fistula
 - Colonic obstruction
 - Cancer prophylaxis
 - Colon dysplasia or cancer

FMGE Solutions Screening Examination

748

89. Ans. (a) Juvenile rectal polyp*Ref: Bailey & Love, 26th ed. pg. 1224*

The most common cause of bleeding per rectum in children is juvenile rectal polyp up to adolescence age. Though in infants and young children (up to 1 yrs) the cause is anal fissure.

90. Ans. (b) Necrosis*Ref: Bailey & Love, 26th ed. pg. 1150***Complications of Ileostomy**

Stoma necrosis may occur in the early postoperative period and usually is caused by skeletonizing the distal small bowel and/or creating an overly tight fascial defect.

91. Ans. (a) B12*Ref: Harrison, 18th ed. ch. 294*

- Post resection of ileum, vitamin B12 deficiency is seen.
- Steatorrhea is fat malabsorption leading to malodorous stools. Fat malabsorption leads to deficiency of vitamin A, D, E, K.

92. Ans. (a) Ascites*Ref: Bailey & Love, 26th ed. pg. 980*

- A peritoneo-venous shunt (also called Denver shunt) is a shunt which drains peritoneal fluid from the peritoneum into veins, usually the internal jugular vein or the superior vena cava.
- It is sometimes used in patients with refractory ascites.
- It is a long tube with a non-return valve running subcutaneously from the peritoneum to the internal jugular vein in the neck, which flows ascitic fluid to pass directly into the systemic circulation.

93. Ans. (a) IBS*Ref: Bailey & Love, 26th ed. pg. 1179*

The Rome criteria is a system developed to classify the functional gastrointestinal disorders (FGIDs), disorders of the digestive system in which symptoms cannot be explained by the presence of structural or tissue abnormality, based on clinical symptoms. *Some examples of FGIDs include irritable bowel syndrome, functional dyspepsia, functional constipation, and functional heart burn.*

94. Ans. (b) Malnutrition*Ref: Bailey & Love, 26th ed. pg. 1134***CHRONIC TROPICAL PANCREATITIS**

- Most common cause of chronic pancreatitis is alcohol intake

- *Non alcoholic form of chronic pancreatitis* prevalent in the tropics like Africa, Asia and India
- Diabetic stage of the disease referred to as fibrocalculous pancreatic diabetes
- **Etiology:** Malnutrition, cyanogens toxicity (present in insufficiently processed cassava), antioxidant def. and genetic factors
- **Classical triad:** steatorrhea, diabetes, abdominal pain
- **Main treatment:** management of diabetes
- **Main cause of death:** complications of diabetes (MC diabetic nephropathy)

95. Ans. (c) RANSON Score*Ref: Bailey & Love, 26th ed. pg. 1128***RANSON CRITERIA****At Admission**

- Age in years > 55 years
- White blood cell count > 16000 cells/mm³
- Blood glucose > 10 mmol/L (> 200 mg/dL)
- Serum AST > 250 IU/L
- Serum LDH > 350 IU/L

Within 48 hours

- Serum calcium < 2.0 mmol/L (< 8.0 mg/dL)
- Hematocrit fall > 10%
- Oxygen (hypoxemia PO₂ < 60 mm Hg)
- BUN increased by 1.8 or more mmol/L (5 or more mg/dL) after IV fluid hydration
- Base deficit (negative base excess) > 4 mEq/L
- Sequestration of fluids > 6 L

Alternatively, Pancreatitis severity can be assessed by any of the following:

- APACHE II score ≥ 8
- **CT Scan** - Substantial pancreatic necrosis (at least 30% glandular necrosis according to contrast-enhanced CT)

96. Ans. (a) Serum bilirubin*Ref: Bailey & Love, 26th ed. pg. 1128*

APACHE score is: Acute Physiology and Chronic Health Evaluation

The APACHE II point score is calculated from 12 routine physiological measurements:

- Age
- Temperature (rectal)
- Mean arterial pressure
- pH arterial
- Heart rate
- Respiratory rate
- Sodium (serum)
- Potassium (serum)

- Creatinine
- Hematocrit
- White blood cell count
- Glasgow Coma Scale

Extra Mile

- Now APACHE III is also available. The APACHE III is used to produce an equation predicting hospital mortality after the first day of ICU treatment.
- **There are 4 components:** Age, Major disease category (reason for ICU admission), Acute (current) physiology, and Prior site of healthcare (e.g. hospital floor, emergency room, etc.).

97. Ans. (a) Acute pancreatitis

Ref: Schwartz's, 9th ed. pg. 1352

Complications of ERCP

1. **Pancreatitis is the most common ERCP complication.**
Transient increase in serum pancreatic enzymes may occur in as many as 75% of patients.
2. Most ERCP-associated *bleeding* is intraluminal, although intra-ductal bleeding can occur.
3. *Post-ERCP cholangitis*.
4. Cardiopulmonary complications
5. Duodenal hematoma
6. Colonic perforation
7. Cardiopulmonary complications

98. Ans. (a) Neurofibromatosis

- **Neurofibromatosis type 1**/von Recklinghausen disease caused by inherited gene, the NF1 gene codes for the protein neurofibromin.
- Patients with neurofibromatosis develop café-au-lait spots, and benign and malignant tumors of the nervous system.
- Benign nervous system involvement include neurofibromas, and the malignant include peripheral nerve sheath tumor.
- *They can also develop distinctive eye lesions called Lisch nodules, which are iris hamartomas*
- *The most common cause of death is CNS tumors.*

Extra Mile

- Turcot syndrome is characterized by intestinal polyposis and CNS tumors: Most commonly glioblastoma or medulloblastoma
- MEN2A sipple consists of parathyroid adenoma, medullary carcinoma thyroid, pheochromocytoma.

99. Ans. (a) Duodeno-Duodenostomy

Ref: Bailey & Love, 26th ed. pg. 1194

- Duodenal atresia and stenosis are treated surgically. In patients with duodenal obstruction, a duodenoduodenostomy is the most commonly performed procedure.

- *A duodenojejunostomy is now rarely performed due to its higher risk of long-term complications.*
- Presenting symptoms and signs are the result of high intestinal obstruction. Duodenal atresia is typically characterized by onset of vomiting within hours of birth. While vomitus is most often bilious, it may be non-bilious because 15% of defects occur proximal to the ampulla of Vater.

100. Ans. (b) Splenosis

Ref: Bailey & Love, 26th ed. pg. 1095-96

Complications of Splenectomy:

- Intraoperative complications:
 - Pancreatic injury
 - Hemorrhage
 - Bowel injury: Colon and stomach
 - Diaphragmatic injuries
- Early post op complications
 - *Pulmonary: Atelectasis, pleural effusion, pneumonitis*
 - *Sub phrenic abscess*
 - Thrombocytopenia and thrombotic complications
 - Wound problems
 - Ileus
- Late post op complications:
 - Overwhelming post splenectomy infection
 - Splenosis

Splenosis occurs due to seeding of peritoneal cavity with splenic tissue which recruits local blood supply.

101. Ans. (d) All of the above

Post Vagotomy Complications:

1. **Post vagotomy diarrhea:**
 - About 30% or more of patients suffer from diarrhea after gastric surgery.
2. **Post vagotomy gastric atony:**
 - After vagotomy, gastric emptying is delayed. This is true for both truncal and selective vagotomies but not in the case of highly selective or parietal cell vagotomy.
 - With selective or truncal vagotomy, patients lose antral pump function and therefore have a reduction in their ability to empty solids
3. **Incomplete Vagal Transection:**
 - It predisposes the patient to the possible development of recurrent ulcer formation. The type of vagotomy performed influences the likelihood of this problem.
 - In highly selective vagotomy, incomplete vagotomy is rarely a problem because of the meticulous dissection required during this procedure.

102. Ans. (c) Ogilvie's syndrome

Ref: Bailey & Love, 26th ed. pg. 1198

FMGE Solutions Screening Examination

750

- Pseudo-obstruction of the colon is called as Ogilvie's syndrome which is characterized by distention of the colon, with signs and symptoms of colonic obstruction, in the absence of an actual physical cause of the obstruction.
- Mirizzi syndrome is a gallstone becoming impacted in cystic duct or neck of gallbladder causing compression of CBD and resultant obstructive jaundice.

103. Ans. (b) Lesser curvature

Ref: Bailey & Love, 26th ed. pg. 1034

Most peptic ulcers are caused by *H. pylori* or NSAIDs with lesser curvature being the most common site of gastric ulcer and duodenal cap being the site of duodenal ulcer.

104. Ans. (d) Lesser sac

Ref: Bailey & Love, 26th ed. pg. 1041

Posterior perforation of peptic ulcer leads to escape of contents to enter into lesser sac via foramen of Winslow. Posterior gastric ulcers may erode into the lesser sac behind the stomach. The lesser sac behind the stomach is a potential space and is less effective in sealing off a posteriorly situated gastric ulcer eroding through the wall of the stomach.

105. Ans. (a) Acute pancreatitis

Ref: Bailey & Love, 26th ed. ch. 313

- Purtscher-like retinopathy is seen in:

1. Acute pancreatitis
2. Fat embolization
3. Amniotic fluid embolization
4. Preeclampsia
5. Hemolysis
6. Elevated liver enzymes, and low platelets (HELLP) syndrome; and vasculitic diseases, such as lupus.

- The findings of white lesions in the retina associated with intraretinal and pre-retinal hemorrhages and papillitis are due to lymphatic extravasation from trauma. These lesions are known as Purtscherflecken (larger infarcts of the retinal capillary bed) and cotton-wool spots (small retinal microinfarcts at the level of the nerve fiber layer).
- No proven treatment exists for Purtscher retinopathy that occurs after traumatic injury.

106. Ans. (b) Autoimmune

Ref: Bailey & Love, 26th ed. pg. 1031

- Autoimmune metaplastic atrophic gastritis is an autoimmune disease that attacks parietal cells, resulting in hypochlorhydria and reduced production of intrinsic factor. Consequences

include atrophic gastritis, B₁₂ malabsorption, and, frequently, pernicious anemia. Risk of gastric adenocarcinoma increases 3-fold. Diagnosis is by endoscopy. Treatment is with B₁₂.

- Type B, or antral-predominant, gastritis is caused by *H. pylori* infection.
- The number of *H. pylori* organisms decreases dramatically with progression to gastric atrophy, and the degree of inflammation correlates with the level of these organisms.
- Early on, with antral-predominant findings, the quantity of *H. pylori* is highest and a dense chronic inflammatory infiltrate of the lamina propria is noted, accompanied by epithelial cell infiltration with polymorphonuclear leukocytes

107. Ans. (a) Stomach

- Primary gastric lymphoma is an uncommon condition, accounting for less than 15% of gastric malignancies and about 2% of all lymphomas. However, the stomach is a very common extranodal site for lymphomas (lymphomas originating somewhere else with metastasis to stomach). It is also the most common source of lymphomas in the gastrointestinal tract.

108. Ans. (d) Stomach CA

Ref: Bailey & Love, 26th ed. ch 63/1050

- Tumor of the stomach may spread via the abdominal cavity to the umbilicus (Sister Joseph's nodule).
- The ovaries may sometimes be the sole site of transcoelomic spread (Krukenberg's tumors).

109. Ans. (b) Stomach

Ref: Bailey & Love, 26th ed. ch 63/1050

110. Ans. (d) Right side of the colon in adults

Ref: Bailey & Love, 26th ed. Ch 69/1171

- Angiodysplasia is a degenerative lesion of previously healthy blood vessels found most commonly in the cecum and proximal ascending colon.
- 77% of angiodysplasias are located in the cecum and ascending colon, 15% are located in the jejunum and ileum, and the remainder are distributed throughout the alimentary tract. These lesions typically are non-palpable and small (< 5 mm).
- Angiodysplasia is the most common vascular abnormality of the GI tract. After diverticulosis, it is the second leading cause of lower GI bleeding in patients older than 60 years.

111. Ans. (d) Epidermoid

Ref: Schwartz, 9th ed. pg. 1277, Sabiston, 19th ed. pg. 1104-05

Types of mesenteric cyst	Features
1. Chylolymphatic cyst	MC age for mesenteric cyst-2 nd decade of life
2. Simple (mesothelial cyst)	MC in women
3. Enterogenous	C/F: painless abdomen swelling>recurrent attack of abdomen pain without vomiting>acute abdomen(torsion,rupture, hrage, infection)
4. Urogenital remnant	
5. Dermoid	
Diagnosis of mesenteric cyst	CT scan is IOC
Chylolymphatic mesenteric cyst	Most common type <ul style="list-style-type: none"> • Arise from misplaced lymphatic tissue • Located at mesentery of ileum • Thin walled,with clear fluid(pic above) • Unilocular,solitary • Blood supply independent
Treatment of choice	Chylolymphatic- Enucleation Enterogenous- Resection and anastomosis

112. Ans. (b) Chylolymphatic cyst

Ref: Schwartz, 9th ed./1277, Sabiston 19th ed./1104-05

113. Ans. (c) Chronic diarrhea

- Immunoproliferative small intestinal disease (IPSID), is a B cell tumor.
- The presentation includes chronic diarrhea, steatorrhea associated with vomiting and abdominal cramps.
- IPSID presents with intestinal secretions of an abnormal IgA that contains a shortened heavy chain and is devoid of light chains.
- The clinical course is one of exacerbations and remissions, with death due to malnutrition and wasting or the development of a lymphoma.

114. Ans. (a) Digital positioning

Ref: Bailey & Love, 26th ed. pg. 1220

- Patients who present with a prolapsed rectum should undergo manual reduction. Conservative management is appropriate in selected patients. Treatment should be directed to the underlying cause. After treating the underlying cause, conservative management is usually successful.
- The prolapsed bowel may be grasped with lubricated gloved fingers and pushed back in with gentle steady pressure. If the bowel has become edematous, firm

steady pressure for several minutes may be necessary to reduce the swelling and allow for reduction. If the prolapse immediately recurs, it may be reduced again and the buttocks taped together for several hours.

- However, if the prolapse persists after an adequate trial of medical therapy (usually a period of months), surgical intervention may be required. Pain, excoriations, and rectal bleeding are considered indications for surgical treatment.

115. Ans. (c) Fistula in ano

Ref: Bailey & Love, 26th ed. pg. 1259

Causes of Acute Anal Pain

1. Thrombosed hemorrhoids
 - **External hemorrhoids** are located distal to the dentate line and are covered with anoderm. Because the anoderm is richly innervated, thrombosis of an external hemorrhoid **may cause significant pain**.
2. Acute anal fissure
 - Characteristic symptoms include tearing pain with defecation and hematochezia (usually described as blood on the toilet paper)
3. Perianal abscess
 - Severe anal pain is the most common presenting complaint. Walking, coughing, or straining can aggravate the pain.

Fistula in ano presents with

Patients usually complain of intermittent purulent discharge (which may be bloody). Schwartz's 9th ed and oxford textbook of surgery do not mention pain as a feature of fistula in ano

116. Ans. (a) Purulent discharge with bleeding

Ref: Bailey & Love, 26th ed. pg. 1259

- A fistula-in-ano is an abnormal tract with external opening in the perianal area and communicates with the rectum or anal canal by an identifiable internal opening. Fistulas arise as a result of cryptoglandular infection with resultant perirectal abscess.
- The patient may present with recurrent perianal abscesses or with a bloody and purulent discharge.

117. Ans. (b) Anterior and posterior fistula

Ref: Bailey & Love, 26th ed. pg. 1260

- Goodsall's rule used to indicate the likely position of the internal opening according to the position of the external opening(s).
- The site of the internal opening may be felt as a point of induration or seen as an enlarged papilla. Whenever possible, it is important to determine by examination the level of the internal opening in relation to the levator mechanism.

FMGE Solutions Screening Examination

752

- Goodsall's law indicates that fistulas with an *anterior external opening, drain directly into the anus at the dentate line*, and those with a posterior external opening take a curved course to enter the anal canal in the midline.

118. Ans. (b) **Squamous cell CA**

Ref: Sabiston, 19th ed. pg. 1405-06

CARCINOMA ANAL CANAL

- Carcinomas arising proximal to the (dentate line) pectinate line are known as *basaloid, cuboidal*, or *cloacogenic* tumors; **about one-third of anal cancers have this histologic pattern.**
- Malignancies arising distal to the pectinate line have **squamous histology**, ulcerate more frequently, and **constitute 55% of anal cancer**
 - **MC type of CA anal canal:** Squamous cell CA > BCC > Melanoma
 - Median age at diagnosis: 60 years
 - **MC symptom:** Bleeding PR
 - **MC site of metastasis:** Lung
 - **MC site of LN metastasis:** Inguinal LNs

Clinical Features of anal Canal CA

- Most patients present with rectal bleeding and pain
- Patients are frequently misdiagnosed as having a benign anorectal condition such as hemorrhoids.
- **Additional symptoms:** Incontinence, change in bowel habits, pelvic pain, and rectovaginal or rectovesical fistulas are ominous.

Diagnosis: IOC for diagnosis of CA anal canal: Proctoscopy with biopsy.

Treatment

- **Nigro regimen:** Chemoradiation is the treatment of choice.
- **Chemotherapy regime:** 5-FU + Mitomycin, Cisplatin
- More than 80% are cured by chemoradiation. If any residual tumor is left behind after chemoradiation, APR is performed.

119. Ans. (a) **Squamous**

Ref: Bailey & Love, 26th ed. pg. 1267

120. Ans. (a) **Human papilloma virus**

Ref: Bailey & Love, 26th ed. pg. 1266

- The development of anal cancer is associated with infection by human papilloma virus.
- The infection may lead to:
 - Anal warts (condyloma acuminata)
 - Anal intraepithelial neoplasia
 - Squamous cell carcinoma.
- The risk for anal cancer is increased among homosexual males.
- Anal cancer risk is increased in both men and women with AIDS, because of their immunosuppressed state

121. Ans. (b) **Liver**

Ref: Bailey & Love, 26th ed. pg. 1226

- Cancers of the colon spread to regional lymph nodes or to the liver through the portal venous circulation.
- *The liver represents the most frequent visceral site of metastasis.*
- Colorectal cancer rarely spreads to the lungs, supraclavicular lymph nodes, bone, or brain without prior spread to the liver.

122. Ans. (a) **Rectal prolapse**

Ref: Bailey & Love, 26th ed. pg. 1220

- The image shows a rectal prolapse which is a sliding hernia through a defect in the pelvic fascia.

123. Ans. (b) **Urine retention**

Ref: Bailey & Love, 26th ed. pg. 1256

- Urinary retention is a common complication following hemorrhoidectomy and occurs in 10% to 50% of patients. Many factors are thought to contribute to urinary retention following hemorrhoidectomy, with pain being a major contributor.
- Bleeding is often minor and can be stopped with local pressure.
- Chronic complications include
 - Poor wound healing
 - Abscess
 - Healing
 - Anal stenosis

124. Ans. (a) 1/3rd above the dentate line and 2/3rd below the dentate line

Ref: Bailey & Love 26th ed./1237

- The anal canal is completely extraperitoneal.
- The length of the (surgical) anal canal is about 4 cm (range, 3–5 cm), with *two thirds of this being above the dentate line and one third below the dentate line (the anatomical anal canal)*.
- The epithelium of the (anatomical) anal canal is called anoderm. It is pigmented and keratinised.
- In anatomy texts, the rectum changes to the anal canal at the dentate line. *For surgeons, however, the demarcation between the rectum above and the anal canal below is the anorectal ring*
- The anorectal ring is situated about 5 cm from anus. At the anorectal angle, the rectum turns backwards to continue as the anal canal

125. Ans. (a) Anterior border is formed by inferior fascia of urogenital diaphragm.

Ref: IB Singh Anatomy, 2nd ed./fig. 25.12

ANTERIOR	POSTERIOR	
<ul style="list-style-type: none"> • Fascia of Colles covering the Transversus perinei superficialis • Inferior fascia of the urogenital diaphragm 	<ul style="list-style-type: none"> • Gluteus maximus • Sacrotuberous ligament 	
LATERAL	SUPERIOR	MEDIAL
<ul style="list-style-type: none"> • Tuberosity of the ischium • Obturator internus muscle • Obturator fascia 	<ul style="list-style-type: none"> • Levator ani • Skin 	<ul style="list-style-type: none"> • Levator ani • Sphincter ani externus muscle • Anal fascia

126. Ans. (d) Solitary Ascariasis in the bowel

Ref: Bailey & Love, 26th ed. pg. 71

- The image shows a round worm in the bowel.
- While roundworms most commonly reside in the jejunal and ileal lumen, on occasion they may migrate into the duodenum and ampullary orifice.
- While intestinal obstruction is more common in children, adults experience allergic reactions more frequently.

BREAST

127. Ans. (c) Nipple

Ref: SRB 5th ed. pg. 543

Sentinel lymph node is localised by pre-operative (within 12 hours) or perioperative injection of isosulfan vital blue or 99m TC radioisotope labelled albumin *near the tumour or into subdermal plexus around the nipple*. Marker will pass into the sentinel node which can be visually detected as blue staining or with hand held gamma camera. It is biopsied with small incision made directly over it. Frozen section biopsy or touch imprint cytology is done for presence of malignant cells. *Combined approach using Radioisotope Peritumoral injection is done on day of surgery and perioperative injection of patent blue dye in sub-areolar region is used nowadays.*

128. Ans. (c) Eczema of skin of nipple

Ref: SRB 5th ed. pg. 533

- Paget's disease of the nipple is an intraductal carcinoma of breast. The malignancy spreads within the duct up to the skin of nipple and down into the substance of breast. It mimics eczema of nipple and areola.
- The disease presents as a hard nodule underneath the areola which later ulcerates and causes destruction of nipple. It contains large ovoid clear Paget cells with malignant features.
- Choice C, mastitis carcinomatosa is alternative name for inflammatory carcinoma and is the most aggressive breast cancer.
- Choice D is seen in elderly females and is a slow growing tumour with better prognosis.

129. Ans. (a) Fibroadenoma

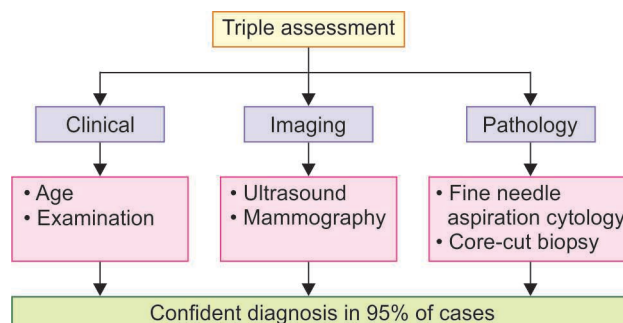

Ref: SRB 5th ed. pg. 516

The most common benign encapsulated tumour of breast is called as fibroadenoma. It is classified as hyperplasia of single lobule of breast. On mammography it shows a popcorn calcification. Excision is via sub-mammary or circumareolar incision.

130. Ans. (b) Axillary sampling

Ref: SRB: 5th ed. pg. 545

Axillary sampling is done after axillary incision and 10-15 nodes are removed for sampling. It is not done now. Triple assessment technique includes choices A, C and D

131. Ans. (a) **Patient's decision**

Ref: SRB 5th ed. P 517

Indications for surgery in Fibroadenoma are:

1. Size >3 cm
2. Multiple
3. Giant type
4. Recurrence
5. Cosmesis
6. Complex type

- Fibroadenoma which is small (size <3 cm), single lesion and patient's age <30 years can be left alone with regular follow-up with USG at 6 monthly interval.
- 30% fibroadenomas may disappear or reduce in size over 2–4 years.
- Complex fibroadenoma is a variant of typical fibroadenoma with fibrocystic changes, apocrine metaplasia, cyst formation, sclerosing adenosis. It occurs in old age and occasionally may turn malignant.
- Juvenile fibroadenoma which occurs at young age never turns malignant.

132. Ans. (b) **Stage II**

Ref: Harrison 19th ed. P 540

- Since size of tumor is 4 cm, it belongs to T2 stage.
- On account of no nodal involvement or distal metastasis the TNM status is T2N0M0. Hence it is stage IIA as per the staging giving below.

Stage Groups

Stage	TNM status
0	Tis N0 M0
IA	T1/T1 mi N0 M0
IB	T0/T1 mi M0 T1/T1 mi N1 mi M0
IIA	T0 N1 M0 T1 N1 M0 T2 N0 M0
IIB	T2 N1 M0 T3 N0 M0
IIIA	T0 N2 M0 T1 N2 M0 T2 N2 M0 T3 N1 M0 T3 N2 M0
IIIB	T4 N0 M0 T4 N1 M0 T4 N2 M0
IIIC	Any T N3 M0
IV	Any T any N M1

133. Ans. (b) **T4B**

THE TNM STAGING OF CARCINOMA BREAST (AJCC 7TH EDITION, 2010 PAGE 539: SRB)

- T1- Tumor less than 2 cm (20 mm)
T1 mi – Microinvasion 1 mm or less in greatest dimension
T1a – 1–5 mm
T1b – 5–10 mm
T1c – 10–20 mm
T2 – 20–50 mm in greatest dimension
T3 – > 50 mm in greatest dimension
T4 – Any size with direct extension to the chest wall or skin or both.
T4a – Tumor of any size extending into the chest wall, not including only pectoralis muscle invasion/adhesion (Chest wall means ribs, intercostal muscles and serratus anterior but not pectoral muscles).
T4b – Ulceration or ipsilateral satellite nodules and/or oedema including peau d'orange of the skin which don't meet the criteria for inflammatory carcinoma.
T4c – T4a and T4b.
T4d – Inflammatory carcinoma

134. Ans. (c) **T3**

Refer to the explanation of the above question.

135. Ans. (b) **Breast cancer**

The mammography image shows *mass lesion with surrounding area micro-calcification* diagnostic of a breast cancer. The popcorn lesion will appear as a discrete lesion.

136. Ans. (c) **Upper outer**

Ref: Bailey, 26th ed. pg. 811

137. Ans. (a) **BRCA1**

Ref: Harsh Mohan Text book of Pathology, 7th ed. pg. 207

Incidence of sporadic, familial and hereditary breast cancer

BRCA1	45%
BRCA2	35%
p 53	1%
STK11	<1%
Sporadic breast cancer	65-75%
Familial breast cancer	20-30%
Hereditary breast cancer	5-10%

138. Ans. (a) Anterior axillary

Ref: Chapter 44: Vishram Singh Anatomy: Volume 1

- Deep lymphatics drain the breast parenchyma and skin of nipple and areola.
- The Nipple and areola drains to the sub-areolar lymphatic plexus of Sappey.
- Most of this drainage occurs to anterior axillary group of lymph nodes.

139. Ans. (a) Duct ectasia

Ref: Bailey, 26th ed. pg. 802

Causes of breast discharge

Discharge from the surface
<ul style="list-style-type: none"> • Paget's disease • Skin diseases (eczema, psoriasis) • Rare causes (e.g. chancre)
Discharge from a single duct
<ul style="list-style-type: none"> • Blood-stained
Intraduct papilloma Intraduct carcinoma Duct ectasia

Contd...

Discharge from the surface

- Seros (any color)

Fibrocystic disease
Duct ectasia
Carcinoma

Discharge from more than one duct

- Blood-stained

Carcinoma
Ectasia
Fibrocystic disease

- Black or green

Duct ectasia

- Purulent

Infection

- Seros

Fibrocystic disease
Duct ectasia
Carcinoma

- Milk:

Lactation
Rare causes (hypothyroidism, pituitary tumor)

140. Ans. (c) Fibroadenoma

Ref: Sabiston, 19th ed. pg. 827

- Fibroadenoma aka Breast mouse is the most common benign tumor of breast.
- It is MC seen in young age group females (15-30 yrs)
- Clinically, it is slow growing, painless solitary mass, which is mobile in nature (*that's why known as breast mouse*).
- **IOC:** FNAC
- **Upon mammography:** Popcorn calcification

141. Ans. (a) Lobular carcinoma

Ref: Sabiston, 19th ed. pg. 842, Bailey, 26th ed. pg. 809

LOBULAR CARCINOMA BREAST SALIENT FEATURES

- Mostly Multi-centric and **bilateral**
- Histological hallmark: *Indian file pattern* due to the tendency of tumor cells to invade in linear strand.
- Presenting feature-Breast mass with ill-defined margins
- Cellular feature- cytoplasmic mucoid globule
- *Neighbourhood calcification*-calcification in LCIS typically occurs in adjacent tissues. *It is a unique feature and adds to diagnosis.*

FMGE Solutions Screening Examination

756

BREAST CANCER- AT A GLANCE

MC cancer in women (Worldwide)
MC cancer in women in urban area (India)

- MC arise from TDLU (terminal duct lobular unit)
- **MC type-** Invasive ductal
- **MC malignant type-** inflammatory breast CA
- **MC Site-** upper outer quadrant
- MC Site of metastasis is bone (osteolytic) lumbar vertebra>femur>thoracic vertebrae.
- **MC Cause of death-** metastatic disease i.e malignant pleural effusion
- 2nd Most common cause of cancer death in women (1st is lung in both sexes)

Evaluation/Diagnosis by triple assessment-

- Clinical
- Imaging (Mammography/USG)
- Histopathology
 - 1st initial Investigation is FNAC
 - **Best/gold standard test-** HPE after biopsy
 - **USG-** for young patient
 - **MRI-** Patient with breast implant condition
 - **PET scan-** For recurrence
 - **Mammography-** For older patient
 - **Mammography:** IOC for micro-calcification

BIRADS	Breast imaging reporting and data system
	0-incomplete assessment
	1-Negative
	2-Benign
	3-Probably benign
	4-Suspicious
	5-Highly suggestive of malignancy
	6-Malignant

142. Ans (d) Lobular carcinomaRef: Bailey & Love, 26th ed. pg. 809**143. Ans. (a) Infiltration of cooper's ligament with cancer cells**Ref: Bailey & Love, 26th ed. pg. 798, 808

- The term implies appearance of dimpled texture of an orange peel. Peau d'orange is caused by *cutaneous lymphatic edema*, which causes swelling.
- The *ligaments of Cooper* are hollow conical projections of fibrous tissue filled with breast tissue; the apices of the cones are attached firmly to the superficial fascia and thereby to the skin overlying the breast. These ligaments account for the dimpling of the skin overlying a carcinoma and can also explain nipple retraction.

144. Ans. (b) Core cut BiopsyRef: Sabiston, 10th ed. pg. 830-31

- Since the question asks about diagnosis and NOT screening, the best option will be core-cut biopsy/True-cut biopsy.

- For screening FNAC is preferred.
- **Mammography** is considered as IOC in patients >40 years with breast condition. Since the above given patient is pregnant, mammography will NOT be preferred.
- **USG:** Initial investigation for palpable lesions in women <35 years. But it is Not useful in screening
- **MRI** is indicated in patients with breast implant.

Biopsy Techniques for Breast Lesions

Technique	Advantages	Disadvantages
FNAC	Rapid painless inexpensive No incision prior to selection of local therapy	Does not distinguish invasive from in situ cancer Marker (ER, PR, HER) not routinely available. Requires experienced cytopathologist
True –cut (core-cut) Biopsy	Rapid, relatively painless, inexpensive. No incision Can be read by any pathologist. Markers (ER, PR, HER-2) routinely available	False-negative results, incomplete lesions characterization can occur

145. Ans. (b) USGRef: Bailey & Love, 26th ed. pg. 527

- Breast abscess is highly probable in this lactating patient. Ultrasonography is used to distinguish solid from cystic structures and to direct needle aspiration for abscess drainage.
- Ultrasound is the imaging method of choice for the majority of women aged < 40 years and during pregnancy and lactation.
- Breast MRI does not form part of the initial imaging assessment of patients in the symptomatic breast disease.

146. Ans. (a) It is often bilateralRef: Bailey & Love, 26th ed. pg. 810

Paget disease of the breast is a malignant condition with appearance of eczema, with skin changes involving the nipple of the breast. *Symptoms usually only affect one breast.* Symptoms may include:

Skin	The first symptom is usually an eczema-like rash. Later, the skin may become flaky or scaly.
Discharge	Straw-colored or bloody.
Sensation	Burning sensation usually occurs in more advanced stages, when serious destruction of the skin often prompts the patient to consult. In more advanced stages, the disease may cause tingling and pain.

Contd...

Nipple changes	May turn inwards
Breast changes	Lump in the breast with redness, oozing and crusting.

- Immunohistochemistry allows definitive diagnosis of mammary PD. Paget cells can be demonstrated by immune - histochemical methods using several antibodies to cell surface and cytoplasmic markers (eg : low-molecular-weight keratins found in simple epithelia, EMA, **HER2/neu**, polyclonal pCEA+).
- Paget's disease of the breast is a type of cancer of the breast. Treatment usually involves a lumpectomy or mastectomy to surgically remove the tumor. Chemotherapy and/or radiotherapy may be necessary, but the specific treatment often depends on the characteristics of the underlying breast cancer.

147. Ans. (a) 1 cm

Ref: Bailey & Love, 26th ed. pg. 813

The amount of breast tissue excised with the lesion may vary with the clinical situation, but is typically 5 mm to 10 mm in all directions. Breast-conserving surgery (BCS): BCS may consist of removal of the tumor with a 1 cm margin of normal tissue (wide local excision) or a more extensive excision of a whole quadrant of the breast (quadrantectomy).

148. Ans. (a) USG

Ref: Schwartz, 10th ed. pg. 527

- The development of a dominant mass during pregnancy or lactation should never be attributed to hormonal changes.
- Breast cysts can be differentiated from solid echogenic abnormalities and will also be used to guide FNAC, core needle biopsy. *In the pregnant lady with breast lump ultrasound will be done initially*, and is a first line investigation modality.
- A dominant mass must be treated with the same concern in a pregnant woman as any other. Breast cancer develops in 1 in every 3000–4000 pregnancies.
- Differential diagnosis of breast mass in pregnant and lactating patient**
 - Breast cancer
 - Fibroadenoma
 - Lactating adenoma
 - Galactocele
 - Fibrocystic changes

149. Ans. (d) Spread to adrenal glands

Ref: Schwartz, 10th ed. pg. 532

- Involvement of chest wall by the cancer, satellite lesions and skin ulceration constitute stage T₄ by TNM staging.
- Stage 4 of breast cancer can be any T stage, any nodal Stage, but is always M1 stage which is spread to distant organs.
- Do not mix up T₄ with stage 4 as both are fundamentally separate concepts.

150. Ans. (b) Satellite lesions

Ref: Schwartz, 10th ed. pg. 532

To	No evidence of primary tumor
TIS	Carcinoma in situ
T1	Tumor ≤ 2 cm
T1a	Tumor > 0.1 cm but ≤ 0.5 cm
T1b	Tumor > 0.5 but < 1 cm
T1c	Tumor > 1 cm but ≤ 2 cm
T2	Tumor > 2 cm but ≤ 5 cm
T3	Tumor > 5 cm
T4	Extension to chest wall, inflammation, satellite lesions, ulcerations

151. Ans. (c) Tumor staging

Ref: Schwartz, 10th ed. pg. 535

- The most important prognostic variable is tumor staging with *Nodal status > Tumor size > Histological grade*
- The breast cancer markers that are most important in *determining therapy* are estrogen receptor, progesterone receptor and HER-2/neu.
- Tumor growth rate* correlates with early relapse. S-phase analysis using flow cytometry is the most accurate measure.
- Histologic classification* of the tumor has also been used as a prognostic factor. Tumors with a poor nuclear grade have a higher risk of recurrence than tumors with a good nuclear grade.
- Molecular changes in the tumor* are also useful. Tumors that overexpress *erbB2* (HER2/neu) or have a mutated p53 gene have a worse prognosis.

152. Ans. (a) Mastitis

Ref: Bailey & Love, 26th ed. pg. 805, 810

FMGE Solutions Screening Examination

Notice the fullness in lateral quadrant with erythema of overlying skin, diagnostic of Mastitis

Mondor disease	<ul style="list-style-type: none"> It involves thrombophlebitis of the superficial veins of the breast and anterior chest wall. It sometimes occurs in the arm and is known as axillary web syndrome Patients with this disease often have abrupt onset of superficial pain, with possible swelling and redness of a limited area of their anterior chest wall or breast.
Cystosarcoma phyllodes	<ul style="list-style-type: none"> Phyllodes tumors are a fibro-epithelial tumor composed of an epithelial and a cellular stromal component. They may be considered benign, borderline, or malignant depending on histologic features including stromal cellularity, infiltration at the tumor's edge, and mitotic activity. All forms of phyllodes tumors are regarded as having malignant potential. They are also known as serocystic disease of Brodie.
Paget disease	<ul style="list-style-type: none"> Patients with mammary Paget disease (PD) present with a relatively long history of an eczematous skin lesion or persistent dermatitis in the nipple and adjacent areas Since in this pic areola is blurred and visible areola appears normal, Paget's is ruled out.

153. Ans. (b) Ocular cancer

Ref: Bailey & Love, 26th ed. pg. 813

- The **sentinel lymph node** is the **first lymph node** or group of nodes draining a cancer. In case of established cancerous dissemination it is postulated that the sentinel lymph node/s is/are the target organs primarily reached by metastasizing cancer cells from the tumor.
- The **main uses of sentinel lymph node biopsy are in breast cancer and malignant melanoma surgery**. Other cancers which have been investigated with this technique are penile cancer, urinary bladder cancer, prostate cancer, testicular cancer and renal cell cancer.

154. Ans. (c) Stage III A

Since the size of the tumor given is 3 cm, it will be stage T2
 Since the number of lymph nodes involved is 4 axillary lymph nodes the stage will be N2
 Distant metastasis stage Mo
 Stage I and IV are easily ruled out. Stage II has nodal stage 1 (N₁)
 Stage III has nodal stage 2 (N₂)

Brief Description of the Terms

Tis : in situ	N0: no regional lymph nodes involved	M0: no metastasis
T0: not evident clinically	N1: ranging from micrometastases to <3 axillary lymph nodes involvement.	M1: presence of metastasis
T1: tumor size 0.1cm-2.0cm	N2: axillary lymph nodes ranging from 3-9 or involment of intermarry group of lymph nodes	
T2: 2cm – 5cm	N3: >10 axillary lymph-nodes involved or clinically detected inter mammary group of lymph nodes	
T3: >5cm		
T4: Involvement of chest muscle, skin and ulceration.		

155. Ans. (b) Simple mastectomy

Ref: Sabiston, 19th ed. pg. 849-853

- According to staging given in question, this is a case of stage 1 breast CA for which simple mastectomy is preferred.

Types of mastectomy

Simple or Total mastectomy	Removal of breast tissue, nipple-areola complex, and skin
Extended simple mastectomy	Simple mastectomy + removal of level I axillary LNs.
Modified radical mastectomy	Removes all breast tissue and skin, nipple areola complex, pectoralis major and minor muscles and the level, I, II and III axillary LNs,
Extended radical mastectomy	Radical mastectomy + Removal of internal mammary, LNs
Super radical mastectomy	Radical mastectomy + Removal of internal mammary, mediastinal and supraclavicular LNs

THYROID AND SALIVARY GLANDS

156. Ans. (b) Soles

Ref: SRB: 5th ed. pg. 78

- Sebaceous cyst is a retention cyst which occurs due to blockage of duct of sebaceous gland causing a cystic swelling.

- It is commonly seen on scrotum, face and scalp but *not* seen in palms and soles as there are no sebaceous glands.

Extra Mile

Multiple sebaceous cysts on scrotum is called as strawberry scrotum.

157. (b) Cancer of parotid gland

Ref: Bailey and Love: 26th ed. pg. 732

The image shows a parotid mass with marking of indelible ink. The painless mass rules out choice A and D while Choice C involves mainly the lips and tongue. The patient is having a parotid tumour and needs an urgent MRI to evaluate the mass followed by FNAC.

158. (c) TB

Ref: Bailey and Love: 25th ed. pg. 700

The image shows a large swelling extending in both anterior and posterior triangle of neck with an orifice of a fistulous tract with some excoriation and inflammation.

Features in favor of TB are:

- Indian patient
- Long standing history
- Location of large abscess overlapping both anterior and posterior triangle of neck
- Non-transilluminant fluctuant swelling.
- Normal overlying skin of abscess

- In contrast Branchial cyst is a *transilluminant fluctuant swelling* in upper or mid 1/3rd of sternocleidomastoid containing cholesterol crystals. The site of orifice is lower 1/3rd of neck on anterior border of sternocleidomastoid. The internal orifice of branchial fistula is present on posterior faucial pillar behind the tonsil. *The cyst becomes red and infected* before a fistula develops while in this case no evidence of any infection is seen as overlying skin is normal.
- Choice B secondaries is ruled out as they would show a progressive increase and do not have any draining fistula. Same logic is valid for ruling out choice D, Lymphoma.

159. Ans. (b) Von Graefe's sign

Ref: SRB 5th ed. P 470

Lid lag sign or Von Graefe's sign is inability of upper eyelid to keep pace with the eyeball when it looks downwards to follow the examiner's finger.

Extra Mile

Eye signs are common in primary thyrotoxicosis.

1. **Lid retraction:** Here upper eyelid is higher than normal; lower eyelid is in normal position. It is due to *sympathetic overactivity* causing spasm of involuntary smooth muscle part of the levator palpebrae superioris (*Muller's muscle*). It is a sign of thyrotoxicosis, not a sign of exophthalmos.
2. **Dalrymple's sign:** Upper eyelid retraction, so visibility of upper sclera.
3. **Stellwag's sign:** Absence of normal blinking—so *staring look*. *First sign to appear*. It is due to widening of palpebral fissure due to lid retraction and also due to contraction of voluntary part of levator palpebrae superioris muscle.
4. **Joffroy's sign:** Absence of wrinkling on forehead when patient looks up (frowns) with head is bent down/flexed position.
5. **Moebius sign:** It is lack of convergence of eyeball. Defective convergence is due to lymphocytic infiltration of inferior oblique and rectus muscles in case of primary thyrotoxicosis. There will be diplopia.
6. **Rosenbach's sign:** Tremor of closed eyelids

160. Ans. (a) Thyroid cancer

Ref: Harrison, 18th ed. pg. 341

- Thyroid carcinoma is the most common malignancy of the endocrine system.
- Differentiated tumors, such as papillary thyroid cancer (PTC) or follicular thyroid cancer (FTC), are often curable, and the prognosis is good for patients identified with early-stage disease.
- In contrast, anaplastic thyroid cancer (ATC) is aggressive, responds poorly to treatment, and is associated with a bleak prognosis.

161. Ans. (a) TSH

Ref: Harrison, 19th ed. pg. 341

Best thyroid function test is TSH as it helps in differentiating between primary and secondary thyrotoxicosis. The change of TSH values also indicate the improvement in medical condition of the patient. For example after resection of a pituitary adenoma secreting excess of TSH, the values of TSH will come back towards normal.

162. Ans. (a) Lymphatic

Ref: Bailey & Love, 26th ed. pg. 765

- Lymphatic spread is common for papillary carcinoma thyroid whereas follicular carcinoma thyroid spreads

FMGE Solutions Screening Examination

760

via the blood stream. In papillary carcinoma thyroid, total thyroidectomy is performed and approximately 4-6 weeks after surgical thyroid removal, patients must have radioiodine therapy to detect and destroy any metastasis and residual tissue in the thyroid.

163. Ans. (a) Iodine 131

Ref: Bailey & Love, 26th ed. pg. 768

164. Ans. (a) Recurrent laryngeal nerve

Ref: SRB, 5th ed. pg. 493; Bailey & Love, 26th ed. pg. 760

- The recurrent laryngeal nerve is at high risk for injury during thyroid surgery. The damage is transient.
- The recurrent laryngeal nerve innervates all intrinsic muscles of larynx with exception of Cricothyroid muscle. Mechanisms of damage include complete or partial transection, traction, contusion and compromised blood supply. The consequence is true vocal fold paralysis.
- The SLN has 2 divisions: internal and external. The internal branch provides sensory innervation to the larynx. The external branch provides motor function to the crico-thyroid muscle.

165. Ans. (d) Calcitonin

Ref: Bailey and Love, 26th ed. ch. 51/764

- Medullary thyroid cancer is a rare form of thyroid cancer and accounts for 3 to 10% of all thyroid cancers. It grows from specialized thyroid cells called *parafollicular cells*.
- **Parafollicular cells-C-cells**; specialized thyroid cells that secrete calcitonin and play a major role in diagnosis of medullary thyroid cancer.
- Calcitonin is a tumor marker and remember there is no hypocalcemia in medullary carcinoma of thyroid.

166. Ans. (d) Medullary

Ref: Bailey and Love, 26th ed. ch. 5/741

Medullary thyroid cancer grows from specialized thyroid cells called *parafollicular* C-cells which are specialized thyroid cells that secrete calcitonin and play a major role in medullary thyroid cancer.

167. Ans. (b) Papillary

Ref: Bailey & Love, 26th ed. pg. 763-64

- Ionizing radiation can cause genetic mutations leading to malignant transformation.
- This association is much stronger for thyroid cancer than for other malignancies, and radiation is the only

well-established environmental risk factor for thyroid malignancy.

- The risk of developing thyroid cancer after exposure to radiation is greater in those exposed during childhood and increases with higher doses of radiation delivered to the thyroid. This is true for exposure to ionizing radiation given for medical purposes and for environmental exposures.
- *The association with radiation is much stronger for papillary than for follicular cancer.*

168. Ans. (a) Papillary

Ref: Bailey & Love, 26th ed. pg. 765-66

■ THYROID MALIGNANCY

- Papillary carcinoma thyroid (PTC) has excellent prognosis (10yr survival rate >90%)
- **MC type-** Papillary Thyroid CA (PTC)
- Among people exposed to external radiation-PTC
- Lateral aberrant thyroid- PTC
- Psammoma bodies-PTC
- Orphan annie nuclei-PTC
- Intranuclear inclusion/pseudo inclusion-PTC
- **Most reliable feature for PTC diagnosis-** nuclear feature i.e. orphan annie nuclei.
- Diagnosis by -FNAC
- **Treatment:** Total or near total thyroidectomy
- Most common thyroid cancer in *iodine sufficient* persons - PTC

169. Ans. (b) Multiple nodular goiter

Ref: Bailey & Love, 26th ed. pg. 749

- Notice the multiple enlarged lobes of this multiple nodular goiter which represents a spectrum of disease ranging from a single hyper-functioning nodule (toxic adenoma) within a multi-nodular thyroid to a gland with multiple areas of hyper function.
- Thyroglossal cyst is ruled out as it is present in midline.
- The answer should not be given as toxic nodular goiter because we cannot comment on thyrotoxicosis status of patient as eye signs etc. are not visible or given and the question also mentions a EUTHYROID status of the patient.

170. Ans. (c) Follicular carcinoma

Ref: Bailey & Love, 24th/785, Schwartz, 8th/1420

- FNAC is unable to distinguish benign follicular lesions from follicular carcinoma. Large follicular tumors (>4 cm) in older men are more likely to be malignant.
- **FNAC is the investigation of choice for solitary thyroid nodules.**

- It cannot distinguish between a follicular Adenoma and a Follicular Carcinoma as this distinction is dependent not on cytology but on histological criteria such as capsular and vascular invasion. It therefore cannot be used to diagnose follicular carcinomas.

171. Ans. (d) **Zygomatic bone**

- **Surgical landmarks to the facial nerve include the tympanomastoid suture line, the tragal pointer, and the posterior belly of the digastric muscle.**
- The tympanomastoid suture line lies between the mastoid and tympanic segments of the temporal bone and is approximately 6-8 mm lateral to the stylomastoid foramen. The main trunk of the nerve can also be found midway between (10 mm posteroinferior to) the cartilaginous tragal pointer of the external auditory canal and the posterior belly of the digastric muscle.

172. Ans. (c) **Pleomorphic adenoma**

Ref: Bailey & Love, 26th ed. pg. 732

PLEOMORPHIC ADENOMA

- Overall most common tumor of salivary gland
- MC benign salivary gland tumor
- MC tumor of major salivary glands
- MC site is parotid tail (superficial lobe).

Extra Mile

- 2nd MC benign tumor of parotid gland: **Warthin's tumor**
- MC malignant tumor of parotid gland: **Mucoepidermoid CA**
- 2nd MC malignant tumor of parotid gland: **Adenoid cystic CA**

173. Ans. (b) **Adenoid cystic carcinoma**

Ref: Bailey & Love, 26th ed. pg. 733

- *The adenoid cystic carcinoma is characterized by propensity to spread along nerves.*
- Tumor may be present for more than 10 years and then suddenly infiltrate the adjacent tissues extensively.
- Tumor has affinity for growth along perineural planes.
- Lung metastases are most frequent.

174. Ans. (a) **Parotid gland**

Ref: Bailey & Love, 26th ed. pg. 733

WARTHIN TUMOR

- An exclusive tumor of parotid gland
- Second most common benign parotid tumor (5%)

- Most common *bilateral benign neoplasm of the parotid*
- Marked male as compared to female predominance
- Occurs later in life (sixth and seventh decades)
- Presents as a lymphocytic infiltrate and cystic epithelial proliferation
- May represent heterotopic salivary gland epithelial tissue trapped within intra-parotid lymph nodes
- Incidence of bilaterality and multi-centricity of 10%
- Malignant transformation rare.

175. Ans. (a) **Parotid gland**

Ref: Schwartz, 10th ed. pg. 600

- MC cause of salivary gland fistula is parotid gland surgery.
- A parotid fistula is a communication through which saliva is discharged.
- Various forms of treatment have been described for parotid gland fistula, including tympanic neurectomy with or without chorda tympani section, radiotherapy and even completion of the parotidectomy.

176. Ans. (a) **Submandibular gland**

Ref: Bailey and Love, 26th ed. ch. 50/732

- Salivary gland stone (sialolithiasis) is due to duct obstruction, which further lead to calcification.
- This calcification further causes secondary bacterial invasion which leads to **SIALADENITIS**
- **Most common organism associated with sialadenitis: Staph. Aureus and Strep. Viridans**
- **Most common salivary gland associated with sialolithiasis: submandibular gland (80 %) > Parotid gland (20%)**
- A stone located in the collecting duct or within the gland may be managed by either endoscopic retrieval, lithotripsy or, least likely, surgical removal.
- Sialography is usually required to identify the stone.
- Parotid duct stones are usually radiolucent and rarely visible on plain radiography. They are frequently located at the confluence of the collecting ducts or located in the distal aspect of the parotid duct adjacent to the parotid papilla.

177. Ans. (a) **Superficial parotidectomy**

Ref: Bailey & Love, 26th ed. pg. 733-34

Treatment of Choice for Pleomorphic Adenoma

- **In parotid gland:** Superficial parotidectomy
- **In other salivary glands:** Excision of the affected gland

Indications or radiotherapy in salivary gland tumors

- High grade tumors
- Cervical LN metastasis
- Large primary lesions
- Perineural invasion
- Bone invasion

HERNIA AND HYDROCOELE

178. Ans. (a) Torsion testis

Ref: SRB 5th ed. pg. 1018

- The bell clapper deformity allows the testicle to twist spontaneously on the spermatic cord since the long axis of the testicle is oriented transversely rather than cephalocaudal.
- This congenital abnormality is present in approximately 12% of males and is bilateral in 40% of cases.

- Torsion occurs as the testis rotates between 90° and 180°, compromising blood flow to and from the testicle. Complete torsion usually occurs when the testicle twists 360° or more; incomplete or partial torsion occurs with lesser degrees of rotation.

179. Ans. (b) Direct

Ref: SRB 5th ed. p 754

In NYHUS classification, type 3A hernia is direct inguinal hernia.

- Type 1: Indirect hernia with normal deep ring
- Type 2: Indirect hernia with dilated deep ring
- Type 3: Posterior wall defect
 - 3A: Direct hernia
 - 3B: Pantaloon hernia
 - 3C: Femoral hernia
- Type 4: Recurrent hernia

180. Ans. (a) Pantaloon hernia

Ref: Bailey, 25th ed. pg. 956

Site of primary	Percentage
Pantaloon hernia	The pantaloon hernia is the simultaneous occurrence of a direct and an indirect hernia. The pantaloon hernia causes two bulges that straddle the inferior epigastric vessels
Richter hernia	Richter's hernia is a hernia at any site through which only a portion of the circumference of a bowel wall, usually the jejunum, incarcerates or strangulates. Because the entire lumen is not compromised, symptoms of bowel obstruction can be absent, despite gangrene of the strangulated portion
Spigelian hernia	Spigelian hernia are herniations through the semilunar line, which is the lateral margin of the rectus muscle. At or just below the junction with the semicircular line of Douglas, unlike groin hernias, these hernias lie cephalad to the inferior epigastric vessels. The tight aponeurotic defect predisposes them to incarceration.
Littre hernia	Any groin hernia that contains a Meckel's diverticulum is Littre's hernia. This type of hernia is usually incarcerated or strangulated.

181. Ans. (a) Omentum

Ref: Bed Side Clinics in Surgery: ed. pg. 552: 2014

The clinical finding of doughy feel suggest diagnosis of omentocoele.

Comparison of enterocele and omentocoele

Omentocoele	Enterocele
Doughy feel	Soft elastic feel
Dull note on percussion	Reduction with gurgling sound and resonant percussion note
Absent bowel sounds	Presence of bowel sounds

Other Findings of Hernia

- Expansile impulse on cough
- Reducibility indicates uncomplicated hernia
- Deep ring occlusion test since congenital hernia occurs through the deep ring
- Whether possible to get above the swelling, to differentiate scrotal or inguino-scrotal swelling
- Soft elastic feel with resonant note and audible bowel sounds suggests presence of enterocele.

182. Ans. (d) Transversalis fascia

Ref: Bailey & Love, 26th ed. pg. 955

- Deep inguinal ring is the opening in the transversalis fascia through which the ductus deferens and gonadal vessels (or round ligament in the female) enter the inguinal canal.

- Located midway between anterior superior iliac spine and pubic tubercle, it is bounded medially by the lateral umbilical fold (inferior epigastric vessels) and inferiorly by the ilio-pubic tract. Indirect inguinal hernias exit the abdominal cavity through the deep inguinal ring.

183. Ans. (b) Congenital hydrocele

Ref: Bailey & Love, 26th ed. pg. 1382

- Hydrocele is an accumulation of fluid in layers of tunica vaginalis.
- **Vaginal hydrocele:** MC type. Accumulation of fluid within tunica vaginalis layers
- Infantile hydrocele: doesn't necessarily appear in infants. The tunica and processus vaginalis are distended to the inguinal ring without any connection with peritoneal cavity.
- **Congenital hydrocele:**
 - It is due to patent processus vaginalis which allows peritoneal fluid to move freely.
 - Size of hydrocele fluctuates usually related to activity
 - **Treatment:** Herniotomy

184. Ans. (a) Herniotomy

Ref: Bailey and Love, 26th ed. ch. 79/1382

- Congenital hydroceles are treated by herniotomy if they do not resolve spontaneously
- **Lord's operation** is suitable when the sac is reasonably thin-walled. There is minimal dissection and the risk of haematoma is reduced.
- Eversion of the sac with placement of the testis in a pouch prepared by dissection in the fascial planes of the scrotum is an alternative (**Jaboulay's procedure**)
- Aspiration of the hydrocele fluid is simple, but the fluid always reaccumulates within a week or so. It may be suitable for men who are unfit for scrotal surgery

185. Ans. (a) Conservative Management till patient is asymptomatic

- Most of the pediatric patients with an inguinal hernia have indirect inguinal hernia.
- Inguinal hernias do not spontaneously heal and must be surgically repaired because of the ever-present risk of incarceration.
- Only 3 procedures are necessary for the surgical repair of indirect inguinal hernias in children:
 1. High ligation and excision of the patent sac with anatomic closure
 2. High ligation of the sac with plication of the floor of the inguinal canal (the transversalis fascia), and
 3. High ligation of the sac combined with reconstruction of the floor of the canal
- In patients with a long-standing history of inguinal hernia, the repeated protrusion of abdominal contents through the

inguinal canal enlarges the internal and external rings, reducing the risk of incarceration and strangulation. This makes repair more difficult and recurrence more likely

186. Ans. (c) Meckel's diverticulum

Ref: Bailey & Love, 26th ed. pg. 1170

- When Meckel's diverticulum forms the content of hernia, it is known as Littre's hernia.

187. Ans. (a) Strangulated hernia

Ref: Sabistan, 19th ed. pg. 1127

- Strangulation occurs more often in patients who have a partially reducible or an irreducible hernia
- Indirect inguinal hernias strangulate more commonly, the direct variety not so often because of the wide neck of the sac.
- **MC constricting agent:** Neck of the sac > External inguinal ring in children > Adhesions within the sac.
- **MC contents:** Small intestine > Omentum

Clinical features of strangulated inguinal Hernia

1. Sudden onset inguinal pain
2. Generalized abdomen pain
3. Tense and extremely tender hernia
4. Discoloration of overlying skin with a reddish or bluish tinge
5. There is no expansile cough impulse.

188. Ans. (a) Below and lateral to pubic tubercle

Ref: Bailey and Love, 26th ed, ch. 60/960

- The femoral hernia appears **below and lateral to the pubic tubercle** and lies in the upper leg rather than in the lower abdomen. Inadequate exposure of this area during routine examination leads to failure to detect the hernia.
- The hernia often rapidly becomes irreducible and loses any cough impulse due to the tightness of the neck. It may only be 1–2 cm in size and can easily be mistaken for a lymph node

189. Ans. (c) **Cough impulse is present**

Ref: Bed Side Clinics in Surgery; Makhan Lal Saha, pg. 49

- **Femoral hernias** occur just below the inguinal ligament, when abdominal contents pass through a naturally occurring weakness called the femoral canal. The femoral hernia follows the tract below the inguinal ligament through the femoral canal. The canal lies medial to the femoral vein and lateral to the lacunar (Gimbernat) ligament. *Because femoral hernias protrude through such a small defined space, they frequently become incarcerated or strangulated*
- Femoral hernias are uncommon variety accounting for only 3% of all hernias.
- Femoral hernias mostly develop in women because of the wider bone structure of the female pelvis.
- The *cough impulse is not seen in femoral hernia*. Lockwood infra-inguinal approach is used in repair.

190. Ans. (c) **Femoral hernia**

Ref: Bailey & Love, 26th ed. Ch. 60/960

- High risk of strangulation is seen with femoral hernia as it has lacunar ligament (Gimbernat's) medially. This is a strong curved ligament with a sharp unyielding edge which impedes reduction of a femoral hernia.
- 50% of cases present as an emergency

191. Ans. (c) **Femoral hernia**

Please refer to above explanation

192. Ans. (b) **Cooper's hernia**

Ref: Sabiston, 19th ed. pg. 1126-27

HERNIAS AT A GLANCE

Amyand's hernia: Containing the appendix vermiformis within the hernia sac

Cooper's hernia: A femoral hernia with two sacs, the first being in the femoral canal, and the second passing through a defect in the superficial fascia and appearing almost immediately beneath the skin.

Epigastric hernia: A hernia through the linea alba above the umbilicus.

Hiatus hernia: A hernia due to "short oesophagus" — insufficient elongation — stomach is displaced into the thorax

Littre's hernia: A hernia involving a **Meckel's diverticulum**. It is named after the French anatomist Alexis Littre

Lumbar hernia: A hernia in the lumbar region (not to be confused with a lumbar disc hernia), contains the following entities:

Petit's hernia: A hernia through Petit's triangle (inferior lumbar triangle). It is named after French surgeon Jean Louis Petit.
Grynfeltt's hernia a hernia through Grynfeltt-Lesshaft triangle (superior lumbar triangle).

Maydl's hernia: Two adjacent loops of small intestine are within a hernial sac with a tight neck. The intervening portion of bowel within the abdomen is deprived of its blood supply and eventually becomes necrotic.

Morgagni hernia: A type of hernia where abdominal contents pass into the thorax through a weakness in the diaphragm

Obturator hernia: Hernia through obturator canal.

Pantaloon hernia (Saddle Bag hernia): A **combined direct and indirect hernia**, when the hernial sac protrudes on either side of the inferior epigastric vessels.

Paraumbilical hernia: A type of umbilical hernia occurring in adults

Perineal hernia: A perineal hernia protrudes through the muscles and fascia of the perineal floor. It may be primary but usually is acquired following perineal prostatectomy, abdominoperineal resection of the rectum, or pelvic exenteration.

Richter's hernia: A hernia involving only one sidewall of the bowel, which can result in bowel strangulation leading to perforation through ischaemia without causing bowel obstruction or any of its warning signs.

Sliding hernia: Occurs when an organ drags along part of the peritoneum, or, in other words, the organ is part of the hernia sac. The colon and the urinary bladder are often involved. The term also frequently refers to sliding hernias of the stomach.

Sciatic hernia: This hernia in the greater sciatic foramen most commonly presents as an uncomfortable mass in the gluteal area. Bowel obstruction may also occur. This type of hernia is only a rare cause of sciatic neuralgia.

Velpeau hernia: A hernia in the groin in front of the femoral blood vessels

193. Ans. (d) **Saddle bag hernia**

Ref: Sabiston, 19th ed. pg. 1126-27

Please refer to above explanation

194. Ans. (d) **Littre's hernia**

Ref: Sabiston, 19th ed. pg. 1126-27

195. Ans. (d) **Hernia at the level of arcuate line**

Ref: Bailey and Love, 26th ed. ch. 60/966

Spigelian hernia

- Spigelian hernia herniates through the spigelian fascia, *which is the aponeurotic layer between the rectus abdominis muscle medially, and the semilunar line laterally.*
- **Always occur at or above the arcuate line** because of the lack of posterior rectus sheath. These are inter-parietal hernias, **which penetrate between the muscles of the abdominal wall**; therefore, there is often no notable swelling.

Contd...

196. Ans. (a) **Posterolateral**

Ref: Bailey & Love, 26th ed. pg. 871-72

- Bochdalek's hernia is the most common form of diaphragmatic hernia, occurring in approximately 1 in 2500 births and twice as often in males as in females.
- *Bochdalek's hernia results from failure of normal development of the posterolateral diaphragm during embryogenesis.*
- Separation of the developing thoracic and abdominal cavities occurs during the eighth week of gestation, when the opening between the chest and abdomen (the pleuroperitoneal canal) closes. A congenital diaphragmatic hernia results when the pleuroperitoneal membrane fails to form.
- Most Bochdalek's hernias occur on the left side, allowing protrusion of the abdominal viscera into the chest. The herniated bowel passes through the defect, filling the chest cavity and causing hypoplasia of the left lung and a shift of mediastinal structures to the right side. It is not uncommon for other abnormalities to be associated with Bochdalek's hernia; these may include neural tube defects and cardiovascular abnormalities
- The left-sided Bochdalek hernia occurs in approximately 85% of cases. Left-sided hernias allow herniation of both the small and large bowel and intraabdominal solid organs into the thoracic cavity.
- In right-sided hernias (13% of cases), only the liver and a portion of the large bowel tend to herniate. Bilateral hernias are uncommon and are usually fatal

Remember

- The 3 basic types of congenital diaphragmatic hernia include the posterolateral Bochdalek hernia (occurring at approximately 6 weeks' gestation), the Anterior Morgagni hernia, and the hiatus hernia.

197. Ans. (c) **Epididymo orchitis**

Ref: Bailey & Love, 26th ed. pg. 1384

ACUTE EPIDIDYMO ORCHITIS

- Inflammation of the epididymis and testis, from an ascending infection from the lower urinary tract.
- *Initially epididymis is involved, after that there is involvement of testis.*
- *Most cases of epididymitis in men younger than 35 years are due to sexually transmitted organisms [C. trachomatis (MC) and N. gonorrhoe]*
- In children and older men this is due to urinary pathogens such as E. coli.
- *Patient presents with fever, swollen, red and tender scrotum.*

- *The epididymis and testis are swollen (Thickened cord with reactive hydrocoele).*
- **Urine analysis** typically demonstrates WBCs and bacteria in the urine or urethral discharge
- **Scrotal USG** showing enlarged epididymis with increased blood flow with reactive hydrocoele.

Extra Mile

- Testicular torsion is commonly seen in pre-pubertal age group (10-25 years). Patients usually presents with sudden agonizing pain.

UROLOGY

198. Ans. (a) **PCNL**

Ref: SRB 5th ed. pg. 1017

- Kidney stone of size more than 2.5 cm in size is treated with percutaneous nephrolithotomy. In contrast Extracorporeal shock wave lithotripsy is used for stones of size less than 2.5 cm. The piezo-ceramic electromagnetic waves are passed via a water bath and shocks are produced at rate of 2/sec. 1000-4000 shocks are required per stone.
- Pyeloplasty is the surgical reconstruction of the renal pelvis (a part of the kidney) to drain and decompress the kidney. In nearly all cases, the goal of the surgery is to relieve a ureteropelvic junction (UPJ) obstruction.

199. Ans. (c) **Sertoli cell tumour**

Ref: SRB 5th ed. pg. 1083

Sertoli cell tumour is a sex cord stromal tumour while the remaining choices are germ cell tumours. The prevalence of germ cell tumour is 95%.

Germ cell tumors	Sex cord stromal tumors
<ul style="list-style-type: none"> • Seminoma • Spermatocytic seminoma • Embryonal carcinoma • Polyembryoma • Embryonal carcinoma and teratoma ('teratocarcinoma') • Teratoma <ul style="list-style-type: none"> • Mature • Immature • With malignant transformation • Choriocarcinoma • Yolk sac tumor 	<ul style="list-style-type: none"> • Leydig cell tumor • Serto cell tumor • Granulosa cell tumor • Mixed forms

200. Ans. (c) 4 hours

Ref: SRB 5th ed. pg. 1063 and American Urological Association Guidelines

Priapism is a persistent penile erection that continues beyond 4 hours and is unrelated to, sexual stimulation. Typically, only the corpora cavernosa are affected.

Subtypes of priapism include:

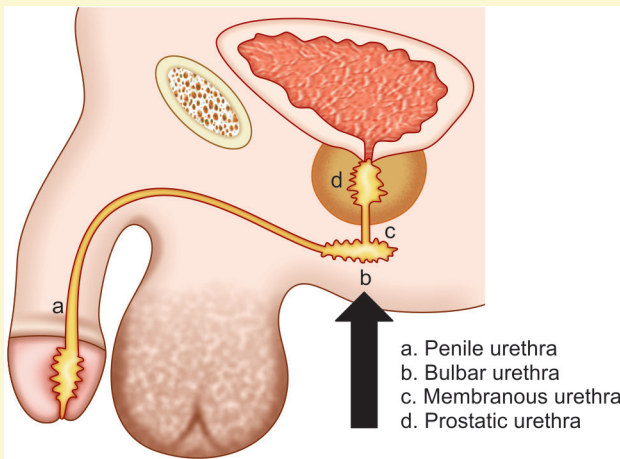

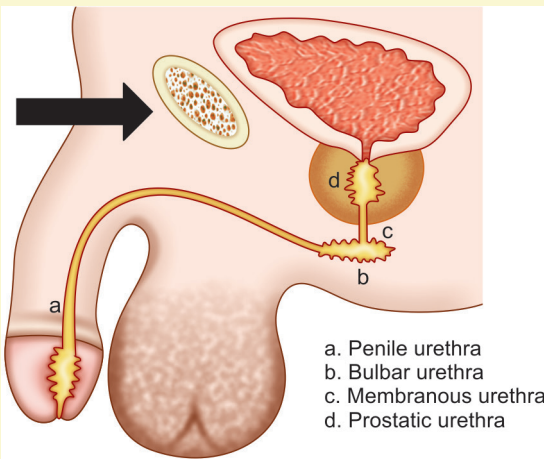

- Ischemic (veno-occlusive, low flow) priapism is a nonsexual, persistent erection characterized by little or no cavernous blood flow and abnormal cavernous blood gases (hypoxic, hypercarbic, and acidotic). Ischemic priapism is an emergency.
- Non-ischemic (arterial, high flow) priapism is a nonsexual, persistent erection caused by unregulated cavernous arterial inflow. Typically the penis is neither fully rigid nor painful. Antecedent trauma is the most commonly described etiology.
- Stuttering (intermittent) priapism is a recurrent form of ischemic priapism in which unwanted painful erections occur repeatedly with intervening periods of detumescence.

201. Ans. (a) Membranous urethra rupture

Ref: SRB 5th ed. P 1037 and 1052

- The patient has pelvic fracture which resulted in trauma to membranous and/or prostatic urethra. This is called *posterior urethral rupture*.
- The presentation will be blood at meatus with inability to pass urine.
- There is extravasation of urine to scrotum, perineum and abdominal wall which explains why bladder is empty.
- This extravasation of urine is called extraperitoneal extravasation of urine.
- *Intraperitoneal rupture of bladder* is seen due to kick on abdomen and leads to diffuse abdominal pain, distention and features of peritonitis as urine leaks into peritoneal space. Vitals will reveal presence of shock. X-ray abdomen will show ground glass appearance. Emergency laparotomy is required with bladder repair.

TABLE: Comparison of anterior and posterior urethra rupture

Rupture of anterior urethra	Rupture of posterior urethra
Trauma to <i>bulbous urethra</i> due to fall astride projectile object like cycling, manhole cover, gymnasium	Trauma to <i>membranous and/or prostatic urethra</i> after pelvic fracture sustained in RTA.
 <p>a. Penile urethra b. Bulbar urethra c. Membranous urethra d. Prostatic urethra</p>	 <p>a. Penile urethra b. Bulbar urethra c. Membranous urethra d. Prostatic urethra</p>

Contd...

Rupture of anterior urethra	Rupture of posterior urethra
Presentation <ul style="list-style-type: none"> Blood at the meatus Perineal hematoma Retention of urine Tell patient not to pass urine else extravasation occurs. PR examination shows normal prostate. 	Presentation <ul style="list-style-type: none"> Difficulty in passing urine Blood at the meatus Extravasation of urine to scrotum, perineum and abdominal wall and hence bladder is empty. PR examination shows <i>floating prostate</i>.

@Note anterior urethra is undersurface and posterior urethra is dorsal surface.

202. Ans. (a) Calcium oxalate

Ref: Harrison 19th ed. P 964

- The normal urinary pH is 5.8–6.2.
- Persistent urinary pH less than 5.5 (*acidic urine*) leads to development of uric acid and cystine stones.
- Persistent urinary pH >7.2 (*alkaline urine*) leads to development of struvite stone.
- Urine pH > 7.5 (*alkaline urine*) leads to development of calcium phosphate stone.
- Calcium oxalate stones development is *independent of urinary pH* and is due to idiopathic hypercalciuria.

Extra Mile

- Increasing urine pH > 6.2 can dramatically increase uric acid solubility. Hence urinary alkalization is done with potassium citrate. Also give allopurinol.
- For calcium phosphate stones keep pH of urine between 6.2 and 6.5.
- For cystine stones keep pH > 7.0 by urinary alkalization.

203. Ans. (a) Cystoscopy

Ref: SRB 5th ed. P 1025

- The age of patient, clinical presentation of painless gross hematuria points to etiology as bladder tumor.
- The IVU finding can be explained by the fact that bladder tumor could have *obstructed the ureteric orifice leading to hydronephrosis*.
- Infundibulum in kidney is the area between the calyx and renal pelvis. The filling defect is due to hydronephrosis.
- Cystoscopy must be done for tissue diagnosis of bladder tumor and resection.
- MRI pelvis should be done to check for invasion and pelvic wall extension.
- DMSA scan is done to evaluate for location of scar in pyelonephritis.

204. Ans. (a) Water intoxication

Ref: Bailey 26th ed. P 1349

- Water intoxication is postoperative complication of TURP.

- The absorption of water into the circulation at the time of transurethral resection can give rise to CCF, hyponatremia and hemolysis. These features can mimic stroke
- Nowadays this is rarely seen due to use of isotonic glycine during irrigation post TURP.

205. Ans. (c) Ureterocele

- The image shows a characteristic cobra/adder head appearance of an ureterocele with contrast filling the bladder. The bladder outline is normal.

206. Ans. (b) Androgen deprivation treatment

Guidelines for Management of Prostate Cancer

- For advanced disease process, androgen ablation is used. It can be achieved with bilateral capsular orchiectomy or drugs
- Drugs like LHRH agonist and androgen blocking agents like flutamide, bicalutamide are used.
- Radiotherapy is used for bone secondaries. Chemotherapeutic drug used is docetaxel.

Prostate Cancer Treatment Guidelines

Treatment by Recurrence Risk

Clinically localized	Therapy
<ul style="list-style-type: none"> T3a Gleason score 8–10 PSA > 20 ng/mL 	<ul style="list-style-type: none"> Radiation therapy + Androgen deprivation therapy (2–3 years) Radical prostatectomy + Pelvic lymph node dissection (in select patients)
Locally advanced	Therapy
T3b–T4 with any Gleason score	<ul style="list-style-type: none"> Radiation therapy + Androgen deprivation therapy (2–3 years) Radiation therapy + Brachytherapy +/- Androgen deprivation therapy (4 to 6 months) Radical prostatectomy + Pelvic lymph node dissection (in select patients)

Contd...

FMGE Solutions Screening Examination

768

Locally advanced	Therapy
	<ul style="list-style-type: none"> Androgen deprivation therapy (in select patients)

207. Ans. (c) Lymphatics

Ref: Bailey, 26th ed. pg. 1385

- Seminomas metastasise mainly via the lymphatics and haematogenous spread is uncommon.
- The lymphatic drainage of the testes is to the para-aortic lymph nodes near the origin of the gonadal vessels.
- The contralateral para-aortic lymph nodes are sometimes involved by tumor spread, but the inguinal lymph nodes are affected only if the scrotal skin is involved.

There are a number of histological types of non-seminomatous germ cell tumors (NSGCT), which may coexist within a single tumor:

- Embryonal carcinoma. Highly malignant tumors that occasionally invade cord structures.
- Yolk sac tumor. Tumours with this component secrete alpha fetoprotein (AFP)
- Choriocarcinoma. Often produces human chorionic gonadotropin (HCG). This is a highly malignant tumor that metastasizes early via both the lymphatics and the bloodstream
- Teratoma. These tumors contain more than one cell type with components derived from ectoderm, endoderm

208. Ans. (a) Scrotal USG

Ref: Bailey, 26th ed. pg. 1386-87

- The diagnosis of testicular cancer is confirmed by ultrasound scanning of the testis which is also able to assess the contralateral testis.
- It is a mandatory test in all suspected cases of testicular tumor.
- Chest X-ray is used to detect Canon Ball metastasis
- CT scan chest and abdomen is used to detect metastasis
- Measure the levels of tumor markers which are raised in around 50 per cent of cases.
- Rise in AFP is seen in around 50–70 per cent of NSGCTs
- Rise in HCG is seen in 40–60 per cent of NSGCTs and around 30 per cent of seminomas.
- When raised, these markers are used to monitor the response to treatment. The mean serum half-lives of AFP and HCG are 5–7 days and 2–3 days, respectively, and reassessment of the markers following orchidectomy can indicate whether all the tumor tissue has been removed.

209. Ans. (a) Right Hydrocele

Findings in favour of diagnosis of Hydrocele-

- Translucent swelling with positive trans-illumination test
- Possible to 'get above the swelling' on examination of the scrotum
- The swelling usually surrounds the testis and epididymis such that they may become impossible to palpate separately.
- Be wary of an acute hydrocele in a young man since there may be a testicular tumor.
 - Choice B: Right inguinal hernia is ruled out as top of testis can be reached
 - Choice C: Epididymal cysts are present bilaterally and are present behind the testis whereas he patient is having a unilateral swelling.
 - Choice D: Encysted hydrocele of the cord is a smooth oval swelling near the spermatic cord, which is liable to be mistaken for an inguinal hernia. The swelling moves downwards and becomes less mobile if the testis is pulled gently downwards.
 - Ascites should be considered if the swellings are bilateral.

210. Ans. (d) Right Pyocele

- The difference in this question from the previous question would be development of an acute on chronic presentation.
- Scrotal pyoceles are purulent collections within the potential space between the visceral and parietal tunica vaginalis surrounding the testicle.
- The presentation of scrotal pyoceles is subacute onset of pain and swelling, which may mimic other pathology.
- The imaging modality of choice to diagnose a scrotal pyocele is ultrasound.
- Internal echoes within the pyocele fluid collection typically represent cellular debris.
- Other sonographic findings include loculations, septae, and fluid-fluid or air-fluid levels in the tunica vaginalis external to the testicle.
- By contrast, a hydrocele will appear on ultrasound as a simple fluid with an anechoic region that collects anterior and lateral to the testis. If the fluid contains internal echoes on ultrasound, the diagnosis of hematocele (most common in the setting of trauma) or pyocele may be made.
- Fournier's gangrene is the most concerning complication of a scrotal pyocele.

211. Ans. (a) Right Testicular torsion

Ref: Bailey, 26th ed. pg. 1379

- Testicular torsion is most common between 10 and 25 years of age

Clinical Findings

- Sudden agonising pain in the groin and the lower abdomen.
- Feels nauseated and may vomit.
- The testis seems high and the tender twisted cord can be palpated above it.
- The cremasteric reflex is lost.
- *Elevation of the testis reduces the pain in epididymo-orchitis and makes it worse in torsion.*
- *Inversion of the testis is the most common predisposing cause.*

212. Ans. (a) **Calcium oxalate**

Ref: Bailey and Love, 26th ed. pg. 1292

Types of Renal Stones (Urolithiasis):

1. **Calcium stones (75–85%)**
 - Made of **calcium oxalate**.
2. **Struvite stone/Triple phosphate stone (15% of cases)**
 - Formed mainly after infection by urea splitting bacteria (**Proteus and some staphylococci**) which **cause alkaline urine** lead to precipitation of phosphate crystals.
 - Causes Staghorn calculi, which occupy large position of renal pelvis.
3. **Uric acid stone**
 - Common in patients with hyperuricemia.
 - Cause: Urine of pH less than 5.5 (uric acid is insoluble in acidic urine) leading to saturation
 - It is radiolucent stone.
4. **Cystine stone**
 - Due to genetic defect in renal absorption of amino acid cysteine leading to cystinuria.
5. **Xanthine stones due to xanthinuria**

213. Ans. (a) **Uric acid**

Radiolucent kidney stones mnemonic **L.U.X**

RadioLucent stones are Uric acid and Xanthine stones

214. Ans. (b) **Triple phosphate stones**

Ref: Bailey & Love, 26th ed. Ch 75/1292

215. Ans. (c) **Triple phosphate stone**

Ref: Bailey & Love, 26th ed. Ch 75/1292

216. Ans. (c) **Uterine fibroid**

The complications of fibroid are

- Thrombo-embolism
- Acute torsion of subserosal pedunculated leiomyomata
- *Acute urinary retention by uterine fibroid*
- Renal failure
- Acute pain caused by red degeneration during pregnancy
- Acute vaginal or intra-peritoneal haemorrhage
- Mesenteric vein thrombosis
- Intestinal gangrene

Causes of Urinary Retention and Bladder Outlet Obstruction

ANATOMICAL	
Extrinsic	Pelvic organ prolapse Gynecological e.g. uterine fibroid, tumor Poorly fitting pessary
Urethral	Stricture Meatal stenosis Thrombosed urethral caruncle Diverticulum
Luminal	Stone Bladder/urethral tumor Ureterocoele Foreign body
Impaired detrusor contractility	Senile bladder change Diabetes mellitus Neurological disease
FUNCTIONAL	
Impaired coordination	Primary bladder neck obstruction
Peri-operative	Pain Analgesia or anesthetic e.g. epidural
Infective/inflammatory	UTI Acute vulvovaginitis Vaginal lichen planus/sclerositis Genital herpes
Pharmacological	Opiates Antipsychotics Antidepressants Antimuscarinics

217. Ans. (b) **NCCT**

Ref: Bailey & Love, 26th ed. pg. 1293

FMGE Solutions Screening Examination

770

- *Helical computed tomography (CT) scanning without radiocontrast enhancement is now the standard radiologic procedure for diagnosis of nephrolithiasis.*
- The advantages of CT include detection of uric acid stones in addition to the traditional radiopaque stones, no exposure to the risk of radiocontrast agents, and possible diagnosis of other causes of abdominal pain in a patient suspected of having renal colic from stones.
- Ultrasound is not as sensitive as CT in detecting renal or ureteral stones.

218. Ans. (d) Urinary bladder

Ref: Bailey & Love, 26th ed. pg. 1330-35

- Transitional cell epithelium lines → the urinary tract from the renal pelvis to the ureter, urinary bladder, and the proximal two-thirds of the urethra.
- **Transitional cell carcinoma**-Cancers can occur at any point mentioned above:
 - 90% of malignancies develop in the bladder
 - 8% in the renal pelvis
 - 2% in the ureter or urethra.

Extra Mile

- Bladder cancer is the **fourth (4th)** most common cancer in men and the **thirteenth (1 + 3 = 4)** in women.
- **Among urothelial tumors**-95% are **transitional cell in origin**.
- **Polychronotropism**-urothelial tumors exhibit polychronotropism, which is the tendency to recur over time in new locations in the urothelial tract.
- Most imp risk factor- **Cigarette smoking**
- **Other**-aniline dyes, drugs phenacetin, external beam radiation. Chronic cyclophosphamide, *Schistosoma haematobium* (a parasite-cause both Scc and Tcc)
- Vitamin A - protective.
- 3 clinical subtypes-
 - **Superficial** (75%)
 - **Invade muscle** (20%)
 - **Metastatic** (5%)
- Clinical presentation
 1. **Hematuria** (painless)- Most common presentation (80–90% of cases)
 2. Irritative bladder symptoms such as dysuria, urgency, or frequency of urination occur in 20-30% of patients with bladder cancer.
- **MC site of lymphatic metastasis: Pelvic lymph nodes (obturator MC)**
- **MC site of hematogenous spread- LIVER > LUNG**
- **Diagnosis**— diagnosis and initial staging is made **by cystoscopy and TUR**.
 - Newer, voided urine assays (i.e., bladder tumor antigen [BTA-Stat, BTA-TRAK], NMP-22, fibrin/fibrinogen degradation products [FDP]) are being used for the detection and surveillance of urothelial carcinoma.

Contd...

- **Management**-cystoscopy and TUR or biopsy
- Further management depends on stage, grade, size, multiplicity, recurrence pattern
- Drugs for intravesical chemo- **Mitomycin, Thiotepa, Epirubicin, BCG (most effective)**

219. Ans. (c) Transitional cell cancer

Ref: Bailey & Love, 26th ed. pg. 1330-35

220. Ans. (d) Painless hematuria

Ref: Bailey & Love, 26th ed. pg. 1330-35

221. Ans. (c) Superficial

Ref: Bailey & Love, 26th ed. pg. 1330-35

222. Ans. (c) Females and males are equally affected

Ref: Bailey & Love, 26th ed. pg. 1330-35

223. Ans. (c) True pelvis only

Ref: Bailey & Love 26th ed. pg. 1361

The prostate has been avulsed from the membranous urethra secondary to fracture of the pelvis. Extravasation occurs above the triangular ligament and is peri-prostatic and perivesical.

224. Ans. (a) Instrumentation

Ref: Harrison, 18th ed. pg. 288

- Urethral catheterization is the single most important predisposing factor in the development of nosocomial urinary tract infection. Cystoscopy may be followed by a transient bacteremia.
- *The most important risk factor for bacteriuria is the presence of a catheter.* Eighty percent of nosocomial UTIs are related to urethral catheterization, while 5-10% are related to genitourinary manipulation. Catheters inoculate organisms into the bladder and promote

colonization by providing a surface for bacterial adhesion and causing mucosal irritation.

225. Ans. (b) Polycystic kidney

Extra Mile

- **Driven snow appearance** - Pindborg's tumor
- **Sunray appearance** - Osteogenic Sarcoma, Ewing Sarcoma
- **Floating Water Lily sign** - Lung Hydatid, Echinococcus
- **Popcorn calcification** - Pulmonary Hamartoma
- **Honeycomb appearance** - RA, Scleroderma, Interstitial Lung Disease
- **Egg shell calcification** - Sarcoidosis, Silicosis, Lymphoma, T.B., Histoplasmosis
- **Spring water cyst** = Pluero Pericardial cyst
- **Rib notching** - Neurofibromatosis, Aortic Aneurysm, Taussig-Bing Operation, Aortic obstruction, Coarctation of aorta.
- **Coeur en Sabot, Flask shape heart** - TOF
- **Candle wax sign** - Melorheostosis
- **Football Sign** - Pneumoperitoneum
- **Thumb Print Sign** - Epiglottis, Ischemic Colitis
- **Double bubble sign** - Duodenal Atresia
- **Single bubble sign** - Pyloric stenosis
- **Soap bubble appearance** - Meconium ileus
- **Meniscus appearance** - CBD stone on cholangiography
- **Central dot sign** - Caroli's disease
- **Chain of lakes appearance** - Chronic pancreatitis
- **Spongy appearance with central sunburst calcification sign** - serous cyst adenoma
- **Rim sign in IVP** - Hydronephrosis
- **Cobra head deformity** - Ureterocele
- **B/L spider leg sign** - Polycystic Kidney
- **Golf hole ureter** - T.B.
- **Flower Vase pattern of pelvis in IVP** - Horse shoe kidney

226. Ans. (b) Ureterocele

Ref: Bailey & Love, 26th ed. pg. 1285

A ureterocele is a congenital saccular dilatation of terminal portion of the ureter. The most common presentation is that of urinary tract infection or uro-sepsis in children. Stasis of urine can lead to calculus formation. Some children may present with palpable mass due to hydro nephrotic kidney. Cyst may prolapse into internal urethral opening causing obstruction to bladder outflow. This condition may remain unrecognized until adult life. Ureterocele is usually discovered on radiological examination or during endoscopy.

227. Ans. (a) Leydig cells

Ref: Bailey & Love, 26th ed. pg. 1341

Rectangular, crystal-like inclusions, composed of protein, with pointed or rounded ends in the interstitial cells of

the testis (Leydig cells) and hilus cells in the ovary. *Inside the Leydig cells of human males can be found Reinke's crystals.* The purpose of these crystals is uncertain, some believe that they are a by-product of a degenerative process related to aging. They appear to have no contribution to androgen or testosterone production, and they *can be used to identify Leydig cells easily when viewing testicular tissue under a microscope.*

228. Ans. (a) Seminoma

Ref: Bailey & Love, 26th ed. pg. 1385

- **Seminoma** is the most common germ cell tumor of the testis or, more rarely, the mediastinum or other extra-gonadal locations. It is a malignant neoplasm and is one of the most treatable and curable cancers, with a survival rate above 95% if discovered in early stages.

229. Ans. (b) Para aortic

Ref: Harrison, 19th ed. pg. 589

Points to Remember about testicular tumor

- In metastatic disease-Retroperitoneal LN is **Most commonly** involved
- **Metastasis**- Lymphatic >> Blood (m/c lung)
- **exception is Choriocarcinoma** where blood metastasis (m/c lung)>> lymphatic metastasis.
- **Most common testicular tumor- in general** → seminoma
 - Prepubertal adults- Teratoma
 - Infant and children- Yolk sac tumor
- **Most common presentation**- nodule or painless swelling of one gonad
- **Most common bilateral testicular tumor- Malignant lymphoma**
- **Most common bilateral primary testicular tumor** Seminoma
- FNAC contraindicated
- **Intial IOC**- USG(hypo echoic area within tunica albuginea is suspicious)
- HPE diagnosis by-radical orchiectomy (inguinal approach)
- **Scrotal orchiectomy**- contraindicated
- **Chavesseac maneuver**- soft clamp applied to cord → biopsy from suspicious area → sent for frozen section → if + ligate cord, do orchiectomy → final HPE

FMGE Solutions Screening Examination

772

230. Ans. (a) **P.S.A (Prostate specific antigen)**Ref: Bailey & Love, 26th ed. pg. 1341

Prostatic acid phosphatase	It is elevated in: <ul style="list-style-type: none"> • Prostate cancer • Metastatic prostate cancer
Prostate specific antigen	As the PSA level increases, so does the risk of this disease. When the PSA is 1 ng/mL, cancer can be detected in about 8% of men if a biopsy is performed. With a PSA level of 4–10 ng/mL, the likelihood of finding prostate cancer is about 25%
N.S.E (NEURON SPECIFIC ENOLASE)	Neuroblastoma/oat cell cancer

231. Ans. (d) **Persists in blood after prostatectomy**Ref: Bailey & Love, 26th ed. pg. 1341

- PSA is a kallikrein-related serine protease that causes liquefaction of seminal coagulum.
- It is produced by both nonmalignant and malignant epithelial cells and, as such, is prostate-specific, not prostate cancer-specific, and serum levels may also increase from prostatitis and BPH. Serum levels are not affected by DRE but the performance of a prostate biopsy can increase PSA levels up to tenfold for 8–10 weeks.
- Elimination of PSA bound to alpha 1-antichymotrypsin is slow (estimated half-life of 1–2 weeks) as it is too large to be cleared by the kidneys. Levels should be undetectable after about six weeks if the prostate has been removed.

232. Ans. (c) **Prostate specific antigen only**Ref: Bailey & Love, 26th ed. pg. 1341

- The most common presentation of advanced prostate cancer is a patient with a rising PSA level in whom initial local therapy has failed. Generally, after a radical prostatectomy, the PSA level should be less than 0.2 ng/mL and, after radiation therapy, less than 0.5 ng/mL. Other important prognostic indicators include PSA velocity, time to PSA nadir, time to PSA recurrence, and pattern of PSA recurrence.
- PSA levels for all men with prostate cancer who are having radical treatment should be checked at the earliest 6 weeks following treatment, at least every 6 months for the first 2 years and then at least once a year thereafter.

233. Ans. (b) **Prostatitis**Ref Bailey & Love, 25th pg. 1320

The **three-glass urine test** is valuable, if the first glass with the initial voided sample shows **urine containing prostatic threads, prostatic is present**.

Prostatodynia is diagnosed by presence of perigenital pain in the absence of any objective evidence of prostate inflammation.

234. Ans. (a) **Bateson plexus**Ref: Bailey & Love, 26th ed. pg. 527

- The **Bateson venous plexus** is a network of valve-less veins in the human body that connect the deep pelvic veins and thoracic veins to the internal vertebral venous plexuses.
- Because of their location and lack of valves, they are believed to provide a route for the spread of cancer metastases. These metastases commonly arise from cancer of the pelvic organs such as prostate and may spread to the vertebral column.

235. Ans. (b) **Localized prostate cancer, life expectancy > 10 years**Ref: Bailey & Love, 26th ed. pg. 1355

- Nerve-sparing RRP is done in patients with clinically localized prostate cancer who have at least a 10-year life expectancy and low comorbidities.
- *Patients with locally advanced disease cannot undergo nerve-sparing RRP; because of the extent of the local tumor burden (especially posteriorly), the nerve-sparing procedure can compromise the adequacy of the operation.*
- The objective of modern RP are to remove the entire cancer with negative surgical margins, minimal blood loss, no serious perioperative complications, and complete recovery of continence and potency.

236. Ans. (a) **Horse shoe kidney**Ref: Bailey & Love, 26th ed. pg. 1282

- Since the contrast can be seen on both sides, absent kidney is ruled out. More over the contrast is at normal level, so undescended kidney is unlikely.
- The *horseshoe kidney* consists of two distinct functioning kidneys on each side of the midline, *connected at the lower poles by an isthmus of functioning renal parenchyma or fibrous tissue that crosses the midline of the body*
- The collecting system has a characteristic appearance on intravenous urography because of an incomplete inward rotation of the renal pelvis, which faces anterior. The axis of the collecting system is deviated inward at the lower poles because of the lower pole's connection with the isthmus.

237. Ans. (a) **Renal cell cancer**

- The large homogenous mass on right shows an enlarged kidney as compared to other side suggestive of malignancy. The hilum of kidney shows renal vein thrombosis.

- Due to homogenous mass present unilaterally, polycystic kidney is ruled out. Since no cystic dilatation is present, hydro-nephrosis is ruled out.

238. Ans. (b) Bladder stone

- Notice the densely radio-opaque, single large calculus.
- Fecolith is hardening of feces into lumps of varying size inside the colon, which may appear whenever chronic obstruction of transit occurs, such as in megacolon and chronic constipation but location of this radioopaque shadow in pelvis rules out fecolith

239. Ans. (b) Carcinoma Penis

Ref: Bailey & Love, 26th ed. pg. 1374

- Penile squamous cell carcinoma, the most common penile malignancy, behaves similarly to squamous cell carcinoma in other parts of the skin. This is a slow-growing cancer in its early stages, and because it seldom interferes with voiding or erectile function
- *Bowen's disease* typically presents as a gradually enlarging, well-demarcated erythematous plaque with an irregular border and surface crusting or scaling. *About 60-85% of patients have lesions on the lower leg, usually in previously or presently sun-exposed areas of skin.*

240. Ans. (b) Inguinal lymph node metastasis operable

Ref: Bailey & Love 26th ed. pg. 1373-74

CARCINOMA PENIS

Clinical Features

- Most commonly occur in 6th decade of life
- **Squamous cell carcinoma (80%) is the MC type**, most commonly originates from glans > sulcus > prepuce > shaft.
- Others are transitional cell carcinoma (15%), basal cell carcinoma, malignant melanoma, sarcoma
- **MC symptom:** foul smelling discharge, with little or no pain
- More than 50% patients of CA penis presents with enlarged inguinal lymph nodes.
- **MC and earliest symptom of metastatic CA penis: Priapism**

Jackson (Extent of spread) Staging for CA Penis

Stage I	Confined to glans or prepuce
Stage II	Extension to shaft
Stage III	Operable inguinal LN metastasis
Stage IV	Inoperable inguinal LN metastasis or local or advanced spread

241. Ans. (d) Phimosis

Ref: Bailey, 26th ed. pg. 1359

PHIMOSIS

- Phimosis is a condition in which the contracted foreskin cannot be retracted over the glans.
- Chronic infection from poor local hygiene is its most common cause.
- Most cases occur in uncircumcised males, although excessive skin left after circumcision can become stenotic and cause phimosis.

Clinical features

- **Difficulty in micturition is the main symptom.**
- Ballooning of prepuce during micturition is suggestive of phimosis.
- *Edema, erythema, and tenderness of the prepuce and the presence of purulent discharge usually cause the patient to seek medical attention.*
- Inability to retract the foreskin is a less common complaint.

HYPOSPADIAS

- Hypospadias results when fusion of urethral folds is incomplete, and urethral meatus opens on the underside of penis or perineum (ventral surface of penis).
- Because fusion of urethral folds is from posterior to anterior, Anterior forms are more common than posterior.
- **Associated pathology:** In addition to ventrally placed ectopic meatus, hypospadias has:
 - **Chordee:** ventral curvature of penis due to contracture of fibrous cord which has replaced the distal urethra and corpus spongiosum.
 - **Hooded prepuce:** Deficient on ventral aspect and excess on dorsal aspect
 - Stenosis of ectopic meatus

EPISPADIAS

- Urethra opens on the dorsum (upper aspect) of the penis in males, in females there is a fissure in the wall of the urethra which opens above the clitoris
- **Females:** Bifid clitoris and separation of the labia. Most are incontinent because of maldevelopment of the urinary sphincters.
- **Males:** Patients with glandular epispadias seldom have urinary incontinence. However, incontinence in penopubic epispadias is 95% and penile epispadias is 75%.

POSTERIOR URETHRAL VALVE

- Exclusively an anomaly of male urethra.
- Symmetrical folds of urothelium extending distally from prostatic urethra to external urinary sphincter.
- Newborns may present with palpable abdominal masses.

FMGE Solutions Screening Examination

774

- Sometimes, the valves are incomplete and the patient remains without symptoms until adolescence or adulthood.

242. Ans. (b) **Hypospadias**

Ref: Bailey, 26th ed. pg. 1359

Refer to above explanation

243. Ans. (b) **Circumcision**

Ref: Bailey & Love, 25th pg. 1371

Balanitis xerotica obliterans (BXO)

- A condition in which the normally pliant **foreskin becomes thickened and will not retract.**
- It is difficult to keep the penis clean and there is a problem with hygiene.
- In later life there is an **increased susceptibility to carcinoma.**
- Treatment is by **circumcision**

244. Ans. (d) **Infection**

Ref: Campbell's Urology, 8th ed. pg. 346,349

Principal causes of death in renal transplant patients (in decreasing order)

1. Heart disease
2. Infection
3. Stroke

HEPATOBIILIARY SYSTEM

245. Ans. (d) **Contrast CT scan**

Ref: SRB 5th ed. pg. 599, 601

The clinical presentation is suggestive of liver abscess. Since the patient is anicteric, viral hepatitis is a less likely diagnosis. The initial investigation to be performed will be USG which will evaluate the echotexture of liver and give insight into altered echogenicity.

CT scan abdomen with contrast has 95% sensitivity to pick up the abscess, location, size and picks up complications as well.

246. Ans. (a) **HCC**

Ref: SRB 5th ed. pg. 609

Alpha-fetoprotein is raised to more than 100 IU in Hepatocellular carcinoma. It begins to rise once vascular invasion occurs by the tumour. The fibrolamellar variant of HCC does not show elevated HCC. Other tumour markers for HCC are:

- PIVKA II
- ALP-L3

- DCP (des carboxy prothrombin)

Tumour marker for fibrolamellar variant of HCC is neurotensin levels and increases in serum vitamin B12 binding protein.

247. Ans. (c) **E.R.C.P**

Ref: Page 634: SRB, 5th edition

The image shows presence of gastroduodenoscopy at 7 o'clock position with a filling defect in CBD. The technique involves cannulation of sphincter of Oddi and dye is injected. It is done under C arm guidance and sedation like midazolam or propofol anaesthesia.

T - Tube cholangiogram

After choledochotomy Kehr's tube is placed in CBD for 14 days and then water-soluble dye is injected into the tube and X-ray is taken. Complete free flow of dye into the duodenum indicates there is no blockage due to residual CBD stones

Percutaneous transhepatic cholangiography

With help of C arm fluoroscopy Okuda needle is passed into dilated biliary duct via the liver parenchyma. It is done to evaluate for high biliary strictures or failure of ERCP.

248. Ans. (a) **Associated with MEN1**

Ref: Harrison 19th ed. P 569

- Zollinger Ellison syndrome/Gastrinoma is the most common pancreatic tumor seen in multiple endocrine neoplasia type 1.
- The most common site is second part of duodenum and hence choice B is wrong.
- The best test for diagnosis of ZES is secretin study with measurement of fasting gastrin levels and BAO/MAO levels.
- Most common presenting symptom is epigastric pain > diarrhea.
- The most frequent metastasis is to liver.

249. Ans. (a) **Hepatoduodenal ligament**

Pringle maneuver is used to slow bleeding flow during liver surgery. The Pringle manoeuvre is characterised by

clamping of hepatoduodenal ligament. It is effective as the liver is partially nourished by backflow from the hepatic veins. However intermittent clamping with 15 minutes of clamping and 5 minutes without clamping is less harmful.

FIGURE: Pringle maneuver. Occlusion of the porta hepatis decreases blood flow to the liver to slow bleeding during liver surgery. It clamps the portal vein and hepatic artery

250. Ans. (a) Cholelithiasis

The USG image shows stones appearing as intraluminal, echogenic, mobile foci that are gravity-dependent and create a clean acoustic shadow. The gravity dependant movement of stone with change of patient position and is called as rolling stone sign.

251. Ans. (b) Aspiration + Anti amoebic drugs

Ref: Bailey, 26th ed. pg. 131

- The presence of solitary abscess in left lobe points to amoebic liver abscess etiology and needs aspiration and anti-amoebic drugs
- Liver involvement occurs following invasion of *E histolytica* into mesenteric venules.
- Amebae then enter the portal circulation and travel to the liver where they typically form large abscesses.
- Routine aspiration of liver abscess is not indicated.
- The aspirate is the color of chocolate/ Anchovy sauce due to mixture of blood and liver tissue.
- Choice D is performed for Hydatid cyst.

Indications of aspiration in amoebic liver abscess are

1. Lack of clinical improvement in 24–48 hours
2. Left lobe abscess
3. Thin rim of liver tissue around the abscess

252. Ans. (a) Liver cancer

Ref: Bailey, 26th ed. pg. 131

- Aflatoxin exposure in food is a significant risk factor for Hepatocellular carcinoma.
- Aflatoxins are primarily produced by the food-borne fungi *Aspergillus flavus* and *Aspergillus parasiticus*, which colonize a variety of food commodities, including maize, oilseeds, spices, groundnuts
- Choice B is related to Smoking and aniline dye exposure
- Choice D is related to the earliest detected proto-oncogene Rb.

253. Ans. (c) Rapid transfusion of fresh blood

Ref: Bailey, 26th ed. pg. 16-17 and pg. 109

Choice A	Vasopressor or inotropic therapy is not indicated as first-line treatment of hypovolemic shock.
Choice B	Laparotomy would require General anesthesia which cannot be given in setting of decompensated shock.
Choice C	If blood is being lost, the ideal replacement fluid is blood, although crystalloid therapy may be required while awaiting blood products.
Choice D	While awaiting Blood transfusion crystalloids must be started and is a first line management.

Extra Mile

Role of vasopressors in shock

- Vasopressor agents (phenylephrine, noradrenaline) are indicated in distributive shock states (sepsis, neurogenic shock) where there is peripheral vasodilatation, and a low systemic vascular resistance, leading to hypotension despite a high cardiac output.
- Where the vasodilatation is resistant to catecholamines (e.g. absolute or relative steroid deficiency) vasopressin may be used as an alternative vasopressor.

254. Ans. (b) Amoebic liver abscess

Ref: Sabistan, 19th ed. pg. 1443

AMOEBC LIVER ABSCESS

- Caused by *Entamoeba histolytica* whose cysts are acquired through the feco-oral route
- Usually Solitary and more common in **right lobe of liver**.
- It most frequently affects the cecum and ascending colon
- **In colon:** Flask-shaped ulcers (MC site: Cecum and ascending colon)

Clinical Features

- Most common symptoms is abdominal pain
- **Typical clinical picture (as seen in the question):** Patient of 20–40 yrs of age, with history of travel to endemic area, presents with fever, chills, anorexia, *right upper quadrant pain*.
- Results from an obligatory colonic infection, a recent history of diarrhea are uncommon.
- USG guided aspiration: Shows anchovy sauce pus

TABLE: Difference between Amoebic liver abscess and Pyogenic liver abscess

Clinical features	Amebic liver abscess	Pyogenic liver abscess
Age (yr)	20–40	>50
Travel in endemic area	Yes	No
Diabetes mellitus	Uncommon	More common
Alcohol use	Common	Common
Jaundice	Uncommon	Common
Elevated bilirubin	Uncommon	Common
Elevated alkaline phosphatase	Common	Common

Extra Mile

- **Most common** symptom of pyogenic abscess: **FEVER**
- MC sign of pyogenic abscess: RUQ tenderness
- **Most common** symptom of amoebic abscess: **Abdominal pain**
- **Most common** sign of amoebic abscess: **HEPATOMEGALY**
- Hydatid cyst is mostly asymptomatic. If presents with symptom, most common presenting symptom is abdominal pain, vomiting, dyspepsia.

255. Ans. (a) **Amoebic liver abscess**

Ref: Bailey & Love, 26th ed. pg. 70

256. Ans. (b) **Peritoneal deposits**

Ref: Bailey & Love, 26th ed. pg. 1100

Advantages of ultrasound in obstructive jaundice

1. Ultrasonography (US) is the least expensive, safest, and most sensitive technique for visualizing the biliary system, particularly the gallbladder
2. Current accuracy is close to 95%. US is the procedure of choice for the initial evaluation of cholestasis and for helping differentiate extrahepatic from intrahepatic causes
3. Visualization of the pancreas, kidney, and blood vessels is also possible.

257. Ans. (a) **Clonorchis sinensis**

Ref: Bailey & Love, 26th ed. pg. 1115

Clonorchis sinensis is liver fluke acquired by ingestion of raw or inadequately cooked fresh water fish. In human body it lives within bile ducts and causes inflammatory reaction leading to cholangitis, cholangio-hepatitis and biliary obstruction. It is well known to be a risk factor for Cholangio-carcinoma.

258. Ans. (b) **Acute cholecystitis**

Ref: Sabiston, 19th ed. pg. 1847

ACUTE CHOLECYSTITIS

- Acute cholecystitis is inflammation of gallbladder and is due to gallstones in 90–95% of cases.
- **Characteristic triad of cholecystitis:** RUQ pain + Fever + Leucocytosis
- Obstruction of the cystic duct leading to biliary colic is the initial event in acute cholecystitis

Clinical Presentation

1. RUQ pain of much longer duration than biliary colic, is the **MC symptom**
2. **Other common symptoms:** Fever, nausea, and vomiting
3. **Upon Physical examination:** RUQ tenderness and guarding are usually present inferior to the right costal margin.
4. **Murphy's sign:** Inspiratory arrest with deep palpation in the RUQ in acute cholecystitis.
5. **Boas sign:** Hyperesthesia below right scapula in acute cholecystitis

259. Ans. (a) **Acute cholangitis**

Ref: Sabiston, 19th ed. pg. 1847

- **Charcot triad** is seen in case of acute cholangitis.
- **It includes: Pain, Fever, Jaundice**
- Do not mix with triad of cholecystitis

260. Ans. (b) **Acute Cholecystitis**

Ref: Page 1107, Chapter 67, Bailey and Love, 26th ed.

- In the acute phase of Cholecystitis, the patient may have right upper quadrant tenderness that is exacerbated during inspiration by the examiner's right subcostal palpation (**Murphy's sign**).

261. Ans. (c) **Cholecystitis**

- Cholecystitis is inflammation of gallbladder wall. Radiological evaluation does not show elevation of right hemidiaphragm in these cases.

- Chest radiographs are abnormal in the majority of patients with amebic hepatic abscesses. Findings include **elevation of the right hemi-diaphragm**, right pleural effusion, atelectasis in the region of the base of the right lung, and a right pleural effusion.
- In case of pyogenic liver abscess and subdiaphragmatic abscess also, there is elevation of right hemi-diaphragm.

262. Ans. (c) Hemangioma

Ref: Bailey & Love, 26th ed. pg. 1083

Hemangioma being a *vascular tumor* is diagnosed by imaging techniques and liver biopsy is contraindicated. Cavernous hemangiomas arise from the endothelial cells and consist of multiple, large vascular channels lined by a single layer of endothelial cells and supported by collagenous walls. These tumors are frequently asymptomatic and incidentally discovered at imaging, surgery, or autopsy.

263. Ans. (a) Hemangioma

Ref: Bailey & Love, 26th ed. pg. 1083

- **Hemangiomas:** These are the *most common type of benign liver tumor*. Most of these tumors do not cause symptoms and do not need treatment.
- **Hepatic adenomas:** These are benign epithelial liver tumors that develop in the liver and are found mainly in women that using estrogens as contraceptives. Symptoms associated with hepatic adenomas are all associated with large lesions which can cause intense abdominal pain.
- **Focal nodular hyperplasia (FNH)** is the second most common tumor of the liver. This tumor is the result of a congenital arteriovenous malformation hepatocyte response.

264. Ans. (b) Hepatic artery

Ref: Bailey & Love, 26th ed. pg. 1073

- **Pringle manoeuvre:** Atraumatic clamping of the hilar vessels to control hepatic bleeding from traumatic injuries also known-as the Pringle maneuver.
- This atraumatic clamp is placed at foramen of Winslow, across the hepato-duodenal ligament
- It clamps the portal vein and hepatic artery, and prevents excessive blood loss during parenchymal transection.

265. Ans. (d) Pale yellow

Ref: Bailey & Love, 26th ed. pg. 1106-1107

Morphology of gall stones

Cholesterol stones:

Cholesterol stones arise exclusively in the gallbladder and are composed of cholesterol. *Pure cholesterol stones are pale yellow, round to ovoid, and have a finely granular, hard external surface.* Stones composed largely of cholesterol are radiolucent: Presence of calcium carbonate in stones makes them radiopaque

Mixed stones:

Increasing proportions of calcium carbonate, phosphates, and bilirubin, the stones exhibit discoloration and appear gray-white to black

Pigment gallstones:

- Pigment stones are classified as "black" and "brown." *Black pigment stones* are found in *sterile gallbladder bile* and *brown stones* are found in *infected intrahepatic or extrahepatic ducts*.
- "Black" pigment stones contain oxidized polymers of the calcium salts of unconjugated bilirubin, small amounts of calcium carbonate, calcium phosphate, and mucin glycoprotein.
- "Brown" pigment stones contain pure calcium salts of unconjugated bilirubin, mucin glycoprotein, a substantial cholesterol fraction, and calcium salts of palmitate and stearate.

266. Ans. (a) Pigment stones

Ref: Bailey & Love, 26th ed. pg. 1106-1107

In hemolytic anemia like hereditary spherocytosis, on account of increased extravascular hemolysis, there is production of calcium bilirubinate stones (pigment stones).

267. Ans. (d) Liver cancer

Ref: Harrison, 18th ed. Ch. 91

- Aspirin suppresses cell proliferation by inhibiting prostaglandin synthesis.
- Regular aspirin use reduces the risk of colon adenomas and carcinomas as well as death from large-bowel cancer.

HEAD AND NECK

268. Ans. (c) Oral lichen planus

Ref: SRB 5th ed. pg. 370

Conditions responsible for premalignant lesions of oral cavity

Equivocal risk lesions are

- Oral lichen planus
- Dyskeratosis congenita
- Discoid lupus erythematosus

Medium risk lesions

- Oral submucosal fibrosis
- Syphilitic glossitis
- Sideropenic Glossitis/Plummer Vinson Syndrome

Contd...

High risk Lesions

- Leukoplakia
- Erythroplakia
- Chronic hyperplastic candidiasis

269. Ans. (d) SCC of lip

Ref: SRB 5th ed. pg. 384

The image shows a fungating mass arising from mucosal part of lip. It shows everted edge with induration. The visible staining of teeth indicates that the patient may be using khaini (mixture of tobacco and lime) kept under the lip which is a common cause in Indian patients

The age of patient also favours the diagnosis. It is usually a well differentiated Squamous cell carcinoma.

270. Ans. (a) Nodulocystic

Ref: SRB, 5th ed. pg. 290

- The most common subtype of Basal cell cancer is rodent ulcer. It is the most common malignant skin tumour seen on face (Oghren line) and is also called tear cancer. The most common subtype is nodulocystic and noduloulcerative subtype.
- Choices A and B are subtypes of malignant melanoma. Choice D pigmented BCC mimics melanoma.

271. Ans. (c) Betel nut chewing

Ref: Harrison 19th ed. P 369

Causes of Submucosal Fibrosis

1. Prolonged irritation by chilies, tobacco (pan/quid), areca due to arecoline
2. Deficiency of vitamin A and B complex (riboflavin)
3. Localized collagen disorder

- It presents with soreness in mouth which increases during meals. There is trismus and difficulty in protruding the tongue. The entire area turns red and later has stiff fibrotic bands and scarring.
- Common sites are buccal mucosa, faucial pillars and soft palate.
- There is progressive nature of disease even with cessation of causative factors.

272. Ans. (d) Pain and paraesthesia in Ulnar nerve distribution

- Neurologic symptoms occur in 95% of cases of thoracic outlet syndrome. The lower 2 nerve roots of the brachial plexus, C8 and T1, are most commonly (90%) involved, producing pain and paresthesias in the ulnar nerve distribution.
- The second most common anatomic pattern involves the upper 3 nerve roots of the brachial plexus, C5, C6, and C7, with symptoms referred to the neck, ear, upper chest, upper back, and outer arm in the radial nerve distribution.

273. Ans. (a) Frontal bone

- Potts puffy tumor is a misnomer and is an acute osteomyelitis of frontal bone.
- It has diffuse external swelling of scalp due to subperiosteal pus formation and scalp oedema. It originates in frontal area.
- It presents as a boggy swelling with pitting scalp oedema. X-ray of Skull is done. It is treated with antibiotics and drainage under GA before it spreads to the CNS.
- Once it extends into the cranial cavity, it is managed by neurosurgical decompression using Dandy's Brain Cannula.

Complications

- Osteomyelitis of frontal bone
- Spread of infection of intracranial cavity.
- Cortical venous thrombosis
- Subdural empyema

274. Ans. (a) Rathke pouch

Ref: Harsh Mohan, 7th ed. pg. 787

Features of Craniopharyngioma are-

- Slow-growing tumor
- Epithelial-squamous
- Calcified hence visible even on X-ray skull

- Cystic tumor arising from remnants of the craniopharyngeal duct and/or Rathke cleft
- Occupying the (supra)sellar region.

275. Ans. (a) Extradural Bleeding

Ref: Bailey, 26th ed. pg. 316

- On CT, extradural haematomas appear as a lentiform (lens shaped or biconvex) hyperdense lesion between skull and brain constrained by the adherence of the dura to the skull.
- Mass effect may be evident, with compression of surrounding brain and midline shift.
- Areas of mixed density suggest active bleeding.

276. Ans. (b) Lung cancer

Ref: Schwartz, 10th ed. pg. 583; Harrison, 18th ed. Ch 99

Metastasis to Cervical Lymph Nodes

Squamous cell carcinoma (SCC) is the most common histotype, followed by adenocarcinoma, undifferentiated

DRAINAGE Sites for Cervical Lymph Nodes

carcinoma and other malignancies (for example, lymphoma and melanoma)

Common site for metastasis to neck nodes – Head and Neck (M.C.), Lungs (2nd M.C.), esophagus, stomach, ovary, pancreas. Approximately ten percent of patients with abnormal cervical nodes present without obvious primary. Most common sites for unknown primary:

1. Nasal Pharynx
2. Pyriform Sinus
3. Tongue Base
4. Tonsillar Crypts
5. Thyroid

The left supraclavicular node is called Virchow's node since it is on the left side of the neck where the lymphatic drainage of most of the body (from the thoracic duct) enters the venous circulation via the left subclavian vein. The metastasis blocks the thoracic duct leading to regurgitation into the surrounding nodes i.e. Virchow's node.

Remember

Probable Source of Nodal Metastasis

- **Level 1:** Oral cavity, submandibular gland.
- **Level 2:** Nasal pharynx, oral pharynx, parotid, supraglottic larynx.
- **Level 3:** Oral pharynx, hypopharynx, supraglottic larynx.
- **Level 4:** Subglottic larynx, hypopharynx, esophagus, thyroid.
- **Level 5:** Nasal pharynx, oral pharynx.
- **Level 6 & 7:** Thyroid, larynx, lung.
- **Note:** Bilateral nodes are common with cancers of soft palate, tongue, epiglottis, and nasal pharynx.

277. Ans. (a) Astrocytoma

Ref: Harrison, 18th ed. pg. 379

- MC malignant brain tumor is astrocytoma
- Overall most common brain tumor: Metastasis (Oat cell cancer of lung)

FMGE Solutions Screening Examination

780

278. Ans. (a) Brain tumor

Ref: Harrison, 18th ed. pg. 379**RADIOSURGERY & STEREOTACTIC RADIOTHERAPY**

- Radiosurgery refers to a single treatment with a relatively large dose of radiation by focusing many small beams of radiation from different directions onto a small tumor (up to 3 cm in diameter).
- The CyberKnife is a specially designed imaging-guided system in which a small linear accelerator is moved around the patient by a programmable robotic arm. In addition to treating tumors of the brain, the Cyberknife can be used to treat tumors of the spine and other sites such as the head and neck, prostate, liver, lung, and kidney.

There are two types of Stereotactic Radiation

- Stereotactic radiosurgery (SRS) refers to a single or several stereotactic radiation treatments of the brain or spine.
- Stereotactic body radiation therapy (SBRT) refers to one or several stereotactic radiation treatments with the body, excluding the brain or spine.
- Generally in brain the procedure is referred as stereotactic surgery if it is done in a single session or as **fractionated stereotactic radiotherapy (SRT)**, if done in multiple sessions.
- If the therapy is done for other parts of the body then it is generally known as stereotactic radiotherapy

279. Ans. (d) Seminoma

Ref: Bailey & Love, 26th ed. pg. 1385

Radiosensitive tumors	Radioresistant tumors
<ul style="list-style-type: none"> • Neuroblastoma • Seminoma • Medulloblastoma • Wilm's tumor • Early cervical cancer and vaginal cancer • Head and neck tumors 	<ul style="list-style-type: none"> • Renal cell cancer • Colonic cancer • Lung cancer • Melanoma • Sarcoma

280. Ans. (b) Osteosarcoma

Most common *secondary malignancy* in retinoblastoma is osteosarcoma developing in second decade of life.

281. Ans. (d) Seen with Juvenile nasopharyngeal angiofibroma

Trotter's triad is seen with nasopharyngeal carcinoma

TROTTER'S TRIAD

1. Conductive deafness
2. Immobility of homolateral soft palate
3. Trigeminal neuralgia

Remember Commonly Asked Triads**Extra Mile****Triad of Alports Syndrome**

- Sensorineural deafness/Progressive renal failure/Ocular anomalies

Triad of Behcet's Syndrome:

- Recurrent oral ulcers/Genital ulcers/Iridocyclitis [mnemonic: can't see, can't pee, can't eat spicy curry]

Beck's Triad

- Muffled heart sound/Distended neck veins/Hypotension

Gradenigo's Triad

- Sixth cranial n. Palsy/Persistent ear discharge/Deep seated retro orbital pain

Charcot's Triad

- Pain + fever + jaundice

Triad of Hypernephroma

- Pain + hematuria + renal mass Triad of Hypernephroma

Hutchinson's Triad

- Hutchinson's teeth/Interstitial keratitis/Nerve deafness

Triad of Kwashiorkor

- Growth retardation/Mental changes/Edema

Saint's Triad

- Gall stones/Diverticulosis/Hiatus hernia

Trotter's Triad

- Conductive deafness/Immobility of homolateral soft palate/Trigeminal neuralgia

Virchow's Triad

- Stasis/Hypercoagulability/Vessel injury

Fanconi Syndrome Triad

- Aminoaciduria/Proteinuria/Phosphaturia

282. Ans. (c) MC site is on Lateral margin

Ref: Bailey, & Love, 26th ed. pg. 713-14**TONGUE CANCER**

- MC site is middle of lateral border or ventral aspect of the tongue.
- MC histological type is squamous cell carcinoma.
- **MC complaint:** Mid-irritation of tongue.
- MC associated risk factors are tobacco and alcohol.
- MC variety is ulcerative.
- *ONLY 30% patients present with cervical node metastasis.*
- The intrinsic tongue musculature provides little restriction to tumor growth, thus it may enlarge considerably before producing symptoms.
- Presents as painless mass or ulcer that fails to heal after minor trauma.

283. Ans. (c) Lateral margin of tongue

Ref: SRB Manual of Surgery, 4th ed. pg. 1310

Squamous cell cancer of the tongue is the commonest cancer. The location is at the following sites

- Lateral margin -50%
- Posterior 1/3 rd tongue-20%
- Dorsum-6.5%
- Ventral surface-6%
- Tip-10%

284. Ans. (c) Cleft lip and palate

Ref: Bailey & Love, 26th ed. pg. 634

Orofacial clefts (ie, cleft lip [CL], cleft lip and palate [CLP], cleft palate [CP] alone, as well as median, lateral [transversal], oblique facial clefts) are among the most common congenital anomalies. *Approximately 1 case of orofacial cleft occurs in every 500-550 births.*

285. Ans. (c) Thyroglossal fistula

Ref: Dhingra's ENT, 5th ed. pg. 398

- Sublingual dermoid cyst present as midline submental swelling. This cyst is not attached to foramen cecum and hence doesn't move upon tongue protrusion or upon deglutition.
- The **thyroglossal cyst** classically moves upwards with swallowing and notably with tongue protrusion, as it is attached to foramen cecum. It merely indicates attachment to the hyoid bone.

286. Ans. (c) Cystic hygroma

Ref: Bailey & Love, 26th ed. pg. 701

■ CYSTIC HYGROMA/LYMPHANGIOMA

- Cystic hygromas are multiloculated cystic swelling filled with clear lymph lined by endothelial cells
- It results due to sequestration of a portion of the jugular lymph sac from the lymphatic system.
- It is associated with Turner's syndrome
- Most cystic hygromas involve the lymphatic jugular sacs
- **MC site:** Posterior neck region
- **Other common sites:** Axilla, mediastinum, inguinal and retroperitoneal regions
- Approximately 50% of them are present at birth.
- It may show spontaneous regression
- The cysts are filled with clear lymph and **lined by a single layer of endothelium epithelium.**

Clinical Features

- Usually manifests in the neonates or in early infancy (50% present at birth).
- Prone to infection and hemorrhage within the mass.
- Usually present as soft masses that distort the surrounding anatomy, can result in acute airway obstruction.

- Swelling is soft and partially compressible and invariably increases in size when the child coughs or cries.
- **Characteristic features: Brilliantly translucent**

Diagnosis: MRI plays a crucial role in preoperative planning

Treatment: Complete surgical excision is the preferred treatment.

Extra Mile

- Carotid body tumor aka potato tumor MC presents in 5th decade with firm, rubbery, mobile mass.
- Branchial cyst most commonly seen in older children or adolescents. However, all branchial remnants are present at the time of birth.

287. Ans. (d) Lined by columnar epithelium

Ref: Bailey & Love, 26th ed. pg. 700-701

VASCULAR SURGERY

288. Ans. (c) Neuralgia

Ref: SRB, 5th ed. pg. 234

Two methods of Venous stripping are:

- Extraluminal collision technique using Myer's stripper
- Invagination technique using Codman stripper

■ COMPLICATIONS OF STRIPPING

- Saphenous neuralgia due to saphenous nerve injury/avulsion
- Numbness or tingling along femoral nerve distribution
- Hematoma
- Infections
- Ulceration
- Recurrence of disease

289. Ans. (c) Popliteal artery

Ref: SRB 5th ed. P 177

- About 70% of peripheral arterial aneurysms are popliteal aneurysm and 20% are iliofemoral aneurysms.
- These aneurysms frequently co-exist with abdominal aortic aneurysms.
- They usually cause limb ischemia and distal embolism.

290. Ans. (c) Relieved on standing still

Ref: Bailey 26th ed. Chapter 53, P 901

Intermittent claudication or vascular claudication is defined as:

- Pain that develops on walking/exercise
 - Not seen with the first step (unlike osteoarthritis knees)
 - Relieved by standing still (unlike neurogenic claudication)
- The distance walked by the patient keeps on progressively reducing.

291. Ans. (b) Carotid angioplasty and stenting

Ref: Schwartz Principles of Surgery, 10th ed. P 903; Harrison 19th ed. p 2571-72

- Radiation induced occlusive carotid artery disease is due to Radiation given to head and neck area. It can lead to development of stroke.
- The best *screening* test is carotid Doppler and measure of carotid intimal thickness is used for diagnosis.
- The gold standard investigation is carotid angiography.
- Carotid angioplasty and stenting is the treatment of choice
- Carotid endarterectomy has higher incidence cranial nerve injury and wound infections which limits its use in these patients.

292. Ans. (d) Varicose veins

Ref: Bailey & Love, 26th ed. pg. 593/903

- Varicose veins are a cause of chronic leg edema and not a result of chronic leg edema.
- Edema is defined as a palpable swelling caused by an increase in interstitial fluid volume. The most likely cause of leg edema in patients over age 50 is venous insufficiency. *Venous insufficiency affects up to 30% of the population, whereas heart failure affects only approximately 1%.* The most likely cause of leg edema in women under age 50 is *idiopathic edema, formerly known as cyclic edema. Pulmonary hypertension and early heart failure can both cause leg edema before they become clinically obvious in other ways.*
- **Marjolin's ulcer** refers to an aggressive ulcerating squamous cell carcinoma presenting in an area of previously traumatized, chronically inflamed, or scarred skin. Histologically, the tumor is a well-differentiated squamous cell carcinoma. This carcinoma is aggressive in nature, spreads locally and is associated with a poor prognosis. Its edge is everted and not always raised.
- The IOC is a wedge biopsy.

293. Ans. (d) All of above

Ref: Bailey & Love, 26th ed. pg. 899-900

- Acute-phase lesions have inflammation involving all coats of the vessel wall, especially of the veins, in association with occlusive thrombosis.

- Intermediate phase is characterized by progressive organization of the occlusive thrombus in the arteries and veins.
- Chronic phase or end-stage lesion is characterized by organization of the occlusive thrombus with extensive recanalization and prominent vascularization of the media.
- In all three phases, the normal architecture of the vessel wall subjacent to the occlusive thrombus and including the internal elastic lamina remains essentially intact.

294. Ans. (c) Small Acral vessels of limb involvement causes hypohidrosis

Ref: Bailey & Love, 26th ed. pg. 899-900

- Arteries affected are plantar and digital vessels of the foot and lower leg. In advanced cases fingers and hands can be involved.
- Sympathetic overactivity can cause excessive sweating and capillary autonomic dysfunction. Raynaud's phenomenon can be a presentation with Buerger disease.
- The visceral and cerebral artery are rarely involved.
- Phlebitis migrans and deep vein thrombosis is attributed to thrombophilia.
- Angiography shows normal proximal vasculature with cork screw collaterals.
- The most frequently affected arteries are anterior (41.4%) or posterior (40.4%) tibial arteries in the lower extremities, and the ulnar artery (11.5%) in the upper extremities.

295. Ans. (d) Saphenofemoral flush ligation with stripping

Ref: Bailey & Love, 26th ed. pg. 903-904

Sapheno-femoral flush ligation if done alone results in development of collaterals and thereby chances of recurrence. The long saphenous vein is not ligated until the T-junction has been confirmed and femoral vein has been exposed. The saphenous trunk is then retrogradely stripped to knee.

296. Ans. (d) All of above

Ref: Bailey & Love, 26th ed. pg. 899-900

- Buerger's disease is an inflammation of the arteries, veins, and nerves in the legs, principally, leading to restricted blood flow. Left untreated, Buerger's disease can lead to gangrene of the affected areas. Buerger's disease is also known as thrombo-angitis obliterans.
- Early symptoms include decrease in the blood supply (arterial ischemia) and superficial (near the skin surface) phlebitis. The main symptom is pain in the affected areas. Inflammation occurs in small and medium-sized arteries and veins near the surface of the limb. The pulse

in arteries of the feet is weak or undetectable. The lack of blood flow can lead to gangrene. A cold sensitivity in the hands, similar to that seen in Raynaud's disease, can develop.

of the middle or ring finger. A positive response is seen with flexion of the terminal phalanx of the thumb.

GENERAL SURGERY

297. Ans. (b) Nerve regeneration

Ref: Bailey & Love, 26th ed. pg. 471

- **Hoffman Tinel sign** is seen in nerve regeneration and should not be confused with *Homan sign seen in deep vein thrombosis*.
- **Hoffman reflex** is elicited by a reflex test which verifies the presence or absence of lesions in the cortico-spinal tract. It is also known as the **finger flexor reflex**. The test involves tapping the nail or flicking the terminal phalanx

298. Ans. (b) S.T.D

Ref: SRB 5th ed. pg. 36

It is a common sensical question that hospital acquired infections would be surgical site infection. Urinary tract infection and pneumonia. Sexually transmitted infections would be on account of high-risk sexual behaviour prevalent amongst young adults.

299. Ans. (c) 30-40%

Ref: SRB: 5th ed. pg. 120

TABLE: Classification of Hemorrhagic shock

Shock class	Blood loss ml (%)	Heart rate Beats/min	Blood pressure	Respiratory rate Breaths/min	Mental status
I	<750 (15)	<100	Normal	14–20	Slightly anxious
II	750–1500 (15–30)	100–120	Normal	20–30	Mildly anxious
III	1500–2000 (30–40)	120–140	Decreased	30–40	Anxious, confused
IV	>2000 (>40)	>140	Decreased	>35	Confused, lethargic

300. Ans. (a) Wet gangrene

Ref: SRB: 5th ed, pg. 206

The image shows a gangrenous toe of left foot with a vague line of demarcation. The part is putrefied and discoloured. Notice the proximal swelling, erythema and slight ulceration. Usual causes are emboli or trauma.

Feature	Dry gangrene	Wet gangrene	Gas gangrene
Site	Commonly limbs	More common in bowel	Limbs
Mechanism	Arterial occlusion	More commonly venous obstruction	Gases produced by <i>Clostridium bacteria</i>
Macroscopy	Organ dry, shrunken, and black	Part moist, soft, swollen, rotten, and dark	Organ red, cold, pale, numb, shriveled up, and auto-amputation
Putrefaction	Limited due to very little blood supply	Marked due to congestion of organ with blood	Marked due to bacteria and infiltration of gases produced by them in tissues
Line of demarcation	Present at the junction between healthy and gangrenous parts	No clear-cut line of demarcation	No clear-cut line of demarcation
Bacteria	Bacteria fail to survive	Numerous present	Major cause
Prognosis	Generally better due to little septicemia	Generally poor due to profound toxemia	Generally poor due to quick spread to the surrounding tissues

FMGE Solutions Screening Examination

784

301. Ans. (a) **Subcutaneous Emphysema**Ref: Bailey and Love: 26th ed. pg. 933

- The image shows puffiness of face with examination finding of crepitus the diagnosis is subcutaneous emphysema.
- Choice B is ruled out as there is history of any trauma given in the patient
- Choice C is ruled out as no history suggestive of acute kidney injury is given.
- Choice D is ruled out as no facial plethora or dilated collaterals on the chest are seen.

302. Ans. (a) **3**

Ref: SRB 5th ed. p 1093

Eye opening = 1 Verbal response = 1 Motor response = 1

Hence the total score is 3. GCS is any way not designed to identify brain death but is used to evaluate presence of coma.

Extra Mile

- Mild head injury GCS score: 13–15
- Moderate head injury GCS score: 9–12
- Severe head injury GCS score: 3–8

303. Ans. (c) **4 L**

Ref: SRB 5th ed. P 133

Applying the Parkland formula: 4 mL per % of burn per kg body weight

$$4 \times 50 \times 40 = 8000 \text{ mL} = 8 \text{ L}$$

Out of this total 8 L, the first 4 L is given over 8 hours and rest 4 L over the remaining 16 hours.

Extra Mile

In burns patient, Muir and Barclay formula is used to calculate the *colloid* to be given after 24 hours of admission.

304. Ans. (a) **Elective intubation**

Ref: SRB 5th ed. P 138

- Airway burns are evidenced by singeing of nasal hair and burns on face and neck.
- Hence *elective intubation is recommended with regular performance of pulmonary toilet* to remove the secretions.
- In case routine intubation is not possible, nasopharyngeal intubation should be performed.
- Tracheostomy/cricothyroidotomy can be life-saving especially in case of endotracheal intubation being not possible.
- However tracheostomy performance via burned tissue of neck has *increased complication rate and risk of sepsis as compared to elective intubation*.

305. Ans. (a) **Acute limb ischemia**Ref: SRB Surgery: 5th ed. pg. 191**Treatment of Embolism and Thrombosis of Acute Limb Ischaemia**

Immediate infusion of 5000-10,000 units of IV heparin and relief of pain are needed first

Surgical

- Embolectomy (surgical exploration and removal of clot) is the choice for embolus. It is done either by interventional balloon 5 French (Fogarty, 1963) embolectomy or open method. It is the standard treatment for arterial embolism. It can be repeated several times until adequate bleeding occurs
- For acute thrombosis causing acute limb ischaemia, open thrombectomy with or without bypass may be the surgical treatment: but it is not the standard treatment for acute thrombosis (standard is thrombolysis, Dotter and co, 1974)

Endovascular therapy

- Intra-arterial thrombolysis using urokinase
- *Percutaneous mechanical thrombectomy*-it is done either by suctioning clot via catheter or dissolution of thrombus by pulverisation and aspiration by high speed motors or fluid jets
- Ultrasound accelerated thrombolysis using catheter based or transdermal using acoustic cavitation to ablate thrombus

Embolectomy

- It is done as early as possible as an emergency, operation.
- Under fluoroscopic guidance. Fogarty catheter (interventional radiology) is passed beyond the embolus and the balloon is inflated. Catheter is withdrawn out gently with embolus. Procedure has to be repeated until embolectomy is completed and good back bleeding occurs. Angiogram is repeated to confirm the free flow
- Postoperatively initially heparin and later oral anticoagulants are used. Procedure is done under general anaesthesia or local anaesthesia.

306. Ans. (a) **Cutting needle**

- *Cutting needle* is used to suture skin, aponeurosis and tough structures.
- *Reverse cutting needle* is used to suture mucoperiosteum
- *Round body needles* are used in soft structures like peritoneum, muscle, vessel, nerves, tendons, bowel and soft tissues.

Surgical Needles

Types

Based on the edge

- Round body needle
- Cutting needle
- Reverse cutting needle
- Taper cut needle
- Side-to-side flat—Hagedron needle

Based on curvature

- Straight needle
- Curved needle. Half circle; 5/8 circle, etc.

Based on Existence of the Eye

- **Atraumatic needle** is eyeless. Here suture material is attached to the needle by swaging. Size of the suture material and that of needle is same and so tissue trauma is less. Needle once used is disposed of (not reusable).
- **Traumatic needle:** It is eyed needle. Needle in the eye area is wider than the body of the needle and so tissue trauma is more. These needles are reusable.

FIGURE: Needles

307. Ans. (a) Pulse rate/BP

Shock index is defined as ratio of pulse rate to blood pressure and value >1 indicates significant blood loss.

Signs of Significant Blood Loss

- Pulse $>100/\text{min}$
- Systolic BP <100 mm Hg
- Diastolic BP drop on sitting or standing >10 mm Hg
- Pallor/sweating

Selective Management of Penetrating Neck Wounds

- Shock index (ratio of Pulse rate to Blood pressure >1)
- Tachycardia is not reliable indicator of haemorrhage.

308. Ans. (d) All of the above

Steps to stop blood loss

- Pressure
- Packing
- Position
- Operative procedures

309. Ans. (b) Colloids

Fluids used in Burns

Fluids used are Ringer lactate, Hartmann fluid, plasma. *Ringer lactate is the fluid of choice.* Blood is transfused in later period (after 48 hours).

First 24 hours only crystalloids should be given (Crystalloids are one which can pass through capillary wall like saline either hypo, iso or hypertonic, dextrose saline, *Ringer lactate*).

Sodium is assessed by formula: $0.52 \text{ mmol} \times \text{kg body weight} \times \% \text{ body burns}$, given at a rate of 4.0 to 4.4 ml/kg hours.

After 24 hours up to 30–48 hours, colloids should be given to compensate plasma loss (colloids are one which are retained in intravascular compartment). Plasma haemacel (gelatin), dextrans, hetastarch are used. Usually at a rate of 0.35–0.5 ml/kg/% burns is used in 24 hours.

310. Ans. (d) Urgent Angiography

- No role exists for probing or local exploration of the neck in the emergency department because this may dislodge a clot and initiate uncontrollable hemorrhage.
- Immediate surgical exploration *is only* done for patients who present with signs and symptoms of shock and continuous haemorrhage from the neck wound.
- **In our case the patient is not in shock. Hence angiography will be done to identify the presence of vascular injury. This is followed by formal neck exploration if required or conservative management is required. Read the protocol mentioned here for better understanding of the topic.**

FMGE Solutions Screening Examination

786

The neck may be divided into 3 zones using anatomic landmarks. Each zone has a group of vital structures that can be injured and may determine the kind of trauma management.

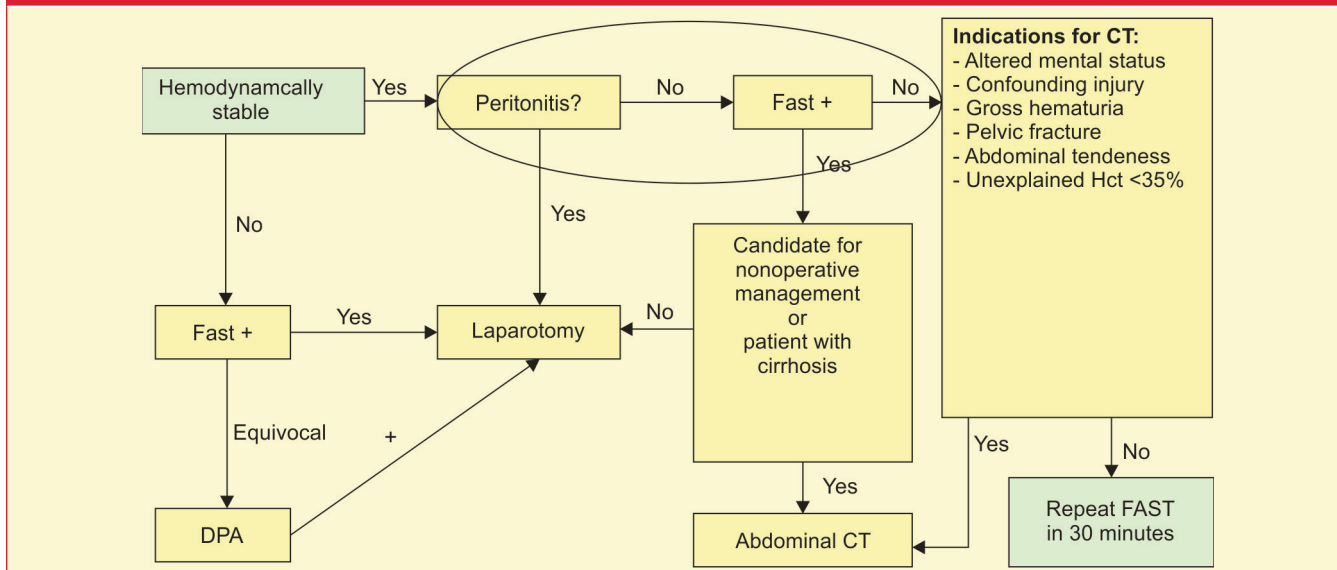

Zones of Penetrating Neck Injury

Zone 1	Horizontal area between the clavicle/suprasternal notch and the cricoid cartilage encompassing the thoracic outlet structures	The proximal common carotid, vertebral, and subclavian arteries and the trachea, oesophagus, thoracic duct, and thymus
Zone 2	Area between the cricoid cartilage and the angle of the mandible	Contains the internal and external carotid arteries, jugular veins, pharynx, larynx, esophagus, recurrent laryngeal nerve, spinal cord, trachea, thyroid, and parathyroids
Zone 3	Area that lies between the angle of the mandible and the base of the skull	Distal extracranial carotid and vertebral arteries and the uppermost segments of the jugular veins

311. Ans. (c) **F.A.S.T**

BAT (blunt abdominal trauma)

312. Ans. (a) 750

CLASSIFICATION OF HAEMORRHAGIC SHOCK (CIRCULATORY FAILURE)

Class	Blood loss	Features
I	Up to 15% (<750 mL)	Normal
II	Blood loss 15–30% (750–1500 mL)	Palor, thirsty, tachycardia
III	Blood loss 30–40% (1500–2000 mL)	Hypotension, tachycardia, oliguria, confusion
IV	Blood loss >40% (>2000 mL)	Rapid pulse, low BP, anuria, unconsciousness, MODS

313. Ans. (a) Acute limb ischemia

Surgical Guidelines for Acute Limb Ischemia

- 5000–10,000 units of heparin
- Relief of pain
- *Embolectomy with 5Fr Fogarthy catheter. The catheter is passed beyond the embolus and balloon is inflated. Catheter is withdrawn gently with the embolus.*
- Surgical exploration and removal of clot if all else fails.

314. Ans. (b) Secondary

Ref: Bailey and Love, 26th ed. pg. 284

Primary hemorrhage	Occurs at the time of surgery or trauma.
Secondary hemorrhage	Secondary haemorrhage is defined as occurring at least 24 hours after surgery, but usually presents several days later, as it is due to postoperative infection.
Reactionary haemorrhage	<ul style="list-style-type: none"> • Common after first 4–6 hours after surgery. • It may be caused by <ul style="list-style-type: none"> ■ Slippage of a ligature ■ Displacement of blood clot ■ Cessation of vasospasm, after coughing or increased mobility.

315. Ans. (c) Blood transfusion

Ref: Bailey, 26th ed. pg. 17

Choice A and B	<p>This statement is direct quote from Bailey page 17, 26th edition</p> <ul style="list-style-type: none"> • “On balance, there is little evidence to support the administration of colloids, which are more expensive and have worse side-effect profiles.” • Most importantly, the oxygen carrying capacity of crystalloids and colloids is zero.
Choice C	<i>If blood is being lost, the ideal replacement fluid is blood, although crystalloid therapy may be required while awaiting blood products.</i>
Choice D	Fluid resuscitation must be done before General anesthesia can be given and surgeon can proceed with immediate laparoscopy.

316. Ans. (a) Urine output

Ref: Bailey, 26th ed. pg. 15

787

Choice A	As shock progresses, renal compensatory mechanisms fail, renal perfusion falls and urine output dips below 0.5 mL/kg per hour.
Choice C ruled out as	Hypotension is one of the last signs of shock. Children and fit young adults are able to maintain blood pressure until the final stages of shock.
Choice D ruled out	Tachycardia may not always accompany shock. Patients who are on beta-blockers or who have implanted pacemakers are unable to mount a tachycardia

The *minimum* standard for monitoring of the patient in shock is

- Continuous heart rate
- Oxygen saturation monitoring
- Frequent non-invasive blood pressure monitoring
- Hourly urine output measurement.

Since the question is asking for the best parameter, out of the given options urine output is the best answer.

Extra Mile

- Shock is the most common and therefore the most important cause of death of surgical patients.
- *Ideal way to manage shock is measure pulmonary capillary wedge pressure > urine output monitoring.*

317. Ans. (a) Detection of Pericardial fluid accumulation

Ref: Bailey, 26th ed. pg. 109

Focused assessment with sonography for trauma (FAST) looks for fluid in the

- Peri-hepatic and hepato-renal space
- Peri-splenic area
- Pelvis
- Pericardium.
 - It has a role in children but it does not detect solid organ injuries nor replace CT.
 - Bowel perforation or deep penetrating trauma requires a laparoscopy or laparotomy.
 - Isolated blunt splenic and/or liver injuries identified on a CT

318. Ans. (a) Septic shock

In Septic shock findings include:

- Enhanced cardiac output
- Peripheral vasodilation
- Fever
- Leukocytosis
- Hyperglycemia
- Tachycardia
- In septic shock, the vasodilatory effects are due in part to the upregulation of the inducible isoform of nitric oxide synthase (iNOS or NOS₂) in the vessel wall.

FMGE Solutions Screening Examination

788

319. Ans. (c) **Crystalloids**Ref: Bailey & Love, 26th ed. pg. 16-17

- **Crystalloid is the first fluid of choice for resuscitation.** Immediately administer 2 L of isotonic sodium chloride solution or lactated Ringer's solution in response to shock from blood loss. Fluid administration should continue until the patient's hemodynamics become stabilized. Because crystalloids quickly leak from the vascular space, each liter of fluid expands the blood volume by 20-30%; therefore, 3 L of fluid needs to be administered to raise the intravascular volume by 1 L.
- About the use of RL and NS in hemorrhagic shock, it has been shown that Resuscitation with NS modulates hypercoagulability after trauma and results in increased fluid requirements. Administration of RL during resuscitation appears to have no effect on the hypercoagulable state induced by trauma. This hypercoagulable state may reduce bleeding and be protective initially, but may lead to thromboembolic complications later in the course of trauma admission. Due to this reason *RL may be preferred in the trauma (hemorrhagic shock) in the initial phase over NS.*
- As the RL is a little hypotonic solution large volume of RL in patients with head injury may lead to cerebral oedema therefore NS may be preferred over LR in patients of hemorrhagic shock with head injury. (Also remember that head injuries may also precipitate hyponatremia. The most common metabolic abnormality after head injury is SIADH).

320. Ans. (a) **Septic shock**

Plasma expanders are used to restore circulatory volume in shock, burns, sepsis, hemorrhage, surgery, and other trauma or for prophylaxis of venous thrombosis and thromboembolism.

- *Plasma expanders are most useful when there is faulty distribution rather than real loss eg- burns, septic/endotoxic shock and trauma. They do not provide oxygen carrying capacity.*
- Septic shock is associated with peripheral vasodilatation causing relative hypovolemia
- Antibiotics are the mainstay of treatment of septic shock
- Examples of plasma expanders
 - Dextran 70 & Dextran 40
 - Polyvinyl pyrrolidone
 - Gelatin polymer
 - Albumin
 - Hydroxyl ethyl starch

321. Ans. (d) **Anesthesia**Ref: Bailey and Love, 26th ed. ch. 2/15

In high spinal anesthesia, Hypotension occurs due to loss of sympathetic autonomic function and unopposed parasympathetic function. Vasoconstrictor tone is lost and venous pooling occurs. Loss of cardiac accelerator fibres results in bradycardia and patients are unable to increase cardiac output by changes in heart rate.

322. Ans. (b) **Normal saline**Ref: Harrison, 18th ed. pg. 270

Normal saline is the preferred fluid for volume expansion in a crashing patient with un-recordable BP. The main point to be noted is that if ringer lactate is infused in these patients, then lactate in the solution will never reach the liver where it is normally converted into bicarbonate. Hence the accumulated lactate will get broken into lactic acid that will worsen the status of patient of poly-trauma who is already acidotic. Dextran would not be indicated as it exhibits anti-thrombotic tendency.

323. Ans. (b) **Normal saline**Ref: Harrison, 18th ed. pg. 270

Fluid of choice in Hypovolemic shock is Normal saline.

324. Ans. (b) **Hypotension**Ref: Nelson, 18th ed. ch. 176

- Sepsis is defined as SIRS plus evidence of infection like positive blood culture report
- Septic shock is defined as sepsis plus evidence of hypotension for > 1 hour inspite of use of vasoactive agents.

SIRS: 2 out of 4 criteria, 1 of which must be abnormal temperature or abnormal leukocyte count

- Core temperature >38.5°C or <36°C (rectal, bladder, oral, or central catheter)
- Tachycardia: mean heart rate >2 SD above normal for age in absence of external stimuli, chronic drugs or painful stimuli; OR unexplained persistent elevation over 0.5–4 hr; OR in children <1 yr old persistent bradycardia over 0.5 hr (mean heart rate <10th percentile for age in absence of vagal stimuli, β blocker drugs, or congenital heart disease)
- Respiratory rate >2 SD above normal for age or acute need for mechanical ventilation not related to neuromuscular disease or general anesthesia
- Leukocyte count elevated or depressed for age (not secondary to chemotherapy) or >10% immature neutrophils

325. Ans. (d) **Normal saline**

Ref: Bailey & Love, 26th ed. pg. 482-83

The first step in the management of a newborn with myelomeningocele is a careful clinical assessment followed by **open defects which should be covered with a saline-moistened non-adherent dressing to prevent injury to and dessication of the neural placode.**

326. Ans. (a) **0.1 mEq**

500 mL of 0.9% saline contains about 154 mEq of sodium and chloride per liter. Thus mathematically 1 ml contains 0.15 mEq approximately.

327. Ans. (a) **0.5 mEq**

Since 3% NaCl has 513 mEq/L of Na and Cl in 1000 ml, mathematically the answer will be 0.5 mEq.

	Size (mL)	Composition (g/L)	Ionic concentration (mEq/L)		Osmolarity (mOsmol/L)	pH
		Sodium chloride USP (NaCl)	Sodium	Chloride		
3% sodium chloride injection, USP	500	30	513	513	1027	5.0 (4.5 to 7.0)
5% sodium chloride injection, USP	500	50	856	856	1711	5.0 (4.5 to 7.0)
* Normal physiological osmolarity range is approximately 280 to 310 mOsmol/L. Administration of substantially hypertonic solutions (≥ 600 mOsmol/L) may cause vein damage						

328. Ans. (d) **50**

Ref: Sabiston, 19th ed. pg. 138-39

TPN Formulation	
Without lipid	With Lipid
<ul style="list-style-type: none"> Calories from amino acids: 20-25% Calories from dextrose: 75-80% 	<ul style="list-style-type: none"> Calories from amino acids: 20-25% Calories from lipids: 20% Calories from dextrose: 55-60%

329. Ans. (a) **1%**

Ref: Sabiston, 9th ed. pg. 523

- This was a confusing question, as most students marked it as 9%, which is true for upper extremity but NOT for hand.
- Bailey in 26th ed. clearly mentions hand as palm and counting it as 1%

Burn size is assessed by Wallace rule of nines (By Alfred Russel Wallace)

- Each upper extremity : 9%
- Head and neck : 9%
- Lower extremities: 18%
- Anterior and posterior aspects of the trunks : 18%
- Perineum and genitalia: 1%

FMGE Solutions Screening Examination

790

330. Ans. (a) 1%

Ref: Sabiston, 19th ed. pg. 523

Perineum involved in burns is 1% of body surface area.

331. Ans. (b) Ringer's lactate

Ref: Sabiston, 19th ed. pg. 529-30

- **IV fluid resuscitation is immediately required:** In children with burn >10% TBSA and adult with burn >15% TBSA
- Maximum fluid is given in first 8 hours (50%) rest of the fluid will be given in subsequent hours (25% + 25% in next 16 hours).
- **Most commonly used/preferred fluid: Ringer lactate** (Crystalloids). Because it is a relatively isotonic crystalloid solution that is the key component of almost all resuscitative strategies, at least for the first 24-48 hours.
- However, some centers use human albumin, FFP or hypertonic saline.
- RL is preferable to isotonic sodium chloride solution (ie, normal saline [NS]) for large-volume resuscitations because *its lower sodium concentration (130 mEq/L vs 154 mEq/L) and higher pH concentration (6.5 vs 5.0) are closer to physiologic levels.*
- Hypotonic fluid is not given, as it can lead to hyponatremia and water intoxication.
- Maintenance fluid in children: Dextrose –saline

Extra Mile

- Hypertonic saline has been effective in treating burn shock as it produces hyperosmolarity and hypernatremia
- This reduces the shift of intracellular water to the extracellular space

332. Ans. (a) Hypotonic solutions

Ref: Sabiston, 19th ed. pg. 530-33

333. Ans. (a) Crystalloids

Ref: Bailey & Love, 26th ed. pg. 392

334. Ans. (a) Hematemesis

Ref: Sabiston, 19th ed. pg. 529-32

Management of burn wound

Exposure Method	Closed method
<ul style="list-style-type: none"> • Application of the agent to the wound 2-3 times a day. <i>No dressings are applied over wound</i> 	<ul style="list-style-type: none"> • Generally closed method is preferred

Contd...

Management of burn wound

- | | |
|--|--|
| <ul style="list-style-type: none"> • Exposure method is commonly used for face and head • Disadvantage: Increased pain, heat loss
Risk of cross-contamination | <ul style="list-style-type: none"> • Occlusive dressing is applied over the agent and changed twice daily • Advantage: Less pain, less heat loss
Less risk of cross-contamination • Disadvantages: If dressing is not changed twice daily, there is risk of contamination |
|--|--|

- *Pseudomonas* is the most common infection in burn patients.
- Due to inhalation of burn particles, stridor can be present.

335. Ans. (a) Dehydration

Ref: Saiston, 19th ed. pg. 534-35

- In this case there is 70% burn and in addition enteral feeding is not given. The most probable cause of death in this case will be dehydration/Hypovolemia.
- MCC of early death in burn patient: **HYPOVOLEMIA**
- MCC of later death in burns: **Septicemia**
- MCC of death in burns: **Septicemia**
- MC CA in burns: **Squamous cell CA**

336. Ans. (d) Hypovolemia

Ref: Sabiston, 19th ed. pg. 534-35

337. Ans. (c) Early elective intubation is safest

Ref: Bailey & Love, 26th ed. pg. 389-90

The shock Reaction after burns

- Burns produce an inflammatory reaction
- This leads to vastly increased vascular permeability
- Water, solutes and proteins move from the intra- to the extravascular space
- The volume of fluid lost is directly proportional to the area of the burn
- Above 15 per cent of surface area, the loss of fluid produces shock

Dangers of smoke, hot gas or steam inhalation

- Inhaled hot gases can cause supraglottic airway burns and laryngeal oedema
- Inhaled steam can cause subglottic burns and loss of respiratory epithelium
- Inhaled smoke particles can cause chemical alveolitis and respiratory failure
- Inhaled poisons, such as carbon monoxide, can cause metabolic poisoning
- Full-thickness burns to the chest can cause mechanical blockage to rib movement

Initial management of the burned airway

- Early elective intubation is safest
- Delay can make intubation very difficult because of swelling
- Be ready to perform an emergency cricothyroidotomy, if intubation is delayed

Fluids for resuscitation

- In children with burns over 10 per cent TBSA and adults with burns over 15 per cent TBSA, consider the need for intravenous fluid resuscitation
- If oral fluids are to be used, salt must be added
- Fluids needed can be calculated from a standard formula
- The key is to monitor urine output

Relative percentage of area affected by growth

Age in years	0	1	5	10	15	Adult
A Head	9	8	6	5	4	3
B Head	2	3	4	4	4	4
C leg	2	2	3	3	3	3

338. Ans. (c) Painless and cherry red

Ref: Harrison, 18th ed. ch. 60/390

- **Third-degree burns** appear white, tan, brown, black, or deep cherry red in color.
- The region of third-degree burn is usually painless because of destruction of sensory receptors.
- **Full-thickness burns** are also termed third-degree burns. The epidermis and the dermis are completely destroyed, and deeper tissue may also be involved.

339. Ans. (a) HSV

- **Viral infection in burns:** Burn patients suffer significant immunosuppression during the first 3 or 4 weeks after

hospitalization. Herpes simplex virus (HSV) infections are commonly seen in immunosuppressed patients and may account for considerable morbidity and some mortality.

- **Bacterial infection in burns:** Burn wound bacterial infections commonly occur in the first weeks of hospitalization. *S aureus* is the most common pathogen infecting burned patients, as it is an early colonizer. *K pneumoniae* wound infections occur around the same time as infections by *S aureus* and seem to be more prevalent in the institutions that use systemic perioperative prophylaxis. As would be expected, infections by the nosocomial organisms *P aeruginosa* and *A baumannii* appear later in the course of the hospitalization (after 2 wk of admission).
- **Fungal infection in burns:** Burn wounds are also commonly infected with fungal pathogens. These infections are frequent after the use of broad-spectrum antibiotics. *Candida albicans* is the most common fungal infection; nonetheless, a trend towards nosocomially acquired, intrinsically resistant fungal infections (eg, *Candida krusei*) has been reported

340. Ans. (d) Sepsis

Ref: Schwartz, 10th ed. pg. 233

Causes of Death in Burns

Cause	%
ARDS	29%
Brain injury	16%
Shock	8%
Sepsis	47%

341. Ans. (d) Air embolism

Ref: Schwartz, 10th ed. pg. 233

The following Complications in burns may occur

- Infections being the most common
- Pneumonia, cellulitis, urinary tract infections
- Anemia secondary to full thickness burns of greater than 10% TBSA is common.
- Electrical burns may lead to compartment syndrome or rhabdomyolysis
- Deep vein thrombosis

Long Term Morbidity with Burns

- The hypermetabolic state result in a decrease in bone density and a loss of muscle mass.
- Keloids may form subsequent to a burn
- Significant psychological trauma
- Social isolation, extreme poverty and child abandonment.

FMGE Solutions Screening Examination

792

342. Ans. (a) **Proptosis**Ref: Bailey & Love, 26th ed. pg. 344

Lefort I	Ecchymosis is present
Lefort II and Lefort III (common)	Gross edema of soft tissue over the middle third of the face, bilateral circumorbital ecchymosis, bilateral subconjunctival hemorrhage, epistaxis, CSF rhinorrhoea, dish face deformity, diplopia, enophthalmos, cracked pot sound.
Lefort II	Step deformity at infra-orbital margin, mobile mid face, anesthesia or paresthesia of cheek.
Lefort III	Tenderness and separation at fronto-zygomatic suture, lengthening of face, depression of ocular levels, Enophthalmos, hooding of eyes, tilting of occlusal plane with gagging on one side

FIGURE: Le-fort fracture

343. Ans. (d) **Proprioception**Ref: Harrision, 18th ed. pg. 377

- Brown sequard consists of ipsilateral weakness (corticospinal tract) and loss of joint position and vibratory sense (posterior column), with contralateral loss of pain and temperature sense (spinothalamic tract) one or two levels below the lesion.
- Segmental signs, such as radicular pain, muscle atrophy, or loss of a deep tendon reflex, are unilateral. Partial forms are more common than the fully developed syndrome.

344. Ans. (b) **Orbital floor**

- Fracture of the orbital floor is the most common traumatic orbital fracture.

- Eyebrow Ptosis after Blowout Fracture Indicates Impairment of Trigeminal Proprioceptive Evocation That Induces Reflex Contraction of the Frontalis Muscle.
- The force of a blow to the orbit is dissipated by a fracture of the surrounding bone, usually the orbital floor and/or the medial orbital wall. Serious consequences of such injury include diplopia in upgaze where there is significant damage to the orbital floor. In blowout fractures, the medial wall is fractured indirectly.
- Fracture of the medial wall is more common than the floor, since the medial wall is slightly thinner (0.25 mm vs 0.50 mm). However, it is known that pure blowout fractures most frequently involve the orbital floor. This is due to the honeycomb structure of the numerous bony septa of the ethmoid sinuses, thus allowing it to withstand the sudden rise in intraorbital hydraulic pressure better than the orbital floor

345. Ans. (c) **Anaerobic Streptococcus**Ref: Bailey & Love, 26th ed. pg. 1388

Current clinical studies have emphasized the *multi-organism nature* of most cases of necrotizing infection, including Fournier gangrene.

E.coli is the predominant aerobe and Bacteroides is the predominant anerobe. Other microflora include:

- Proteus
- Enterococcus
- Pseudomonas
- Clostridium
- Staphylococcus
- Streptococcus
- Klebsiella

346. Ans. (d) **Microaerophilic streptococcus**Ref: Bailey & Love, 26th ed. pg. 57

- **Chronic undermining burrowing ulcer** (also known as **Meleney gangrene**, or **Meleney's ulcer**) is a cutaneous condition that is a postoperative, progressive bacterial gangrene. Synergistic gangrene is caused by microaerophilic streptococci acting synergistically with aerobic staphylococci, with or without Gram-negative bacilli. It occurs in debilitated patients with other disorders (e.g. diabetes, malnutrition, alcoholism. Infection spreads rapidly along fascial and subcutaneous planes without a severe inflammatory reaction.

347. Ans. (b) **Insulin**Ref: Bailey & Love, 26th ed. pg. 4

- The stress response to surgery is characterized by increased secretion of pituitary hormones and

activation of the sympathetic nervous system. Release of corticotrophin from the pituitary stimulates cortisol secretion from the adrenal cortex. Arginine vasopressin is secreted from the posterior pituitary and has effects on the kidney. In the pancreas, glucagon is released and insulin secretion may be diminished.

- Logic for ADH increase is that the body is trying to retain water.

Hormones increased	ACTH, GH, AVP, Cortisol, Aldosterone, Small Increase In Glucagon
Hormones decreased	Insulin, Thyroxine (T4) And T3
May increase or decrease	Tsh, Fsh, Lh

348. Ans. (c) Subsides over time

Ref: Bailey & Love, 26th ed. pg. 30

- Keloid formation is a type of scar which, depending on its maturity, is composed mainly of either type III (early) or type I (late) collagen.
- Keloids are firm, lesions or shiny, fibrous nodules, and vary from pink to flesh-colored or red to dark brown in color. A keloid scar is benign and not contagious, but sometimes accompanied by severe itchiness, pain, and changes in texture.
- They may not improve in appearance over time and can limit mobility if located over a joint.

349. Ans. (a) Spleen

Ref: Bailey & Love, 26th ed. pg. 1087

- The spleen is the most commonly injured viscus in blunt abdominal trauma and can result from the most trivial of traumas.
- The classical presentation is that of a hemodynamically unstable patient with a history of trauma, with severe abdominal pain and signs of peritonitis.
- The classic physical findings of splenic rupture are left shoulder pain, left upper quadrant pain and tenderness, and Kehr's sign (left shoulder pain from irritation of inferior border of left diaphragm by hematoma).
- Absence of one or more or even all of these signs does not rule out splenic injury. Diagnosis is based on a thorough physical examination and confirmed with the FAST examination

350. Ans. (c) 5-12 days

Ref: Bailey & Love, 26th ed. pg. 279

- Patients maximum at risk for wound dehiscence are those who are/have

- Obese
- Malnourished
- Abdominal distention
- Malignancy
- Multiple trauma to the abdomen
- Infected wounds are also prone to dehiscence.
- Chronic cough are also at risk.

Wound separation occurs especially between the fifth and eight postoperative days.

351. Ans. (a) Is a skin graft including the epidermis and part of the dermis

Ref: Bailey & Love, 26th ed. pg. 402

- Skin transplanted from one location to another on the same individual is termed an autograft. If the entire thickness of the dermis is included, the appropriate term is full-thickness skin graft (FTSG).
- If less than the entire thickness of the dermis is included, this graft is referred to as a split-thickness skin graft (STSG). STSGs are categorized further as thin (0.005-0.012 in), intermediate (0.012-0.018 in), or thick (0.018-0.030 in), based on the thickness of the harvested graft.

352. Ans. (d) Transplantation of living tissues/organs from one species to another

Ref: Bailey & Love, 26th ed. pg. 833

- **Xenotransplantation** is the transplantation of living cells, tissues or organs from one species to another. Such cells, tissues or organs are called **xenografts** or **xenotransplants**.
- In contrast, the term allotransplantation refers to a same-species transplant. Human xenotransplantation offers a potential treatment for end-stage organ failure, a significant health problem in parts of the industrialized world.

353. Ans. (b) Buruli ulcer

Ref: SRB Manual of Surgery, 23rd ed. pg. 23

- Buruli ulcer is an infectious disease caused by *Mycobacterium ulcerans*. The early stage of infection is characterised by a painless nodule, with non-pyogenic, necrotizing lesions developing in the skin, and occasionally in adjacent bone, as the disease progresses.
- *M. ulcerans* secretes a lipid toxin, mycolactone, which functions as an immune suppressant, necrotising agent and activator of cellular apoptosis in mammalian tissues.
- The disease is primarily an infection of subcutaneous fat, resulting in a focus of necrotic (dead) fat containing

FMGE Solutions Screening Examination

myriads of the mycobacteria in characteristic spherules formed within the dead fat cells. Skin ulceration is a secondary event.

- All other ulcers are associated with significant scarring in the tissues. Scarring in gastric ulcer/duodenal ulcer leads to gastric outlet obstruction.

354. Ans. (d) **Marjolin's ulcer**

Ref: Bailey & Love, 26th ed. pg. 918

- Marjolin's ulcer is a misnomer. It is a malignant degeneration arising within a **pre-existing cicatrix or scar**
- Most commonly found in the lower extremity → especially the **heel and plantar foot**.
- Causes:
 - As originally presented by Marjolin, to this day the **leading cause is old burn scars**.
 - The second most common association is malignant degeneration arising within **osteomyelitic fistulae**.
 - Other causes in decreasing order of frequency: secondary to **venous insufficiency** ulcers or pressure ulcers, scarring from lupus, amputation stumps, frostbite, vaccination sites, skin graft donor sites, scars, urinary fistulas, and radiation.
- Marjolin's ulcers are 3 times more likely in **men** than in women.
- Average age of diagnosis is the **fifth decade** of life.
- As a rule, normal healing should be exhibited within the first **2 to 3 weeks**, and ulcers that repeatedly break down, do not respond to treatment and are chronic in nature, are suspicious for malignancy
- Most commonly well-differentiated **squamous cell tumors** found but can be basal cell or melanoma
- **Duration of ulceration** is directly proportional to chance of malignant transformation
- Although there is **no definitive treatment** protocol, therapy generally involves wide local excision with skin grafting or amputation proximal to the lesion depending upon size.
- **Most widely accepted treatment/most definitive option to treat the cancer, and infection/when the bone or joint is involved is amputation.**

355. Ans. (a) **Metaphysis**

Ref: Bailey & Love, 26th ed. pg. 541

- **The most common site is the rapidly growing and highly vascular metaphysis of growing bones. The apparent slowing or sludging of blood flow as the vessels make sharp angles at the distal metaphysis predisposes the vessels to thrombosis and the bone itself to localized necrosis and bacterial seeding.**
- Vertebral osteomyelitis at any age is most often a secondary complication of a remote infection with hematogenous seeding.
- Direct or contiguous inoculation osteomyelitis is caused by direct contact of the tissue and bacteria during trauma or surgery.

356. Ans. (a) **Primary intention**

Ref: Bailey & Love, 26th ed. pg. 25

HEALING BY PRIMARY INTENTION

- It involves epidermis and dermis without total penetration of dermis healing by process of epithelialization when wound edges are brought together so that they are adjacent to each other (re-approximated).
- This minimizes scarring
- Most surgical wounds heal by primary intention healing
- Wound closure is performed with sutures (stitches), staples, or adhesive tape
- **Examples:** well-repaired lacerations, well reduced bone fractures, healing after flap surgery

357. Ans. (a) **8-10 days**

Ref: Sabiston, 18th ed. pg. 2134

Scalp suture should be removed on 6th to 8th day. Given these options, 8-10 days is the best choice.

TABLE: Day of suture removal from different body areas

Body area	Suture removal on
• Scalp	6 – 8 days
• Face	3 – 5 days
• Chest, Abdomen	8 – 10 days
• Ear	10 – 14 days
• Extremities, back	12 – 14 days

358. Ans. (d) **Recovery time is longer**

- Laparoscopy is a technique in which operations in the abdomen are performed through small incisions (usually 0.5–1.5 cm) as opposed to the larger incisions needed in laparotomy.
- Rather than a minimum 20 cm incision as in traditional (open) cholecystectomy, four incisions of 0.5–1.0 cm

will be sufficient to perform a laparoscopic removal of a gallbladder.

- Since the gallbladder is similar to a small balloon that stores and releases bile, it can usually be removed from the abdomen by suctioning out the bile and then removing the deflated gallbladder through the 1 cm incision at the patient's navel.
- *Post operative stay in hospital is short.*
- The risk of Trocar injuries is increased in patients who have a low body mass index or have a history of prior abdominal surgery.
- Vascular injuries can result in hemorrhage that may be life threatening. Injuries to the bowel can cause a delayed peritonitis. It is very important that these injuries be recognized as early as possible.

359. Ans. (c) Mesentery

Ref: Bailey & Love, 26th ed. pg. 982

- Seat belt syndrome is characterized by tear of mesentery on sudden deceleration while the patient is using a seat belt.
- **In the absence of seat belt being worn by the car passenger, the chest of the victim would slam into the steering wheel resulting in hemo-pericardium and a resultant high mortality.**

360. Ans. (a) Damage to respiratory centre

Ref: Bailey & Love, 26th ed. pg. 310

The Cushings triad is the triad of bradycardia, hypertension, and respiratory irregularity that often occupies a herniation event clinically. It is likely due to brainstem compression.

361. Ans. (a) CECT

Ref: Bailey & Love, 26th ed. pg. 208

Since the patient is in shock with history of blunt abdomen trauma, the first investigation to be done should be FAST. The main role of ultrasound includes the assessment of intraperitoneal fluid and haemopericardium. In the presence of free intraperitoneal fluid and an unstable patient, the ultrasound allows the trauma surgeon to explore the abdomen as a cause of blood loss.

In the presence of fluid and a haemodynamically stable individual, further assessment by way of CT shall be performed. Occasionally, a second ultrasound scan may show free fluid in the presence of an initially negative FAST scan.

362. Ans. (a) Tetany

Ref: Harrison, 18th ed. pg. 352

- Painful lock jaw is related to inflammation of anatomical structures of jaw and surrounding structures. Tetanus is

characterized by release of tetano-spasmin toxin which causes painful muscle spasm and lockjaw.

- However in the question the choice A is Tetany/ Hypocalcemia where either Chvostek sign and Carpopedal spasm is seen.

363. Ans. (c) Lower lip

Ref: Bailey & Love, 26th ed. pg. 710

- Lip cancer is the most common malignant lesion of the oral cavity, constituting 25-30% of all oral cavity cancer cases and is the second most common malignancy of the head and neck overall (after cutaneous malignancy). Unlike other sub-sites of the oral cavity, sun exposure is a well established risk factor for development of lip cancer.
- 95% of carcinoma of lip arise on lower lip and 15% rise in central one-third and commissures. The lymph nodes involved are submental and submandibular glands.

364. Ans. (a) Common peroneal nerve

- Common peroneal nerve originates from the dorsal branches of the fourth and fifth lumbar and the first and second sacral nerves. It descends obliquely along the lateral side of the popliteal fossa to the head of the fibula, close to the medial margin of the biceps femoris muscle. **Where the common peroneal nerve winds round the head of the fibula, it is palpable and vulnerable to injury.**

Remember

- Tarsal tunnel syndrome- Posterior tibial nerve
- MeralgiaParasthetica- Lateral cutaneous nerve of thigh
- Claw hand- ulnar nerve
- Mononeuritis multiplex is most commonly caused by Polyarteritis Nodosa. (If asked for India Ans. as leprosy).

365. Ans. (b) Surgical site infection

Ref: Bailey & Love, 26th ed. pg. 136/140

- Surgical site infections (SSIs) have been reported to be one of the most common causes of nosocomial infections; accounting for 20% to 25% of all nosocomial infections worldwide. SSIs have been responsible for the increasing cost; morbidity and mortality related to surgical operations and continue to be a major problem worldwide.
- Globally, surgical site infection rates have been reported to range from 2.5% to 41.9%. *Nosocomial infections can be defined as those occurring within 48 hours of hospital admission, 3 days of discharge or 30 days of an operation.*

366. Ans. (a) Right lower lobe superior basal

Ref: Complete Review of Medicine by Deepak Marwah, 1st ed.

FMGE Solutions Screening Examination

796

- In supine position and with the patient on back superior segment of RLL is the most dependent segment.
- In right lateral decubitus position the axillary subsegments of anterior and posterior segments of RUL are the dependant site for aspiration. Abscess is located in the middle of lateral CXR corresponding to RUL bronchus take off.
- When the patient is on abdomen, aspiration does not occur, thus it is extremely unlikely for any anterior segments, middle lobe and lingula to be the site for aspiration lung abscess.
- **The superior segments of Right Lower Lobe and axillary subsegments of anterior and posterior segments of RUL are common sites for aspiration and will account for 85% of all Lung abscesses.**

367. Ans. (d) Surgery + Imiquimod

Ref: Schwartz, 10th ed pg. 647;
Bailey & Love, 26th ed. pg. 463

- Most cancers of the anus, cervix, head and neck, and vagina are epidermoid carcinomas and also called squamous cell carcinoma.
- Treatment modalities for SCC include cautery and ablation, cryotherapy, drug therapy including imiquimod, surgical excision, Moh's microsurgery, and radiation therapy.
- Topical fluorouracil is FDA-approved treatment for superficial Basal Cell Carcinoma.

368. Ans. (c) Number of lymph nodes

MISCELLANEOUS

369. Ans. (a) Size of tumor

TNM is based on 3 components:

Letter	Stands for	Description
T	Tumour	Indicates the size of the primary tumor and the degree of spread into nearby tissues (local invasion)
N	Lymph nodes	Indicates whether or not the cancer has spread to nearby lymph nodes, the size of the nodes that contain cancer and how many lymph nodes contain cancer
M	Metastasis	Indicates whether or not cancer has spread (metastasized) to distant organs

Additional letters or numbers are placed after T, N and M to provide more specific details:

- X means the tumor or lymph nodes cannot be assessed or evaluated.

- T followed by a number (0–4) describes the size of tumor and how much nearby tissue it has invaded.
- N followed by a number (0–3) describes the degree of spread to the lymph nodes.
- M followed by the number 0 or 1 describes whether or not cancer has spread to other parts of the body.
- Lowercase letters (a, b or c) are used to subdivide the tumor, lymph nodes or metastasis categories to make them more specific.

370. Ans. (d) Metastasis

The X-Ray spine AP shows multiple lytic lesions suggestive of malignancy metastasizing to the vertebra. The most probable origin is from the prostate which is the leading cancer in males.

Also notice the combination of osteolytic and osteosclerotic secondaries.

371. Ans. (a) Gestational age 1-7 months in abdomen

Ref: Human Embryology, 10th ed. pg. 311

- The testes remain high in the abdomen until the 7th month of gestation, when they move from the abdomen through the inguinal canals into the two sides of the scrotum.
- In first phase, movement across the abdomen to the entrance of the inguinal canal appears controlled by anti-müllerian hormone (AMH)
- In second phase, in which the testes move through the inguinal canal into the scrotum, is dependent on androgens (most importantly testosterone).
- In many infants with inguinal testes, further descent of the testes into the scrotum occurs in the first 6 months of life. This is attributed to the postnatal surge of gonadotropins and testosterone that normally occurs between the first and fourth months of life.

372. Ans. (d) Descending colon

Ref: High Yield Embryology, 5th ed. pg. 294

373. Ans. (d) Hepatocellular jaundice

Ref: Manipal Manual of Surgery, 4th ed. pg. 520

- The anchovy sauce pus of amebic liver abscess is sterile and is produced due to broken RBCs and damaged hepatocytes.
- Due to right branch of portal vein being more in line with portal vein the organism will have higher chances of seeding in the right lobe than the left lobe.
- Most patients will be male and alcoholic from lower socio-economic background and will present with severe right hypochondrium pain and symptoms of pleurisy and right shoulder pain.
- On examination intercostal tenderness is seen
- Bed side USG is the investigation of choice.

- Jaundice is not seen usually or if seen is of obstructive type.

374. Ans. (a) Ameobic liver abscess

Ref: Manipal Manual of Surgery, 4th ed. pg. 521

Refer to the above explanation

Hydatid cyst	Usually clinically silent Enlarged liver with smooth surface and is non tender.
Pyogenic liver abscess	Multiple abscess leading to spiky fever and enlarged liver.
Hepatic adenoma	Presents in young women on OCP and is solitary. Liver enlargement may or may not be seen.

375. Ans. (a) Cholesterosis

Ref: Bailey & Love, 26th ed pg. 1108

- The submucous aggregation of cholesterol crystals in mucosa of gallbladder lends it appearance to be called strawberry gallbladder.
- Porcelain gallbladder exhibits calcification and is a risk factor for malignancy of gallbladder.

Extra Mile

Strawberry Tongue	Kawasaki Disease
Strawberry nose	Rhinosporidiosis
Strawberry vagina	Bacterial vaginosis
Strawberry gingiva	Wegener granulomatosis

376. Ans. (d) Cholesterosis

Ref: Manipal Manual of Surgery, 4th ed. pg. 584

377. Ans. (a) Volvulus

Ref: Manipal Manual of Surgery, 4th ed. pg. 739

- In sigmoid volvulus, the X-ray abdomen erect shows hugely dilated sigmoid loop called bent inner tube sign.
- Acute sigmoid volvulus presents as intestinal obstruction and starts after straining at stool. *It occurs in anti-clockwise direction and after one and a half turns, the entire loop becomes gangrenous.*
- The percussion note on the abdomen shall be tympanitic note.

378. Ans. (b) Sigmoid Volvulus

Ref: Manipal Manual of Surgery, 4th ed. pg. 738

- In sigmoid volvulus the loop of bowel twists to result in tympanitic note all over the abdomen. Hypovolemic shock develops within 6-8 hours and per rectum shows rectum to be empty.
- On performing a *contrast enema*, when the barium enters the rectum, it tapers into sigmoid colon called as *Bird Beak sign*.
- Bird beak sign on barium swallow occurs with achalasia cardia.

379. Ans. (d) Hirschsprung's Disease

Ref: Manipal Manual of Surgery, 4th ed. pg. 731

Common causes of ileal obstruction

- Adhesions
- Obstructed hernia
- Stricture
- Intussusception
- Ileocaecal TB
- Bands

Common causes of colonic obstruction

- Fecal impaction
- Carcinoma colon
- Hirschsprung's disease
- Anorectal malformations

380. Ans. (a) Stomach

Ref: Bailey and Love 26th ed. pg. 1160

- GIST is a mesenchymal tumor with increased size and high levels of c-kit (CD117)
- *GIST tumors are found most commonly in the stomach*
- Occur most commonly in the 50-70-year age group.
- Presents with pain, nausea, hematemesis or melena.
- Surgery is the most effective way of removing GISTs, as they are radio-resistant.
- Imatinib Mesylate is the best drug

381. Ans. (a) Stomach

Ref: Advances in Oncology, Vol. 3/137

The most common extra-nodal site of lymphoma is GIT with the most common site being the stomach followed by small intestine and ileo-caecal region.

382. Ans. (a) Intussusception

Ref: Schwartz 10th ed. pg. 1237

The intraoperative picture shows presence of intussusception.

- Most common lead point causing intussusception in children = Meckel's Diverticulum
- Most common type of intussusception in children = Ileocolic (Post Rota virus diarrhea)
- Most common lead point causing intussusception in Adults = Polyp (Villous Adenoma)

- Most common type of intussusception in adults= Colocolic
- Most common small bowel tumor in children causing intussusception = lymphoma

383. Ans. (b) Gastroduodenal artery

Ref: Bailey and Love, 26th ed. pg. 1023

- Perforations involving the gastroduodenal artery complex occur as a sequel to transmural ulceration of the posterior duodenal wall.
- The gastroduodenal artery, is a branch of the hepatic artery, passes behind the first part of the duodenum, and is responsible for bleeding in duodenal ulcer.

384. Ans. (c) It is accurate in detecting <50 mL of free blood

Ref: Bailey and Love, 26th ed. pg. 359

- FAST does not reliably detect less than 100ml of free blood. Hence choice **C is False**.
- It does not identify injury to hollow viscus. It cannot reliably exclude injury in penetrating trauma.

Focused assessment with sonography for trauma (FAST) should include views of

- Hepato-renal recess (Morison pouch)
- Peri-splenic view
- Sub-xiphoid pericardial window
- Supra-pubic window (Douglas pouch).

If an extended FAST (E-FAST) examination is performed, views of

- The bilateral hemithoraces and
- The upper anterior chest wall, should also be obtained.

385. Ans. (c) Full thickness skin graft

Ref: Bailey and Love, 26th ed. pg. 404

If the entire thickness of the dermis is included, the appropriate term is full-thickness skin graft (FTSG). If less than the entire thickness of the dermis is included, this graft is referred to as a split-thickness skin graft (STSG).

STSGs are categorized further as

- Thin (0.005-0.012 in)
- Intermediate (0.012-0.018 in)
- Thick (0.018-0.030 in)
- Split-thickness skin grafts (of varying thickness). These are sometimes called Thiersch grafts. They are used to cover all sizes of wound, are of limited durability and will contract. They may be used to provide valuable

temporary wound closure before better cosmetic secondary correction after rehabilitation.

- **Full-thickness skin grafts (Wolfe grafts):** Used for smaller areas of skin replacement where good elastic skin that will not contract is required (such as fingers, eyelids, facial parts).
- **Composite skin grafts (usually skin and fat, or skin and cartilage).** Often taken from the ear margin and useful for rebuilding missing elements of nose, eyelids and fingertips

386. Ans. (d) Liver Laceration

Ref: Bailey and Love 26th ed. pg. 1073

- Pringle manoeuvre is used for control of bleeding in liver trauma
- This technique enables surgeons to *halt hemorrhage and find the source of bleeding*, allowing time for repair of the vessel. In the setting of hepatic resection of benign and malignant lesions, this maneuver *can be used to assist with control of bleeding*.
- *It involves vascular inflow occlusion by placing an atraumatic clamp across the foramen of Winslow.*

387. Ans. (b) At the induction of anaesthesia

Ref: Bailey and Love 26th ed. pg. 1109

- Prophylaxis is uniformly recommended for all clean-contaminated, contaminated and dirty procedures.
- Timing of antibiotic administration is critical to efficacy. The first dose should always be given before the procedure, preferably within 30 minutes before incision.
- Re-administration at one to two half-lives of the antibiotic is recommended for the duration of the procedure.
- In general, postoperative administration is not recommended.
- There is a delay before host defences can become mobilised after a breach in an epithelial surface, whether caused by trauma or surgery. The acute inflammatory, humoral and cellular defences take up to 4 hours to be mobilised. This is called the 'decisive period', and it is the time when the invading bacteria may become established in the tissues.
- Cefazolin provides adequate coverage for most other types of procedures.

388. Ans. (b) Polyamide polymer

Ref: Bailey and Love, 26th ed. pg. 37

**TABLE: Non-absorbable suture materials**

Suture	Types	Raw Material
Silk	Braided or twisted multi-filament Dyed or undyed Coated (with wax or silicones) or uncoated	Natural protein Raw silk from silk-worm
Linen	Twisted	Long staple flax fibres
Nylon	Monofilament or multifilament	An alloy of Iron, nickel and chromium
Polyester	Monofilament or braided multifilament	Polyamide polymer
Polybut-ester	Monofilament Dyed or undyed	Polybutylene terephthalate and polytetramethylene ether glycol
Polypropylene	Monofilament Dyed or undyed	Polybutylene terephthalate and polytetramethylene Polymer of propylene

389. Ans. (a) Anatomical abnormality is unilateral and contralateral testis should not be fixed

Ref: Bailey and Love, 26th ed. pg. 1379

Anatomical abnormality is unilateral and contralateral testis should not be fixed	<i>The other testis should also be fixed because the anatomical predisposition is likely to be bilateral. An infarcted testis should be removed and prosthetic device deployed.</i>
Prompt exploration and twisting & fixation is the only way to save the torqued testis	Patient presents with sudden agonising pain in the groin and the lower abdomen. The patient feels nauseated and may vomit. If the testis is viable when the cord is untwisted it should be prevented from twisting again by fixation with non-absorbable sutures between the tunica vaginalis and the tunica albuginea.
Most common between 10 & 25 years of age	Testicular torsion is most common between 10 and 25 years of age, although a few cases occur in infancy.
Inversion of testis is the most common predisposing cause	Inversion of the testis is the most common predisposing cause. The testis is rotated so that it lies transversely or upside down.

390. Ans. (b) Pain

Ref: Handbook of Clinical Anesthesia, 3rd ed. pg. 783

Pain should be recorded as the fifth vital sign along with blood pressure, heart rate, respiratory rate and temperature.

391. Ans. (d) Squamous cell carcinoma

Ref: Devita, 9th ed. pg. 729

- Most common site oral Cancer: Carcinoma Tongue > Carcinoma Lip
- Most common histological type: Squamous Cell Cancer
- Most common site of oral Cancer in India: Cancer of Buccal Mucosa
- Max Risk of L.N. Metastasis: Carcinoma Tongue
- Min Risk of L.N Metastasis: Carcinoma lip > hard palate
- Most common age: 50-60 years

392. Ans. (b) Intestinal metaplasia

Ref: Sabiston, 19th ed. pg. 1033

- Barrett's esophagus is characterized by metaplasia of esophageal squamous epithelium into columnar in distal esophagus.
- For diagnosis of Barrett's esophagus it requires both endoscopically visible segment of columnar lining of distal esophagus and intestinal metaplasia showing goblet cells on biopsy.
- Barrett's esophagus is the single most important risk factor for adenocarcinoma of esophagus.
- Adenocarcinoma develops at the squamo-columnar junction or within 2 cm from the junction.

393. Ans. (c) Spontaneous Perforation

Ref: Sabiston, 19th ed/1043, SRB manual of Surgery/1287

- Boerhaave's syndrome is spontaneous perforation of esophagus, occurring usually due to severe barotrauma when a person vomits against a closed glottis.
- Most common location of perforation is left posterolateral side of the distal esophagus.
- Tear is full thickness penetrating complete through all the layers of esophageal wall with spillage of contents into the mediastinum. (In Mallory Weiss tear it is partial thickness, extends through the mucosa and submucosa, but not through the muscular layer.)
- **Clinical finding – Mackler's triad**
 - Vomiting
 - Thoracic pain
 - Cervical subcutaneous emphysema

394. Ans. (d) Gastric freezing

Ref: Harrison, 18th ed. pg. 2598

- Endoscopy followed by endoscopic variceal ligation should be performed.

FMGE Solutions Screening Examination

- Balloon tamponade with Sengstaken Blakemore tube or Minnesota tube can be used in patients who cannot get endoscopic therapy immediately or who need stabilization prior to endoscopic therapy.
- Some endoscopists will use variceal injection therapy (sclerotherapy) as initial therapy, particularly when bleeding is vigorous.
- Shunt therapy (Transjugular intrahepatic portacaval shunt) has been shown to control refractory bleeding.

Pharmacologic Therapy for Variceal Hemorrhage

- Vasopressin, most potent vasoconstrictor, use is limited by side effects.
- Somatostatin and octreotide
- Octreotide is the preferred pharmacological agent

395. Ans. (c) Like toothpaste emulsion in the gallbladder*Ref: Harrison, 18th ed. pg. 2622*

- It is a complication of chronic cholecystitis.
- Calcium salts in the lumen of the gallbladder in sufficient concentration may produce calcium precipitation and diffuse, hazy opacification of bile or a layering effect on plain abdominal radiography.
- This so called **limey bile or milk of calcium bile**, is usually clinically innocuous but cholecystectomy is recommended, especially when it occurs in a hydropic gallbladder.
- In the entity called porcelain gallbladder, calcium salt deposition within the wall of a chronically inflamed gallbladder may be detected on the plain abdominal film.

396. Ans. (d) Hemorrhage*Ref: CSDT, 11th ed. pg. 638*

- Serious post-op hemorrhage from cyst occurs from cystogastrostomy.
- Most common cause of pseudopancreatic cyst is pancreatitis.
- It may resolve spontaneously, so it is followed with serial ultrasonic studies.

Indications of Surgical Intervention

- Age of cyst more than 6 weeks without resolution
- Size of cyst greater than 6 cm
- Evidence of secondary infection
- Development of any other complications

Surgical Methods

- Internal drainage – most preferred surgical management
- There are three options:
 - Cysto-Jejunostomy
 - Cysto-gastrostomy
 - Cysto-Duodenostomy

- Excision of pseudocyst
- External drainage

397. Ans. (b) Bluish discoloration in the umbilicus*Ref: Sabiston, 19th ed. pg. 1524***Signs indicative of retroperitoneal bleeding in severe pancreatitis**

Flank ecchymosis	Grey turner sign
Periumbilical ecchymosis	Cullen's sign
Inguinal ecchymosis	Fox sign

Radiological Signs of Acute Pancreatitis

- Renal halo sign
- Gasless abdomen
- Ground glass appearance
- Colon cut off sign
- Sentinel loop

Radiological Signs of Chronic Pancreatitis

- Chain of lakes appearance
- String of pearl appearance
- Beaded appearance

398. Ans. (b) Ureter*Ref: Campbell, 10th ed. pg. 1108-1112*

- Ureters are involved most commonly.
- MC site is lower third.
- Obstructive uropathy is the **earliest and most common specific** symptom.
- 70% cases are primary or idiopathic (Ormond's disease)
- **Investigation of choice** is CT scan.
 - In patients with renal compromise, MRI is the investigation of choice.

399. Ans. (b) Extension*Ref: Sabiston, 19th ed. pg. 1280*

Blumberg's sign	Rebound tenderness at Mc Burney's point
Cope's psoas test	Pain on hyperextension of right hip Suggestive of retro-caecal appendix.
Dunphy's sign	Pain on coughing
Rovsing's sign	Pain in the right lower quadrant during palpation of the left quadrant
Obturator sign	Pain on internal rotation of the hip Suggestive of pelvic appendix

400. Ans. (b) Epidermoid*Ref: Maingot's, 10th ed. pg. 1505*

- Epidermoid carcinoma of the anus includes squamous cell carcinoma, cloacogenic carcinoma, transitional carcinoma and basaloid carcinoma. The clinical behavior and natural history of these tumors is similar.
- Mainly 3 types of malignant neoplasm are seen in anal canal –
 - Squamous cell carcinoma (most common)
 - Basal cell carcinoma (2nd most common)
 - Melanoma

- Most common rectal and colon carcinoma is adenocarcinoma.

ANSWERS TO IMAGE-BASED QUESTIONS

482. Ans. (c) Intussusception

Ref: Page 1234, Schwartz 10th edition

The intraoperative picture shows presence of intussusception.

- Most common lead point causing intussusception in children= Meckel's Diverticulum
- Most common type of intussusception in children= Ileocolic (Post Rota virus diarrhea)
- Most common lead point causing intussusception in Adults= Polyp (Villous Adenoma)
- Most common type of intussusception in adults= Colocolic
- Most common small bowel tumor in children causing intussusception = lymphoma

483. Ans. (b) Artery Forceps & Needle Holder

Thumb forceps

Sponge holder

Artery forceps

Needle holder

Contd...

Allis forceps

Ovum forceps

484. Ans. (d) Collagen bundles are present

The picture shows presence of keloid, which is called so as it extends to normal tissues with its claw like processes.

Hypertrophic scar	Keloid
Itching not present or mild	Severe itching and worsens after 1 year
Never crosses boundaries of original incision	Extends to normal tissues and has claw like lesions
Occurs at original site of incision and has minimal vascularity	Occurs at vaccination sites, injection and incision sites and piercing sites.
Occurs due to hypertrophy of mature fibroblasts with minimal blood vessels	Immature fibroblasts with immature blood vessels and exhibits high tendency to recur and collagen bundles are absent.

485. Ans. (d) Rubbery consistency of involved lymph nodes

The image shows anti gravity drainage of a cold abscess being done. The upper deep cervical lymph nodes are usually involved. On palpation matting of lymph nodes is characteristic feature while the rubbery consistency of lymph nodes is seen in Hodgkins lymphoma.

Cold Abscess Features are

- No local rise of temperature
- No redness
- Transillumination test is negative
- On sternocleidomastoid contraction test, it becomes less prominent indicating it is deep to deep fascia.

**486. Ans. (c) Ring block with adrenaline used**

- The image shows presence of commonest hand infection which is acute paronychia. It occurs due to trimming of nail or ingrown toe nail. The infection starts in subcuticular area and spreads all around as eponychium is adherent to nail base.
- Use of digital block and I and D is done by incising the eponychium. Adrenaline is not used for infiltration in the finger, penis and ear lobule.

487. Ans. (a) Venous ulcer; (b) Arterial ulcer

- Image A shows presence of ulcer on lateral aspect of leg with granulation tissue present
- Image B shows presence of ulcer on dorsal aspect of foot with wet gangrene visible.
- Neuropathic ulcer in diabetes can occur on the heel or pressure point in the sole of the foot

Characteristics of Arterial and Venous Ulcer

Venous ulcer	Ischemic ulcer
Occur at medial or lateral aspect of leg	Dorsum of foot Typical arterial ulcers occur on tips of toes
Single and oval	Irregular
Superficial and does not penetrate deep fascia	Deep ulcer and penetrates the deep Fascia
Pigmentation present	Pigmentation present

488. Ans. (c) Neuropathic ulcer

Venous ulcer	Occurs above medial or lateral malleolus with granulation tissue and surrounding pigmentation
Arterial ulcer	Occurs on toes with poor peripheral pulses
Neuropathic ulcer	Occurs on heel
Bazin's ulcer	Occurs in obese young females in ankle region with abnormal amount of subcutaneous fat. Lesions begin as erythematous purplish nodules which rupture producing non healing ulcer

489. Ans. (a) Immediately remove the needle in the vessel

This is a case of inadvertent intra-arterial injection of thiopentone into one of the high division of brachial artery resulting in blanching and severe pain in the hand. Steps to be followed are

- Do not remove the needle
- Inject 5 ml of 1% lignocaine or 2 % papaverine

- Intra-arterial dilute heparin
- Intra-arterial streptokinase
- Brachial plexus block to reduce sympathetic activity induced spasm of blood vessels

490. Ans. (c) Lymphatic metastasis

- The image shows presence of marjolin's ulcer which grows very slowly and develops at the site of previous burn site or varicose ulcer, snake bite scar or osteomyelitis scar.
- It is painless scar and doesnot exhibit metastasis. It is cured by surgery and radiotherapy is not useful.

491. Ans. (a) Thyroglossal Cyst

- The image shows presence of midline swelling which is moving with movement of the tongue. The most common site is sub-hyoid cyst. It is a cystic fluctuant trans-illumination negative swelling and moves as it is attached to hyoid bone.
- Branchial cyst arises from the vestigial remnants of 2nd branchial arch and is located in the anterior triangle of the neck partly under cover of the upper 1/3rd of the anterior border of sterno-mastoid. The swelling on aspiration contains cholesterol crystals
- Cold abscess occurs in anterior triangle of the neck and does not move with tongue movement.
- Carotid body tumor is called chemodectoma and occurs at the upper part of anterior triangle of the neck, at the level of hyoid bone beneath the anterior edge of the sternomastoid muscle. It is firm to hard and is called classical potato tumor.

492. Ans. (a) Carcinoma alveolar margin

- The image shows presence of staining of teeth, with an exophytic lesion with everted margins suggestive of diagnosis of a malignancy.
- Leukoplakia is a white patch in the mouth that cannot be scraped off.
- Hyperplastic candida involves the commissures of the mouth with candida invasion and shows no response to drugs, surgery and laser.
- Fibrous epulis is a fibroma arising from periodontal membrane and is slow growing without any ulceration.

493. Ans. (a) Pleomorphic adenoma

- The image shows a nodular growth at location of parotid gland and also notice the ear lobule of the patient is elevated with obliterated retromandibular groove.
- In mumps bilateral parotid enlargement is seen and does not have a bosselated appearance.

FMGE Solutions Screening Examination

- Sialadenitis occurs due to stones and is more common in submandibular gland (80% of stones occur in submandibular gland). Even if parotid is involved bosselated or nodular appearance is suggestive of a tumor.

494. Ans. (d) Constipation

- The image shows presence of upper sclera above the limbus visible in the patient suggestive of diagnosis of thyrotoxicosis. Contraction of the Muller's muscle due to sympathomimetic overdrive results in lid spasm
- Pretibial myxedema is a feature in Grave's Disease, and patient has tachycardia with excessive sweating leading to moist warm hands.
- Constipation is a feature of hypothyroidism

495. Ans. (c) Diagnosis depends on HER2

- 25% of all breast cancers overexpress HER-2 which is a transmembrane tyrosine kinase receptor. These patients should be given Trastuzumab. HER-2/neu is a *prognostic and not a diagnostic marker*.
- Modified Van Nuys prognostic index includes size of tumor, margins, pathology grade and age in years.
- 5 year disease free survival for VPIN 4-6 =100%
- The image shows nipple ulceration and infiltration of skin by the tumor called as peau'd orange. Remember puckering or dimpling of skin is seen due to infiltration of ligaments of cooper.

496. Ans. (b) Hydatid cyst

- The image shows a CT scan of the liver with classical Cart wheel appearance, suggestive of multiple hydatid cysts. The calcified cysts are left alone as they are dead cysts.
- Medical treatment with Albendazole for 21 days is given and surgery is done in case of symptomatic cysts or asymptomatic patient with cyst > 5cm or a non-calcified infected cyst.

497. Ans. (b) Gastrinoma triangle

The image shows gastrinoma triangle where ZES gastrinoma is located. The boundaries are from the *confluence* of cystic duct and Common hepatic duct, *confluence* of second and third part of duodenum and *junction* of neck and body of pancreas.

Hesselbach triangle

Triangular area on the inferior aspect of the anterior abdominal wall within the groin. Its boundaries are:

- Base is the inguinal ligament
- Lateral border is formed by the inferior epigastric vessels
- Medial border is the lateral edge of the rectus sheath.

Calot's triangle

- Triangle formed by cystic duct, common hepatic duct and base of liver and contains the cystic artery.

Killian triangle

- Site for Zenker Diverticulum

498. Ans. (b) Ileal obstruction

- Vomiting of feculent contents indicates terminal ileal obstruction. It does not contain fecal matter but contains terminal ileal contents which undergo bacterial degradation and fermentation resulting in smell of fecal matter.
- Jejunal obstruction results in bilious vomiting while diverticulitis produces hematochezia.
- Mesenteric ischemia will lead to abdominal angina.

499. Ans. (d) Fistula in ano

- The image shows presence of rectal prolapse and occurs due to habitual constipation undeveloped sacral curve, whooping cough, marasmus and torn perineum in obstetric trauma

**500. Ans. (b) Pilonidal sinus**

- The image shows a presence of external sinus opening just above the anal verge in midline over the coccyx. This is diagnostic of pilonidal sinus.
- Methylene blue shall be injected to demonstrate the branches of the sinus followed by excision
- Fistula of ano is located around the anal orifice and is due to infection of the anal glands.
- It is squamous cell carcinoma in situ of the anus, and is the precursor to the invasive squamous cell carcinoma. It is associated with HPV type 16 and 18.
- Hidradenitis suppurativa is recurrent suppuration of apocrine glands in the skin, resulting in multiple abscesses which rupture causing *multiple sinuses*.

501. Ans. (a) Appendix

- The structure shown is closer to caecum appendix whereas Meckel's Diverticulum is seen about 60 cm from the ileo-caecal junction.
- Intra-operatively, appendix can be identified by tracing Taenia Coli which converges onto the base of the appendix.

502. Ans. (a) Lichtenstein repair

- The image shows polypropylene mesh which is used in hernia repair called as *Lichtenstein repair*.
- Bassini repair is a herniotomy with approximation of posterior wall of inguinal canal; by suturing the conjoined tendon above to the inguinal ligament below by using interrupted non absorbable suture material such as nylon.
- Shouldice method is method of tensionless repair in three layers where in the above image only a mesh can be seen.
- Lord's procedure is ruled out as it is done for hydrocele.

503. Ans. (b) Indirect inguinal hernia

- Direct inguinal hernia pushes through the posterior wall and hence it is *unusual for it to descend into the scrotum*. It is common in elderly whereas the patient is only 25 years of age.
- Expansile impulse on coughing is diagnostic of hernia and indirect hernia can occur in any age group and is mainly unilateral.
- Trans-illumination test is positive in vaginal hydrocele and impulse on coughing is absent.

504. Ans. (d) Low Renin due to pressure atrophy of JG apparatus

- The picture shows autosomal dominant polycystic kidneys in which there is progressive enlargement of cysts with new ones developing with age. The IVU shows a spider leg deformity of the calyces.

- The damage to the kidney results in decrease in amount of erythropoietin leading to normocytic normochromic anemia.
- The damage to the kidney results in development of reduction in GFR and positive feedback to R.A.A.S system results in increase in renin levels as well as high Blood pressure.

505. Ans. (d) Painless intermittent hematuria

- The image shows presence of large vesical calculus. The stone is more common in males and shows pain aggravated by jumping or jolting and is referred to tip of penis at the end of urination.
- Laser lithotripsy (Holmium Laser) can break most large stones and ultrasound lithotripsy is very safe but only for small stones.
- In litholapaxy, the stone is grasped firmly and broken while the small fragments are evacuated by using a evacuator

506. Ans. (b) Vesico-ureteric reflux

- The image shows presence of Vesico-ureteric Reflux with dye from the bladder refluxing into the tortuous dilated ureters. This is seen with stage V of V.U.R.
- The investigation of choice is MCU: Micturating Cystourethrography

507. Ans. (a) Gangrene of testis

- The diagnosis is Fournier gangrene characterised by extensive gangrene of scrotal skin. The sloughed skin exposes the testicles. In some cases the gangrene can involve the skin of penis, anterior abdominal wall.
- The testis is not involved as it has a thick tunica albuginea.

508. Ans. (b) Crescent sign

- The CT scan shows an air crescent sign with rim of air surrounding the aspergilloma or fungus ball caused by aspergillus species. The fungus settles in the cavity which is pre-existing and grows into a ball.
- Meniscus sign is seen in pleural effusion while tree in bud appearance is seen in pneumocystis carinii infection and tuberculosis.
- Loculated empyema would in the periphery of lung.

509. Ans. (a) A = Ventriculoperitoneal shunt, B = Ventriculo-atrial shunt

La Veen and Denver shunts are used in portal Hypertension and start from peritoneal cavity and hence choice C and D are ruled out.

510. Ans. (c) Burr Hole surgery

The image shows presence of extra-dural haemorrhage due to presence of biconvex lenticular opacity. Due to risk of

FMGE Solutions Screening Examination

brain herniation leading to death best management will be burr hole surgery.

511. Ans. (a) **Kocher forceps**

- The forceps has serrations with a sharp tooth at the tip which differentiates it from artery forceps. It is used to hold tough structures like aponeurosis, fascia.
- Allis forceps has a ratchet and has triangular expansion at the tip where serrations are present.

512. Ans. (c) **Babcock forceps**

The instrument shows expansion with fenestrations at the operating end but does not have teeth. It is used to hold intestines during anastomosis.

513. Ans. (a) **Needle holder**

The needle holder has two small blades with serrations and is used to hold curved needles which are used to suture the parts.

519. Ans. (a) **Foley catheter**514. Ans. (b) **Self-retaining catheter**

The image shows presence of strong heavy instrument used to spread the laparotomy wound and is called as self-retaining retractor.

515. Ans. (a) **Proctoscope**

The image shows a proctoscope with outer sheath and inner blunt part called as obturator. It is used to diagnose hemorrhoids, carcinoma rectum or rectal ulcers.

516. Ans. (a) **Malecot catheter**

The image shows a red rubber catheter with a flower shaped ending to ensure that it is a self-retaining catheter. This is used to drain an amoebic liver abscess

517. Ans. (c) **Blackmore sengastaken catheter**

It is a double balloon and triple lumen tube used for control of bleeding esophageal varices.

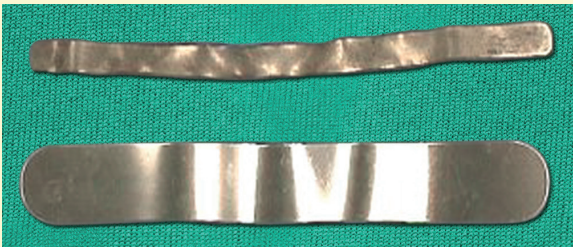

518. Ans. (a) **Ranula**

Ranula is a pseudocyst that is associated with mucus extravasation into the surrounding soft tissues. These lesions occur as the result of trauma or obstruction to the salivary gland excretory duct and spillage of mucin into the surrounding soft tissues.

Sengstaken Blake-more tube	Control of bleeding esophageal varices	
Endotracheal tube	Secure Airway	

520. Ans. (a) Deaver retractor

Richardson retractor		
Malleable retractor		
Goulet		

Pediatrics

MOST RECENT QUESTIONS 2019

1. A 3-year-old child with weight of 12 kg is having loose motions. He is thirsty, drinks eagerly, tears are absent and skin pinch goes back slowly. What is the best treatment plan for this child?
 - a. 1200 ml RL over 12 hours
 - b. 600ml RL over 6 hours
 - c. ORS 100 ml per episode of loose stool
 - d. ORS 50 ml per episode of loose stool
2. Wide open posterior fontanelle with large tongue with rough dry skin is seen in?
 - a. Pellagra m
 - b. Down syndrome
 - c. Hypothyroidism
 - d. Nutritional rickets
3. Chronic malnutrition in child is best evaluated by?
 - a. Weight for height
 - b. Weight for age
 - c. Height for age
 - d. Ponderal index
4. Neonatal jaundice becomes detectable at serum bilirubin exceeding?
 - a. 2 mg%
 - b. 3 mg%
 - c. 4 mg%
 - d. 5 mg%
5. Severity of cyanosis in Fallot's physiology is best decided by?
 - a. V.S.D
 - b. Overriding of aorta
 - c. Concentric RVH
 - d. Subpulmonic stenosis
6. Infant is admitted with respiratory distress and prolonged expiration with Rhonchi in chest are heard. CXR shows hyperinflation. What is the diagnosis?
 - a. Pneumonia
 - b. Croup
 - c. Asthma
 - d. Bronchiolitis
7. Which of these is used in treatment of bronchiolitis?
 - a. Ribavirin
 - b. Amantadine
 - c. Racemic epinephrine
 - d. Corticosteroids

8. 6th day disease is?

- a. Erythema Infectiosum
- b. Exanthema subitum
- c. Erythema marginatum
- d. Erythema nodosum

9. Protein in Cow's milk in comparison to human milk is?

- a. Double
- b. Triple
- c. Quadruple
- d. Same

NEONATOLOGY

10. Maximum heat loss in neonate is from:

(Recent Pattern Question 2018-19)

- a. Head
- b. Skin
- c. Respiration
- d. Trunk

11. All are features of congenital syphilis except?

(Recent Pattern Question 2018-19)

- a. Gumma
- b. Saddle nose
- c. Osteochondritis
- d. Charcot joints

12. Which is the best marker for NTD?

(Recent Pattern Question 2018)

- a. αFP
- b. hCG
- c. Pseudocholinesterase
- d. Inhibin-A

13. The pupil of a newborn is:

(Recent Pattern Question 2018)

- a. Dilated
- b. Mid-dilated
- c. Constricted
- d. Normal

14. Gynecomastia in neonate is seen due to:

(Recent Pattern Question 2018)

- a. Mother intake of estrogen
- b. Mother intake of progesterone
- c. GnRH
- d. Gonadotropins

15. Which is the most common cause of neonatal sepsis in India?

(Recent Pattern Question 2018)

- a. Klebsiella pneumoniae
- b. Mycoplasma pneumoniae
- c. Group B Streptococcus
- d. Listeria monocytogenes

16. A term child is brought with complaints of having jaundice on day 3 of life. How much should be the minimum level to cause jaundice?

- a. 5 mg% *(Recent Pattern Question 2017)*
- b. 10 mg%
- c. 15 mg%
- d. 20 mg%

17. A term baby is apneic and has a heart rate 90/min. Bag and mask ventilation was given for 30 seconds. Subsequently the Heart rate is still less than 100 bpm. What is the next step? *(Recent Pattern Question 2017)*

- a. Reduce oxygen supply
- b. Check chest movement
- c. Give supplemental oxygen
- d. Give chest compression

18. What is the diagnosis of the child shown in the image, whose mother is having Bronchial asthma? *(Recent Pattern Question 2016)*

- a. Atopic dermatitis
- b. Contact dermatitis
- c. Seborrheic dermatitis
- d. Irritant dermatitis

19. Apgar score system contains all of the following criteria EXCEPT:

- a. Respiratory rate
- b. Color
- c. Motor activity
- d. Heart rate

20. For accurate measurement of axillary temperature in newborn, thermometer is kept for?

- a. 1 min
- b. 2 min
- c. 3 min
- d. 5 min

21. Anterior fontanelle corresponds to all structures EXCEPT:

- a. Frontal bones
- b. Coronal suture
- c. Lambdoid suture
- d. Sagittal suture

22. What is the most common cause of Jaundice in term newborns requiring treatment?

- a. Rh incompatibility
- b. ABO incompatibility
- c. Physiological jaundice
- d. Sepsis

23. In neonatal sepsis, acute phase reactant is:

- a. WBC
- b. Alpha anti trypsin
- c. IL-6
- d. CRP

24. True about Cephal-hematoma:

- a. Jaundice is prolonged due to cephal-hematoma
- b. Crosses the suture line
- c. Appears on occiput in first few hours of life
- d. Due to rupture of bridging arteries

25. Hutchinson teeth are seen in:

- a. Early congenital spirochete infection
- b. Late congenital syphilis
- c. Rickets
- d. Scurvy

26. Congenital Rubella Syndrome has all of the following EXCEPT:

- a. Sensorineural deafness
- b. Cataract
- c. Cardiac Defects
- d. Hydrocephalus

27. A 28-year-old woman gave birth to a small for age newborn at 38 weeks of pregnancy. On examination, the newborn was found to have rhinitis, distended abdomen; wrinkled skin, and palmoplantar blisters. The woman had an earlier history of abortion and stillbirth. The most likely diagnosis is:

- a. Neonatal pemphigus
- b. Scabies
- c. Congenital syphilis
- d. Congenital HIV infection

28. Physiological jaundice in a full term new born usually resolves by:

- a. One week
- b. Two weeks
- c. Three weeks
- d. Four weeks

29. The time usually taken for air to reach the descending colon after birth in a normal infant is:

- a. 1–2 hrs
- b. 3–4 hrs
- c. 5–6 hrs
- d. 8–9 hrs

30. In neonatal resuscitation which is correct?

- a. Put cold water on back
- b. Slap on back
- c. Tickle the sole
- d. Suspend head down

31. Drug of choice for acute lead encephalopathy

- a. Succimer
- b. d-penicillamine
- c. EDTA
- d. Zinc acetate

32. Key features of kangaroo mother care are all the following EXCEPT?

- a. Skin to skin contact between mother and baby
- b. Exclusive breast feeding
- c. Initiated in a facility and continued at home
- d. Done for babies with cyanosis

33. Nipple confusion means?

- a. Baby fed with a bottle finding it difficult and confusing to suckle at breast
- b. Baby not able to suckle with bottle
- c. Baby not able to feed with spoon
- d. Baby not able to feed with paladi

34. Bag and mask ventilation is contraindicated in newborn resuscitation with clinical suspicion of?

- a. Diaphragmatic hernia
- b. Intracranial hemorrhage
- c. Meconium ileus
- d. Pneumothorax

35. A mother complains that baby is more comfortable and breathes better when held against shoulder. What important clinical problem do you suspect?
- Nose block
 - Psychological anxiety or insecurity
 - Aerophagy with abdominal fullness
 - Orthopnea
36. The following component of human milk is not protective against GIT infections?
- Lysozyme
 - Lactoferrin
 - Bifidus factor
 - β_2 transferrin
37. Increased oxygen delivery during prematurity causes all the following EXCEPT:
- Vasoconstriction
 - Vasodilation
 - Vaso obliteration
 - Neovascularisation
38. Expressed breast milk can be stored at room temperature for how many hours?
- 4
 - 8
 - 16
 - 24
39. Pathological jaundice criteria includes all EXCEPT:
- 24 hours later but within 72 hours
 - More than 14 days persistence
 - >2 mg/dL conjugated bilirubin
 - Clay colored stool
40. Growing fetus derives energy from?
- Amino acid
 - Carbohydrate
 - Lipid
 - Minerals
41. The ratio of chest compression to breathing in neonatal life support is?
- 3:1
 - 4:1
 - 5:1
 - 6:1
42. Which type of cerebral palsy is most commonly seen as a sequel of bilirubin encephalopathy?
- Spastic quadriplegia
 - Spastic diplegia
 - Atonic cerebral palsy
 - Extra pyramidal cerebral palsy
43. Hemorrhagic disease of the newborn is attributed to the deficiency of?
- Vitamin A
 - Vitamin E
 - Vitamin K
 - Vitamin C
44. In neonate which is the indication for chest compressions?
- Irregular breathing with heart rate 80 after 30 seconds
 - Regular breathing with heart rate 80 after 30 seconds
 - AMBU Bag ventilation for 30 seconds with heart rate of 50
 - Regular breathing with Cyanosis

MILESTONES IN CHILDREN

45. What is the cut off level of imbecile?
- (Recent Pattern Question 2018)*
- 0–20
 - 20–49
 - 50–69
 - >70
46. A baby with tripod position, bi dextrous approach, recognises strangers and can spell out mono syllable by what age:
- 7 months
 - 12 months
 - 9 months
 - 10 months
47. Beyond what age, absence of social smile is regarded as abnormal:
- 12 weeks
 - 14 weeks
 - 16 weeks
 - 18 weeks
48. Moro's reflex disappears by which age?
- 3 month
 - 6 months
 - 9 months
 - 12 months
49. Most common cause of neonatal mortality in India?
- Prematurity
 - Congenital malformation
 - Pneumonia
 - Metabolic (hypoglycemia)
50. A baby placed in the prone position is able to lift the head and upper chest on extended arms by?
- 1 month
 - 3 months
 - 6 months
 - 9 months

BREASTFEEDING

51. Best management for formula fed child with severe Cow milk protein allergy? *(Recent Pattern Question 2016)*
- Soya milk
 - Hydrolysed formula feed
 - Amino acid based formula
 - Total Parenteral nutrition
52. All of the following are signs of good attachment during breast feeding EXCEPT:
- Baby's mouth is wide open
 - Baby's lower lip is inverted
 - Upper areola is more visible than lower
 - Baby's chin touching the breast
53. All of the following are signs of good attachment during breast feeding EXCEPT:
- Baby's mouth is wide open
 - Baby's lower lip is everted
 - Lower areola is more visible than upper
 - Baby's chin touching the breast
54. Recommendation for exclusive breast feeding is up to:
- 3 months
 - 4 months
 - 5 months
 - 6 months

55. Breast milk contains all EXCEPT?
- Lactoglobulin
 - Lactoalbumin
 - Whey protein
 - Avidin
56. "Good attachment" of infant to mother's breast during breast feeding includes all of the following EXCEPT:
- Chin of the infant touches mother's breast
 - Upper part of areola is visible more than the lower part
 - Lower lip of infant is inverted
 - Mouth of infant is wide open
57. Which amino acid, present in human milk in large amount helps in brain development?
- Alanine
 - Tyrosine
 - Lysine
 - Taurine

GROWTH AND DEVELOPMENT

58. Swallowing reflex appears at?
- (Recent Pattern Question 2017)*
- 6 week
 - 16 weeks
 - 18 weeks
 - 22 weeks
59. Undescended testis is a feature of?
- (Recent Pattern Question 2016)*
- Prematurity
 - Post term
 - Term child
 - Term small for date
60. How many teeth are present in a 3 year child?
- 8 teeth
 - 12 teeth
 - 18 teeth
 - 20 teeth
61. False regarding the testicular development during fetal stage:
- Develop in abdomen
 - Gubernaculum plays decisive role
 - 7 months into scrotum
 - Scrotum empty at 7 months
62. All of the following are common problems of pre-school children EXCEPT:
- Temper tantrums
 - Sleep problems
 - Truancy
 - Pica
63. Early sign of puberty in male is enlargement of testes. In females it is determined by:
- Pubarche
 - Menarche
 - Thelarche
 - Menstruation
64. Nocturnal Enuresis is occurrence of involuntary voiding at night in a child more than
- 2 ½ years
 - 3 ½ years
 - 4 years
 - 5 years
65. An infant is considered anemic at Hemoglobin less than gm%?
- 8
 - 9
 - 10
 - 12
66. A 3-year-old Child who has diurnal enuresis and soiling of clothes. Treatment required?
- Urethroplasty
 - Put catheter for 7 days
 - Circumcision at 10 years
 - Behaviour modification
67. Rickets in India is most commonly caused by?
- Malnutrition
 - Lack of sun exposure
 - Lactose intolerance
 - Genetics
68. Age at which child can tell gender?
- 2 years
 - 3 years
 - 4 years
 - 5 years
69. Concerning attention deficit hyperactivity disorder which is true?
- Impulsive behavior is a feature
 - Higher incidence in tic disorders
 - May respond to treatment with stimulants such as amphetamine
 - All the above
70. X-ray of choice for age detection in 6 months old child is?
- Skull
 - Hand
 - Knee
 - Shoulder
71. Most common location of supernumerary teeth is?
- Between incisors
 - Between canines
 - Between molars
 - Between premolars
72. Birth weight doubles by?
- 3 months
 - 5 months
 - 9 months
 - 12 months
73. Birth length doubles by what age?
- 1 year
 - 2 years
 - 3 years
 - 4 years
74. At what age do first permanent teeth appear?
- 5 years
 - 6 years
 - 7 years
 - 8 years
75. Vocabulary of a 2 year old child is?
- 20 words
 - 50 words
 - 100 words
 - 200 words
76. A child draws Triangle at what age?
- 3 years
 - 4 years
 - 5 years
 - 7 years
77. A 18 month baby can do which of the following?
- Hide & seek game
 - Write Alphabet
 - Say short sentence
 - Walk short distance
78. Which of the following is called as red flag sign in child development, if not attained?
- Vocalization at 2 months
 - Walking at 12 months
 - Single word at 12 months
 - Social smile at 3 months

79. To diagnose anemia in age group 6 month to 6 years, level of hemoglobin should be?
 a. Hb 10g/dL b. Hb 11g/dL
 c. Hb 12g/dL d. Hb 13g/dL
80. By what age can a child tell his/her own gender?
 a. 1.5–2 years b. 2.5–3 years
 c. 3.5–4 years d. 4.5–5 years
81. Which of the following is the first sign of sexual maturity in boys?
 a. Increase in height b. Appearance of facial hair
 c. Change in voice d. Increase in testicular size
82. At what age (in years) does a child attain a height of 100 cms?
 a. 2 b. 3
 c. 4 d. 5

PROTEIN ENERGY MALNUTRITION

83. Which is the most specific clinical feature for diagnosis for Kwashiorkor? *(Recent Pattern Question 2018)*
 a. Fatty liver b. Easy pluckable hair
 c. Low serum albumin d. Edema
84. Adaptive starvation with increased metabolism: *(Recent Pattern Question 2018)*
 a. Bulimia b. Kwashiorkor
 c. Marasmus d. Cachexia
85. Which of the following defects will lead to this presentation? *(Recent Pattern Question 2017)*

- a. ABCD1 b. SLC39A4
 c. ATP7B d. ATP7A
86. Chronic malnutrition is measured by:
 a. Weight/height b. Height/age
 c. Weight/age d. Mid arm circumference
87. Which is the best parameter for acute severe malnutrition:
 a. Weight/height b. Height/age
 c. Weight/age d. Mid arm circumference
88. BMI is measured in children by:
 a. Wt.kg/Ht.m² b. Wt.kg/Ht.cm²
 c. Wt.gm/Ht.cm² d. Wt.gm/Ht.m²
89. Very low birth weight child weighs:
 a. 1000 gm b. < 1500 gm
 c. < 2500 gm d. < 750 gm

90. Extremely low birth weight baby is defined as?
 a. <1000 gms b. <1500 gms
 c. <2500 gms d. <2800 gms
91. What is the mid upper arm circumference – cut off value for malnutrition of a child:
 a. 12.5 cm b. 10.5 cm
 c. 14.5 cm d. 9.5 cm
92. Ponderal index in malnourished babies is?
 a. <1 b. <2
 c. <4 d. <6
93. A 4-year-old boy, with swollen bleeding gums, petechiae and dry eyes. Diagnosis:
 a. Rickets b. Marasmus
 c. Scurvy d. Dehydration
94. Flag hair sign is seen in
 a. Kwashiorkor b. Marasmus
 c. Scurvy d. Pellagra
95. All are seen in Marasmus EXCEPT:
 a. Muscle wasting b. Hepatomegaly
 c. Low insulin d. Muscle wasting
96. All are seen in Kwashiorkor EXCEPT
 a. Increase appetite b. Flag sign on hair
 c. Hepatomegaly d. Apathy
97. Nutritional rickets is treated by a single dose of Vitamin D of
 a. 5,000 mcg b. 10,000 mcg
 c. 15,000 mcg d. 20,000 mcg
98. All are seen in nutritional Rickets EXCEPT?
 a. Pseudoparalysis
 b. Delayed dentition
 c. Widening of the wrist joint
 d. Double medial malleolus
99. The metabolic defect in hereditary fructose intolerance is due to deficiency of enzyme:
 a. Fructokinase b. Aldolase-B
 c. Xylitol dehydrogenase d. Phosphofructokinase
100. Chronic malnutrition diagnosis is based upon?
 a. Decreased weight for age
 b. MAC < 11.5 cm
 c. <3.5 gm% serum protein
 d. Decreased height for age
101. All are seen in marasmus EXCEPT?
 a. Hunger b. Wasting
 c. Loose folds skin d. Apathy

PEDIATRIC NEUROLOGY

102. Medulloblastoma is: *(Recent Pattern Question 2018)*
 a. Malignant tumor in adults
 b. Malignant tumor in children
 c. Benign brain tumor
 d. Malignant cerebellar tumor in adults

103. Elevated amniotic fluid acetylcholinesterase is used for diagnosis of? *(Recent Pattern Question 2017)*

- a. Neonatal myasthenia gravis
- b. Spinal dysraphism
- c. Hydrops fetalis
- d. Neonatal heart block

104. Which of the following is a neural tube marker?

(Recent Pattern Question 2017)

- a. Pseudo-cholinesterase
- b. Acetylcholinesterase
- c. Transketolase
- d. Beta 2 transferrin

105. NTD with maximum viability is?

(Recent Pattern Question 2017)

- a. Spina bifida occulta
- b. Anencephaly
- c. Myelomeningocele
- d. Meningocele

106. SSPE is caused by? *(Recent Pattern Question 2017)*

- a. Rubella
- b. Rubeola
- c. Varicella
- d. Variola

107. A 1-year-old baby brought by the mother complaining of a cystic mass on back and inability to move both legs ever since birth. Possible diagnosis?

- a. Pilonidal cyst
- b. Meningocele
- c. Meningomyelocele
- d. Sacrococcygeal teratoma

108. All are true regarding congenital hydrocephalus EXCEPT:

- a. Stenosis of aqueduct can contribute
- b. Mostly Hereditary in nature
- c. Can be seen together with Spina bifida
- d. Broad forehead and wide open anterior fontanel

109. Continuous prophylactic anticonvulsant therapy is not needed in a child with febrile convulsion with?

- a. Developmental delay
- b. Family history of epilepsy
- c. Typical simple Febrile fits
- d. Persistent neurological deficit

110. In a child diagnosed with H. influenza meningitis, what investigation must be done before discharging him from the hospital?

- a. BERA
- b. MRI
- c. CT scan
- d. X-ray skull

111. Most common cause of meningo-encephalitis in children is?

- a. HSV
- b. Measles
- c. Adenovirus
- d. Enterovirus

112. Treatment of Rolandic epilepsy is?

- a. Phenytoin
- b. Lamotrigine
- c. Carbamazepine
- d. ACTH

113. All of the following are manifestations of hypervitaminosis A EXCEPT?

- a. Loss of hair
- b. Generalized exfoliation
- c. Decreased Intracranial pressure
- d. Muscle pains

GENETICS

114. Trisomy of Down's syndrome is:

- a. 21
- b. 22
- c. 18
- d. 13

115. Which is correct about estriol level in Down syndrome?

- a. No change
- b. Low
- c. Elevated
- d. Double-triple

116. Trisomy 18 is? *(Recent Pattern Question 2016)*

- a. Down syndrome
- b. Edward syndrome
- c. Patau syndrome
- d. Turner syndrome

117. Anti-mongoloid facies, Short stature, undescended testis, and pulmonic stenosis are seen in?

(Recent Pattern Question 2016)

- a. Noonan syndrome
- b. Down syndrome
- c. Klinefelter syndrome
- d. Angelman syndrome

118. Recent marker for Down syndrome:

- a. HCG
- b. Alpha feto protein
- c. Inhibin
- d. Estriol

119. All are seen in Down's syndrome EXCEPT:

- a. Low IQ
- b. Brachycephaly
- c. Umbilical hernia
- d. Hypothyroidism

120. For Prenatal diagnosis of Down's syndrome, all are true EXCEPT?

- a. Reduced femur and humerus length
- b. Nuchal fold thickness >2.5 mm
- c. Increased umbilical blood flow
- d. Ventricular septal defect may be present

121. Neural tube defects marker

- a. Estriol
- b. Beta hCG
- c. Alpha feto-protein
- d. Acetylcholine esterase

122. The earliest congenital anomaly identified by ultrasound is:

- a. Hydrocephalus
- b. Encephalocele
- c. Spina bifida
- d. Anencephaly

PEDIATRIC CARDIOLOGY

123. Most common cardiac anomaly associated with Noonan syndrome: *(Recent Pattern Question 2018-19)*

- a. Pulmonic stenosis
- b. Coarctation of aorta
- c. VSD
- d. TAPVR

124. Continuous murmur is heard in?

(Recent Pattern Question 2018-19)

- a. Patent ductus arteriosus
- b. VSD
- c. ASD
- d. Tetralogy of Fallot

125. All of the following statements are true regarding TOF, EXCEPT: *(Recent Pattern Question 2018)*

- a. Right ventricular hypertrophy
- b. ASD
- c. Overriding of aorta
- d. Subpulmonic stenosis

126. The innocent murmur is best heard in children at:

- a. Pulmonic area *(Recent Pattern Question 2018)*
- b. Aortic area
- c. Left lower sternal border
- d. Apex

127. A 2-week-old child presents with cyanosis. Which of the following heart disease will have highest chances of 1 year survival? *(Recent Pattern Question 2017)*

- a. T.O.F
- b. T.G.A
- c. T.A.P.V.C
- d. Tricuspid Atresia

128. Which of the following is a feature of Tetralogy of fallot?

- a. Pan-systolic murmur *(Recent Pattern Question 2017)*
- b. Congestive heart failure
- c. Pulmonic stenosis
- d. Normal Cardiothoracic ratio

129. Structure with functional closure immediately after birth? *(Recent Pattern Question 2017)*

- a. Foramen Ovale
- b. Ductus venosus
- c. Ductus arteriosus
- d. Umbilical artery

130. Most common heart defect in children?

(Recent Pattern Question 2016)

- a. Muscular V.S.D
- b. Membranous VSD
- c. Ostium Secundum
- d. Ostium Primum

131. Which of the following is an acyanotic heart disease:

- a. TOF
- b. TGA
- c. PDA
- d. COA

132. All are seen in Kawasaki disease EXCEPT:

- a. Mitral regurgitation
- b. Ischemic heart disease
- c. Myocarditis
- d. Pericardial tamponade

133. Which of the following is synonymous with Mucocutaneous lymph node syndrome?

- a. Scarlet fever
- b. Kawasaki disease
- c. Behcet's syndrome
- d. Tuberculosis

134. In septum primum type of ASD over burden occurs in which chamber?

- a. RV
- b. LV
- c. RA
- d. LA

GASTROINTESTINAL TRACT

135. A 1-month-old baby presents with lethargy, non-bilious vomiting, excessive crying and F.T.T. The diagnosis is?

- a. Ileal atresia *(Recent Pattern Question 2017)*
- b. Duodenal atresia
- c. Hypertrophic pyloric stenosis
- d. Trachea-esophageal fistula

136. What is the dose of zinc given to 4 month old child in diarrhoea? *(Recent Pattern Question 2016)*

- a. 5 mg
- b. 10 mg
- c. 15 mg
- d. 20 mg

137. In pediatrics, differential for Acute appendicitis are all EXCEPT:

- a. Gastroenteritis
- b. Volvulus
- c. Trauma
- d. Torsion

138. Useful in acute diarrhea:

- a. Zinc
- b. Magnesium
- c. Calcium
- d. Potassium

139. IOC for congenital hypertrophic pyloric stenosis:

- a. X-ray
- b. CT San
- c. MRI
- d. Ultrasound

140. Which drug consumption by pregnant lady can lead to baby developing hypertrophic pyloric stenosis?

- a. Vancomycin
- b. Nifedipine
- c. Erythromycin
- d. Phenyl propalamine

141. Double bubble appearance is seen in?

- a. Jejunal atresia
- b. Duodenal atresia
- c. Obstructive jaundice
- d. Pyloric atresia

142. What is the most-likely diagnosis of a 26-day-old infant presenting with recurrent nonbilious vomiting with constipation and loss of weight?

- a. Esophageal atresia
- b. Annular pancreas
- c. Ileal atresia
- d. Pyloric stenosis

143. All are seen in lactose intolerance EXCEPT?

- a. Benedict test positive in urine
- b. Alkaline urine
- c. Acidic stool
- d. Lactase enzyme deficiency

144. All are seen in lactose intolerance EXCEPT?

- a. Benedict test positive in urine
- b. Non Reducing sugar in urine
- c. Acidic stool
- d. Lactase enzyme deficiency

145. A child presents with bilious vomiting on day 2 of life and the mother gives history of polyhydramnios. The radiological imaging is shown. What's your probable diagnosis?

- a. Duodenal atresia
b. Hypertrophic pyloric stenosis
c. Ileal atresia
d. Congenital Mega-colon
146. In Hypertrophic pyloric stenosis which electrolyte should be replenished first?
a. Na^+ b. K^+
c. Cl^- d. HCO_3^-
147. A 5-year-child came with dehydration. Plan A was proposed for treatment of dehydration. How much ORS should be given per loose stool?
a. 0–50 mL b. 50–100 mL
c. 100–200 mL d. 200–300 mL

FLUID & ELECTROLYTE BALANCE

148. 24 hour normal fluid requirement for a one year old child weighing 8 kg is
a. 700 mL b. 800 mL
c. 900 mL d. 1000 mL
149. The sodium concentration of low osmolarity ORS is:
a. 45 mmol/L b. 60 mmol/L
c. 75 mmol/L d. 90 mmol/L
150. A 2-year-old female child was brought to a PHC with a history of cough and fever for 4 days with inability to drink for last 12 hours. On examination, the child was having weight of 5 kg and respiratory rate of 45 per minute with fever. The child will be classified according to IMNCI as suffering from:
a. Very severe pneumonia b. Severe pneumonia
c. Pneumonia d. No pneumonia

151. Calculate the Fluid requirement for severe dehydration in a one year old child weighing 8 kg:
a. 600 mL b. 800 mL
c. 900 mL d. 1000 mL
152. What serum level of albumin is considered as mild degree of malnutrition:
a. 4.0 g/dL b. 3.5 g/dL
c. 3.0 g/dL d. 2.5 g/dL
153. Severe dehydration is seen in 2-year-old child. IV fluid to be given:
a. 30 mL in 60 min b. 30 mL in 30 min
c. 70 mL in 360 min d. 70 mL in 180 min
154. Intraosseous line is placed in which bone in children?
a. Femur b. Tibia
c. ASIS d. Iliac crest
155. Low Osmolar ORS composition is?
a. Na 90 + 311 mOsm b. Na 75 + 245 mOsm
c. Na 60 + 245 mOsm d. Na 60 + 240 mOsm

VACCINES

156. What is the upper limit of initiation of first dose of Rotavirus vaccine? *(Recent Pattern Question 2017)*
a. 6 weeks b. 10 weeks
c. 12 weeks d. 15 weeks
157. Which of the following vaccine can be given to AIDS positive child?
a. DPT b. BCG
c. Measles d. OPV
158. Which among the following is vaccine for cholera?
a. PPV 23 b. Dukoral
c. Ty 21 a vaccine d. JE-MB Nakayama
159. Osteomyelitis is side effect of which vaccine?
a. Hepatitis B vaccine b. BCG
c. Measles vaccine d. IPV

KIDNEY

160. Mutation in NPHS 1 gene causes which disease?
a. Alport syndrome
b. Congenital Finnish type nephrotic syndrome
c. Focal segmental glomerulonephritis
d. Nail patella syndrome
161. Child presents with Pathological fracture, Renal stone and Psychiatric symptoms. Most probable diagnosis is?
a. Renal tubular acidosis b. Hyperparathyroidism
c. Polycystic kidney disease d. CRF
162. Henoch Schonlein purpura commonly involves which age group?
a. 4–8 years b. 10–15 years
c. 15–20 years d. > 25 years

RESPIRATORY SYSTEM

163. Which of the following clinical presentation is correct for a child with pneumonia?

(Recent Pattern Question 2018)

- a. <50/min RR, with age of 2 months
- b. >40/min RR, for 2–12 months
- c. >40/min RR, for 12–60 months
- d. <60/min RR, for 0–2 months

164. Most common cause of common cold in children is?

- a. RSV
- b. Rhinovirus
- c. Influenza
- d. Allergic

INBORN ERRORS OF METABOLISM

165. A normal born child presents with mental retardation, blond hair and convulsions at 1 year of age. Most probable diagnosis is?

- a. Albuminuria
- b. Phenylketonuria
- c. Gaucher's disease
- d. Tyrosinemia

ENDOCRINOLOGY

166. Nelson syndrome is seen in?

- a. Adrenalectomy
- b. Hypopituitarism
- c. Deficiency of beta cells
- d. Deficiency of growth hormone

MISCELLANEOUS

167. Hand foot mouth disease is usually caused by:

(Recent Pattern Question 2018)

- a. Coxsackie A
- b. Adenovirus
- c. Rotavirus
- d. Hepatitis B virus

168. Which of the following is the cause of development of acute scrotum in a 2-year-old child?

(Recent Pattern Question 2017)

- a. Torsion of appendix of testis
- b. Epididymitis
- c. Testicular trauma
- d. Idiopathic swelling of scrotum

169. An 8 month baby presents with fever, cough and confluent rash on hairline, face, neck and body. Which of the following is a causative organism?

(Recent Pattern Question 2017)

- a. Varicella
- b. Variola
- c. Rubella
- d. Rubeola

170. Slapped cheeks appearance is seen in?

(Recent Pattern Question 2016)

- a. Erythema infectiosum
- b. Measles
- c. Chicken pox
- d. Erythema nodosum

171. Post streptococcal glomerulonephritis in children is diagnosed by

- a. Heavy proteinuria, high cholesterol, high ASO titre
- b. Heavy proteinuria, hematuria, low ASO titre
- c. Mild proteinuria, high hematuria, high ASO titre
- d. Mild proteinuria, high cholesterol, normal ASO titre

172. Acrodermatitis enterohpatica is due to:

- a. Pustular psoriasis
- b. Zinc toxicity
- c. Zinc deficiency
- d. Collodion baby

173. What is the dose of isoniazid in infants:

- a. 5 mg/kg
- b. 10 mg/kg
- c. 15 mg/kg
- d. 20 mg/kg

174. Precocious puberty and patchy skin pigmentation is known as:

- a. Albright's syndrome
- b. Litter Siwe disease
- c. Asherman's syndrome
- d. Morquio's syndrome

175. All are seen at Congenital rubella syndrome EXCEPT?

- a. SN hearing loss
- b. Cataract
- c. Headlight in fog appearance
- d. PDA

176. The following is helpful in a child with severe falciparum malaria with high parasitemia?

- a. IV corticosteroids
- b. Exchange transfusion
- c. Hyperbaric oxygen
- d. IVIG

177. Most common age for pediatric TB is?

- a. < 1 year
- b. 1–4 years
- c. 5–8 years
- d. 8–14 years

- 178. In mechanical ventilation of a newborn with ARDS, the end tidal volume is kept at?**
 a. 5 mL/kg b. 7 mL/kg
 c. 10 mL/kg d. 15 mL/kg
- 179. Regarding Wilson's disease, the true statement is:**
 a. Hemolytic anemia
 b. Autosomal dominant inheritance
 c. Decreased urinary copper excretion
 d. Normal hepatic copper level
- 180. Which of the following is the most common symptom of Henoch-Schonlein Purpura?**
 a. Abdominal pain b. Joint pain
 c. Decreased urine output d. Rashes
- 181. Which of the following cannot be done by a four year old child?**
 a. Count 10 pennies
 b. Hop on one foot
 c. Copy a bridge
 d. Identify the longer of two lines
- 182. What is the most common cause of congenital hypothyroidism?**
 a. Maternal antibiotics
 b. Dyshormonogenesis
 c. Thyroid dysgenesis
 d. Maternal medications
- 183. The most common type of congenital oesophageal atresia is?**
 a. Proximal end blind, distal end communicating with trachea
 b. Distal end blind, proximal end communicating with trachea
 c. Proximal and distal ends open and communicating with trachea
 d. Both ends blind
- 184. Which one of the following infections is characterized by an increased TLC with absolute lymphocytosis?**
 a. Diphtheria b. Measles
 c. MI d. Pneumonia
- 185. All of the following methods are used for the diagnosis of HIV infection in a 2 month old child EXCEPT:**
 a. DNA PCR b. Viral culture
 c. HIV ELISA d. p 24 antigen assay
- 186. Sub-periosteal hemorrhage in the long bones is usually seen in?**
 a. Osteogenesis imperfecta b. Scurvy
 c. Rickets d. Hemophilia
- 187. Acrodermatitis Enterohepatica occurs due to deficiency of?**
 a. Ascorbic acid b. Vitamin B12
 c. Zinc d. Riboflavin

BOARD REVIEW QUESTIONS

- 188. Most common cause of respiratory distress in newborn baby after caesarean section?**
 a. Hyaline membrane disease
 b. Meconium aspiration syndrome
 c. Transient Tachypnea of new-born
 d. Primary pulmonary hypertension
- 189. Incorrect about breast milk is?**
 a. 65 kcal /100 mL b. High lactaglobulin
 c. Contains IgA d. Deficient in vitamin K
- 190. Air Broncho gram in CXR of a neonate is diagnostic of**
 a. Hyaline membrane disease
 b. Meconium aspiration syndrome
 c. Transient Tachypnea of new-born
 d. Primary pulmonary hypertension
- 191. Phototherapy works by?**
 a. Photo-oxidation
 b. Structural isomerization
 c. Configuration isomerization
 d. Photo-dissolution
- 192. Breastfeeding is contraindicated in**
 a. Cleft palate b. HIV positive mother
 c. Unilateral breast abscess d. Inverted nipple
- 193. All are true about a baby born to a mother with gestational diabetes mellitus, EXCEPT?**
 a. Congenital malformations b. Polycythemia
 c. Jaundice d. Hyperinsulinemia
- 194. DPT is contraindicated in**
 a. Epilepsy b. Mental retardation
 c. Cerebral palsy d. Fever after last shot
- 195. Persistent diarrhoea is defined as diarrhoea lasting more than?**
 a. 7 days b. 14 days
 c. 21 days d. 28 days
- 196. Feature of Wilson disease is**
 a. Decreased serum copper b. Decreased urinary copper
 c. Decreased hepatic copper d. Increased ceruloplasmin
- 197. Neonate with cyanosis on day 0?**
 a. Tricuspid atresia b. TGA
 c. TAPVC d. VSD
- 198. Upper segment: lower segment ratio becomes 1:1 at**
 a. Birth
 b. 3 years
 c. 6 years
 d. 10 years

199. Kanawati index is

- a. Mid arm circumference/head circumference
- b. Head circumference/weight
- c. Weight/head circumference
- d. Weight/length³

200. Hutchinson teeth are seen in:

- a. Early congenital spirochete infection
- b. Late congenital syphilis
- c. Rickets
- d. Scurvy

201. All are seen in Kwashiorkor EXCEPT:

- a. Increase appetite
- b. Flag sign on hair
- c. Hepatomegaly
- d. Apathy

202. Short stature is defined as less than _____

- a. 3rd centile
- b. 10 centile
- c. 25 centile
- d. 50 centile

203. Child can lift head, greater part of chest while supporting weight on extended arms at

- a. 2 months
- b. 4 months
- c. 6 months
- d. 8 months

204. Hopping is seen at

- a. 2 years
- b. 3 years
- c. 4 years
- d. 5 years

205. Child helps in household chores, dresses and undresses at

- a. 2 years
- b. 3 years
- c. 4 years
- d. 5 years

206. Apgar score system contain all of the following criteria EXCEPT:

- a. Respiratory rate
- b. Color
- c. Motor activity
- d. Heart rate

207. A baby with tripod position, bi dexterous approach, recognizes strangers and can spell out mono syllable by what age?

- a. 7 months
- b. 12 months
- c. 9 months
- d. 10 months

208. Most common type of seizures in neonate is?

- a. Subtle
- b. Absence
- c. GTCS
- d. Myoclonic seizure

209. Most common brain tumour in children

- a. Medulloblastoma
- b. Cerebellar astrocytoma
- c. Germinoma
- d. Pinealoma

210. Most common type of cerebral palsy?

- a. Spastic
- b. Athetoid
- c. Mixed
- d. Dystonic

211. All of the following are signs of good attachment during breast feeding EXCEPT:

- a. Baby's mouth is wide open
- b. Baby's lower lip is everted
- c. Lower areola is more visible than upper
- d. Baby's chin touching the breast

212. How many teeth are present in 3 year child:

- a. 8 teeth
- b. 12 teeth
- c. 18 teeth
- d. 20 teeth

213. What is the most common cause of Jaundice in term newborns requiring treatment?

- a. Rh incompatibility
- b. ABO incompatibility
- c. Physiological jaundice
- d. Sepsis

214. Chronic malnutrition is measured by

- a. Weight/height
- b. Height/age
- c. Weight/age
- d. Mid arm circumference

215. Very low birth weight child weights

- a. 1000 g
- b. <1500 g
- c. <2500 g
- d. <750 g

216. Extremely low birth weight

- a. <1000
- b. <1500
- c. <2500
- d. <2800

217. Malnutrition of a child mid upper arm circumference – cut off value is

- a. 12.5 cm
- b. 10.5 cm
- c. 14.5 cm
- d. 9.5 cm

218. Ponderal index in malnourished babies is:

- a. <1
- b. <2
- c. <4
- d. <6

219. Flag hair sign is seen in

- a. Kwashiorkor
- b. Marasmus
- c. Scurvy
- d. Pellagra

220. Harrison groove is seen in

- a. Rickets
- b. Scurvy
- c. Vitamin D resistant rickets
- d. Chondrocalcinosis

221. Keshan disease is due to deficiency of?

- a. Selenium
- b. Chromium
- c. Zinc
- d. Iodine

222. Asymmetric tonic neck reflex disappears at

- a. 3 month
- b. 6 month
- c. 9 month
- d. 12 months

223. Drug of choice for lipoid nephrosis

- a. Statin
- b. Steroid
- c. Cyclophosphamide
- d. High protein diet

224. Lymphoma in children is predominantly seen at what age?

- a. < 4 years
- b. < 14 years
- c. > 14 years
- d. < 1 year

225. Infective endocarditis is least common in?

- a. Severe MR
- b. Severe AR
- c. Small VSD
- d. Small ASD

226. Alpha-1- antitrypsin deficiency presents as?

- a. Emphysema
- b. Bronchiectasis
- c. Empyema
- d. Bronchogenic carcinoma

227. Percentage of dose given as basal insulin in bolus-basal regimen in children is?

- a. 0–25%
- b. 25–50%
- c. 50–75%
- d. None of these

- 228. Most common birth defect in north India is?**
 a. CTEV
 b. Neural tube defects (Spina bifida)
 c. Down's syndrome
 d. Hemoglobinopathies
- 229. In children renal failure in terms of urine output is defined as?**
 a. Less than 0.3 mL/kg/hr b. Less than 0.5 mL/kg/hr
 c. Less than 0.8 mL/kg/hr d. Less than 1 mL/kg/hr
- 230. Average gain of height in first year is?**
 a. 25 cm b. 50 cm
 c. 75 cm d. 100 cm
- 231. Treatment of breath holding spells is?**
 a. Pyridoxine b. Zinc
 c. Iron d. Molybdenum
- 232. Conjugated bilirubin is increased in?**
 a. Rotor Syndrome b. Gilbert's syndrome
 c. CriglerNajjar syndrome 1
 d. CriglerNajjar syndrome 2
- 233. At what age do first permanent teeth appear?**
 a. 5 years b. 6 years
 c. 7 years d. 8 years
- 234. Most common cardiac anomaly in Turner's Syndrome is?**
 a. Coarctation of aorta b. Bicuspid aortic valve
 c. Ventricular septal defect d. Atrial septal defect
- 235. Adolescence starts at the age of?**
 a. 7 years b. 10 years
 c. 14 years d. 17 years
- 236. Child draws triangle at what age?**
 a. 3 years b. 5 years
 c. 6 years d. 7 years
- 237. Which of the following has no role in diagnosis of childhood TB?**
 a. ELISA b. Mantoux
 c. CXR d. FNAC
- 238. A child 4-month-old has 10 episodes of vomiting and 2–3 episodes of loose stools and crying since the last 24 hours, best line of management will be?**
 a. Intravenous fluids
 b. ORS
 c. Intravenous fluids then ORS
 d. Hospitalise and treat
- 239. True about Wilson's disease is?**
 a. Increased serum ceruloplasmin
 b. Decreased liver copper
 c. Increased urinary copper excretion
 d. Decreased urine copper excretion
- 240. Most common enzyme deficiency leading to childhood hypertension is?**
 a. 17-Alpha hydroxylase
 b. 21-Beta hydroxylase
 c. 11-Beta hydroxylase
 d. 3-Beta hydroxy steroid dehydrogenase
- 241. Blood volume in preterm neonate is?**
 a. 90 mL/kg b. 80 mL/kg
 c. 70 mL/kg d. 60 mL/kg
- 242. Preterm neonate target oxygen saturation is?**
 a. 85–95%
 b. >95%
 c. 70–95%
 d. <80%

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (c) ORS 100 ml per episode of loose stool

Ref: OP Ghai, 8th ed. pg. 294

- The diagnosis of this child who is thirsty and drinks eagerly with absent tears is some dehydration. Hence ORS is to be given to this child for correction of dehydration at rate of 75 ml/Kg over the next 4–6 hours plus ongoing losses.
- For ongoing losses in children over 2 years, 100 ml per episode of loose stool should be given extra over the correction mentioned in first point.
- Choice A and B are ruled out as intravenous correction is done for severe dehydration.

Age	Amount of ORS to be given after each loose stool
<24 months	50–100 ml per episode
2–10 years	100 ml–200 ml per episode
>10 years	Ad Lib

2. Ans. (c) Hypothyroidism

Ref: Nelson 20th ed. pg. 2269

- Choice A Pellagra manifests as edema, erythema, and burning of sun-exposed skin on the face, neck, and dorsal aspects of the hands, forearms, and feet.
- Choice B presents as protuberant tongue with brachycephaly and early closure of fontanelles.
- Choice D presents as wide open anterior fontanelle.
- Choice C Congenital Hypothyroidism presents with patent posterior fontanelle with myxedema leading to large tongue and coarse dry skin. The leading cause of congenital hypothyroidism is thyroid dysgenesis.

3. Ans. (c) Height for age

Ref: Nelson 20th ed. pg. 298

- Height for age is a measure of linear growth and a deficit represents cumulative effect of adverse events in first 1000 days from conception. It results in chronic malnutrition and stunting. Conversely a low weight for height or wasting indicates acute malnutrition.
- Weight for age is most commonly used index of nutritional status although it does not differentiate between wasting and stunting.

4. Ans. (d) 5mg%

Ref: Nelson 20th ed. pg. 871

Jaundice in neonates becomes apparent in cephalocaudal progression starting from face and progressing to abdomen and feet. Dermal pressure reveals anatomic progression. Jaundice on face starts at 5 mg/dl.

5. Ans. (d) Subpulmonic stenosis

Ref: Nelson 20th ed. pg. 2212

The major determinant of cyanosis in TOF is subpulmonic stenosis which will decide the amount of blood entering into lungs.

6. Ans. (d) Bronchiolitis

Ref: Nelson 20th ed. pg. 245

- The characteristic feature of bronchiolitis is prolonged expiration due to airway inflammation. It is caused by Respiratory syncytial virus.
- Choice A has presence of Bronchial breathing and crepitations and is ruled out.
- Choice B manifests as hoarseness, a seal-like barking cough, inspiratory stridor, and a variable degree of respiratory distress.
- Choice C has episodic attacks on exposure to allergens.

7. Ans. (a) Ribavirin

Ref: Nelson 20th ed. pg. 1608

Bronchiolitis caused by respiratory syncytial virus is managed with aerosol of Ribavirin. It causes only modest improvement. Hence, humidified oxygen is the main stay of treatment. Latest approach is to use palivizumab for prophylaxis in high risk infants.

Virus	Clinical syndrome	Antiviral agent of choice	Alternative antiviral agents
Influenza A	Treatment	Oseltamivir (> 1yr old)	Rimantadine Amantadine
	Prophylaxis	Oseltamivir (> 1yr old)	Amantadine Rimantadine Zanamivir (> 7 yr old)
Influenza B	Treatment	Oseltamivir	Zanamivir (> 7 yr old)
Respiratory syncytial virus	Bronchiolitis or pneumonia in high-risk host	Oseltamivir Ribavirin aerosol	

8. Ans. (b) Exanthema subitum

Ref: Nelson 20th ed. pg. 1594

- Human herpes-6A, Herpes-6B and HHV7 causes Roseola infantum or exanthema subitum and is called sixth disease.
- The most common cause is primary infection with human herpesvirus 6B.
- The classic presentation of roseola infantum is a 9- to 12-month-old infant who acutely develops a high fever and often a febrile seizure. After 3 days, a rapid defervescence occurs, and a morbilliform rash appears.

Extra Mile

Number	Other names for the disease	Etiology (ies)
First disease	Rubeola, measles, hard measles, 14-day measles, morbilli	Measles virus
Second disease	Scarlet fever, scarlatina	<i>Streptococcus pyogenes</i>
Third disease	Rubella, German measles, 3-day measles	Rubella virus
Fourth disease	Filatov-Duke's disease, staphylococcal scalded skin syndrome, Ritter's disease	Some say the disease does not exist. Other believe it is due to <i>Staphylococcus aureus</i> strains that make epidermolytic (exfoliative) toxin
Fifth disease	Erythema infectiosum	Erythrovirus (Parvovirus) B19
Sixth disease	Exanthem subitum, roseola infantum, "Sudden Rash", rose rash of infants, 3-day fever	Human herpes virus 6B or human herpes virus 7

9. Ans. (b) Triple

Ref: Nelson 20th ed. pg. 417

Compositions of human colostrum, mature breast milk, and cow's milk (g/L)			
Compositions	Human colostrum	Human breast milk	Cow's milk
Total protein	23	11	31
Immunoglobulins	19	0.1	1
Fat	30	45	38
Lactose	57	71	47
Calcium	0.5	0.3	1.4
Phosphorus	0.16	0.14	0.90
Sodium	0.50	0.15	0.41

NEONATOLOGY

824

10. Ans. (a) Head

Ref: *Op Ghai, 8th ed. pg. 143*

Maximum heat loss in neonates occurs from the scalp.

11. Ans. (d) Charcot joints

Ref: *Nelson 20th ed. pg. 2050-51*

- Congenital syphilis can lead to development of rare hypersensitivity phenomenon like soft tissue gumma.
- Depression of nasal route as a result of syphilitic rhinitis destroying the adjacent bone and cartilage leads to saddle nose.
- Osteochondritis is painful and results in inability to move the involved extremity and is called as pseudo-paralysis of parrot.
- Seen in late congenital syphilis clutton joints are unilateral or bilateral painless joint swelling (usually involving knees) from synovitis with sterile synovial fluid. Spontaneous remission occurs after several weeks.
- *Charcot joints are seen in Tabes dorsalis in adult patient of syphilis.*

12. Ans. (a) α FP

Ref: *Nelson 20th ed. P 2802*

- Failure of closure of the neural tube allows excretion of fetal substances (α -fetoprotein [α FP], *acetylcholinesterase*) into the amniotic fluid, serving as biochemical markers for a NTD.
- Prenatal screening of maternal serum for α FP in the 16th-18th week of gestation is an effective method for identifying pregnancies at risk for fetuses with NTDs *in utero*.

Extra Mile

- Inhibin-A is a part of quadruple test for Down syndrome screening.
- Inhibin-B has negative feedback on FSH.
- It is used as tumor marker for granulosa cell tumor.

13. Ans. (c) Constricted

Ref: *Advanced Pediatric Assessment, By Ellen M. Chiocca; p 320*

- Pupil size is measured against a standardized size gauge; the normal range in infants and children is 2–6 mm
- Infants normally have miotic (constricted) pupils. Children normally have larger pupils than infants or adults.

14. Ans. (a) Mother intake of estrogen

Ref: *OP Ghai 8th ed. P 135*

- Transient breast enlargement in the newborn has been reported in 20% to 30% of newborn babies. It is usually the result of the transplacental transfer of maternal and placental estrogens.
- Engorged breasts should not be squeezed or massaged as it could lead to soreness and infection.

15. Ans. (a) *Klebsiella pneumoniae*

Ref: *AIIMS Newborn Protocols*

- Data from National Neonatal Perinatal Database 2000 suggests that *Klebsiella pneumoniae* and *Staphylococcus aureus* are the most common causes of neonatal sepsis in India.
- Worldwide, the most common cause is Group B *Streptococcus*
- Neonatal sepsis is the second most common cause of neonatal mortality contributing to 23% of all neonatal deaths.

16. Ans. (a) 5 mg%

Ref: *Nelson, 20th ed. pg. 1928*

Since the neonate developed Jaundice on day 3 of life it indicates physiological jaundice. It appears when total serum bilirubin exceeds 5 mg% and progresses in cephalocaudal direction.

Dermal pressure may reveal the anatomic progression of

1. Face = 5 mg/dL
2. Mid-abdomen = 15 mg/dL
3. Soles = 20 mg/dL

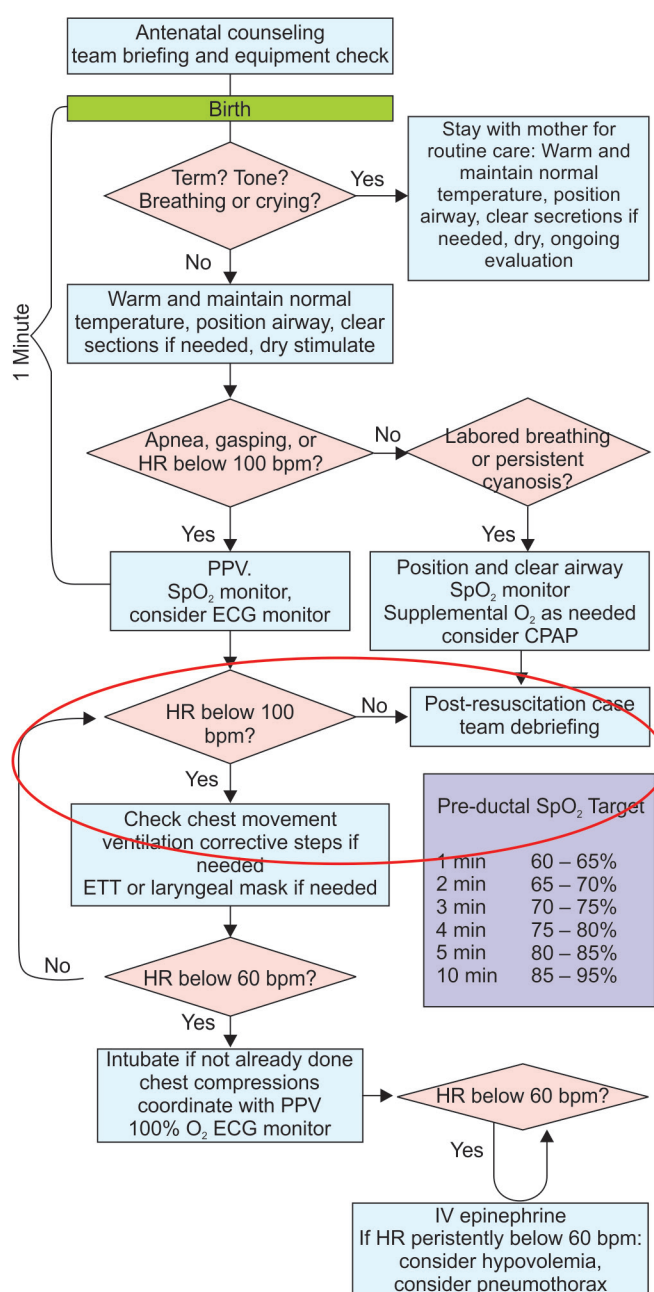

Numbers here indicate progression of Jaundice

- The yellow color usually results from the accumulation of *unconjugated, nonpolar, lipid-soluble bilirubin pigment in the skin*.
- This unconjugated bilirubin is an end product of heme-protein catabolism from a series of enzymatic reactions by heme-oxygenase and biliverdin reductase and non-enzymatic reducing agents in the reticuloendothelial cells

17. Ans. (b) Check chest movement

Ref: 2016 Update on Neonatal Resuscitation by AAP

- Since 30 seconds of PPV has already been administered and heart rate is still less than 100/min, check chest movement to take ventilation corrective steps.
- It could be that the face mask used is not of appropriate size or proper seal was not obtained leading to impaired ventilation.
- If the heart rate stabilizes to 100/min and spontaneous respiration is established then continue supplemental oxygen and post resuscitation care should be established.
- It is a must for you to know neonatal resuscitation. So please write down the algorithm and read it one day before the examination. For adult resuscitation protocol refer to the medicine section.

18. Ans. (a) Atopic dermatitis

Ref: Nelson, 20th ed. pg. 1096

- The most common chronic relapsing skin disease seen in infancy and childhood is atopic dermatitis.
- Affects 10–20% of children worldwide
- Frequently occurs in families with asthma, allergic rhinitis, and food allergy.
- “**Atopic march.**” is a term used to define infants with Atopic Dermatitis is predisposed to developing allergic rhinitis and/or asthma later in childhood.

Major Clinical Features of Atopic Dermatitis

Pruritus
Facial and extensor eczema in infants and children
Flexural eczema in adolescents
Chronic or relapsing dermatitis
Personal or family history of atopic disease

19. Ans. (a) Respiratory rate

Ref: OP Ghai, 8th ed. pg. 126

- **Apgar score:** A numerical expression of condition of new born infant, usually determined at 1 minute and 5 minute after birth.
- Can be remembered as APGAR (Appearance, Pulse rate, Grimace, Activity, RESPIRATORY EFFORT)
- Remember, its NOT respiratory rate you count in APGAR scoring, rather its respiratory effort.

	Score 0	Score 1	Score 2
Appearance	Blue or pale all over	Blue at extremities	Pink all over
Pulse rate	Absent	<100	>100

Contd...

FMGE Solutions Screening Examination

826

	Score 0	Score 1	Score 2
(Grimace) Reflex irritability	No response	Grimace	Cry or pull away when stimulated
Activity	None	Some flexion	Flexed arms and legs that resist extension
Respiratory effort	Absent	Weak, irregular, gasping	Strong, lusty cry

Total score : 10
 No distress : 7–10
 Mild distress : 4–6
 Severe distress : 0–3

20. Ans. (c) 3 min

Ref: OP Ghai, 8th ed. pg. 144

HOW TO TAKE ARMPIT (AXILLARY) TEMPERATURES in new born

- Place the tip of the thermometer in a dry armpit.
- Close the armpit by holding the elbow against the chest for 3 minutes.
- Remove the thermometer after you hear the signal (usually a series of beeps) and read the temperature on the screen.
- A child has a fever if the armpit temperature is over 99°F (37.2°C). If you're not sure if it is correct, check it by taking a rectal temperature.

21. Ans. (c) Lambdoid suture

Ref: OP Ghai, 8th ed. pg. 41

- Well you can look at the diagram for the logic and memorize the diagram as it will help you in anatomy also.

- Lambdoid suture corresponds with posterior fontanelle.

22. Ans. (a) Rh incompatibility

Ref: OP Ghai, 8th ed. pg. 175

- Most common cause of pathological jaundice in children is Rh incompatibility.
- Characteristics of pathological jaundice**
 - Appears within first 24 hours of birth
 - Peak values exceed >15 mg%
 - Rate of rise of Serum bilirubin >5 mg/dL/day

Management

Principles of Phototherapy

Configurational isomerization	Z isomer converted to E isomer which is excreted slowly
Structural isomerization	Bilirubin converted to lumirubin which is rapidly excreted and responsible for phototherapy induced decline in TSB

- Phototherapy:** Start phototherapy if serum bilirubin > 15 mg% or >12 mg% in preterm baby.
- Exchange transfusion:** Done via the umbilical vein. O negative blood used for double volume exchange transfusion.

23. Ans. (d) CRP

Ref: Nelson, 18th ed. chapter 176

- CRP, an acute phase reactant is produced by liver and turns positive in sepsis.
- Other abnormalities in sepsis are:**
 - Hematologic abnormalities include thrombocytopenia, prolonged prothrombin and partial thromboplastin times,
 - Reduced serum fibrinogen levels and elevated fibrin split products, and anemia.
 - Elevated neutrophil and increased immature forms (bands, myelocytes, promyelocytes), vacuolation of neutrophils, toxic granulations, and Döhle bodies can be seen with infection.
 - Neutropenia is an ominous sign of overwhelming sepsis.

24. Ans. (a) Jaundice is prolonged due to cephal-hematoma

Ref: Harrison, 18th ed. chapter 61

- Cephalhematoma is seen due to birth trauma, and represents sub-periosteal hemorrhage.
- The hematoma is limited sharply by the margins of the bone and does not cross suture lines.
- In first 2 weeks, the hematoma is of soft tissue density due to its blood contents and X skull films show the swelling as a soft tissue "mass" which is limited at its margins by the cranial sutures.

25. Ans. (b) Late congenital syphilis

Ref: OP Ghai, 8th ed. pg. 273

It is a common pattern of presentation for congenital syphilis, and consists of three phenomena *aka* **Hutchinson triad**:

- Interstitial keratitis
- Hutchinson incisors
- Eighth nerve deafness.

26. Ans. (d) Hydrocephalus

Ref: OP Ghai, 8th ed. pg. 272

The classic Triad for Congenital Rubella Syndrome is:

1. Sensorineural deafness (58% of patients)
2. Eye abnormalities—especially retinopathy, cataract and microphthalmia (43% of patients)
3. Congenital heart disease—especially patent ductus arteriosus (50% of patients)

*“Salt-and-pepper” retinopathy is the most common ocular manifestation of congenital rubella.

Other Manifestations of CRS may Include:

- Spleen, liver or bone marrow problems
- Mental retardation
- Microcephaly^Q
- Eye defects
- Low birth weight
- Thrombocytopenic purpura (presents as a characteristic blueberry muffin rash)^Q
- Hepatomegaly
- Micrognathia

27. Ans. (c) Congenital syphilis

Ref: OP Ghai, 8th ed. pg. 182, 273

Early manifestations of congenital infection vary and involve multiple organ systems.

- About 60% of infants born with congenital syphilis are asymptomatic at birth.

- Symptoms develop within the first 2 months of life. In symptomatic infants, the *most common physical finding, seen in 100% of cases, is hepatomegaly.*
- The other common findings are skeletal abnormalities, rash, and generalized lymphadenopathy.
- Radiographic abnormalities, periostitis or osteitis, involve multiple bones. Sometimes, the lesion is painful and an infant will favor an extremity (pseudopalsy).
- The rash is maculopapular and may involve palms and soles. In contrast to acquired syphilis, a vesicular rash and bullae may develop. These lesions are also highly contagious.
- Mucosal involvement may present as rhinitis (“*snuffles*”). Nasal secretions are highly contagious.
- Hematological abnormalities include anemia and thrombocytopenia.

Late-onset congenital syphilis (diagnosed >2 y)

Manifestations include neurosyphilis and involvement of the teeth, bones, eyes, and the eighth cranial nerve, as follows:

1. Bone involvement - Saber shins^Q, saddle nose
2. Teeth involvement - Notched, peg-shaped incisors (Hutchinson teeth)^Q
3. Pigmentary involvement - Linear scars (rhagades)^Q at the corners of the mouth
4. Interstitial keratitis - Presents in the first or second decade of life
5. Sensory-neural hearing loss (eighth cranial nerve deafness)
6. Classic Hutchinson triad^Q - (1) defective incisors, (2) interstitial keratitis, (3) eighth cranial nerve deafness.

28. Ans. (b) Two weeks

Ref: OP Ghai, 8th ed. pg. 172

- Physiological jaundice is seen in most infants due to elevation of un-conjugated bilirubin concentration during their first week.
- **Term infants** - Jaundice lasts for about 10 days with peak of serum bilirubin up to 15 mg/dL by 3 days of age.
- **Preterm infants** - Jaundice lasts for about two weeks, with a rapid rise of serum bilirubin up to 12 mg/dL.

Mechanisms involved in physiological jaundice are mainly:

- Relatively low activity of the enzyme glucuronosyl transferase^Q
- Shorter life span of fetal red blood cells^Q, being approximately 80 to 100 days in a full term infant, compared to 100 to 120 days in adults.
- Relatively low conversion of bilirubin to urobilinogen by the intestinal flora^Q, resulting in relatively high absorption of bilirubin back into the circulation.

FMGE Solutions Screening Examination

828

29. Ans. (d) 8-9 hrs

- There is no gas in the abdomen of a new born baby. It takes 8 hours for the air to reach the descending colon and performing the X-ray shall be useful.
- Invertogram in neonates with suspected ano-rectal malformations should be done after 24 hours of life.

30. Ans. (c) Tickle the sole

Ref: Chapter 100: Delivery Room Emergencies: Nelson 18th edn.

Immediately after birth, an infant in need of resuscitation should be placed under a radiant heater and dried (to avoid hypothermia), *positioned head down and slightly extended, the airway cleared by suctioning, and gentle tactile stimulation provided (slapping the foot, rubbing the back).* Simultaneously, the infant's color, heart rate, and respiratory effort should be assessed

31. Ans. (a) Succimer

Ref: Nelson 20th edn. pg. 3433

Children with blood lead levels >45 µg/dL require 2, 3 Dimercaptosuccinic acid/succimer.

32. Ans. (d) Done for babies with cyanosis

Ref: OP Ghai, 8th ed. pg. 148

- **Kangaroo care** is a technique practiced on newborn, usually preterm, infants wherein the infant is held, skin-to-skin, with an adult.
- The kangaroo position provides ready access to nourishment.
- The parent's stable body temperature helps to regulate the neonate's temperature more smoothly than an incubator, and allows for readily accessible breastfeeding.
- Babies who are eligible for kangaroo care include pre-term infants, weighing less than 1,500 grams, and breathing independently.
- Cardiopulmonary monitoring, oximetry, supplemental oxygen or nasal (continuous positive airway pressure) ventilation, intravenous infusion, and monitor leads do not prevent kangaroo care.
- Babies who are in kangaroo care tend to be less prone to apnea and bradycardia and have stabilization of oxygen needs.

33. Ans. (a) Baby fed with a bottle finding it difficult and confusing to suckle at breast

Ref: OP Ghai, 8th ed. pg. 153

- A problem that may beset a bottlefed baby in which it forgets how to nurse on mother's nipple

- Breastfeeding requires far more vigorous mouth and tongue motions and greater muscle coordination than bottlefeeding.
- On bottle nipples or even pacifiers, a newborn can forget how to nurse properly.
- This confusion can lead to diminished or discontinued nursing. Nipple confusion is usually not a concern after the early weeks, once the baby is nursing well.

34. Ans. (a) Diaphragmatic hernia

Ref: OP Ghai, 8th ed. pg. 129

- In diaphragmatic hernia: Bag and mask will lead to over-distention of the stomach which is already lying in chest cavity. This will worsen the mediastinal shift and compress the ipsilateral lung further leading to worsening of the patient.
- Bag and mask ventilation is also not to be done in meconium aspiration syndrome. In choice C, it is written meconium ileus.

35. Ans. (d) Orthopnea

Ref: OP Ghai, 8th ed. pg. 397-98

- Breathing difficulty in children when lying down is a condition in which a child has trouble catching his or her breath or breathing normally when lying down. Breathing difficulty in children when lying down (pediatric orthopnea) includes:
 - Airway obstruction e.g., foreign object
 - Chronic obstructive pulmonary disease
 - Cystic fibrosis
 - Cor pulmonale
 - Heart failure
- Baby feels better when held against shoulders.

36. Ans. (d) β_2 transferrin

- Macrophages in human milk may synthesize complement, lysozyme, and lactoferrin. Breast milk contains lactoferrin, an iron-binding whey protein that is normally saturated with iron and has an inhibitory effect on the growth of *Escherichia coli* in the intestine.
- Further, the lower pH of the stool of breast-fed infants is thought to contribute to the favorable intestinal flora of these infants compared with formula fed infants (more bifidobacteria and lactobacilli; fewer *Escherichia coli*), and this helps protect against infections caused by some species of *E. coli*.

37. Ans. (b) Vasodilation

Ref: Nelson's, 18th ed. Ch. 97.2

Supplemental O₂ helps in vasoconstriction and ductal closure. Both functional and anatomical closure of ductus arteriosus is attributed to increasing O₂ levels. Increased O₂

is also responsible for neovascularization and development of retinopathy of prematurity.

Oxygen causes tissue injury through the formation of reactive oxygen intermediates and peroxidation of membrane lipids.

38. Ans. (b) 8

Ref: OP Ghai, 8th ed. pg. 155

Expressed breast milk can be stored in:

- Room temperature-for 8 hours
- Refrigerator-for 24 hours
- Deep freezer-for 3 months

39. Ans. (a) 24 hours later but within 72 hours

Ref: OP Ghai, 8th ed. pg. 172

Presence of any of the following signs denotes that the jaundice is pathological

- Clinical jaundice detected before 24 hours of age
- Rise in serum bilirubin by more than 5 mg/dL/day
- Serum bilirubin more than 15 mg/dL
- Clinical jaundice persisting beyond 14 days of life
- Clay/white colored stool and/or dark urine staining the clothes yellow.
- Direct bilirubin >2 mg/dL at any time.

Characteristics of Physiological Jaundice

- First appears between 24–72 hours of age
- Maximum intensity seen on 4–5 th day in term and 7th day in preterm neonates.
- Does not exceed 15 mg/dL.
- Clinically undetectable after 14 days.
- No treatment is required but baby should be observed closely for signs of worsening jaundice.

40. Ans. (b) Carbohydrate

Ref: OP Ghai, 8th ed. pg. 8–9

- In order to supply the fetus with energy, the pregnant woman increases her hepatic glucose production by 16–30%. The transfer of glucose from the maternal circulation to the fetus takes place by facilitated diffusion involving glucose transporter 1. (GLUT1)
- A considerable part of the trans-placentally transferred glucose is used by the fetal brain. Although enzyme systems that are necessary for glucose production (gluconeogenesis) develop early, the fetus only produces its own glucose under extreme condition such as during maternal starvation.

41. Ans. (a) 3:1

Ref: Ghai, 7th ed. pg. 691–2

- Ratio of chest compressions to rescue breaths in neonates is 3:1. In pediatric resuscitation with single rescuer, the ratio is 30:2.
- In resuscitation in adults the ratio is again 30:2 with a single/two rescuers.

Sternum should be compressed to depress approximately **one third to one half of the anteroposterior diameter** of the chest. Chest compression should be delivered providing **equal time in compression and relaxation phases.**

42. Ans. (d) Extra pyramidal cerebral palsy

Ref: Ghai, 7th ed. pg. 559–560

Extrapyramidal cerebral palsy is caused by **bilirubin encephalopathy**. It is also associated with deafness.

Clinical Manifestations Include:

- Dyskinesia such as athetosis, choreiform movements, dystonia, tremors and rigidity
- **Early indicator is inability to reach for and grasp a dangling ring by the age of 6 months.**

Types of Cerebral palsy

Spastic cerebral Palsy: Most common type of cerebral palsy. It is of the following subtypes:

Spastic Quadripareisis: More in **term babies**
 Spastic Diplegia: More in **preterm babies**; associated with periventricular leukomalacia
 Spastic Hemiplegia: recognized after 4–6 months of age
 Hypotonic (atonic) cerebral palsy
 Extrapyramidal cerebral palsy/athetoid cerebral palsy:
 Kernicterus

43. Ans. (c) Vitamin K

- Vitamin K is produced by our gut flora. The gut of a New-born baby is sterile and hence no vitamin K is being produced.
- Moreover vitamin K is negligible in breast milk. *In lieu of these factors all babies are susceptible to development of Hemorrhagic disease of New-born.*
- To prevent this from happening therefore, as standard operating procedure in all hospitals injection vitamin K₁ 1 mg intramuscular is given to prevent hemorrhagic disease of new born.
- In our country where a large number of children are born via home deliveries, no vitamin K would be given to the child and therefore the *child may be brought to the hospital on day 5 with umbilical stump bleeding.*
- For management: the child should be given injection vitamin K 1mg intravenously. If bleeding is still present then FFP needs to be administered.

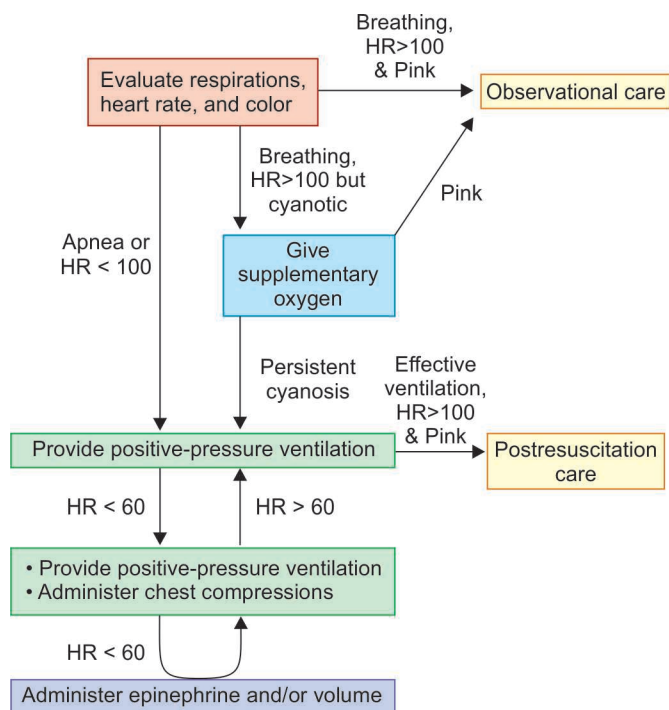

Extra Mile

- Type of vitamin K used for treatment of H.D.N= vitamin K₁
- Umbilical stump bleeding in child on day 1 of life= factor 13 deficiency
- Umbilical stump bleeding in child on day 5 of life= H.D.N
- Male baby with excessive circumcision bleeding= Hemophilia A
- Vaginal bleeding in a girl child on day 5 of life= No intervention required (occurs due to transplacental transfer of hormones)

44. Ans. (c) AMBU Bag Ventilation for 30 seconds with heart rate of 50

Ref: Nelson, 18th ed. Chapter 100,

- If the heart rate does not improve after 30 sec with bag and mask (or endotracheal) ventilation and remains below 100/min, ventilation is continued and chest compression should be initiated over the lower third of the sternum at a rate of 120/min. The ratio of compressions to ventilation is 3:1.
- If the heart rate remains <60 despite effective compressions and ventilation, administration of epinephrine should be considered.
- AAP guidelines are given below.

MILESTONES IN CHILDREN

45. Ans. (b) 20–49

Ref: Nelson 20th ed. P 217

IQ range	Classification
140 and over	Genius or near genius
120–140	Very superior intelligence
110–120	Superior intelligence
90–110	Normal or average intelligence
80–90	Dullness
70–80	Borderline deficiency
50–69	Moron
20–49	Imbecile
Below 20	Idiot

TABLE: Identification of cause in children with severe intellectual disability

Cause	Examples	Percent of total
Chromosomal disorder	Trisomies 21, 18, 13 Klinefelter syndrome	~20
Genetic syndrome	Fragile X syndrome Prader-Willi syndrome Rett syndrome	~20
Nonsyndromic autosomal mutations	Variations in copy number, <i>de novo</i> mutations in <i>SYNGAP 1</i> , <i>GRIK2</i> , <i>TUSC3</i>	~10
Developmental brain abnormality	Hydrocephalus ± meningocele, lissencephaly	~8
Inborn errors of metabolism or neurodegenerative disorder	PKU, Tay-Sachs	~7
Congenital infections	HIV, toxoplasmosis, rubella, CMV, syphilis, herpes simplex	~3
Perinatal causes	HIE, meningitis, IVH, PVL, fetal alcohol syndrome	4
Postnatal causes	Trauma (abuse), meningitis, hypothyroidism	~4
Unknown	Cerebral palsy	~20

46. Ans. (a) 7 months

Ref: OP Ghai, 8th ed. pg. 49

- Lets evaluate data step wise to arrive at answer.
 1. Baby can sit in tripod position by 5th month.
 2. Bi dextrous approach by 5th month.
 3. Monosyllables by 6th month.
 4. Stranger anxiety by 7th month.

47. Ans. (a) 12 weeks

Ref: OP Ghai, 8th ed. pg. 52

There are Two Types of Smiles for Babies

- The *spontaneous* or almost reflexive smile that can occur early in the newborn period.
- The *social smile* that occurs in response to something, like when you talk or sing to baby
- The social smile is a developmental milestone that infants reach when they are one to two months old.
- *Not having a social smile by three months of age is a red flag for child to be evaluated by an expert.*

48. Ans. (b) 6 months

Ref: OP Ghai, 8th ed. pg. 142

- **Moro reflex persists until 6 months.** It is sometimes referred to as the startle reflex.
- The Moro reflex is present at birth, peaks in the first month of life, and *completely disappears around 6 months of age.*
- It is likely to occur if the infant's head suddenly shifts position, the temperature changes abruptly, or they are startled by a sudden noise.
- **The legs and head extend while the arms jerk up and out with the palms up and thumbs flexed. Shortly afterward the arms are brought together and the hands clench into fists, and the infant cries loudly.**
- *Bilateral absence* of the reflex may be linked to damage to the infant's central nervous system, while a *unilateral absence* could mean an injury due to birth trauma (e.g., a fractured clavicle or injury to the brachial plexus). Erb's palsy or some other form of paralysis is also sometimes present in such cases.

49. Ans. (a) Prematurity

Ref: OP Ghai, 8th ed. pg. 124

- Most common cause of neonatal mortality in India is prematurity (obviously lack of hospital care).
- Metabolic causes like hypoglycemia infant of diabetic mother, can be asked in questions.

50. Ans. (c) 6 Months

Ref: OP Ghai, 8th ed. pg. 154

- Head lag disappears by 3 months
- Head control is achieved by 4 months
- A child in prone position at 3 months can lift chin off the bed, but it takes a while for the shoulder muscles to develop sufficient strength so as to lift the chest and head off the bed. This activity would be possible by 6 months
- Wave bye-bye by 9 months
- Stand without support at 12 months
- Run by 18 months

BREASTFEEDING

51. Ans. (c) Amino acid based formula

Ref: Nelson, 20th ed. pg. 288-89

- Most common cause associated with food intolerance during infancy: **Cow's milk proteins > Soyabean milk**
- Nearly, 50% of children affected by cow's milk protein intolerance develop soy protein intolerance as well if they are fed with soy based formulas.
- Therefore soy-based formulas should not be used for the treatment of cow's milk protein intolerance

Management of Cow Milk Protein Allergy

Exclusively breast fed child	Formula fed child
Maternal exclusion diet avoiding food containing Cow Milk Protein and hen's eggs is advised, since these are excreted in breast milk.	Elimination diet and avoid egg protein The elimination diet should be continued for a minimum of 2 weeks, and up to 4 weeks in cases of atopic dermatitis or allergic colitis.
If no improvement start Extensively hydrolyzed formula feed (eHF)	If no improvement, start <i>amino acid based formula</i>

- Use complete milk protein hydrolysates in infants who cannot be breastfed. Occasionally, children may develop intolerance toward complete hydrolysed formulas. In these cases, use amino acid-based formulas, which are now widely available and are balanced in trace elements and vitamins.

52. Ans. (b) **Baby's lower lip is inverted**

Correct Positioning During Breast feeding

1. The mother should be seated comfortably in an upright position, so that her breasts fall naturally and she has good support for her back, arms and feet
2. The infant should be supported behind the shoulders and facing the mother, with his or her body flexed around the mother's body. The position must be a comfortable drinking position for the infant
3. The chin should be tucked well into the breast, and the infant's mouth should be wide open, with the bottom lip curled back. More areola will be evident above the infant's top lip than below the bottom lip
4. After an initial short burst of sucking, the rhythm will be slow and even, with deep jaw movements that should not cause the mother any discomfort – pauses are a normal part of the feed and they become more frequent as the feed continues
 - If the cheeks are being sucked in or there is audible 'clicking', the infant is not attached correctly
 - The infant should stop feeding of his or her own accord by coming off the breast spontaneously

53. Ans. (c) **Lower areola is more visible than upper**

Ref: OP Ghai, 8th ed. pg. 154

Please refer to above explanation.

54. Ans. (d) **6 months**

Ref: OP Ghai, 8th ed. pg. 150

- Exclusive breast feeding is up to 6 months and should be continued upto 2 years.
- Prelacteal feeds like water, honey, and so called health tonics are contraindicated in children less than 6 months of age.

55. Ans. (d) **Avidin**

Ref: Nelson, 18th ed. Chapter 42

- Human milk contains a variety of cells, including macrophages, T cells, stem cells, and lymphocytes.
- In early lactation, the breastfed infant may consume as many as 10^{10} maternal leukocytes per day.
- About 80% of the cells in early milk are breast milk macrophages, which originate as peripheral blood monocytes that exit the bloodstream and migrate into milk through the mammary epithelium.
- The proteins of human milk are divided into the whey and casein fractions or complexes, with each comprising of a remarkable array of specific proteins and peptides.

- The most abundant proteins are casein, α -lactalbumin, lactoferrin, secretory immunoglobulin IgA, lysozyme, and serum albumin.

56. Ans. (c) **Lower lip of infant is inverted**

Ref: OP Ghai, 8th ed. pg. 154

- The basic concept is that when the child suckles the breast the lower lip should be EVERTED.

57. Ans. (d) **Taurine**

Clinical studies have elucidated various mechanisms by which taurine promotes brain development, the main effect being on neurotransmitter production. In previous year same question was asked with different choices and you need to remember that DHA- Docosa Hexanoic Acid plays an important role in brain myelination in infants. Infact studies have shown that IQ of breast fed baby is higher than that of cow milk fed baby with DHA making all the difference.

GROWTH AND DEVELOPMENT

58. Ans. (b) **16 weeks**

Ref: Rudolph Paediatrics, 22nd ed. pg. 183

Must know time line for fetal development

Appearance of fetal pole shadow (USG)	5–6 weeks fertilization
Heart beat (USG)	6–7 weeks
Erythropoiesis	
In liver	6 weeks
In bone marrow	16 weeks
Development of lymphocytes	
In thymus	9 weeks
In lymph nodes	10 weeks
Breathing movement	11–12 weeks
Swallowing reflex	16 weeks
Appearance of meconium	20 weeks
Secretion of urine	End of first trimester

59. Ans. (a) **Prematurity**

- Prenatal ultrasonography shows no testicular descent before 28 weeks' gestation, other than transabdominal movement to the internal inguinal ring.

- Transinguinal migration, thought to be under hormonal control, occurs at 28–40 weeks' gestation, usually resulting in a scrotal testis by the end of a full term of gestation

TABLE: New ballard scoring for determining prematurity

	-1	0	1	2	3	4
Skin	Sticky friable transparent	Gelatinous red, translucent	Smooth pink, visible veins	Superficial peeling &/or rash. Few veins	Cracking pale areas rare veins	Parchment deep cracking no vessels
Plantar surface	Heel-toe 40-50 mm: -1 < 40 mm: -2	> 50 mm no crease	Faint red marks	Anterior transverse crease only	Creases ant. 2/3	Creases over entire sole
Breast	Imperceptible	Barely perceptible	Flat areola no bud	Stippled areola 1–2 mm bud	Raised areola 3–4 mm bud	Full areola 5-10 mm bud
Eye/Ear	Lids fused loosely; -1 tightly; -2	Lids open pinna flat stays folded	Slightly Curved pinna; soft; slow recoil	Well-curved pinna; soft but ready recoil	Formed & firm instant recoil	Thick cartilage ear stiff
Genitals Male	Scrotum flat, smooth	Scrotum empty faint rugae	Testes in upper canal	Testes descending few rugae	Tests down good rugae	Testes pendulous deep rugae
Genitals Female	Clitoris prominent labia flat	Prominent clitoris small labia minora	Prominent clitoris enlarging minora	Major & minora equally prominent	Major large minora small	Major cover clitoris & minora

60. Ans. (d) 20 teeth

- All 20 teeth (10 in the upper jaw and 10 in the lower jaw) have come in by the time the child is 2 ½ to 3 years old. The complete set of primary teeth is in the mouth from the age of 2 ½ to 3 years of age to 6 to 7 years of age.
 - ♦ Basic rule of thumb is that approximately 4 teeth will erupt for every 6 months of life.
 - ♦ Lower teeth erupt before upper teeth with teeth in both jaws usually erupting in pairs.
 - ♦ Primary teeth are whiter and smaller in color than the permanent teeth that will follow.
 - ♦ By the time a child is 2 to 3 years of age, all primary 20 teeth should have erupted.
- Shortly after age 4, the jaw and facial bones of the child begin to grow, creating spaces between the primary teeth.
- Between the ages of 6 and 12, a mixture of both primary teeth and permanent teeth reside in the mouth.

61. Ans. (c) 7 months into scrotum

Ref: OP Ghai, 8th ed. pg. 540

From the 3rd month of pregnancy and its end the testes migrate from the lumbar area to the future scrotum.

This transfer is secondary to

- Combination of growth processes and hormonal influences.

- Gubernaculum testis also plays a decisive role in this phenomenon.
- Scrotum is empty at 7 months. The testis descends into inguinal canal at 7 months.

62. Ans. (c) Truancy

- **Pre-school children are classified as children between 2 to 5 years. The usual problems seen are:**

1. **Temper tantrums** Control is a central issue.
Tantrums normally appear toward the end of the 1st yr of life and peak in prevalence between 2 and 4 yr of age. Tantrums lasting more than 15 min or regularly occurring more than 3 times/day may reflect underlying medical, emotional, or social problems
2. Sleep problems
3. Pica involves repeated or chronic ingestion of non-nutritive substances, which may include plaster, charcoal, clay, wool, ashes, paint, and earth.

- **Truancy is seen in school going children. Truancy and run-away behavior are never** developmentally appropriate. Approximately ½ of school refusal incidents result from child and adolescent behavioral problems; the other ½ of incidents are related to mood and anxiety symptoms. **Often, truancy represents disorganization within the home, developing personality problems, or both.**

FMGE Solutions Screening Examination

63. Ans. (c) **Thelarche**Ref: Nelson, 18th ed. Adolescence: chapter 12**IN GIRLS**

- The first visible sign of puberty and the hallmark of SMR2 (Sexual maturity rating) is the **appearance of breast buds**, between 8 and 12 yr of age.
- Menses typically begins 2–2½ yr later, during SMR3–4 (median age, 12 yr), around the peak height velocity.

IN BOYS

- **The first visible sign of puberty and the hallmark of SMR2 is testicular enlargement, beginning as early as 9½ yr.** This is followed by penile growth during SMR3. Peak growth occurs when testis volumes reach approximately 9–10 cm³ during SMR4.
- Under the influence of LH and testosterone, the seminiferous tubules, epididymis, seminal vesicles, and prostate enlarge. The left testis normally is lower than the right. Erections are common, and nocturnal emissions may occur. The voice deepens, and linear growth is accelerated.

Also remember: Precocious puberty is defined as the onset of secondary sexual characteristics before 8 year of age in girls and 9 year in boys.

64. Ans. (d) **5 yrs**

- OP ghai states enuresis as urinary incontinence beyond the age of 4 years for daytime and 6 years for night-time enuresis.
- It is said to be present if it occurs twice per week for 3 consecutive months.
- Most of children attain complete bladder control by age of 5 years
- The prevalence of enuresis is 7% in boys and 3% in girls at age of 5 years and keeps on decreasing for every subsequent year.
- Treatment of choice for nocturnal enuresis is alarm devices with desmopressin nasal spray.

65. Ans. (d) **12 g%**Ref: Nelson, 18th ed. Table 447-1**TABLE:** Hematologic values during infancy and childhood

Hemoglobin (G/DL)		
Age	Mean	Range
Cord blood	16.8	13.7–20.1
2 week	16.5	13.0–20.0
3 month	12.0	9.5–14.5

Contd...

Hemoglobin (G/DL)		
6 mo–6 year	12.0	10.5–14
7–12 year Adult	13.0	11.0–16.0
Female	14	12.0–16.0
Male	16	14.0–18.0

66. Ans. (d) **Behavior modification**Ref: Nelson, 18th ed. Chapter 573

- In children with overactive bladder, urge incontinence, and dysfunctional voiding, voiding at predetermined times aids in retraining the child to exercise voluntary bladder control.
- Behavioral modification has remained the mainstay of treatment for daytime wetting. These measures focus on relearning and training the normal responses from the bladder and urethra.
- Bladder irritants such as caffeine should be eliminated from the diet.
- The child voids on waking, and subsequently at least every 2 h, during waking hours. As urgency improves, the interval between voids can be extended. In children with infrequent voiding, in whom an elevated PVR volume is encountered, double voiding will both increase functional bladder capacity and decrease the risk of infection.

67. Ans. (a) **Malnutrition**Ref: Nelson, 18th ed. Chapter 45

- **Rickets**, a disease of growing bone, occurs in children due to malnutrition in India. It occurs before fusion of the epiphyses, and is due to un-mineralized matrix at the growth plates.
- Earliest presentation is craniotables and presentation after 6 months of age is widening of Bilateral wrist joints.

68. Ans. (b) **3 years**Ref: Nelson, 18th ed. Chapter 9**Milestones at 3 years of age**

1. Can tell age gender and recall story
2. Rides tricycle
3. Stands momentarily on one foot
4. Makes tower of 10 cubes; imitates construction of “bridge” of 3 cubess
5. Copies circle
6. Imitates cross
7. Plays simple games (in “parallel” with other children)
8. Helps in dressing (unbuttons clothing and puts on shoes)
9. Washes hands

69. Ans. (d) All of the above

Ref: OP Ghai, 8th ed. pg. 59

- Attention deficit hyperactivity disorder in the (ICD-10) is a psychiatric disorder of the neurodevelopmental type in which there are significant problems of attention, hyperactivity, or acting impulsively that are not appropriate for age.
- Symptoms must begin by age six to twelve years and persist for more than six months for a diagnosis to be made. In school-aged individuals inattention symptoms often result in poor school performance

Symptoms

1. Inattention
2. Hyperactivity (restlessness in adults)
3. Disruptive behavior, and
4. Impulsivity, are common in ADHD
 - Academic difficulties are frequent as are problems with relationships. Based on the presenting symptoms ADHD can be divided into three subtypes predominantly inattentive, predominantly hyperactive-impulsive, or combined.

An individual with hyperactivity may have some or all or the following symptoms:

- Fidget and squirm in their seats.
- Talk nonstop.
- Dash around, touching or playing with anything and everything in sight.
- Have trouble sitting still during dinner, school, doing homework, and story time.
- Be constantly in motion.
- Have difficulty doing quiet tasks or activities.

70. Ans. (d) Shoulder

Ref: Ghai, 8th ed. pg. 6

Skeletal age determination	
Age	X-ray
Newborn	Knee
Infant between 3-9 months	Shoulder
1-13 years	Single film of Hand & Wrist
12-14 years	Elbow & hip

71. Ans. (a) Between incisors

Ref: Shafer's Textbook of Oral Pathology, 6th ed. pg. 46

- Supernumerary tooth or hyperdontia refers to presence of an extra tooth. It can be one or more than one.
- It develops from third tooth bud arising from the dental lamina near the permanent tooth bud or possibly by splitting of permanent tooth bud itself.

- The most common location is anteriorly between the maxillary incisors

72. Ans. (b) 5 months

Ref: O.P Ghai, 8th ed. pg. 4

Birth weight doubles at 5 months, triples in an year and is four times at 2 years and becomes 5 times at 3 years.

Note: Newborns lose 10% of body weight in first ten days due to loss of extracellular water, after which they gain 25-30 g/day for first 3 months of life.

73. Ans. (d) 4 years

Ref: O.P Ghai, 8th ed. pg. 5

Time	Length
At birth	50 cm
3 months	60 cm
9 months	75 cm
2 years	90 cm
4 1/2 years	100 cm

Indian children gain 5 cm height every year until 10 years of age.

74. Ans. (b) 6 years

Ref: Nelson, 18th ed. Ch 8

75. Ans. (c) 100 words

Ref: Nelson's, 18th ed. ch: 32.2

76. Ans. (c) 5 years

Ref: Nelson's, 18th ed ch: 9

77. Ans. (d) Walk short distance

Ref: Nelson, 18th ed. chapter 10

Hide and seek game	Not mentioned but by my experience >3 years
Do not confuse with peak a boo	
Write alphabet	6 years
Say short sentence	2 years
Walk short distance	18 months

78. Ans. (d) Social smile at 3 months

79. Ans. (c) Hb = 12 g/dL

Ref: OP Ghai, 8th ed /298

Hemoglobin levels below 12 g/dL in children from 6 months to 6 years and below 13 g/dL in older children is suggestive of anemia.

FMGE Solutions Screening Examination

836

80. Ans. (b) 2.5–3 years

Ref: OP Ghai, 8th ed. pg. 52 Table 3.3

By the age of three years a child can tell his/her age and gender. They can recall experiences for example - a child ate my lunch in the play school

Extra Mile

- Child can draw a circle by the age of = 3 years
- Autism diagnosis in children can be made by age of = 3 years
- ADHD diagnosis in children by the age of = 6 years
- Nocturnal enuresis cut off age = 6 years

81. Ans. (d) Increase in testicular size

Please refer explanation of question 40

82. Ans. (c) 4 years

Ref: OP Ghai 8th ed./13

- Length of Indian baby at birth = 50 cm
- Length at 1 year = 75 cm
- Length at 4½ years = 100 cm
- Subsequently 5–6 cm/year
- Pubertal growth spurt = 6–8 cm/year

PROTEIN ENERGY MALNUTRITION

83. Ans. (d) Edema

Ref: OP Ghai 8th ed. P 99

- Kwashiorkor usually affects children aged 1–4 years.
- The main sign is *pitting edema*, usually starting in the legs and feet and spreading, in more advanced cases, to the hands and face.
- Because of edema, children with Kwashiorkor may look healthy because of which their parents view them as well fed.

84. Ans. (c) Marasmus

Ref: Nelson 20th ed. P 2802

- Individuals with *marasmus* appear cachectic and wasted due to long-term deficits of all nutrients, especially energy and protein.
- In *marasmus*, the normal *adaptive* response to uncomplicated *starvation* is to utilize body energy stores while preserving lean body mass, leading to a wasted appearance.

85. Ans. (b) SLC39A4

Ref: Nelson, 20th ed. pg. 3238–3239

- The image shows rash at peri-oral area, groin and spreading to involve the inguinal folds and genitals. This is seen in *acro-dermatitis entero-hepatica* and occurs due defect in the gene **SLC39A4**.
- The SLC39A4 gene encodes a transmembrane protein that is part of the zinc/iron-regulated transporter-like protein (ZIP) family *required for zinc uptake*.
- This protein is expressed in the enterocytes in the duodenum and jejunum and the patient will have a *decreased ability to absorb zinc from dietary sources*.

86. Ans. (b) Height/age

Ref: Nelson's Pediatrics, 18th ed. Ch 43

The nutritional indices commonly calculated for young children are:

- **Weight for height** – an index used to measure wasting or acute malnutrition; (WHAM)
- **Height for age** – an index used to measure stunting or chronic malnutrition; (HA-CM)
- **Weight for age** – an index used to measure underweight (or wasting and stunting combined). (WASW)
- **Mid arm circumference** is a specific indicator of wasting or acute malnutrition.

Remember:

- Weight reflects only present health status of the child, whereas height indicates events in the past also
- Most sensitive measure of physical growth- WEIGHT
- Single best parameter for assessment of physical growth- WEIGHT

87. Ans. (a) Weight/height

Please refer to above explanation.

88. Ans. (a) Wt.kg/Ht.m²

Ref: Nelson, 18th ed. chapter 44

Also note that the way we diagnose obesity in children is different from adults

BMI percentile for age	Weight status
<5th percentile	Underweight
5th–84th percentile	Normal weight
85th–94th percentile	At risk for overweight
≥95th percentile	Overweight

The obesity guidelines for adults are

BMI (kg/m ²)	Weight status
<18.5	Underweight
18.5–24.9	Normal weight

Contd...

BMI (kg/m ²)	Weight status
25–29.9	Obesity
30–39.9	Obese
40–49.9	Morbid obesity
≥50	Super morbid obesity

89. Ans. (b) <1500 g

Ref: OP Ghai, 8th ed. pg. 125

- Normal birth weight - 2800 g- 3000 g
- Low birth weight (LBW) - <2500 g
- Very low birth weight (VLBW) - <1500 g
- Extremely low birth weight (ELBW) - <1000 g.

90. Ans. (a) <1000 g

Ref: OP Ghai, 8th ed. pg. 125

Refer to above explanation

91. Ans. (a) 12.5 cm

Ref: OP Ghai, 8th ed. pg. 97

- Mid arm circumference is measured by a Field instrument → Shakir's tape
- Among age group: 1–5 yrs
- <12.5 cm shows severe malnutrition

92. Ans. (b) <2

Ref: Rudolph Pediatrics, 22th ed. pg. 191

Ponderal index = Weight in grams/ (Length of baby in cm)³ multiplied by 100

- Value is less than 2 = Asymmetrical IUGR
- Value is normal in Symmetrical IUGR
- Asymmetrical IUGR is more common. In asymmetrical IUGR, there is restriction of weight followed by length. The head continues to grow at normal or near-normal rates (head sparing). This is a protective mechanism that may have evolved to promote brain development. This type of IUGR is most commonly caused by extrinsic factors that affect the fetus at later gestational ages.
- Symmetrical IUGR is less common and is more worrisome. This type of IUGR usually begins early in gestation. Since most neurons are developed by the 18th week of gestation, the fetus with symmetrical IUGR is more likely to have permanent neurological sequelae.

93. Ans. (c) Scurvy

Ref: OP Ghai, 8th ed. pg. 120

Features of Scurvy:

- Frog leg appearance^Q

- Bone pain
- Myalgias may occur because of reduced carnitine production.
- Skin changes with roughness, easy bruising and petechiae, gum swelling & bleeding, loosening of teeth, poor wound healing.

94. Ans. (a) Kwashiorkor

Ref: Nelson's Pedia, 19th ed. Ch 670

KWASHIORKOR

Disease occurs due to decreased protein and caloric intake.

Clinical Features are:

- **Hypoalbuminemia:** Which leads to pedal edema. This pedal oedema can mask weight loss.
- **Hepatomegaly:** Hallmark feature of kwashiorkor
- **Skin:** Sun-exposed skin is relatively spared, as are the feet and dorsal aspects of the hands;
- **Hair and Nail:** Nails are thin and soft, and hair is sparse, thin, and depigmented, sometimes displaying a **flag sign** of alternating light and dark bands that reflect alternating periods of adequate and inadequate nutrition.
- Apathy^Q
- Lack of appetite^Q
 - **Pellagra** presents with edema, erythema, and **burning of sun-exposed skin on the face, neck, and dorsal aspects of the hands, forearms, and feet.**
 - **Scurvy** presents initially with follicular hyperkeratosis and **coiling of hair.** Perifollicular erythema and hemorrhage, swollen, erythematous gums; stomatitis; Subperiosteal hematomas lead to frog leg appearance (Pseudo-paralysis)

95. Ans. (b) Hepatomegaly

Ref: OP Ghai, 8th ed. pg. 99

- **Marasmus** is characterized by failure to gain weight and irritability, followed by weight loss and listlessness until emaciation results. *The skin loses turgor and becomes wrinkled and loose as subcutaneous fat disappears. Loss of fat from the sucking pads of the cheeks often occurs late in the course of the disease. The infant's face gives wizened old man's look.*
- *The abdomen may be distended or flat, with the intestinal pattern readily visible. There is muscle atrophy and resultant hypotonia.*
- **Kwashiorkor** is characterized by development of pedal edema which can mask weight loss. Dietary protein deficiency leads to brain damage and apathy, and/or irritability. *When advanced, there is lack of growth, lack*

FMGE Solutions Screening Examination

838

of stamina, loss of muscle tissue, increased susceptibility to infections, vomiting, diarrhea, anorexia, flabby subcutaneous tissues, and edema.. It is often present in internal organs before it is recognized in the face and limbs.

- Hepatomegaly due to fatty liver is seen with flag sign on hair and skin showing flaky paint dermatosis.

96. Ans: (a) Increase appetite

Ref: OP Ghai, 8th ed. pg. 99

- Kwashiorkor is protein and calorie deficiency and hence the serum albumin of the child is very low. This causes the child to develop pedal edema and generalized anasarca later.
- Since the child is not eating proteins, essential amino acids like phenylalanine is deficient and therefore the child forms less of melanin. *This results in hair of the child being reddish in color. This color change of hair strand is seen as FLAG sign.*
- The children with kwashiorkor have a FATTY liver and thereby a hepatomegaly.
- Apathy means lack of interest in surroundings and therefore this child is not interested in playing with the mother or toys. This occurs due to brain damage secondary to chronic protein deprivation.
- **Note:** Increased appetite can be seen in patients with Marasmus.

97. Ans. (c) 15,000 mcg

Ref: OP Ghai, 8th ed. pg. 113

- 1mcg of vitamin D = 400 I.U.
- For treatment of rickets, cholecalciferol can be given in a single-day dose of 15,000 mcg (600,000 U), which is usually divided into 4 or 6 oral doses. An intramuscular injection is also available.
- An alternative regimen is to give 125–250 mcg (5000–10,000 U) daily for 2–3 months until healing is well established and the alkaline phosphatase concentration is approaching the reference range.

98. Ans. (a) Pseudoparalysis

Ref: OP Ghai, 8th ed. pg. 113

- Note the distal end of radius on the left and ulna on right. Even without experience you can notice that distal end has fraying. Mentally visualize a paint brush. The distal end of bone is widened (SPRAYED).
- **Rickets due to deficiency of calcium and vitamin D will have delayed dentition which is defined as (ZERO TEETH AT >13 months of age.**
- The widening of wrist joint is seen usually beyond 6 months of age when the child starts crawling and creeping and weight of body fall on distal radius.
- Double medial malleolus
- Bowing of legs (GENU VARUM) and knock knees (GENU VALGUM) is seen.
- Pigeon chest with rachitic rosary (*non tender*).

99. Ans. (b) Aldolase-B

Ref: OP Ghai, 8th ed. pg. 696

- Hereditary fructose intolerance, or the presence of fructose in the blood (fructosemia), is caused by a deficiency of aldolase B, the second enzyme involved in the metabolism of fructose. This enzyme deficiency results in an accumulation of fructose-1-phosphate, which inhibits the production of glucose and results in diminished regeneration of adenosine triphosphate. Clinically, patients with hereditary fructose intolerance are much more severely affected than those with essential fructosuria, with elevated uric acid, growth abnormalities and can result in coma if untreated.

Remember and Don't Confuse with:

- **Essential fructosuria** caused by a deficiency of the enzyme hepatic fructokinase is a clinically benign condition characterized by the incomplete metabolism of fructose in the liver, leading to its excretion in urine.

100. Ans. (d) Decreased height for age

Ref: Nelson, 18th ed. Chapter 14

- Height for age is used for chronic malnutrition which leads to Stunting. The term "stunting" is used to describe a condition in which children fail to gain sufficient height, given their age.
- In acute malnutrition the best parameter used is weight for height.

101. Ans. (d) Apathy

Ref: Nelson, 18th ed. Chapter 43

- **Marasmus** is characterized by weight loss and listlessness until emaciation results :MONKEY FACIES
- The skin loses turgor and becomes wrinkled and loose as subcutaneous fat disappears from buttocks leading to BAGGY PANTS appearance.

- Loss of fat from the sucking pads of the cheeks often occurs late in the course of the disease; thus, the infant's face may retain a relatively normal appearance compared with the rest of the body.
- *These children are irritable and have a voracious appetite. Apathy is a feature of kwashiorkor.*
- The abdomen has muscle wasting leading to pot belly with the intestinal pattern readily visible.

PEDIATRIC NEUROLOGY

102. Ans. (b) Malignant tumor in children

Ref: OP Ghai 8th ed. P 571

Medulloblastoma

- These are midline cerebellar tumors and occur in infancy.
- They are fast growing and malignant.
- Craniospinal spread along neuraxis is common and death occurs early.

103. Ans. (b) Spinal dysraphism

Ref: Nelson, 20th ed. pg. 2802-2803

- Elevated amniotic fluid acetylcholinesterase is used for diagnosis of neural tube defects which are also called spinal dysraphism.
- *Tests for antenatal diagnosis of spina bifida occulta.*
 - Antenatal USG showing Frog sign
 - Amniotic fluid acetylcholinesterase

104. Ans. (b) Acetylcholinesterase

Ref: Nelson, 20th ed. pg. 2802-2803

Refer to the explanation of the question above.

105. Ans. (a) Spina bifida occulta

Ref: Nelson, 20th ed. pg. 2802-2803

- Most common neural tube defect is Spina bifida occulta.
- Most severe neural tube defect is Craniorachisch totalis
- Best prognosis and maximum viability (survival chances) is seen with Spina bifida occulta
- If spina bifida occulta is not in choices then answer is Meningocele.

106. Ans. (b) Rubeola

Ref: Rudolph Paediatrics, pg. 2186

This disease is a complication of measles virus called rubeola. Features of SSPE

- Slowly progressive disease characterized by seizures and progressive deterioration of cognitive and motor functions, with death occurring 5–15 years after measles virus infection.

- SSPE most often develops in persons infected with measles virus at <2 years of age.
- Investigation of choice is antibody to measles virus in CSF
- EEG shows sharp wave complexes called as Rademacher's complex.
- DOC is inosine prabonex.

107. Ans. (c) Meningomyelocele

Ref: Nelson's, 18th ed. Ch 592

- **Myelomeningocele** is a type of spina bifida in which the spinal canal does not close before birth.
- A **meningocele** is formed when the meninges herniate through a defect in the posterior vertebral arches. The spinal cord is usually normal and assumes a normal position in the spinal canal.
- In Meningocele, just the membranes extend through, *while in Myelomeningocele, the spinal cord also pushes through the hole within the sac that the meninges makes by extending through the opening.*

108. Ans. (b) Mostly Hereditary in nature

Ref: Nelson's, 18th ed. Ch 592.11

- Hydrocephalus is not a specific disease; rather, it represents a diverse group of conditions that result from impaired circulation and absorption of CSF
- Congenital hydrocephalus implies hydrocephalus is present at birth. Most common cause of congenital hydrocephalus is aqueductal stenosis.

Other Causes of Congenital Hydrocephalus can be

- Dandy Walker syndrome
- Arnold chiari malformation
- Toxoplasmosis
- CMV

Clinical Manifestation

1. An accelerated rate of enlargement of the head is the most prominent sign.
2. *The anterior fontanelle is wide open and bulging, and the scalp veins are dilated.*
3. *The forehead is broad,* and the eyes may deviate downward because of impingement of the dilated suprapineal recess on the tectum, producing the **setting-sun eye sign**.

109. Ans. (c) Typical Simple Febrile fits

Ref: OP Ghai, 8th ed. pg. 556-57

Typical febrile seizures are the most common type of seizures in children. For management intermittent prophylaxis with oral diazepam is required. For atypical febrile seizures continuous prophylaxis is recommended.

FMGE Solutions Screening Examination

840

110. Ans. (a) **BERA**Ref: OP Ghai, 8th ed. pg. 619; Oski's Pediatrics

Due to high incidence of deafness post H. influenzae meningitis, BERA should be done.

111. Ans. (d) **Enterovirus**

- **Meningo-encephalitis is caused by:**
 - Enterovirus (Commonest cause)
 - Coxsackie virus, echo virus – spread is mainly by mouth to mouth transmission
 - Flavi-Virus – West Nile virus, Japanese B Encephalitis
 - Herpes virus
 - Measles and mumps

112. Ans. (c) **Carbamazepine**Ref: Nelson's, 18th ed. ch: 593.3

Rolandic epilepsy or Benign Epilepsy of Childhood with Centro-temporal Spike is one of the epilepsy syndromes of childhood with a good prognosis.

- It occurs in children aged 2–14 years and EEG shows centro-temporal spikes
- The disorder occurs in children with positive family history of epilepsy. The seizures usually manifest as
 - Partial seizures with somatosensory symptoms are often confined to the face.
 - Oropharyngeal symptoms include tonic contractions, guttural noises, dysphagia, and excessive salivation
- Consciousness may or may not be impaired, and the partial seizure may proceed to secondary generalization
- Carbamazepine is the preferred drug, which is continued for at least 2 years or until 14–16 year of age

113. Ans. (c) **Decreased Intracranial pressure**Ref: OP Ghai, 8th ed. pg. 111-112

- Manifestations of **acute toxicity** include muscle and bone tenderness, especially over the long bones of the upper and lower extremities, as well as neurologic manifestations with signs of increased intracranial pressure (eg, children may have bulging fontanelles).
- Manifestations of **chronic toxicity** include the following: Alopecia/xeroderma with itchy skin/Skin erythema/Skin desquamation/itching/Brittle nails/Exanthema/Cheilitis/Petechiae/Premature epiphysial closure in children/Hepato-splenomegaly/Peripheral neuritis/Benign intracranial hypertension.

Extra Mile

- Pseudotumor cerebri/benign intracranial hypertension = vitamin A toxicity
- Earliest sign of vitamin A deficiency = Conjunctival xerosis
- Treatment of vitamin A deficiency = vitamin A orally 2 LAC IU on day 0,1 and day 14.

GENETICS

114. Ans. (a) **21**

Ref: O.P Ghai 8th Ed. P 420

- Down syndrome is the most common chromosomal disorder, occurring with a frequency of 1:800 to 1:1000 newborns.
- Chromosome number 21 is present in triplicate, the origin of the extra chromosome 21 being maternal (due to maternal meiotic non disjunction).

115. Ans. (b) **Low**Ref: Rudolph Paediatrics, 22nd ed. pg. 1415

Aneuploidies	AFP	Estriol	hCG	Inhibin A
Down's syndrome	Low	Low	High	High
Turner's syndrome	Decreased	Decreased	Very high	Very high
Edward's syndrome	Unchanged	Low	Very low	Unchanged
Patau's syndrome	Increased	Normal	Normal	Normal

116. Ans. (b) **Edward syndrome**Ref: Nelson, 20th ed. pg. 611

Syndrome	Description
Down syndrome	Trisomy 21
Edward syndrome	Trisomy 18
Patau syndrome	Trisomy 13 <i>Patau syndrome is the least common and most severe of the viable autosomal trisomies. Median survival is fewer than 3 days.</i>
Turner syndrome	45 XO

117. Ans. (a) **Noonan syndrome**Ref: Nelson, 20th ed. pg. 2747-48

NOONAN SYNDROME

- The term is applicable to males and females with normal karyotypes who have certain phenotypic features that occur also in females with Turner syndrome.
- Inheritance pattern is *Autosomal dominant* with variable expression.

**Clinical Features:**

1. Hypertelorism, epicanthus, downward slanted palpebral fissures known as antimongoloid facies.
2. Short stature, webbing of the neck
3. Pectus carinatum or pectus excavatum
4. Cubitus valgus
5. The cardiac defect is most often *pulmonary valvular stenosis*, hypertrophic cardiomyopathy, or atrial septal defect.

**118. Ans. (c) Inhibin**

Ref: Nelson, 18th ed. pg. Ch. 95

- Triple test can screen trisomy 21. (Diagnostic sensitivity 70%)
- In addition to Down syndrome, the triple and quadruple tests screen for fetal trisomy 18 also known as Edward's syndrome, open neural tube defects, and may also detect an increased risk of Turner syndrome, trisomy 16 mosaicism, fetal death, Smith-Lemli-Opitz syndrome, and steroid sulfatase deficiency

Extra Mile**Quadruple test incorporates the above parameters and Inhibin A**

- High LEVELS are seen in Trisomy 21.
- Low levels are seen in Trisomy 18.
- Variable levels in Trisomy 13 (Patau syndrome)

Triple test parameters	Alpha fetoprotein	Unconjugated Estriol	Beta HCG
Down syndrome	Low	Low	High
Edward syndrome	Low	Low	Low
Neural tube defects Omphalocele, multiple gestation	High	Not applicable	Not applicable

119. Ans. (c) Umbilical hernia

Ref: OP Ghai, 8th ed. pg. 638

- Brachycephaly implies small skull, due to premature fusion of the coronal suture. Therefore the brain is not able to grow and results in mental retardation.
- Overall the most common cause of mental retardation is idiopathic > Down syndrome.
- Thyroid abnormalities in form of either thyroid agenesis or autoimmune thyroiditis are seen in Down syndrome.
- Eye findings of down syndrome have also been asked and should be remembered as (MEBB)
 1. Mongoloid slant of eyes
 2. Epicanthal folds
 3. Blue dot cataract
 4. Brushfield spots in the iris

Clinical features of Down syndrome

- Flattened facies and low set ears
- Mental retardation
- Single transverse palmar crease and atypical finger prints
- Clinodactyly
- Hypotonia
- Brachycephaly
- Congenital heart disease (ASD): Endocardial cushion defect
- Macroglossia
- Epicanthix fold
- Strabismus
- Brushfield spots (Iris)

120. Ans. (c) Increased Umbilical blood flow

Ref: OP Ghai, 8th ed. pg. 639

- Best way for prenatal diagnosis of Down syndrome is Chorionic villus sampling. However antenatal ultrasound features are:
 - Reduced length of femur and humerus
 - Nuchal fold translucency >2.5 mm
 - Congenital heart disease like ASD, VSD.

121. Ans. (d) Acetylcholine esterase

Ref: OP Ghai, 8th ed. pg. 575-76

- NTD (anencephaly, open spina bifida or meningomyelocele, and encephalocele) are a heterogeneous group of congenital malformations resulting from a failure of fusion of the neural tube.
- When a NTD is suspected based upon maternal serum alpha-fetoprotein (AFP) screening results or diagnosed via ultrasound, analysis of AFP and acetylcholinesterase (AChE) in amniotic fluid are useful diagnostic tools.

FMGE Solutions Screening Examination

842

- AChE is primarily active in the central nervous system with small amounts of enzyme found in erythrocytes, skeletal muscle, and fetal serum.
- Normal amniotic fluid does not contain AChE, unless contributed by the fetus as a result of an open NTD.

122. Ans. (d) Anencephaly

Ref: Nelson, 18th ed. pg. Ch. 592.6

- Anencephaly is absence of cranial vault posteriorly with brain and meninges exposed. This condition can be detected by antenatal USG as early as 11–12 weeks. The USG sign is called as *frog eye sign*.

PEDIATRIC CARDIOLOGY

123. Ans. (a) Pulmonic stenosis

Ref: Nelson 21st/E p 2995

Pulmonary stenosis, with or without dysplastic pulmonary valve and hypertrophic cardiomyopathy, are the “classic” cardiac defects reported in Noonan syndrome.

Features of Noonan Syndrome

124. Ans. (a) Patent ductus arteriosus

Ref: Op ghai 8th ed page 417

- Continuous murmur is heard in PDA due to huge pressure difference between aorta and pulmonary artery. It is heard both in systole and diastole and peaks at S2.

Causes of Continuous Murmurs

1. Patent ductus arteriosus
2. Coronary arteriovenous
3. Ruptured sinus of Valsalva aneurysm
4. Aortic-pulmonary window
5. Anomalous left coronary artery origin from pulmonary artery
6. Coarctation of aorta
7. Pulmonary artery atresia
8. Truncus arteriosus
9. Pulmonary artery stenosis
10. Systemic arteriovenous fistula
11. Pulmonary arteriovenous fistula
12. Mammary soufflé
13. Venous hum

125. Ans. (b) ASD

Ref: OP Ghai 8th ed. P 420

Classic Tetrad of TOF

1. Severe right ventricle outflow obstruction due to sub-pulmonic stenosis
2. Large VSD
3. Over-Riding of aorta
4. Right ventricular hypertrophy.

Extra Mile

- Major determinant of central cyanosis in TOF is sub-pulmonic stenosis.
- IOC for TOF is T.T.E
- DOC for TOF is Alprostadil
- Palliative surgery for TOF is Blalock Taussig shunt.

126. Ans. (c) Left lower sternal border

Ref: Nelson 20th ed. P 2169

- Many murmurs in children are *not associated* with significant hemodynamic abnormalities. They are called “innocent” murmurs.
- The most common innocent murmur is a medium-pitched, vibratory or “musical,” relatively short *systolic ejection murmur*, which is heard best along the left lower and midsternal border and has no significant radiation to the apex, base or back.

127. Ans. (a) TOF

Ref: Nelson 20th ed. pg. 2212-2213

- Tetralogy of Fallot is the most common cyanotic heart disease and will have the maximum viability out of the structural defects given in the choices. *After successful total correction, patients are generally asymptomatic and are able to lead unrestricted lives.*
- TGA will present with cyanosis on day 0 and will result in death due to mixing of two circulations unless atrial septostomy is done followed by switch operation. Without treatment, the prognosis is poor; most patients succumb in the 1st year of life because of heart failure, hypoxemia, and pulmonary hypertension.
- Tricuspid atresia with pulmonic atresia will lead to cyanosis on day 0 and has bad prognosis.
- TAPVC will cause overloading of right side of heart with obstructive flow in infra-cardiac variety. It again has a bad prognosis.

128. Ans. (d) Normal Cardiothoracic ratio

Ref: Nelson 20th ed. pg. 2212-2213**Tetralogy of Fallot has**

1. Sub-pulmonic stenosis (Ejection Systolic murmur)
2. VSD (Right to Left Shunting)
3. Concentric right ventricular hypertrophy
4. Over-riding aorta

Due to right ventricular hypertrophy the chances of RVF is unlikely. On CXR boot shaped heart is seen with normal CT ratio.

Extra Mile

- Most common cause of cyanosis with normal sized heart is TOF.
- Most common cause of cyanosis with left sided enlargement of heart is tricuspid atresia.

129. Ans. (a) Foramen Ovale

Ref: Langman Embryology, pg. 47

Key Functional Changes after Birth

1. & 2 Umbilical cord clamped (Closure of Umbilical arteries and vein)
3. Foramen ovale closed
4. Ductus arteriosus closed
5. Ductus venosus closed

130. Ans. (b) Membranous VSD

Ref: Nelson, 20th ed. pg. 2194-95

VSD is the most common cardiac malformation and accounts for 25% of congenital heart disease. Defects may occur in any portion of the ventricular septum, but most are of the membranous type.

Types of VSD

- Membranous
- Muscular VSD or Swiss cheese type multiple defects
- Supra-cristal VSD

Types of ASD

- Ostium secundum (most common type)
- Ostium primum (associated with Down Syndrome)
- Sinus venous variety (associated with Partial anomalous venous connection)

131. Ans. (c) PDA

Ref: Nelson, 18th ed. Chapter 426

Acyanotic heart disease	Cyanotic heart disease	Obstructive heart disease
PDA VSD ASD	TOF Tricuspid atresia Transposition of great arteries	Coarctation of aorta
Presents with recurrent pneumonia and congestive heart failure	Presents with cyanosis. Tet spells and failure to thrive. On examination the child has cyanosis with single S2. CXR in TOF shows Boot shaped heart/ Coarctation	Presents with hypertension
Treatment PDA = Indomethacin/ surgical ligation VSD = Dacron patch ASD = Occlusion device	Treatment Modified Blalock taussig shunt TGA= Atrial Septostomy followed by switch operation	Treatment Balloon dilation with stenting

132. Ans. (d) Pericardial tamponade

Ref: Nelson, 18th ed./ Ch. 165

Cardiac Manifestations of Kawasaki Disease

- Coronary artery aneurysms develop in up to 25% of untreated patients in the 2nd-3rd wk of illness and are best detected by two-dimensional echocardiography.
- Myocarditis, manifested as tachycardia out of proportion to fever occurs in at least 50% of patients
- Valvular regurgitation: Mitral and Aortic regurgitation have been associated with Kawasaki disease in both early and chronic phase of the disease.
- Pericarditis with a small pericardial effusion is common during the acute illness.
- Giant coronary artery aneurysms (>8 mm internal diameter) pose greatest risk for rupture, thrombosis or stenosis, and myocardial infarction.

133. Ans. (b) Kawasaki Disease

Ref: OP Ghai, 8th ed. pg. 631

134. Ans. (d) LA

Ref: OP Ghai, 8th ed. pg. 413

- Ostium primum ASDs commonly present with a cleft in the anterior leaflet of the mitral valve. This is sometimes termed a partial AV canal defect or a partial AV septal defect.
- Due to cleft in mitral valve, the LV decompresses into LA leading to overloading of left atrium. In contrast in O. Secundum ASD it is right atrium and right ventricular that develop overloading.

GASTROINTESTINAL TRACT

135. Ans. (c) Hypertrophic pyloric stenosis

Ref: Nelson, 20th ed. pg. 1787

Ileal atresia	Presents as bilious vomiting and triple bubble sign on X-ray Abdomen.
Duodenal atresia	Presents as bilious vomiting and double bubble appearance on X-Ray abdomen
Hypertrophic pyloric stenosis	The presentation is after 2 weeks of life in usually a first born boy baby. The child presents with non-bilious vomiting.
Trachea-esophageal fistula	Presents with choking after feeds with failure to thrive. Drooling of saliva in neonates indicates esophageal atresia.

136. Ans. (b) 10 mg

Ref: Nelson, 20th ed. pg. 1872-73

Zinc supplementation is given at a dose of 2RDA per day (20 mg per day for >6 months and 10 mg per day for younger than 6 months) for 14 days is effective in reducing severity of diarrhea as well as duration of episode.

137. Ans. (c) Trauma

Ref: Nelson's Pedia, 18th ed. Ch. 340

- The list of illnesses that can mimic acute appendicitis includes: 1. Gastroenteritis; 2. Mesenteric adenitis; 3. Meckel diverticulitis; 4. Inflammatory bowel disease; 5. Pneumonia; 6. Cholecystitis; 7. Urinary tract infection; 8. Infectious enteritis; 9. Testicular torsion.

138. Ans. (a) Zinc

Ref: OP Ghai, 8th ed. pg. 121

- The World Health Organization (WHO) and UNICEF recommend daily 20 mg zinc supplements for 10-14

days for children with acute diarrhea, and 10 mg per day for infants under six months old, to curtail the severity of the episode and prevent further occurrences in the ensuing -two to three months, thereby decreasing the morbidity considerably.

- One out of every five children who die of diarrhea worldwide is an Indian. Daily around 1,000 children die of diarrhea in India, which means 41 children lose their lives every hour.

139. Ans: (d) **Ultrasound**

Ref: Nelson, 18th ed. pg. Ch. 326.1

■ ULTRASONOGRAPHY

- The criterion standard imaging technique for diagnosing HPS
- Muscle wall thickness 3 mm or greater and pyloric channel length 14 mm or greater are considered abnormal in infants younger than 30 days.

■ BARIUM UPPER GI STUDY

- Effective when Ultrasonography is not diagnostic.
- Should demonstrate an elongated pylorus with antral indentation from the hypertrophied muscle.
- May show the “double track” sign when thin tracks of barium are compressed between thickened pyloric mucosa or the “shoulder” sign when barium collects in the dilated pre-pyloric antrum.
- Serum electrolytes should be measured to document adequacy of fluid resuscitation and correction of electrolyte imbalances before surgical repair.
- The definitive treatment of pyloric stenosis is with surgical pyloromyotomy known as Ramstedt’s procedure
- It is done by simple incision of about 3-4 cm which leads to relaxation of pyloric muscles and hence gastric outlet opens up.

The classic biochemical abnormality seen in case of HPS is hypochloremic, hypokalemic metabolic alkalosis with paradoxical aciduria.

140. Ans. (c) **Erythromycin**

- Exposure to erythromycin between 3 and 13 days of life is associated with an eightfold risk of infantile hypertrophic pyloric stenosis (IHPS) developing shortly thereafter, according to the results of a retrospective cohort study published in the July, 2015 issue of the Archives of Pediatric and Adolescent Medicine.

▶ Extra Mile

Perinatal drug exposure	Teratogenic effect
Lithium	Ebstein anomaly
Vitamin D3	William syndrome (supravalvular aortic stenosis)
Thalidomide	Phocomelia
Erythromycin	Infantile hypertrophic pyloric stenosis
Carbimazole/methimazole	Aplastic cutis congenital
Warfarin	Nasal hypoplasia and phalangeal defects
Steroids	Cleft lip and palate

141. Ans. (b) **Duodenal atresia**

Ref: Nelson, 18th ed. pg. Ch. 327.1

Look at the two X-rays. The left one shows double bubble appearance of duodenal atresia and the right one shows triple bubble sign of jejuno-ileal atresia.

142. Ans. (d) **Pyloric stenosis**

Ref: Nelson, 18th ed. pg. Ch. 326.1

- All babies REGURGITATE curdled milk. So the mother is instructed to always put the baby to shoulder after breast feeding the child as this shall help the child burp and expel the swallowed air.
- However if a male infant, first born, 2-3 weeks old is brought to your clinic with recurrent vomiting which is non-bilious and associated with failure to gain weight, then suspect-HYPERTROPHIC PYLORIC STENOSIS
- A lump may be palpable to gentle examination in the epigastrium with finding of visible peristalsis. The investigation of choice shall be USG abdomen. Surgery to be done shall be a pyloromyotomy (Ramstedt operation).

FMGE Solutions Screening Examination

846

Extra Mile

- **Hypokalemic hypochloremic metabolic alkalosis** is seen in = Hypertrophic pyloric stenosis
- **Hyperkalemic hyperchloremic metabolic acidosis** is seen in = Uretero-sigmoidostomy
- MC cause of hematochezia in a preterm neonate = Necrotizing Enterocolitis
- MC cause of hematochezia in children = Rectal Prolapse > Meckel's Diverticulum
- Double bubble sign = duodenal atresia
- Inverso-gram (Special X-ray of the baby in inverted position) is used for = Ano-rectal malformations

143. Ans. (b) **Alkaline urine**

Ref: Lippincott's, 4th ed. pg. 85

LACTOSE INTOLERANCE/ LACTASE DEFICIENCY

The classic example of osmotic diarrhea is lactose intolerance due to lactase enzyme deficiency. *The colonic bacteria ferment the non-absorbed lactose to short-chain organic acids, generating an osmotic load and causing water to be secreted into the lumen.*

- Lactose is by far the most commonly Mal-absorbed carbohydrate.
- Secondary lactose intolerance follows small bowel mucosal damage (celiac disease, rotavirus infection) and is usually transient, improving with mucosal healing.
- Lactase deficiency can be diagnosed by hydrogen breath test or by measurement of mucosal lactase concentration with small bowel biopsy
- *Confirmatory diagnosis is made by stool acidity test, undigested lactose creates lactic acid that can be detected in stool sample.*
- *Undigested lactose may get absorbed and eliminated in urine (Lactoseuria), hence acidic urine.*
- In lactose intolerance reducing substance will be positive by Benedict's test in urine.
- Diagnostic testing is not mandatory and often simple dietary changes that produce symptom relief. Eliminate lactose from the diet result in symptom relief
- *Treatment of lactase deficiency consists of a milk-free diet.*

144. Ans. (b) **Non reducing sugar in urine**

Ref: Lippincott's, 4th ed. pg. 85

Refer to above explanation.

145. Ans. (a) **Doudenal Atresia**

Ref: Bailey and love 24th ed., /1199,

- The hallmark of duodenal obstruction is **bilious vomiting** without abdominal distention, which is usually noted on the 1st day of life.

- A history of **polyhydramnios** is present in half the pregnancies and is caused by a failure of absorption of amniotic fluid in the distal intestine.
- The diagnosis is suggested by the presence of a "**double-bubble sign**" on plain abdominal radiographs. *The appearance is caused by a distended and gas-filled stomach and proximal duodenum*

146. Ans. (b) **K+**

Ref: Sabiston, 18th ed. /Ch .71

- Hypertrophic pyloric stenosis presents with *hypokalemic, hypochloremic metabolic alkalosis with paradoxical aciduria.*
- Treatment includes replacement of the volume deficit with isotonic saline and then potassium replacement once adequate urine output is achieved.
- For most infants, administration of fluid containing 5% dextrose and 0.45% saline with **2 to 4 mEq/kg of added potassium at a rate of approximately 150 to 175 mL/kg for 24 hours** will correct the underlying deficit. After resuscitation, a Fredet-Ramstedt pyloromyotomy is performed
- Fluid resuscitation with correction of electrolyte abnormalities and metabolic alkalosis is essential before induction of general anesthesia for operation.

147. Ans. (c) **100–200 mL**

Ref: OP Ghai, 6th ed. pg. 273

PLAN A

Home Based Treatment of Dehydration

Age	Amount of ORS to give after each loose stool or other culturally appropriate ORT fluids	Amount of ORS to provide for use at home
< 2 years	50–100 mL	500 mL/day
2–10 years	100–200 mL	1000 mL/day
>10 years	As much as desired	2000 mL/day

FLUID & ELECTROLYTE BALANCE

148. Ans. (b) **800 mL**

Ref: OP Ghai, 8th ed. pg. 73, 293

The fluid requirement of children less than 10 kg is *100 mL per kg of body weight*. The preferred fluid shall be N/5 in 5% dextrose with added potassium for daily requirements.

149. Ans. (c) 75 mmol/L

Ingredient	g/L	Mmol/L
Sodium chloride	2.6g	75
Anhydrous glucose	13.6	75
Potassium chloride	1.5	20
Trisodium citrate	2.9	10

The low osmolality ORS has osmolality of 245 mOsm.

150. Ans. (a) Very severe pneumonia

Ref: OP Ghai, 8th ed. pg. 294

- The clinical presentation of severely malnourished child with fast breathing will be classified as very severe pneumonia
- Integrated management of childhood illness encompasses a holistic approach towards a sick child where criteria based diagnosis is made and treatment initiated as per the protocol.
- The primary criteria for diagnosis of pneumonia are based on respiratory rate and the age of child

Age of child	Pneumonia diagnosed if respiratory rate is
Less than 2 months	>60 breaths/min
2–12 months	>50 breaths/min
>1–5 yrs	>40 breaths/min

The disease is Classified as Very Severe if any of the Following is Present

- Cyanosis
- Inability to drink or breast feed
- Seizures/encephalopathy
- PEM grade 4

The disease is Classified as Severe Pneumonia in presence of

- Chest in-drawing
- Sub-costal and or intercostals recessions
- Use of accessory muscles of respiration like nasal flaring/ sterno-mastoid prominent

151. Ans. (b) 800 mL

Ref: Harrison 18th ed., Chapter 54: Deficit therapy

- For correction of severe dehydration, the fluid requirement the formula = 100 mL/Kg
- The total fluid required in 8 kg child would be therefore 800 mL
- The initial fluid here would be given at a rate of 30 mL/kg = 240 mL given over 1 hour.
- The remainder fluid here would be given at a rate of 70 mL/kg = 560 mL over 5 hours.

152. Ans. (b) 3.5 g/dL

All the following criteria must be met for diagnosis of mild malnutrition

- Patient is 20% below usual weight or significant history of weight loss documented
- Serum albumin < 3.4 g/dL

153. Ans. (b) 30 mL in 30 min

Ref: Nelson's Pediatrics, 18th ed. Ch. 54

MILD DEHYDRATION

- **In infant:** <5% of body weight is dehydrated
- **In older child or adult:** <3% of body weight is dehydrated.
- Normal or increased pulse; decreased urine output; thirsty; normal physical findings

MODERATE DEHYDRATION

- **In infant:** 5–10% of body weight is dehydrated
- **In older child or adult:** 3–6% of body weight is dehydrated.
- Tachycardia; little or no urine output; irritable/lethargic; **sunken eyes and fontanel**; decreased tears; dry mucous membranes; mild delay in elasticity (skin turgor); **delayed capillary refill** (>1.5 sec).

SEVERE DEHYDRATION

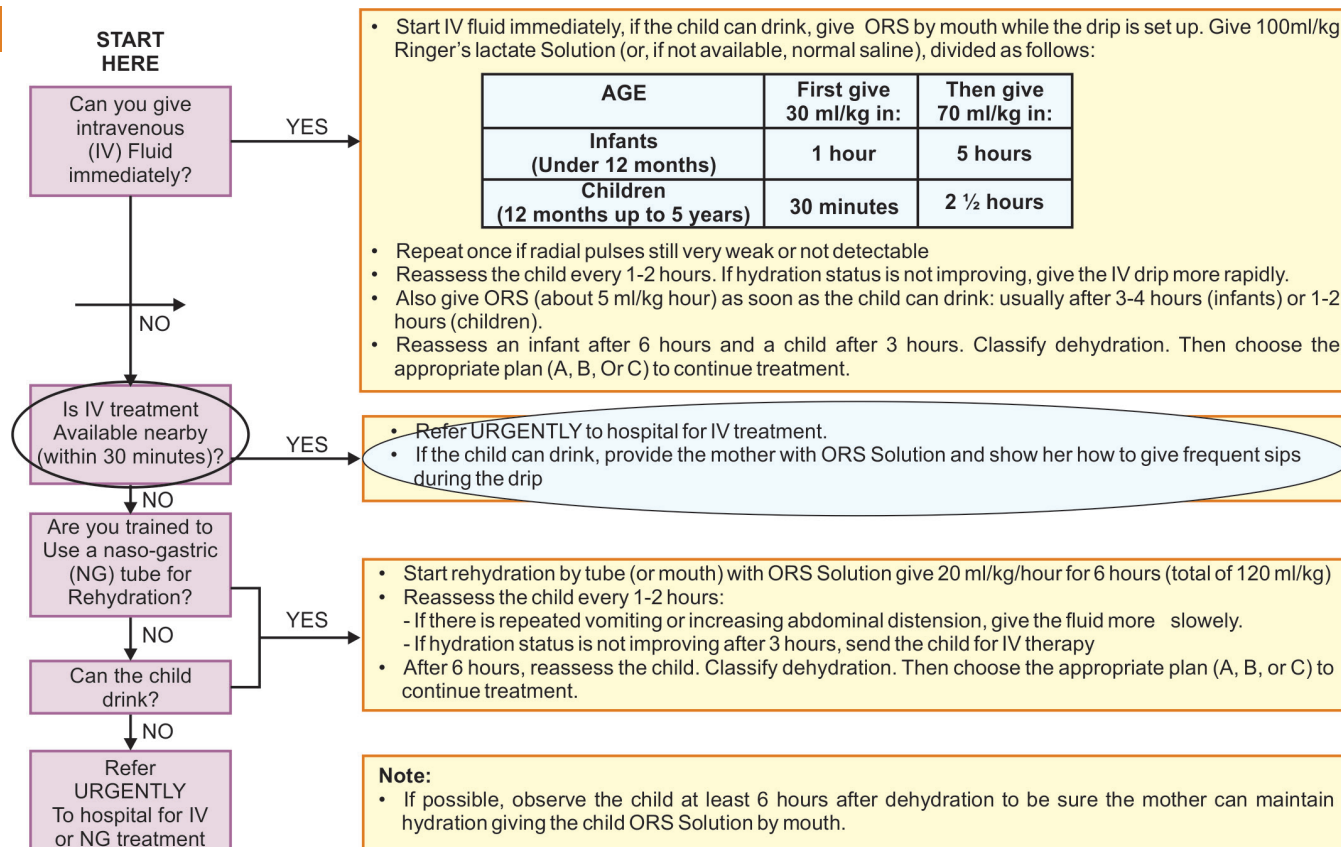

- **In infant:** >10% of body weight is dehydrated
- **In older child or adult:** >6% of body weight is dehydrated.
- Rapid and weak or absent peripheral pulses; decreased blood pressure; **no urine output**; **very sunken eyes and fontanel**; **no tears**; parched mucous membranes; delayed elasticity (**poor skin turgor**); **very delayed capillary refill** (>3 sec); cold and mottled; limp, depressed consciousness.
- **For a child > 1 yr - 30 mL/kg is given in 1/2 hour and 70 mL/kg is given in 2½ hour (total over 3 hours).**

FMGE Solutions Screening Examination

Treatment for Severe Dehydration

848

154. Ans. (b) Tibia

Ref: Nelson's, 18th ed./ ch. 66

- If venous access is not available in an arrest situation within 1 min, an intraosseous line should be placed in the anterior tibia (with care taken to avoid traversing the epiphyseal plate)
- The needle should penetrate the anterior layer of compact bone, with its tip advanced into the spongy interior of the bone.
- Intraosseous needles are special rigid, large-bore needles that resemble those used for marrow aspiration. Current recommendations urge the use of intraosseous cannulation in patients for whom intravenous access proves difficult or unattainable, even in older children.
- Once the patient has received initial drug and fluid therapy through the IO line, every effort should be made to obtain more conventional central venous access and remove the IO line as soon as possible.
- Alternative sites for intraosseous (IO) insertion include the distal tibia, distal femur, sternum, and humerus

Complications of IO Infusion

- Extravasation of fluid is the most common complication and occurs when a needle is misplaced
- Compartment syndrome is a risk with IO insertion.
- Extravasation of hypertonic or caustic medications, such as sodium bicarbonate, dopamine, or calcium chloride, can result in necrosis of the muscle.
- Infection and osteomyelitis are relatively rare complications and occur most commonly if aseptic technique is not followed during insertion.
- Other possible complications include local hematoma, pain, fracture and growth plate injuries (with incorrect placement), and fat microemboli and compartment syndrome

155. Ans. (b) Na 75 mEq + 245 mOsm

Ref: OP Ghai, 8th ed. pg. 294

The concentration of sodium in low osmolality ORS is 75 mEq. The osmolality is 245 mOsm.

Extra Mile

- WHO recommends a special ORS formulation, known as **ReSoMal**, for management of diarrhoea in **severely malnourished children** that contains a lower amount of sodium (45mmol/L) and higher amount of potassium (40 mmol/L) than the standard WHO-ORS.

VACCINES

156. (d) 15 weeks

Ref: IAP 2016 Guidelines

■ ROTAVIRUS (RV) VACCINES

Routine Vaccination

- Minimum age: 6 weeks for all available brands (RV-1) [Rotarix], RV-5 [RotaTeq] and RV-116E [Rotavac])
- Only two doses of RV-1 are recommended
- RV1 should preferably be employed in 10 and 14 week schedule.
- If any dose in series was RV-5 or RV-116E or vaccine product is unknown for any dose in the series, a total of 3 doses of RV vaccine should be administered.

Catch-up vaccination

- The maximum age for the first dose in the series is 14 weeks, 6 days
- Vaccination should not be initiated for infants aged 15 weeks, 0 days or older
- The maximum age for the final dose in the series is 8 months, 0 days

157. Ans. (a) DPT

Ref: OP Ghai, 8th ed. pg. 193

- Since all live vaccines are contraindicated in immune-compromised patients hence only DPT can be given. *Please note that the question mentions an AIDS positive patient and "not a child born to HIV positive mother".*
- If a child is born to HIV positive mother, the child may or may-not be acquire HIV infection from the mother. Hence WHO recommends BCG should be given to a baby born to HIV positive lady. *Textbook clearly mentions that if baby has documented AIDS then live vaccines are contraindicated. In such cases I.P.V. can be given in place of O.P.V.*

158. Ans. (b) Dukoral

Ref: Nelson, 18th ed chapter 173, <http://wwwnc.cdc.gov/eid/article/17/11-0822> article

- Dukoral is indicated for active immunization against disease caused by *Vibrio cholerae* sero group O1 in adults and children from 2 years of age who will be visiting endemic/epidemic areas
- The standard primary course of vaccination with Dukoral against cholera consists of 2 doses for adults and children from 6 years of age. Children 2 to below 6 years of age should receive 3 doses. Doses are to be administered at intervals of at least one week. If more than 6 weeks have elapsed between doses, the primary immunization course should be re-started.
- Immunization should be completed at least 1 week prior to potential exposure to *V. cholerae* O1.

159. Ans. (b) BCG

Ref: OP Ghai, 8th ed. pg. 191

■ BCG

- Although BCG vaccination often causes local reactions, serious or long-term complications are rare. *Reactions that can be expected after vaccination include moderate axillary or cervical lymphadenopathy and induration and subsequent pustule formation at the injection site;* these reactions can persist for as long as 3 months after vaccination.
- Most serious complication of BCG vaccination is disseminated BCG infection.
- The most frequent disseminated infection is BCG osteomyelitis

KIDNEY

160. Ans. (b) Congenital Finnish type nephrotic syndrome

Ref: Nelson, 18th ed./ Table 527.1

- Congenital nephrotic syndrome is one of the Finnish heritage diseases and rare form of nephrotic syndrome.
- It occurs predominantly in families of Finnish origin and manifests shortly after birth
- The condition is caused by a defect in the protein nephrin, which is found in the kidney.
- Gene responsible is NPHS 1.

161. Ans. (b) Hyperparathyroidism

Renal Tubular acidosis	RTA 1 can present with Nephrocalcinosis and renal rickets but pathological fractures and psychiatric symptoms are not seen
Hyperparathyroidism	The increased bone resorption explains pathological fracture. Hypercalcemia leads to deposition of calcium in the kidney parenchyma. Psychiatric symptoms are seen in hyperparathyroidism.

Contd...

FMGE Solutions Screening Examination

850

Polycystic kidneys	Presents with CRF with cystic kidneys
CRF	Can have pathological fracture due to Osteitis Cystica Fibrosa due to secondary Hyperparathyroidism.

162. Ans. (a) 4-8 years

Henoch schonlein purpura is the most common type of vasculitis in children and presents at 4–8 years of age. IgA is incriminated in pathogenesis of HSP. The commonest presentation is extensor purpura.

RESPIRATORY SYSTEM

163. Ans. (c) >40/min RR, for 12–60 months

Ref: OP Ghai 8th ed. P 381

As per WHO clinical classification of acute lower respiratory infection, pneumonia is defined as:

Increased respiratory rate:

<2 months old	>60 per minute
2–12 months old	>50 per minute
12–60 months old	>40 per minute

164. Ans. (b) Rhinovirus

Ref: Harrison, 18th ed. chapter 186,
Nelson, 18th ed. chapter 376

The most common pathogens associated with the common cold are the rhinoviruses.

In contrast bronchiolitis is caused by RSV.

Pathogens Associated with the Common Cold

Association	Pathogen	Relative Frequency
Agents primarily associated with colds	Rhinoviruses Coronaviruses	Frequent Occasional
Agents primarily associated with other clinical syndromes that also cause common cold symptoms	Respiratory syncytial viruses (MC cause of bronchiolitis)	Occasional
	Influenza viruses	Occasional
	Parainfluenza viruses	Uncommon
	Adenoviruses	Uncommon
	Enteroviruses	Uncommon

INBORN ERRORS OF METABOLISM

165. Ans. (b) Phenylketonuria

Ref: Nelson, 18th ed. chapter 85.1, Harrison's 17th ed. Ch 358

Clinical Manifestations of Classic Phenylketonuria

- The affected infant is normal at birth.
- Mental retardation may develop gradually and may not be evident for the 1st few months.
- Vomiting, sometimes severe enough to be misdiagnosed as pyloric stenosis, may be an early symptom.
- Older untreated children become hyperactive, with purposeless movements, rhythmic rocking, and Athetosis.
- Infants are lighter in their complexion than unaffected siblings with blonde hair.
- These children have an unpleasant odor of Phenyl-acetic acid, which has been described as musty or mousey.
- Most infants are hypertonic with hyperactive deep tendon reflexes.
- Microcephaly, prominent maxilla with widely spaced teeth, enamel hypoplasia, and growth retardation are other common findings in untreated children.

ENDOCRINOLOGY

166. Ans. (a) Adrenalectomy

Ref: Nelson, 18th ed. / Ch. 578

Nelson syndrome is seen post adrenalectomy. The rise of ACTH post-operatively leads to hyper pigmentation of palm, sole creases.

MISCELLANEOUS

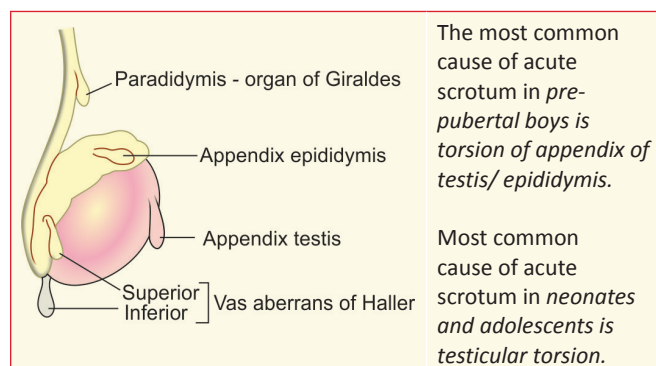

167. Ans. (a) Coxsackie A

Ref: OP Ghai 8th ed. P 219

- Hand-foot-mouth disease is a common viral illness primarily affecting children below 5 years of age.
- The most common causes of hand foot mouth disease are Coxsackie virus A16 and enterovirus 71.

168. Ans. (a) Torsion of appendix of testis

Ref: Nelson, 20th ed. pg. 2595-96

169. Ans. (d) Rubeola

Ref: Nelson, 20th ed. pg. 1544

- The clinical presentation given is of measles (Aka Rubeola) and is characterised by rash on face, neck and spreading to rest of the body.
- Chicken pox rash appears on extremities and is maculo-papulo-vesicular. The rash is red but has vesicles which are not given in the clinical presentation above.
- Rubella presents as measles but has posterior cervical lymphadenopathy.
- Variola is the small pox virus and the vaccine for small pox is made from a virus called *vaccinia*.

170. Ans. (a) Erythema infectiosum

- Erythema infectiosum (also known as fifth disease) is usually a benign childhood condition characterized by a *classic slapped-cheek appearance* and lacy exanthem.
- It results from infection with human parvovirus (PV) B19, an erythrovirus

171. Ans. (c) Mild proteinuria, high hematuria, high ASO titre

Ref: OP Ghai, 8th ed. pg. 474-75

- Glomerulo-nephritis is characterized by inflammation of glomerulus leading to hematuria with sub-nephrotic proteinuria. The inflammation follows a skin infection or a sore throat and therefore requires serological evidence in form of elevated ASO titer or anti DNA-ase-B.

172. Ans. (c) Zinc deficiency

Ref: Pediatric Dermatology, 3rd ed. pg. 1137

- Zinc toxicity can cause zinc shakes especially after inhalation of zinc following welding of galvanized metals.
- Zinc deficiency is known as *acrodermatitis enteropathica*

173. Ans. (c) 15 mg/kg

Ref: OP Ghai, 8th ed. pg. Table 10.9

Drug	Pediatric dose in mg/kg	Side effect	MAX adult dose
INH	15 mg /kg thrice weekly, under RNCTP 20-30 mg twice weekly dosages	Peripheral neuritis	300 mg
Rifampicin	15 mg/kg	Hepatitis	600 mg
Pyrazinamide	30–35	Gout	2000 mg
Ethambutol	20–25	Optic neuritis	1500 mg

Please note that the values for INH and rifampicin under the revised programme are equal.

174. Ans. (a) Albright's syndrome

Ref: Nelson, 18th ed. Ch. 563

McCune Albright syndrome is suspected when two of the three following features are present:

1. Endocrine hyperfunction such as precocious puberty
2. Polyostotic fibrous dysplasia
3. Unilateral Cafe-au-lait spots

175. Ans. (c) Headlight in Fog appearance

Ref: Nelson, 18th ed.,: Table 244-1

Headlight in fog appearance is seen in Toxoplasmosis

Cardiovascular	PDA Pulmonary artery stenosis VSD (ASD is not seen)
Central nervous system	Parenchymal necrosis Vasculitis with calcification Chronic meningitis
Eye	Microphthalmia Cataract Iritis Ciliary body necrosis Glaucoma Salt and Pepper Retinopathy ^a
Ear	Cochlear damage Endothelial necrosis

176. Ans. (b) Exchange transfusion

Ref: OP Ghai 8th ed./176

- Supportive therapy is very important in falciparum malaria and includes red blood cell transfusion(s) to maintain the hematocrit above 20%, exchange transfusion in life-threatening *P. falciparum* malaria with parasitemia >5%.
- Supplemental oxygen and ventilatory support is required for pulmonary edema or cerebral malaria.

FMGE Solutions Screening Examination

- Careful intravenous rehydration for severe malaria, intravenous glucose for hypoglycemia, anticonvulsants for cerebral malaria with seizures and dialysis for renal failure. *Corticosteroids are no longer recommended for cerebral malaria.*

177. Ans. (b) 1–4 years

Ref: Park, 22nd ed pg. 178

178. Ans. (a) 5 mL/kg

Ref: Nelson's, 18th ed. ch: 101.4

- During mechanical ventilation of newborns, it has been found out that large tidal volumes can lead to lung injury; therefore small tidal volumes are recommended.
- In a healthy newborn tidal volume of 5–8 mL/kg may be used, however in a newborn with ARDS, a tidal volume of 4–6 mL/kg is recommended.
- PEEP levels of 4–6 cm H₂O are usually safe and effective

179. Ans. (a) Hemolytic anemia

Ref: OP Ghai, 8th ed. pg. 320

- Hemolytic anemia is a feature of Wilson's disease. Hemolytic anemia occurs because large amounts of copper derived from hepatocellular necrosis are released into the bloodstream.
- Wilson disease is an *autosomal recessive* trait caused by mutations in the *ATP7B* gene in chromosome 13
- ATP7B protein deficiency impairs biliary copper excretion, resulting in copper toxicity affecting the liver and brain
- Hepatic features: may present as hepatitis, cirrhosis or as hepatic decompensation
- Most common Neurological feature in Wilson is dysarthria followed by dystonia

Investigations

- Serum Ceruloplasmin is decreased. Serum ceruloplasmin should not be used for definitive diagnosis, because they are normal in up to 10% of affected patients.
- 24-hour urine copper excretion – increased: Screening test
- Hepatic copper content – Increased
- Liver biopsy:
 - Gold standard test for Wilson's disease
 - Liver copper >200 microgram/gram dry weight of liver is suggestive of Wilson's disease.
 - Copper stain — Rhodamine stain

Treatment

Disease status	First choice	Second choice
Early disease Hepatitis or cirrhosis without decompensation	Zinc	Trientine
Hepatic decompensation: Mild Moderate Severe	Trientine and zinc Trientine and zinc Hepatic transplantation	Penicillamine and zinc Hepatic transplantation Trientine and zinc
Initial neurologic/ psychiatric	Tetrathiomolydate and zinc	Zinc
Maintenance	Zinc	Trientine
Pediatric	Zinc	Trientine
Pregnant	Zinc	Trientine

Prognostic index of Nazer is used to assess severity of Wilson's disease

- Parameters: Bilirubin, AST, Prothrombin time

180. Ans. (d) Rashes

Ref: OP Ghai, 8th ed. pg. 632–633

HENOCH-SCHONLEIN PURPURA

- Most common cause of non-thrombocytopenic purpura in children
- Age group:** 4–7 years. However, the disease may also be seen in infants and adults. Males > Females.
- Etiology is unknown, but typically follows an upper respiratory tract infection and is associated with increased IgA levels.

Clinical Features

- In pediatric patients, *palpable extensor purpura* is seen in *virtually all patients*.
- Damage to cutaneous vessels also results in local angioedema, which may precede the palpable purpura.
- Polyarthralgias
- GI involvement is characterized by colicky abdominal pain usually associated with nausea, vomiting, diarrhea or constipation and is frequently associated with passage of blood and mucus per rectum.
Renal involvement is characterized by mild glomerulonephritis leading to proteinuria and microscopic hematuria.

181. Ans. (a) Count 10 pennies

Ref: Nelson Textbook of Pediatrics, table 9.1

Motor	Hops on one foot	Cut paper with scissors
Adaptive	Copies a bridge from a model or draw gate with cubes	Identifies longer of two lines
Language	Counts 4 pennies Counts 10 pennies at 5 yrs.	Tells a story
Social	Group play	Goes to toilet alone

182. Ans. (c) **Thyroid dysgenesis**

Ref: OP Ghai, 8th ed. pg. 516

- Most cases of congenital hypothyroidism are not hereditary and result from thyroid dysgenesis.
- Some cases may be familial, usually caused by one of the inborn errors of thyroid hormone synthesis, and may be associated with Goiter.
- In many cases, the deficiency of thyroid hormone is severe, and symptoms develop in the early weeks of life. In others, lesser degrees of deficiency occur, and manifestations may be delayed for months.
- The prevalence of congenital hypothyroidism based on nationwide programs for neonatal screening is 1/4,000 infants worldwide

183. Ans. (a) **Proximal end blind, distal end communicating with trachea**

Ref: Nelson chapter 316, *Congenital Anomalies of Esophagus*

- Esophageal atresia (EA) is the most frequent congenital anomaly of the esophagus, affecting $\approx 1/4,000$ neonates. Of these, >90% have an associated tracheoesophageal fistula (TEF).
- In the most common form of EA, the upper esophagus ends in a blind pouch and the TEF is connected to the distal esophagus.
- The inability to pass a nasogastric or orogastric tube in the newborn is suggestive of esophageal atresia.

TEF can be detected by

1. Plain radiography in the evaluation of respiratory distress may reveal a coiled feeding tube in the esophageal pouch and/or an air-distended stomach.
2. Pure EA may present as an *airless, scaphoid abdomen*.
3. Esophagogram with contrast medium injected under pressure may demonstrate the defect.
4. The orifice may be detected at bronchoscopy or when methylene blue dye injected into the endotracheal tube during endoscopy is observed in the esophagus during forced inspiration

184. Ans. (b) **Measles**

Ref: T Singh, 2nd pg. 148-9

Lymphocytosis is defined as **more than 45% lymphocytes** in the peripheral blood. Examples include:

1. TB, brucellosis, syphilis
2. CLL, NHL with spillover
3. Infectious mononucleosis
4. Mumps, **measles**, chicken pox
5. Toxoplasmosis
6. Viral infections

Diphtheria, MI and pneumonia cause neutrophilia.

185. Ans. (c) **HIV ELISA**

Ref: OP Ghai, 8th ed. pg. 234

The question tests your elementary knowledge of the fact that IgG class of antibody present in the body of the infected mother can be passively transmitted to the baby. These antibodies are detected by ELISA test and will test positive in every baby born to HIV positive lady. This does not mean that the baby has mother's infection but only acquired antibodies.

The transmission of infection from mother to child is best detected by DNA PCR. We can determine the viral load in the baby through the same test. Viral culture would tell you regarding viral load and changes after HAART. The p 24 antigen was done routinely till DNA PCR was available.

Extra Mile

- Peri-natal transmission rate for HIV = 30%
- Best drug to reduce Perinatal transmission rate for HIV = nevirapine single dose to mother and baby
- By how much % does the Perinatal transmission rate for HIV reduce after nevirapine = 50% reduction.
- BCG is indicated in baby born to HIV lady but if the question asks whether BCG/live vaccine should be given to a child with AIDS then the answer is NO.

186. Ans. (b) **Scurvy**

Ref: OP Ghai, 8th ed. pg. 120

FMGE Solutions Screening Examination

- In scurvy due to vitamin C deficiency, the bleeding in children is seen as SUBPERIOSTEAL BLEEDING.
- Periosteum is the pain sensitive structure in the bone. Therefore the child keeps on lying on the bed, due to pain, refusing to indulge in walking/running.
- In fact if parent touches the leg of the baby he howls in pain. This is referred to as PSEUDOPARALYSIS and the position of the legs of the baby is known as FROG LEG appearance.
- The usual clinical history given shall be a 1 year old child from poor family, exclusively breastfed at 1 year of age, no complimentary feeds given is brought to the hospital with complaints on irritability and cannot bear weight on standing. Always get an X-ray knee joint (unlike X-ray WRIST joint in rickets)

Extra Mile

- X-ray knee in scurvy shows damage at = Metaphyseal end as compared to epiphyseal end in rickets.
- X-ray knee in scurvy shows findings as = Pelkan spur, Wimberger Ring and white line of Frankel
- Wimberger line is seen in syphilis

187. Ans. (c) **Zinc**Ref: OP Ghai, 8th ed. pg. 121

Autosomal recessive disorder caused by an inability to absorb sufficient zinc from the diet.

Genetic defect is in the intestinal zinc specific transporter gene SLC39A4.

Clinical Manifestations

1. Vesiculo-bullous, eczematous, dry, scaly, or psoriasiform skin lesions symmetrically distributed in the *peri-oral*, and *perineal areas* and on the *cheeks*, knees, and elbows.
2. The hair often has a peculiar reddish tint
3. Ocular manifestations include photophobia, conjunctivitis, blepharitis, and corneal dystrophy
4. Chronic diarrhea, stomatitis, glossitis, nail dystrophy, growth retardation
5. Delayed wound healing
6. Lymphocyte function and free radical scavenging are impaired.

Extra Mile

- DOC acrodermatitis enterohepatica = ZINC therapy rapidly abolishes the manifestations of the disease.
- Radiological findings of rickets = Cupping, Fraying, Splaying on distal end of radius.
- Dose of vitamin D for rickets = 6 lac IU intramuscular single dose or 60,000IU orally X10 days.
- Keshan disease = Selenium deficiency

Obstetrics and Gynecology

OBSTETRICS

MOST RECENT QUESTIONS 2019

1. A 16-year-old girl presented with primary amenorrhea with orderly appearance of secondary sexual characteristics like breast and pubic hair. What is the next best step for this patient:
 - a. Reassure
 - b. USG
 - c. HSG
 - d. Hormonal study
2. A 19-year-old primigravida, presents with 8 weeks amenorrhea, light bleeding and pain. USG reveals intra uterine pregnancy. What is preferred management in this case?
 - a. Estrogen plus Progesterone therapy
 - b. D and C
 - c. Bed rest and Progesterone
 - d. Beta hCG
3. A 35 year female presented with complaints of infertility. She has previous history of PID. Preliminary investigations like USG showed normal organs and hormone levels were also normal. What is the next best investigation?
 - a. Repeat USG
 - b. Hysterosalpingography
 - c. Endometrial biopsy
 - d. Urine culture and sensitivity
4. Couvelaire uterus is seen in:
 - a. Placenta previa
 - b. Vasa previa
 - c. Abruptio placenta
 - d. Placenta percreta
5. Risk of endometrial cancer is least in:
 - a. Nullipara
 - b. Obesity
 - c. Late menopause
 - d. Multigravida
6. A grand multipara is a women who has given birth to ____ births:
 - a. >2
 - b. >3
 - c. >4
 - d. >5

7. A 26 weeks pregnant female presented with HTN for the first time. There is no proteinuria. Diagnosis of such condition
 - a. Chronic hypertension
 - b. Eclampsia
 - c. Gestational Hypertension
 - d. Preeclampsia
8. Minimum sperm count for normal semen analysis according to WHO:
 - a. 2 million/mL
 - b. 5 million/mL
 - c. 10 million/mL
 - d. 20 million/mL
9. Endometrial biopsy for infertility test in women should be done at:
 - a. Ovulatory phase
 - b. Menstrual phase
 - c. Anytime during cycle
 - d. Premenstrual period
10. In this normal menstrual cycle graph, the mark 'X' graph is due to:

11. A patient who was using CuT for contraception, presented with a 20 weeks pregnancy. The IUCD is placed at fundus, tail visible at OS and she wants to continue the pregnancy. What is your next step in this patient:
- Leave IUD in-situ, continue pregnancy
 - Do medical termination of Pregnancy
 - Remove IUCD and continue pregnancy
 - Remove IUCD and do MTP
12. Which of the following can be a cause of Oligohydramnios?
- Multiparity
 - Twins
 - Renal agenesis
 - Macrosomia

ANATOMY AND PHYSIOLOGY

13. Beta hCG is secreted by:
- (Recent Pattern Question 2018-19)
- Yolk sac
 - Placenta
 - Syncytiotrophoblast
 - Umbilical cord
14. At 24 weeks the fundus height reaches to:
- (Recent Pattern Question 2018)
- Symphysis pubis to umbilicus
 - Symphysis pubis to mid of umbilicus
 - Between umbilicus to xiphisternum
 - At xiphisternum
15. Constipation in pregnancy is due to:
- (Recent Pattern Question 2017)
- Uterus enlargement
 - Estrogen effect
 - Progesterone effect
 - Excessive micturition
16. During pregnancy urine frequency increases in which trimester?
- (Recent Pattern Question 2017)
- T1
 - T2
 - T3
 - Puerperium
17. Change in BMR(%) during pregnancy:
- (Recent Pattern Question 2017)
- Rise by 25%
 - Fall by 25%
 - Rise by 50%
 - Fall by 50%
18. Which is the largest diameter of fetal head?
- (Recent Pattern Question 2017)
- Mentovertical
 - Occipitofrontal
 - Submentobregmatic
 - Suboccipitofrontal
19. Placenta develops completely by—age of gestation:
- (Recent Pattern Question 2016)
- 3 weeks
 - 4 weeks
 - 6 weeks
 - 12 weeks
20. Vessel which disappears in placenta:
- (Recent Pattern Question 2016)
- Left umbilical artery
 - Left umbilical vein
 - Right umbilical vein
 - Right umbilical artery
21. Blood is carried from placenta to inferior vena cava through:
- (Recent Pattern Question 2016)
- Ductus arteriosus
 - Ductus venosus
 - Right umbilical vein
 - Left umbilical vein
22. Which of the following decreases during pregnancy
- (Recent Pattern Question 2016)
- Systemic venous resistance
 - CO
 - HR
 - Plasma volume
23. Normal pH of vagina
- (Recent Pattern Question 2016)
- 2–2.5
 - 3.5–4.5
 - 4.5–5.5
 - 5.0–6.5
24. Nulliparous cervix: body uterus ratio
- (Recent Pattern Question 2016)
- 50–50
 - 60–40
 - 30–70
 - 70–30
25. In a normal menstrual cycle, lowest amount of estrogen and progesterone is seen at:
- (Recent Pattern Question 2016)
- Follicular phase
 - Ovulation
 - At beginning of menses
 - Secretory phase
26. True support of uterus:
- Broad ligament
 - Round ligament
 - Cardinal ligament
 - Uterosacral ligament
27. Which gland opens on posterolateral margin of vaginal opening:
- Skene gland
 - Cooper gland
 - Bartholin's gland
 - Bulbourethral gland
28. Which is the smallest transverse diameter of fetal head:
- Biparietal
 - Bitemporal
 - Bimastoid
 - Super subparietal
29. Longest diameter of fetal skull is:
- Occipitofrontal
 - Submentobregmatic
 - Suboccipitofrontal
 - Mentovertical
30. Shortest diameter of pelvic outlet:
- Anteroposterior
 - Intertuberous
 - Oblique
 - Interspinous
31. Largest diameter of pelvic inlet:
- Transverse
 - True conjugate
 - Oblique
 - Bituberous
32. What is the least diameter of pelvic inlet?
- (Recent Pattern Question 2017)
- Sacrococcygeal
 - Pubococcygeal
 - Transverse
 - Sacrocotyloid
33. Prominent iliac spine is seen in which type of pelvis:
- Gynaecoid
 - Platypelloid
 - Android
 - Anthropoid
34. Which of the following is not increased during pregnancy:
- Plasma volume
 - RBC count
 - Platelet count
 - Hemoglobin
35. In pregnancy which clotting factor will be decreased:
- Factor II
 - Factor V
 - Factor VII
 - Factor XI

**36. Most common cause of secondary amenorrhea**

- a. Turner syndrome b. Pregnancy
- c. Mullerian agenesis d. Kallmann syndrome

37. When is the best time to do breast self-exam?

- a. 3 days after menstruation
- b. 3 days before menstruation
- c. During menstruation
- d. During ovulation

38. When is the time for ovulation:

- a. 14 days after menstruation
- b. Along with LH surge
- c. 1 week before menstruation
- d. 2 weeks before next menstruation

39. Oxygenated blood from placenta goes to fetal heart via:

- a. Ductus arteriosus b. Ductus venosus
- c. Foramen ovale d. Umbilical artery

40. Which of the following closes before birth:

- a. Ductus arteriosus b. Ductus venosus
- c. Cardinal vein d. Umbilical vein

41. Uterus is at the level of umbilicus at which age of gestation:

- a. 12 weeks b. 22 weeks
- c. 20 weeks d. 24 weeks

42. Oxytocin will not do the following action:

- a. Milk production
- b. Milk let down
- c. Contraction of myo-epithelial cells
- d. Vascular contraction

EMBRYOLOGY**43. After 28 weeks AOG major amount of amniotic fluid is secreted from:** *(Recent Pattern Question 2018-19)*

- a. Fetal skin b. Fetal urine
- c. Placental cell membrane d. Plasma

44. In a general population, the screening of Down syndrome is done by: *(Recent Pattern Question 2018)*

- a. USG
- b. Serum biomarkers
- c. Chorionic villus sampling
- d. Amniocentesis

45. Which of the following is best done for intrapartum fetal monitoring? *(Recent Pattern Question 2018)*

- a. Fetal echocardiography
- b. Fetal scalp pH
- c. Continuous electrical fetal monitoring
- d. Physical examination

46. Amniocentesis is best done by:*(Recent Pattern Question 2018)*

- a. 10–11 weeks b. 12–13 weeks
- c. 15–18 weeks d. 20–35 weeks

47. Size of graffican follicle at the time of ovulation:

- a. 10 mm b. 15 mm
- c. 20 mm d. 25 mm

48. Which of the following is not related with fertilization:

- a. Sperm crosses corona radiata
- b. Implantation after 6 days
- c. Zona pellucida facilitation by hyaluronidase
- d. Zona reaction attracts the sperms

49. What is the function of zona pellucida?*(Recent Pattern Question 2017)*

- a. Prevent wrong implantation of embryo
- b. Formation of blastocyst
- c. Prevention of multiple sperm entry
- d. Prevent wrong attachment of sperm

50. Which of the following is a true statement:

- a. Placenta is formed at morula stage
- b. Implantation starts on 10th day
- c. During initial weeks corpus luteum survival is due to LH
- d. Fertilization takes place in ampulla

51. Implantation occurs after fertilization:

- a. 5–6 days b. 7–8 days
- c. 8–10 days d. 10–12 days

52. Gestational sac can be visualized via USG by:

- a. 4 weeks b. 5 weeks
- c. 8 weeks d. 10 weeks

53. Corpus luteum formation occurs on _____ of menstrual cycle:

- a. 15th day b. 22nd day
- c. 1st day d. 28th day

54. Doubling of Beta hCG levels is seen in:

- a. 24 hours b. 48 hours
- c. 72 hours d. 96 hours

55. Placental blood supply is established on:*(Recent Pattern Question 2016)*

- a. 2nd week b. 3rd week
- c. 5th week d. 8th week

56. Labia minora is homologous to which organ in males?*(Recent Pattern Question 2017)*

- a. Glans penis b. Scrotum
- c. Corpus cavernosa d. Penile urethra

57. Inferior 1/3rd of vagina is derived from:*(Recent Pattern Question 2017)*

- a. Metanephric bud b. Urogenital sinus
- c. Mullerian duct d. Genital fold

58. When is the embryo termed as fetus?*(Recent Pattern Question 2017)*

- a. End of 7th week
- b. After 10 weeks from LMP
- c. End of 8th week after LMP
- d. From end of 2nd trimester

59. Fertilization most commonly occurs at:*(Recent Pattern Question 2017)*

- a. Ampulla b. Interstitium
- c. Isthmus d. Uterine cavity

60. When does Haematopoiesis shift to liver from yolk sac:

- a. 10 weeks b. 12 weeks
- c. 16 weeks d. 20 weeks

61. Maximum number of oogonia:
a. 6 million b. 4 million
c. 5 million d. 7 million
62. 1st polar body is released at the time of:
a. Birth b. Puberty
c. Menstruation d. Fertilization
63. What is released at the time of ovulation:
a. 1st polar body b. Primary oocyte
c. Female pronucleus d. 2nd polar body
64. Ovulation occurs after the extrusion of:
a. Primary oocyte b. Female pronucleus
c. 1st polar body d. 2nd polar body
65. Maternal side of placenta is derived from which layer:
a. Decidua basalis b. Zona capsularis
c. Zona parietalis d. Inner cell mass
66. True about fetal surface of placenta:
a. Derived from decidua basalis
b. It has spongy and rough surface
c. It has umbilical cord attachment site
d. It has cotyledons
-
- LABOR AND DELIVERY**
-
67. During childbirth all of the following can cause prolapse EXCEPT: *(Recent Pattern Question 2018-19)*
a. Precipitated labour b. Prolonged 2nd stage
c. Premature bearing down d. 3rd degree perineal tear
68. A 32-year-old pregnant female presented with 34-week pregnancy with complaints of pain in the abdomen, and decreased fetal movements. Upon examination, BP = 90/60, FHR = 100, upon per vaginum examination there is blood seen and cervix is closed. What is the preferred management? *(Recent Pattern Question 2018-19)*
a. Tocolytics b. Induce labour
c. Immediate LSCS d. Wait and watch
69. Uterus relaxation in order to delay the labor is caused by: *(Recent Pattern Question 2018)*
a. Ritodrine b. Tolterodine
c. Oxytocin d. Labetalol
70. Which of the following the presenting part in the fetus in left occiput anterior (LOA) position: *(Recent Pattern Question 2018)*
a. Suboccipito-bregmatic b. Submentoverical
c. Brow d. Vertex
71. Pacemaker of uterine contraction is located at:
a. Fundus b. Anterior wall
c. Posterior wall d. Tubal ostia
72. 1/5 head is palpable suprapubic. True statement regarding this is: *(Recent Pattern Question 2016)*
a. Brow presentation b. 1/5 of head at pelvic brim
c. Fetal head is engaged
d. 1/5th of the head below ischial spine
73. According to the rule of 5th, when is the fetal head engagement:
a. 1/5th of the fetal head palpable
b. 2/5th of the fetal head palpable
c. 3/5th of the fetal head palpable
d. 4/5th of the fetal head palpable
74. Moulding of fetal head *(Recent Pattern Question 2016)*
a. Disappears in few weeks
b. Can damage brain
c. No alteration in shape of head
d. Complicates the delivery
75. During the 3rd stage of labor, what is the pressure in the uterus:
a. 30–40 mm Hg b. 100–120 mm Hg
c. 80–100 mm Hg d. 40–60 mm Hg
76. Pressure inside uterus during early phase of active labor:
a. 50 mm Hg b. 100 mm Hg
c. 150 mm Hg d. 200 mm Hg
77. Force developed from uterine contraction:
a. 7 kg b. 14 kg
c. 21 kg d. 25 kg
78. Duration of 2nd stage of labor in primigravida:
a. 30 minutes b. 2 hours
c. 15 minutes d. 4 hours
79. To monitor fetal heart rate in a normal delivery partogram, it should be repeated every:
a. 30 minutes b. 1 hours
c. 2 hours d. 90 minutes
80. While doing partogram, pelvic examination is done at:
a. 30 minutes b. 1 hours
c. 2 hours d. 4 hours
81. Peak of prostaglandins occurs in what stage:
a. 1st stage of labor b. 2nd stage of labor
c. 3rd stage of labor d. Before 1st stage of labor
82. Amniotic fluid at term:
a. 1000–1200 mL b. 800–1000 mL
c. 1200–1500 mL d. 700–800 mL
83. Amniotic fluid is maximum at:
a. 22–26 weeks b. 34–36 weeks
c. 38–40 weeks d. 40–42 weeks
84. Bishop score includes all EXCEPT:
a. Cervical consistency b. Dilatation of cervix
c. Position of cervix d. Cervical length
85. Most common fractured bone during birth is:
a. Humerus b. Scapula
c. Clavicle d. Radius
86. Cord compression leads to:
a. Late deceleration b. Early deceleration
c. Variable deceleration d. Acceleration
87. Late deceleration is due to:
a. Head compression
b. Cord compression
c. Uteroplacental insufficiency
d. All of the above

88. Identify the progress of partogram:

- a. Early deceleration
- b. Variable deceleration
- c. Late deceleration
- d. Normal partogram

89. As compared to mediolateral episiotomy, median episiotomy has complications because of:

- a. Poor repair
- b. Cosmetic problem
- c. Extension to rectum
- d. More blood loss

90. Arrest disorder is defined as the cessation of cervical dilatation in active phase of labor of more than:

- a. 1 hour
- b. 1.2 hours
- c. 1.5 hours
- d. 2 hours

94. Lactiferous duct of breast contraction is due to

(Recent Pattern Question 2016)

- a. Progesterone
- b. Estrogen
- c. Oxytocin
- d. Prolactin

95. First investigation to be done for screening the presence of fetus:

- a. TVS
- b. TAS
- c. MRI
- d. Doppler

96. Placental circulation is established by:

- a. 15 days
- b. 16 days
- c. 21 days
- d. 25 days

97. A 35 year primigravida visited your clinic. USG given below: What is the diagnosis?

- a. Anencephaly
- b. Holoprocencephaly
- c. Nuchal translucency
- d. Hydrocephaly

ANTEPARTUM AND POSTPARTUM PERIOD

91. EDD calculated by: *(Recent Pattern Question 2018-19)*

- a. Young's rule
- b. Naegele's formula
- c. Cardiff formula
- d. Hadlock formula

92. True sign of placental separation are all EXCEPT:

(Recent Pattern Question 2018)

- a. Gush of blood
- b. Raised fundal height
- c. Lengthening of cord
- d. Discoid uterus

93. Which is correct about iron status in pregnancy?

(Recent Pattern Question 2016)

- a. Serum iron is increased
- b. TIBC increased
- c. Serum ferritin increased
- d. Serum iron: TIBC ratio increased

- 98. Iron and folic acid supplement during pregnancy:**
 a. 500 mg iron + 100 mcg folic acid
 b. 100 mg iron + 500 mcg folic acid
 c. 100 mg iron + 100 mcg folic acid
 d. 20 mg iron + 100 mcg folic acid
- 99. Test which identifies fetal well being by detecting fetal heart rate acceleration and fetal movement:**
 a. Bio-Physical profile b. Stress test
 c. Non-stress test d. Contraction stress test
- 100. Biophysical profile scoring includes all EXCEPT:**
 a. FHR deceleration b. Fetal breathing
 c. Fetal movement d. Amniotic fluid
- 101. Length of lower uterine segment at term:**
 a. 5 cm b. 10–12 cm
 c. 15 cm d. 20 cm
- 102. Hegar sign is seen earliest at:**
 a. 6 weeks b. 10 weeks
 c. 14 weeks d. 15 weeks
- 103. Jacquemier's sign of pregnancy occurs in which week:**
 a. 6th week b. 8th week
 c. 10th week d. 12th week
- 104. Obstetric care will mostly affect:**
 a. Infant mortality rate
 b. Early neonatal mortality rate
 c. late neonatal mortality rate
 d. Perinatal mortality rate
- 105. LMP of patient is 30 June 2015, EDD is __:**
 a. 7 March, 2016 b. 7 April, 2016
 c. 30 March, 2016 d. 30 April, 2016
- 106. Lochia lasts for:**
 a. 5 days b. 2 weeks
 c. 3 weeks d. 4 weeks
- 107. The most common site of puerperal infection is:**
 a. Placental site b. Cervical laceration
 c. Episiotomy wound d. Vaginal laceration
- 108. Following are signs of placental separation EXCEPT:**
 a. Uterus rises in abdomen
 b. Uterus becomes discoid
 c. Lengthening of cord
 d. Fresh gush of blood from the vagina
- 109. Which of the following is a sign of placental separation in stage III of labor:**
 a. Gushing of blood
 b. Discoid uterus
 c. Filling of placenta in vagina
 d. Increase in blood pressure
- 110. The signs and symptoms of placental separation include all of the following EXCEPT:**
 a. Raised fundal height
 b. Fundus of uterus below umbilicus
 c. Gush of Vaginal bleeding
 d. Lengthening of cord
- 111. Common cause of 3rd day Puerperal fever:**
 a. Breast Engorgement b. UTI
 c. Puerperal sepsis d. Pulmonary
- 112. What is the most common cause of maternal mortality in India?**
 a. Haemorrhage b. Obstructed Labor
 c. Cardiac arrest d. Anemia
- 113. Most common indirect cause of maternal mortality:**
 a. Sepsis b. Hemorrhage
 c. Obstructed labor d. Anemia
- 114. Which of the following is the cause of amenorrhoea in a lactating mother:**
 a. Increased release of LH b. Increased GnRH secretion
 c. Hyperestrogenic state d. Increased prolactin level
- 115. Weight of uterus immediately after delivery:**
 a. 60 g b. 500 g
 c. 1000 g d. 800 g
- 116. Heart rate returns to normal after delivery:**
 a. Immediately b. 4 weeks
 c. 4 hours after d. 6 weeks
- 117. Cardiac output return to normal how many days after delivery:**
 a. 1 hour b. 4 hours
 c. 2 weeks d. 4 weeks
- 118. The uterus becomes pelvic organ how many days after normal delivery:**
 a. 5–7 days b. 12–14 days
 c. 16–18 days d. 20–22 days
- 119. Blood loss of fetal origin:**
 a. Placenta previa b. Vasa previa
 c. Abruptio Placenta d. Circumvallate placenta
- 120. A pregnant patient after delivery presented with hemorrhage. Immediate hysterectomy is done in:**
 a. Pre-eclampsia b. Rupture of uterus
 c. Atonic uterus d. Inversion of uterus
- 121. During delivery there is a perineal tear involving the anal sphincter but anal mucosa is not involved. Which is the degree of tear?**
 a. I b. II
 c. III d. IV

ABORTION AND THIRD TRIMESTER BLEEDING

- 122. A G4P2 lady presented with history of two abortions at 16 weeks and 20 weeks AOG. Which of the following could be the most suspected cause for this abortions?**

(Recent Pattern Question 2018-19)

- a. Chromosomal abnormality
 b. Cervical incompetence
 c. Placenta previa
 d. Thyroid abnormality

- 123. Most common cause of miscarriage in 1st trimester abortions:** (Recent Pattern Question 2018)
a. Trisomy b. Monosomy X
c. Triploidy d. Tetraploidy
- 124. Most common cause of bleeding in early pregnancy** (Recent Pattern Question 2016)
a. Spontaneous abortion b. Missed abortion
c. Ectopic pregnancy d. Abruptio placenta
- 125. Most common cause of 1st trimester abortions:**
a. Trisomy b. Monosomy X
c. Triploidy d. Tetraploidy
- 126. Commonest cause of first trimester miscarriage is:**
a. Syphilis
b. Cervical incompetence
c. Chromosomal abnormalities
d. Rhesus isoimmunisation
- 127. In Inevitable abortion:**
a. Uterus size larger than to AOG, cervix open
b. Uterus size equal to AOG, cervix close
c. Uterus size smaller than to AOG, cervix open
d. Uterus size smaller than to AOG, cervix close
- 128. Treatment of choice of inevitable abortion less than 10 week:**
a. Dilatation and evacuation
b. Suction and evacuation
c. Medical management
d. Complete hysterectomy
- 129. For MTP which of the following drug dosage is used:**
a. 200 mg mifepristone + 400 mg misoprostol
b. 200 mg misoprostol + 400 mg mifepristone
c. 200 mg mifepristone + 400 mcg misoprostol
d. 400 mcg mifepristone + 200 mg misoprostol
- 130. Which one of following is the legal drug used for MTP in India?**
a. Misoprostol + Methotrexate
b. Mitoprostane + Methotrexate
c. Mifepristone 200 mg + Misoprostol 400 mcg oral
d. None
- 131. Which of the following is not used in MTP?**
a. Misoprostol
b. Mifepristone
c. Misoprostol + Tamoxifen
d. Mifepristone + Misoprostol
- 132. Dangerously low lying placenta is:**
a. Type I anterior b. Type II anterior
c. Type I posterior d. Type II posterior
- 133. McAfee and Johnson regimen is used for:**
a. Eclampsia b. Placenta previa
c. Placental abruption d. Placenta accrete
- 134. Patient with 37 week AOG, centrally located placenta pre-via presented with bleeding per vaginum. Management:**
a. Caesarean section b. Abortion
c. Vacuum delivery d. Forceps delivery
- 135. Umbilical cord attached to the margin of placenta:**
a. Circumvallate placenta b. Battledore placenta
c. Velamentous insertion d. Vasa previa
- 136. Nitabuch's membrane is absent in:**
a. Placenta accreta b. Vasa previa
c. Abruptio placenta d. Placenta previa
- 137. Absence of Nitabuch's membrane leads to in all EXCEPT:**
a. Placenta previa b. Placenta accreta
c. Placenta increta d. Placenta percreta
- 138. Recurrence of hydatiform mole is assessed by:**
a. AFP level b. β -hCG level
c. LDH level d. Estrogen level
- 139. Complete mole contains**
a. 46 YY b. 46 XY
c. 46 XXY d. 69 XXX
- 140. In gestational trophoblastic disease, metastases most commonly occurs to:**
a. Brain b. Liver
c. Lungs d. Bone
- 141. Theca lutein cyst are seen in**
a. Complete mole b. Partial mole
c. Tubal ectopic d. Missed abortion
- 142. In a patient who underwent post molar evacuation by dilatation and curettage. Which of the following test used to define successful removal of H. Mole:**
a. Beta hCG b. Per speculum
c. Progesterone d. USG
- 143. The risk of uterine rupture after previous lower transverse uterine incision at Caesarean Section is:**
a. 1% b. 3%
c. 5% d. 7%

TWIN PREGNANCY

- 144. If a zygote divides 2–3 days after fertilization, which of the following type of twinning is seen:** (Recent Pattern Question 2018-19)
a. Monochorionic, Monoamniotic
b. Monochorionic, Diamniotic
c. Diamniotic, Dichorionic
d. Dichorionic, Monoamniotic
- 145. Division of zygote took place on 5th day after fertilization. What is the type of twinning?**
a. Monochorionic, monoamniotic
b. Monochorionic, diamniotic
c. Dichorionic, diamniotic
d. Dichorionic, monoamniotic
- 146. Most common type of twin gestation is:**
a. Monochorionic monoamniotic
b. Diamniotic, monochorionic
c. Conjoined twins
d. Dichorionic monoamniotic

147. **Best position of twins for normal vaginal delivery:**
 a. A non-vertex, B vertex b. A vertex, B non-vertex
 c. A vertex, B vertex d. A non-vertex, B non-vertex
148. **Twin pregnancy is earliest detected at:**
 a. 10 weeks b. 12 weeks
 c. 6 weeks d. 8 weeks
149. **Twin pregnancy is least associated with:**
 a. Multigravida b. Genetic
 c. Young female
 d. Patient receiving fertilization treatment

ECTOPIC PREGNANCY

150. **In a patient with ectopic tubal pregnancy which is the earliest to rupture?** *(Recent Pattern Question 2018-19)*
 a. Interstitial b. Isthmus
 c. Ampulla d. Infundibulum
151. **Most common site of ectopic pregnancy:** *(Recent Pattern Question 2017)*
 a. Ampulla b. Interstitium
 c. Isthmus d. Fimbriae
152. **Which is the most dangerous site for Ectopic pregnancy:** *(Recent Pattern Question 2017)*
 a. Isthmus b. Ampulla
 c. Interstitial d. Fimbriae
153. **A 29-year-old female presented with 7 weeks of pregnancy. She has complaint of vaginal spotting. USG shows empty uterus. Best treatment:** *(Recent Pattern Question 2017)*
 a. If sac >3.5 cm do medical management
 b. Laparoscopy with salpingostomy
 c. Laparotomy with salpingectomy
 d. Laparotomy
154. **Ectopic pregnancy with adnexal mass <2.5 cm. Treatment:** *(Recent Pattern Question 2017)*
 a. Medical management
 b. Surgical management
 c. Laparoscopy
 d. Laparoscopy with salpingectomy
155. **Most common complaints of ectopic pregnancy** *(Recent Pattern Question 2016)*
 a. Pain b. Vaginal bleeding
 c. Infection d. Amenorrhea
156. **Pain is more common than bleeding in** *(Recent Pattern Question 2016)*
 a. Ectopic pregnancy b. Complete mole
 c. Incomplete abortion d. Missed abortion
157. **Suspected ectopic pregnancy is best diagnosed by** *(Recent Pattern Question 2016)*
 a. MRI b. TVS
 c. X-ray abdomen supine d. HSG

158. **Drug used for ectopic pregnancy** *(Recent Pattern Question 2016)*
 a. Mifepristone + misoprostol
 b. Misoprostol 200 mg
 c. Methotrexate 50 mg IM
 d. Progesterone
159. **Triad of ectopic pregnancy are all EXCEPT:**
 a. Vomiting b. Bleeding
 c. Abdominal pain d. Amenorrhea
160. **All are true about ectopic pregnancy EXCEPT**
 a. Most common cause is Progestasert
 b. Can be diagnosed by hCG level
 c. A negative pregnancy test excludes the diagnosis
 d. Methotrexate is used as medical management
161. **Most sensitive diagnostic test for ectopic pregnancy:**
 a. Transvaginal USG
 b. Serial monitoring of beta hCG
 c. Culdocentesis d. MRI
162. **Criteria for medical termination of ectopic pregnancy:**
 a. Beta hCG < 5000 b. Mass of >3.5 cm
 c. Present fetal heart beat d. 6 week pregnancy

MALPRESENTATION, DIFFICULT DELIVERY AND INSTRUMENTATION

163. **The pressure used for gynecological laparoscopy:** *(Recent Pattern Question 2018)*
 a. 10–15 mm Hg b. 15–20 mm Hg
 c. 20–30 mm Hg d. 30–50 mm Hg
164. **Upon hysteroscopy which of the following cannot be seen?** *(Recent Pattern Question 2018)*
 a. OS b. Cervix
 c. Endometrium d. Uterus surface
165. **True about frank breech:** *(Recent Pattern Question 2018)*
 a. Mostly associated with congenital anomaly
 b. Footling presentation
 c. ECV done after 34 weeks
 d. Has hip extended and knee flexed
166. **Which is the most prominent part in transverse lie?** *(Recent Pattern Question 2016)*
 a. Acromion b. Sternum
 c. Buttock d. Mentum
167. **In face presentation what is the presenting denominator?** *(Recent Pattern Question 2016)*
 a. Cheek b. Mentum
 c. Forehead d. Lips
168. **Breech presentation with footling. Management is:**
 a. Vaginal delivery b. Cesarean section
 c. Forceps delivery d. Internal podalic version

169. Which of the following is most common compound presentation:

- a. Head with foot b. Head with hand
- c. Hand, head and foot d. Both hand and foot

170. In Brow presentation, head of the fetus:

- a. Complete hyperextension
- b. Partial extension
- c. Complete flexion
- d. Moderate flexion

171. What is the presentation of the given image:

- a. Face presentation b. Transverse lie
- c. Brow presentation d. Vertex

172. Fetus in transverse position. Which of the following is true:

- a. Polyhydramnios is a cause
- b. It can be caused by abruptio placenta
- c. It results to hand prolapsed in all cases
- d. Shoulder dystocia is a major threat

173. Treatment of choice of acute hydramnios with fetal distress in pregnancy:

- a. Amniocentesis b. Cordocentesis
- c. Indomethacin d. Termination

174. Which of the following is a contraindication for trial of vaginal delivery in VBAC:

- a. Breech presentation
- b. Previous CS of more than 2
- c. Presence of anesthesiologist
- d. Informed consent

175. All are contraindications of Internal cephalic version EXCEPT:

- a. Shoulder presentation of first fetus
- b. Face presentation
- c. Transverse lie of second fetus in a twin pregnancy
- d. Breech presentation of 2nd fetus in a twin.

176. External cephalic version is done in all EXCEPT:

- a. Primigravida b. Flexed breech
- c. Anemia d. PIH

177. Following are contraindications to External Cephalic Version EXCEPT:

- a. Contracted pelvis b. Antepartum hemorrhage
- c. Multiple pregnancy d. Hydramnios

178. Low forceps are applied when:

- a. Scalp is visible at the introitus
- b. Fetal head is at pelvic floor
- c. Fetus is at station + 2
- d. Fetal head is engaged

DISEASES DURING PREGNANCY

179. Feature of hydrops fetalis in a fetus can be due to:

(Recent Pattern Question 2018-19)

- a. Epstein barr virus b. Human papilloma virus
- c. Parvovirus B19 d. Influenza virus

180. Cut off point for 50 gram glucose challenge test at 1 hour mg%:

(Recent Pattern Question 2018-19)

- a. 100 b. 140
- c. 180 d. 200

181. Chromosome pattern in complete mole:

(Recent Pattern Question 2018-19)

- a. 46 XY both maternal origin
- b. 46 XX both maternal origin
- c. 46 XX both paternal origin
- d. 46 YY both paternal origin

182. Agent used for status eclampticus?

(Recent Pattern Question 2017)

- a. Hydralazine
- b. Thiopentone sodium
- c. Valproate
- d. Magnesium sulfate

183. In an eclamptic patient with raised ICT, which drug should be given:

(Recent Pattern Question 2017)

- a. Mannitol b. Furosemide
- c. Labetalol d. Hydralazine

184. Maximum risk of pre-eclampsia is due to

(Recent Pattern Question 2016)

- a. CRF b. Heart disease
- c. Anemia d. Liver disease

185. Drugs not useful in emergency in pregnancy:

- a. Nifedipine b. Labetalol
- c. Ritodrine d. Phenobarbitone

- 186. In pregnancy with hypertension which drug is given:**
 a. Propranolol b. Acebutalol
 c. Metoprolol d. Labetalol
- 187. Which of the following anti-hypertensive is contraindicated in pregnancy:**
 a. Beta blockers b. ACE inhibitors
 c. Methyldopa d. Ca channel blockers
- 188. Drug contraindicated in pregnancy:**
 a. Angiotensin receptor blockers
 b. Beta blockers
 c. Calcium channel blockers
 d. Methyl dopa
- 189. Antenatal mother with epilepsy on phenytoin therapy must be given:**
 a. Folic acid supplementation
 b. Vitamin B₁₂ supplementation
 c. Vitamin B₆ supplementation
 d. Vitamin A supplementation
- 190. A 42 years primigravida presents at 28 weeks period of gestation and has left upper breast mass. Choose the best investigation modality:**
 a. Mammography b. CT scan
 c. MRI d. High Resonance ultrasound
- 191. Best marker in intrahepatic cholestasis of pregnant women:**
 a. Bile acid b. Bilirubin
 c. Alkaline phosphatase d. SGPT
- 192. All of the following can cause DIC in women EXCEPT:**
 a. Amniotic fluid embolism b. Sepsis
 c. Placenta previa d. HELLP
- 193. All are true about HELLP syndrome EXCEPT:**
 a. Increased LDH b. Low platelet
 c. Increased liver enzymes d. Hyponatremia
- 194. DOC for candidiasis in pregnancy**
 a. Metronidazole 500 mg
 b. Tinidazole 500 mg
 c. Fluconazole 150 mg
 d. Metronidazole 1 g
- 195. A pregnant women with BP 150/100 mm Hg, proteinuria after 20 weeks. Diagnosis?**
 a. Pre-eclampsia
 b. Pregnancy induced hypertension
 c. Renal hypertension
 d. Eclampsia
- 196. All can be done in pre-eclampsia EXCEPT:**
 a. Diuretics b. Anti hypertensives
 c. MgSO₄ d. Admission and wait
- 197. For controlling eclamptic patient with convulsion, which of the following will be used:**
 a. Mannitol b. Furosemide
 c. Hydralazine d. MgSO₄
- 198. A patient presented with a pregnancy of 32 weeks with antepartum haemorrhage. Patient with hypertension. Management at this point of time:**
 a. Caesarean section
 b. Observation on OPD basis
 c. Hospitalization and observation
 d. Induce labor
- 199. A pregnant lady with PIH is having bleeding per vagina. The decision to continue pregnancy is based on:**
 a. Presence of fetal cardiac activity
 b. Availability of blood
 c. Blood pressure
 d. Adequate medical facilities
- 200. In a diabetic mother, most common fetal complication will be:**
 a. Neural tube defect
 b. Congenital sacral agenesis
 c. Congenital heart disease
 d. Hydrocephalus
- 201. DOC for hyperthyroidism in pregnancy:**
 a. Propylthiouracil b. Methimazole
 c. I-131 d. Thyroxine

FETAL GROWTH AND DEVELOPMENT

- 202. Best parameter to find out age of gestation in first trimester:** *(Recent Pattern Question 2018)*
 a. Dates of menstrual period
 b. CRL
 c. Femur length
 d. Weight of the fetus
- 203. Breathing movement of fetus on USG is first detected at:** *(Recent Pattern Question 2017)*
 a. 11 weeks b. 20 weeks
 c. 24 weeks d. 26 weeks
- 204. During intrauterine life fetal waste is excreted by:** *(Recent Pattern Question 2017)*
 a. Straight into mother's blood by simple diffusion
 b. Diffusion into amniotic fluid
 c. Ultrafiltration
 d. Leakage
- 205. Fetal haemoglobin is maximum secreted by** *(Recent Pattern Question 2016)*
 a. Liver b. Yolk sac
 c. Spleen d. Bone marrow
- 206. Deoxygenated blood from the fetus to the mother is carried via:**
 a. Umbilical artery b. Umbilical veins
 c. Pulmonary artery d. Pulmonary vein
- 207. Cardiac activity in fetus can be assessed via transabdominal scan by:**
 a. 6–7 weeks b. 8–9 weeks
 c. 9–11 weeks d. 12–14 weeks

**208. Crown rump length at 12 weeks:**

- a. 7 cm b. 10 cm
c. 12 cm d. 25 cm

209. At 12 weeks pregnancy "CRL" is:

- a. 60 mm b. 100 mm
c. 120 mm d. 250 mm

210. Radiotherapy is most harmful in which week of gestation:

- a. 4–16 weeks b. 18–23 weeks
c. 28–32 weeks d. 36–38 weeks

211. In folate + vitamin B12 combined deficiency which of the following is/are mainly seen?

- a. Neural tube defects b. Megaloblastic anemia
c. Abruptio placentae d. Placenta previa

INTRAUTERINE FETAL DEATH**212. Intrauterine death is least likely caused by:**

- a. Rh-incompatibility b. Obstructed labor
c. Low birth weight d. Placental insufficiency

213. Which of the following sign is seen in intrauterine fetal demise:

- a. Von Braun-Fernwald's sign
b. Roberts sign c. Goodell's sign
d. Oslander sign

214. Which of the following is most likely cause of intrapartum death?

- a. Cord prolapsed b. Abruptio placentae
c. Hyaline membrane disease
d. Eclampsia

215. Methotrexate is indicated mainly in:

- a. Pre-eclampsia b. IUD
c. Prematurity d. Ectopic pregnancy

MISCELLANEOUS**216. Which of the following statement is Not true about placenta:**

- a. Weight of full term placenta is 508 and volume is 497 ml
b. At 17th week weight of placenta is equal to weight of fetus
c. It has 4 to 6 lobes
d. Total of lobes remain the same throughout the gestation

217. Level of which hormone are increased during post menopausal women:

- a. Estrogen b. Progesteron
c. FSH d. Cortison

218. Drug contraindicated in pregnancy:

- a. Oral penicillin b. Cephalosporin 1st generation
c. Chloramphenicol d. Erythromycin

219. Antibody to cross placenta

- a. IgA b. Ig G
c. Ig E d. Ig M

220. Earliest sex-determination is done at:

- a. 1 month b. 2 months
c. 3 months d. 4 months

221. The dose of anti-D immunoglobulin to be given to non-immune Rh D negative women after delivery is:

- a. 50 µg b. 150 µg
c. 300 µg d. 450 µg

GYNECOLOGY**ANATOMY, MENARCHE AND MENOPAUSE****222. A 58-year-old lady with menopause and hot flushes presents to the physician. Which is correct?***(Recent Pattern Question 2018-19)*

- a. Increased FSH, increased estrogen
b. Decreased FSH, decreased estrogen
c. Decreased FSH, increased estrogen
d. Increased FSH, decreased estrogen

223. A girl is said to have primary amenorrhea in absence of secondary sexual characters by what age:*(Recent Pattern Question 2018)*

- a. 12 b. 13
c. 14 d. 16

224. Which of the following is the most common cause of secondary amenorrhea? *(Recent Pattern Question 2018)*

- a. Pelvic irradiation b. Diabetes
c. Kallmann syndrome d. Imperforate hymen

225. Marker of ovarian reserve in a premenopausal female:*(Recent Pattern Question 2018)*

- a. Antral follicle size b. Raised LH/FSH ratio
c. Decreased inhibin A
d. Anti-mullerian hormone

226. According to American fertility society classification system, unicornuate uterus is classified under this class:

- a. Class I b. Class II
c. Class III d. Class IV

227. Thelarche definition: *(Recent Pattern Question 2017)*

- a. Growth of pubic and axillary hair
b. Growth of breast
c. Increase in height
d. Onset of menstruation

228. The hormone which increases on thelarche:*(Recent Pattern Question 2017)*

- a. GnRH b. Estrogen
c. Progesterone d. GH

229. Average age of menopause:

(Recent Pattern Question 2017)

- a. 40
- b. 45
- c. 55
- d. 60

230. Precocious puberty in females is defined as:

(Recent Pattern Question 2016)

- a. Occurrence of menarche before age of 8 years
- b. Occurrence of menarche before age of 12 years
- c. Appearance of secondary sexual characteristics before 8 years
- d. Appearance of secondary sexual characteristics before 10 years

231. Follicles in ovary are decreasing with age, the first change is:

(Recent Pattern Question 2016)

- a. Increase FSH
- b. Increase LH
- c. Increase inhibin
- d. Increase estradiol

232. Menstrual blood stored in vagina in:

- a. Pyometra
- b. Hematometra
- c. Hematocolpos
- d. Hematosalpinx

INFECTION

233. Which is correct about presentation of *C. trachomatis* infection?

(Recent Pattern Question 2018-19)

- a. Pruritic Vaginitis
- b. Leads to Infertility
- c. Uveitis
- d. Inclusion body pneumonitis

234. Which of the following infections can commonly lead to infertility:

(Recent Pattern Question 2018-19)

- a. Chlamydia
- b. Trichomoniasis
- c. Candidiasis
- d. Bacterial vaginosis

235. A 32-year-old female presented with acute history of profuse mucoid vaginal discharge, abdominal pain and deep dyspareunia. Per speculum examination reveal erosion of cervix and a reddened area around cervix external os. Which of the following treatment option is preferred for this patient:

(Recent Pattern Question 2018-19)

- a. Laser therapy
- b. Conization operation
- c. Cryosurgery
- d. Policresulen

236. Common mode of transmission in pyogenic TB salpingitis:

(Recent Pattern Question 2018)

- a. Hematogenous
- b. Lymphatic
- c. Direct invasion
- d. Sexually transmitted

237. A 25-year-old lady who presents with curdy white discharge from vagina is likely to be suffering from:

(Recent Pattern Question 2018)

- a. Gonococcal vulvovaginitis
- b. Candida vaginitis
- c. Trichomoniasis
- d. Chlamydia trachomatis

238. Temperature in puerperal pyrexia:

(Recent Pattern Question 2018)

- a. 98.4°F
- b. 99°F
- c. 100.4°F
- d. 104°F

239. Which of the following organism is common cause of tubal blockage?

- a. Chlamydia
- b. Herpes simplex
- c. Candida
- d. HPV

240. A 29-year-old female presents with PID, what is the indication to hospitalize?

(Recent Pattern Question 2017)

- a. Pregnancy
- b. Cervical discharge
- c. TB
- d. Acute mild PID

241. Most common presentation in fallopian tube TB:

(Recent Pattern Question 2017)

- a. Infertility
- b. Pain
- c. Abdominal cramps
- d. Bleeding

242. Recurrent vulvo-vaginitis is defined as:

(Recent Pattern Question 2016)

- a. >2 infection in a year
- b. >3 infection in a year
- c. >4 infection in a year
- d. >5 infection in a year

243. Clue cells are seen in:

(Recent Pattern Question 2016)

- a. Bacterial vaginosis
- b. Cystitis
- c. Candida albicans
- d. Trichomoniasis

244. 10% KOH is used for diagnosing:

(Recent Pattern Question 2016)

- a. Candida
- b. Trichomonas
- c. Mycoplasma
- d. Gardenella vaginalis

245. Fishy odor in whiff test is seen in:

(Recent Pattern Question 2016)

- a. Giardia
- b. Bacterial vaginosis
- c. Trichomoniasis
- d. Candidiasis

246. Trichomoniasis is caused by:

- a. Bacteria
- b. Virus
- c. Protozoa
- d. Chlamydia

247. All of the following statement are true about Bacterial vaginosis EXCEPT:

- a. Cause by gardenella vaginalis
- b. Fishy odor upon whiff test
- c. Infection seen when vaginal pH is <4.5
- d. It is not an STD

248. Clue cells are seen in:

- a. Bacterial vaginosis
- b. Candidiasis
- c. Trichomoniasis
- d. Gonococcal

249. Whiff test done for:

- a. Gonococcal infections
- b. Gardenella
- c. Trichomoniasis
- d. Candiasis

250. In patients with asymptomatic carrier of Chlamydia, organisms resides most commonly in:

- a. Vagina
- b. Urethra
- c. Ectocervix
- d. Endocervix

**251. First symptom of fallopian tube TB:**

- a. Pain
- b. Bleeding
- c. Watery discharge
- d. Uterine prolapse

252. Clubbing of fimbrial end of Fallopian tube is seen upon HSG. What could be the possible pathology:

- a. Tuberculosis
- b. Gonococcal
- c. Hydrosalpinx
- d. Mullerian anomaly

253. A young female was worked up for examined for her infertility by hysterosalpingography reveals 'Bead — like' fallopian tube and clubbing of ampulla. Which of the following is the most likely cause?

- a. Gonococcus
- b. Mycoplasma
- c. Chlamydia
- d. Mycobacterium tuberculosis

254. PID can be due to:

- a. IUCD insertion
- b. Oral contraceptive
- c. Condom
- d. Hypertension

255. A 40-year-old woman presents with PID. Best investigation to be done:

- a. USG
- b. CT
- c. MRI
- d. Laparoscopy

CERVICAL CANCER

256. Cervical cancer is mostly caused by:

(Recent Pattern Question 2018-19)

- a. HPV 6
- b. HPV 16
- c. HPV 31
- d. HPV 56

257. Most common type of cervical cancer:

- a. Squamous cell CA
- b. Small cell CA
- c. Adeno CA
- d. Adenoma

258. All of the following statements are true regarding etiology of cervical cancer EXCEPT:

- a. Both active and passive cigarette smoking increases the risk of cervical cancer
- b. Oral contraceptives decreases the risk of cervical cancer
- c. Abstinence from sexual activity and barrier protection decrease cervical cancer risk
- d. Low education increases cervical cancer risk

259. Most common cause of CA cervix:

- a. HPV 6 and 18
- b. HPV 16 and 18
- c. HPV 6
- d. HPV 6 and 11

260. Most commonly associated human papilloma virus with Cancer Cervix is?

- a. HPV 16
- b. HPV 24
- c. HPV 32
- d. HPV 36

261. Secondary level prevention of CA cervix:

- a. Vaccination
- b. Pap smear
- c. Colposcopy
- d. Spectroscopy

262. Screening test for cervical cancer is:

- a. Biopsy
- b. Papanicolaou smear
- c. Visual inspection
- d. Colposcopy

263. Cancer cervix screening according to WHO guidelines:

- a. Women between the ages of 21 and 29 should have a Pap test every 3 years
- b. Women between the ages of 30 and 65 should have both a Pap test and an HPV test every 5 years
- c. Women over age 65 who have had regular screenings with normal results should NOT be screened for cervical cancer
- d. All of the above

ENDOMETRIAL AND FALLOPIAN TUBE CANCER

264. Effect of tamoxifen: (Recent Pattern Question 2018)

- a. Increased risk of endometrial carcinoma
- b. Decreased risk of ovarian CA
- c. Causes cardiotoxicity
- d. Increased risk of osteoporosis

265. In endometriosis which of the following is not given?

(Recent Pattern Question 2018)

- a. Gonadotropin analogue
- b. Aromatase inhibitor
- c. Mifepristone
- d. Estradiol

266. Radiological test for staging of endometrial carcinoma is best done with: (Recent Pattern Question 2018)

- a. MRI
- b. Sonosalpingography
- c. PET-CT
- d. Doppler USG

267. Most common presentation of adenomyosis?

(Recent Pattern Question 2017)

- a. Dyspareunia
- b. Infertility
- c. Dysmenorrhea
- d. Hypomenorrhea

268. _____% women with postmenopausal bleeding found to have endometrial cancer:

- a. 20
- b. 30
- c. 40
- d. 50

269. This type of endometrial hyperplasia leads to increased risk of endometrial cancer:

- a. Simple
- b. Proliferative
- c. Atypical
- d. Secretive

270. Best prognostic for endometrial pathology

- a. Transvaginal ultrasound
- b. Biopsy
- c. Hysteroscopy
- d. Fractional curettage

271. What would be the appropriate treatment of stage-I endometrial cancer:

- a. Conservative management
- b. Chemo therapy followed by radio therapy
- c. Simple hysterectomy
- d. Bilateral salpingo oophorectomy

272. Earliest presentation of fallopian tube cancer:

- a. Painless watery discharge
- b. Painless vaginal bleeding
- c. Painful watery discharge
- d. Painful vaginal bleeding

273. Tumor erodes serosa/adnexa of uterus in this stage of endometrial CA:

- a. Ib
- b. II
- c. IIIa
- d. IIIb

OVARIAN CANCER

274. Call exner bodies are seen in:

(Recent Pattern Question 2017)

- a. Granulosa cell tumor
- b. Yolk cell tumor
- c. Teratoma
- d. Krukenberg tumor

275. Theca lutein cysts are common in

(Recent Pattern Question 2016)

- a. Vagina
- b. Uterus
- c. Ovary
- d. Cervix

276. All of the following are germ cell tumor EXCEPT:

- a. Dysgerminoma
- b. Choriocarcinoma
- c. Clear cell tumor
- d. Teratoma

277. Most common germ cell ovarian tumor:

- a. Dysgerminoma
- b. Teratoma
- c. Endodermal sinus tumor
- d. Clear cell tumor

278. Most common malignant germ cell ovarian tumor:

- a. Yolk sac tumors
- b. Dysgerminoma
- c. Dermoid cyst
- d. Brenners

279. Most frequent epithelial tumors of ovary:

- a. Papillary serous cystadenoma
- b. Brenners
- c. Endometrioid
- d. Mucinous cyst adenoma

280. Most common malignant ovarian tumor?

- a. Clear cell tumor
- b. Serous cyst adenocarcinoma
- c. Mucinous cyst adenocarcinoma
- d. Granulosa cell tumor

281. All of the following statements are true about choriocarcinoma EXCEPT:

- a. Can present with epigastric pain
- b. Ovary is the primary site
- c. Lungs are common site of metastasis
- d. Snow storm appearance upon CXR

282. Syncytiotrophoblast is seen in:

- a. Partial mole
- b. Complete mole
- c. Choriocarcinoma
- d. Placental site of trophoblastoma

283. Treatment of choice in choriocarcinoma is

- a. Chemotherapy
- b. External beam radiotherapy
- c. Hysterectomy
- d. Intracavitary brachytherapy

284. Tumor marker of CA ovary for follow up

- a. CEA
- b. PSA
- c. CA 125
- d. BETA hCG

VULVAR AND VAGINAL CANCER

285. In a patient with Vulval ulcer. Which of the following will lead to malignancy?

- a. HSV1
- b. HSV2
- c. STD
- d. HPV

286. Vulval cancer spreads to urethra at what stage?

- a. Stage I A
- b. Stage I B
- c. Stage II
- d. Stage III A

287. Urethra is involved in which stage of Vulvar neoplasia?

- a. Stage I
- b. Stage II
- c. Stage III
- d. Stage IV

288. A Vulvar cancer of 3 cm, no lymph node involved. Treatment:

- a. Simple partial vulvectomy with lymphadenectomy
- b. Simple partial vulvectomy without lymphadenectomy
- c. Wide local excision with lymphadenectomy
- d. Radical vulvectomy

289. Treatment for vulval cancer stage 1

- a. Complete radical Vulvectomy
- b. Partial vulvectomy
- c. Total vulvectomy and bilateral groin lymph node resection
- d. CT or RT followed by resection of residual tumor

290. Infertility occurs due to carcinoma of all EXCEPT:

- a. Endometrial carcinoma
- b. Ovarian carcinoma
- c. Vaginal carcinoma
- d. Cervix CA

DYSFUNCTIONAL UTERINE BLEEDING (DUB) AND DYSMENORRHEA

291. True about endometriosis:

(Recent Pattern Question 2018-19)

- a. Presence of endometrial gland in deep myometrium
- b. Presence of endometrium at ectopic locations
- c. Treated with hysterectomy
- d. Not associated with infertility

292. A 29-year-old female presented with infertility. There is history of abdominal pain, dyspareunia, dysmenorrhea, menorrhagia. Most likely cause:

(Recent Pattern Question 2018-19)

- a. Adenomyomatosis
- b. Endometriosis
- c. Myomas
- d. Cervicitis

293. In a 25-year-old lady with primary dysmenorrhea, which of the following statement is true?

(Recent Pattern Question 2018)

- a. No clinical significant pelvic pathology is found
- b. Menorrhagia and dyspareunia
- c. More commonly seen after 3rd decade
- d. Biochemical parameters are always normal

294. Most common cause of dysfunctional uterine bleeding:

- a. PID
- b. Endometriosis
- c. Dermoid cyst
- d. Anovulatory

295. Which of the following is an acyclical bleeding:

- a. Menorrhagia
- b. Polymenorrhoea
- c. Metrorrhagia
- d. Oligomenorrhoea

296. A 15-year-old girl presented with dysmenorrhea in every menstrual period. Menarche occurs at 13 years of age. Since then she experiences this very severe pain at right side associated with nausea and vomiting. She can't attend the school during menses from past year for which she consulted and started to take NSAIDs. Initially it is effective but after some time it is ineffective. What is next line of management?

- a. Pelvic and abdomen USG
- b. Oral contraceptive pills
- c. Dilatation and curettage
- d. High dose of non-specific steroid

297. Drug of choice in case of Puberty menorrhagia:

- a. Progesterone
- b. OCP
- c. IUCD
- d. Endometrial curettage

FIBROID

298. During caesarean section which fibroid is the easiest to remove:

(Recent Pattern Question 2018-19)

- a. Pedunculated
- b. Interstitial
- c. Cervical
- d. Intramural

299. Which of the following is *not* associated with pain in submucosal fibroids?

(Recent Pattern Question 2018)

- a. Torsion
- b. Large size
- c. Sarcomatous change
- d. Red degeneration

300. Most common type of uterine tumor is:

(Recent Pattern Question 2018)

- a. Leiomyoma
- b. Endometrial cancer
- c. Adenomyoma
- d. Leiomyosarcoma

301. Retention of urine is caused by which type of fibroid:

(Recent Pattern Question 2017)

- a. Subserosal
- b. Cervical
- c. Intramural
- d. Submucosal

302. Hysteroscopic excision can be done for all EXCEPT:

- a. Uterine fundus fibroid
- b. Submucous fibroid
- c. Subserous fibroid
- d. Endometrial polyp

303. Laproscopic surgery is most applicable to which types of fibroid:

- a. Subserous fibroid
- b. Uterine fundus fibroid
- c. Submucous fibroid
- d. Endometrial polyp

304. A pregnant female with 16 week AOG presented with bleeding. Upon USG Fibroid detected. Management:

- a. Conservative management
- b. Laparoscopic myomectomy
- c. Curettage
- d. Hysterectomy

305. Drug indicated in uterine fibroid:

- a. Danazol
- b. GnRH analogue
- c. Mifepristone
- d. All of the above

CHROMOSOMAL ANOMALIES

306. In Turner syndrome all are seen EXCEPT:

- a. Webbed neck
- b. Tall stature
- c. Widening of long bones of leg
- d. XO inheritance

307. Which of the following is true about Turner syndrome?

- a. 45 X Chromosome
- b. Primary Amenorrhea
- c. Coarctation of aorta
- d. All of the above

308. Turner syndrome is

- a. 45 XO
- b. 47 XXY
- c. Trisomy 13
- d. Trisomy 18

309. Turner syndrome presents with which heart defect?

- a. PDA
- b. TOF
- c. Coarctation of aorta
- d. Mitral stenosis

310. In Down's syndrome, 2nd trimester quadruple test includes all EXCEPT:

- a. Alpha fetoprotein
- b. hCG
- c. Inhibin A
- d. PAPP

311. Young female comes in with primary amenorrhea with normal breast, normal pubic hair. USG reveals absent uterus and cervix with short vaginal pouch and normal ovaries. Diagnosis:

- a. Klinefelter syndrome
- b. Mullerian agenesis
- c. Gonadal dysgenesis
- d. XYY

312. Female pseudohermaphroditism, all are true EXCEPT:

- a. Mullerian inhibiting substance is not produced
- b. Karyotype 46 XX
- c. Ovaries and uterus are absent
- d. Fused posterior labia with prominent clitoral hypertrophy

TROPHOBLASTIC TUMORS

313. Most common site of metastasis of choriocarcinoma

(Recent Pattern Question 2016)

- a. Lung
- b. Liver
- c. GIT
- d. Ovaries

314. After evacuation of molar pregnancy, monitoring is done with

(Recent Pattern Question 2016)

- a. Serial TVS
- b. Serial serum β hCG level
- c. Speculum examination
- d. LDH level

315. Which of the following is not trophoblast related:

- a. Choriocarcinoma
- b. H. mole
- c. Placental Site trophoblast tumor
- d. Chorioangioma

INFERTILITY AND CONTRACEPTION

316. 28-year-old lady (G_2P_1) who does not want to conceive after abortion, which is the preferred mode of contraception:

(Recent Pattern Question 2018-19)

- a. OCP
- b. IUD
- c. Barrier
- d. Implant

317. After a normal delivery OCP is to be started after ____:

(Recent Pattern Question 2018-19)

- a. 2 weeks
- b. 6 weeks
- c. 12 weeks
- d. 3 months

318. In a couple, initial work-up done for infertility:

(Recent Pattern Question 2018-19)

- a. Semen analysis, CXR, Montoux
- b. Semen analysis, Tubal patency test, Ovulation test
- c. Ovulation, tubal patency, Montoux test
- d. Testicular biopsy, USG, sperm penetration test

319. Absolute contraindication of OCP's are all EXCEPT:

(Recent Pattern Question 2018)

- a. Smoking
- b. Age <35 years
- c. Lactation
- d. Breast cancer

320. OCP can lead to:

(Recent Pattern Question 2018)

- a. Hepatic adenoma
- b. Thyroid adenoma
- c. Fibroadenoma
- d. Myoma

321. Which of the following is the preferred mode of contraception recommended during lactation?

(Recent Pattern Question 2018)

- a. IUCD
- b. DMPA
- c. Progesterone only pills
- d. OCP

322. Which of the following is the first line drug for follicle induction in infertility?

(Recent Pattern Question 2018)

- a. Clomiphene citrate
- b. GnRH agonist
- c. OCP
- d. hCG therapy

323. Which of these is true about RU_486 given for abortion?

(Recent Pattern Question 2017)

- a. Used till 11th week
- b. Teratogenic effect
- c. Used for emergency contraception
- d. Protects from ectopic pregnancy

324. Most common complication of IUD insertion

(Recent Pattern Question 2016)

- a. Pain
- b. Vaginal bleeding
- c. Expulsion
- d. Infection

325. Unexplained infertility is diagnosed in:

- a. 1% of infertile couples
- b. 5% of infertile couples
- c. 10% of infertile couples
- d. 25% of infertile couples

326. Testicular biopsy is best indicated in diagnostic workup of patient with:

- a. Azoospermia
- b. Oligospermia
- c. Necrospemnia
- d. Pyospermia

327. A couple after four days of having sex, contraceptive recommended:

- a. Oral contraceptive pills
- b. CuT 380
- c. Yuzpe method
- d. Low dose POP with norgesterol

328. Failure rate of Pomeroy's technique of sterilization is:

- a. 0.1% to 0.3%
- b. 0.3% to 1%
- c. 1.0% to 1.5%
- d. 1.6% to 2.0%

329. Contraceptive effect of CuT-380A lasts for how many years?

- a. 5
- b. 10
- c. 15
- d. 20

330. Levo-norgesterol all statement are true EXCEPT:

- a. Used in combined OCP with estrogen
- b. Composition in combined OCP is 0.15 mg
- c. Should be given for 21 days
- d. They are lipid friendly

331. True about pearl index:

- a. Population study
- b. Family planning
- c. Contraceptive methods
- d. Contraceptive failure

332. All are benefits of OCPs EXCEPT:

- a. Improve menstrual abnormality
- b. Protect against unwanted pregnancy
- c. Protect from breast cancer
- d. Protect from endometrial cancer

333. Non-contraceptive benefit of combined oral contraceptive pills include all EXCEPT:

- a. Protection against endometrial cancer
- b. Protection against cervical cancer
- c. Relief of dysmenorrhoea
- d. Relief of menorrhagia

334. Mechanism of action of combined OCP:

- a. Prevent implantation of ovum
- b. Prevent fertilization
- c. Prevent release of ovum from ovary
- d. Reduce sperm motility

POLYCYSTIC OVARIAN SYNDROME (PCOS)/STEIN LEVANTHAL SYNDROME

335. MC cause of hirsutism:

(Recent Pattern Question 2018-19)

- a. Drug induced
- b. PCOS
- c. Endometriosis
- d. Adenomyosis

336. The number of ovarian follicles are increased in:

(Recent Pattern Question 2018)

- a. Turner syndrome
- b. Klinefelter syndrome
- c. PCOD
- d. Primary amenorrhea

337. Most common cause of hirsutism in females is:

- a. Metropathica heamorrhagica
- b. PCOD
- c. Endometriosis
- d. PID

338. Patient with history of amenorrhea and hirsutism. USG of uterus given below. Diagnosis:

- a. PCOS
- b. Endometriosis
- c. Adenomomatosis
- d. Choriocarcinoma

339. Primary treatment for hirsutism in PCOD:

- a. Minoxidil
- b. Progesterone
- c. GnRH analogue
- d. Combined OCP

PROLAPSE

340. True about Pessary used in prolapse:

(Recent Pattern Question 2018-19)

- a. Filling type pessary used
- b. Not preferred in pregnancy
- c. Needs to be changed every 3 months
- d. Never used with Gel to insert

341. Conservative treatment for pelvic organ prolapse:

(Recent Pattern Question 2018-19)

- a. Perineorrhaphy
- b. Shirodkar procedure
- c. Pessary
- d. Le Fort repair

MISCELLANEOUS

342. A patient presented to you Post hysterectomy with osteoporosis and in need of HRT. What will be the choice of HRT for such patient:

- a. Progestin
- b. Estrogen
- c. Estrogen and progestin both
- d. Testosterone

343. Best gas used for creating pneumoperitoneum at laparoscopy is

- a. N₂
- b. O₂
- c. CO₂
- d. N₂O

BOARD REVIEW QUESTIONS

344. The ratio of fetal weight and placental weight at term is?

- a. 4:1
- b. 5:1
- c. 6:1
- d. 7:1

345. Velocity of sperms in female genital tract is?

- a. 0-1 mm/min
- b. 1-2 mm/min
- c. 4-5 mm/min
- d. 5-6 mm/min

346. True about circumvallate placenta is?

- a. Fetal plate smaller than basal plate
- b. Basal plate smaller than fetal plate
- c. Has accessory lobes
- d. Is membranous

347. Vaccine preventable cancer is?

- a. Endometrial cancer
- b. Breast cancer
- c. Cancer cervix
- d. Ovarian cancer

348. Subpubic angle in Gynaecoid pelvis is?

- a. 75°
- b. 80°
- c. 100°
- d. 120°

349. Investigation for bacterial vaginosis is?

- a. Pap smear
- b. Gram stain
- c. Culture
- d. Microscopy

- 350. Vacuum cup is placed?**
 a. Anterior to anterior fontanelle
 b. Posterior to posterior fontanelle
 c. Anterior to posterior fontanelle
 d. Posterior to anterior fontanelle
- 351. Intrauterine contraceptive device with an effective life of 10 years is?**
 a. Cu T 380 A
 b. Mirena
 c. Cu T 200
 d. Progestasert
- 352. Mirena releases _____ microgram of LNG/day?**
 a. 20
 b. 55
 c. 65
 d. 380
- 353. Today vaginal sponge failure rate is:**
 a. 5%
 b. 9%
 c. 16%
 d. 20%
- 354. Which of the following causes OCP failure?**
 a. Carbamazepine
 b. Rifampicin
 c. NSAIDS
 d. Ethambutol
- 355. Maximum transmission of rubella occurs in:**
 a. 1st trimester
 b. 2nd trimester
 c. 3rd trimester
 d. Labor
- 356. Narrowest part of fallopian tube is?**
 a. Infundibulum
 b. Ampulla
 c. Cornual
 d. Interstitium
- 357. Glucose challenge test is done with _____ grams of glucose and is seen at _____ hours?**
 a. 75 g and 2 hours
 b. 100 g and 2 hours
 c. 50 g and 1 hour
 d. 75 g and 1 hour
- 358. Earliest sign in Sheehan syndrome is?**
 a. Hypomenorrhea
 b. Amenorrhea
 c. Lack of lactation
 d. Cold intolerance
- 359. Drug of choice in pregnant women with Secondary Syphilis is?**
 a. Doxycycline
 b. Benzathine Penicillin
 c. Ceftriaxone
 d. Cotrimoxazole
- 360. Calcium requirement in pregnancy is?**
 a. 1 g
 b. 1.2 g
 c. 1.5 g
 d. 2 g
- 361. Father of obstetrics ultrasound is?**
 a. John Wild
 b. Ian Donald
 c. Mc Donald
 d. Mc Roberts
- 362. Number of follicles in female newborn is?**
 a. 1 million
 b. 2 million
 c. 3 million
 d. 4 million
- 363. Normal development of a female with absent uterus and vagina indicates?**
 a. Turner's syndrome
 b. Testicular feminizing syndrome
 c. Mullerian agenesis
 d. Gonadal dysgenesis
- 364. Most common type of conjoined twin is:**
 a. Thoracopagus
 b. Craniopagus
 c. Pyopagus
 d. Ischiopagus
- 365. Medical management of unruptured tubal pregnancy**
 a. Methotrexate
 b. Oxytocin
 c. Progesterone
 d. All of above
- 366. Biggest fetal skull diameter is**
 a. Biparietal
 b. Bitemporal
 c. Mento vertical
 d. Submentobregmatic
- 367. Dusky hue of vestibule and anterior vaginal wall is**
 a. Chadwick sign
 b. Oslander sign
 c. Goodell sign
 d. Hegar sign
- 368. Most common Type of female pelvis**
 a. Gynaecoid
 b. Anthropoid
 c. Android
 d. Platy pelloid
- 369. Most common cause of Breech presentation**
 a. Prematurity
 b. Twins
 c. Android pelvis
 d. Previous LSCS
- 370. A pregnant women with BP 150/100 mmHg, proteinuria after 20 weeks. Diagnosis?**
 a. Pre-eclampsia
 b. Pregnancy induced hypertension
 c. Renal hypertension
 d. Eclampsia
- 371. If zygote divides after 8 days it will lead to twin:**
 a. Dichorionic, diamniotic
 b. Monochorionic diamniotic
 c. Monochorionic monoamniotic
 d. Conjoined twins
- 372. Incidence of uterine rupture in previous LSCS**
 a. 1%
 b. 0.1%
 c. 5%
 d. 10%
- 373. Smallest transverse diameter of fetal head:**
 a. Biparietal
 b. Bitemporal
 c. Bimastoid
 d. Mentovertical
- 374. Minimum pressure of uterine contraction to cause pain:**
 a. 10 mm Hg
 b. 15 mm Hg
 c. 30 mm Hg
 d. 45 mm Hg
- 375. Piskacek's sign is seen at?**
 a. 6 weeks
 b. 8 weeks
 c. 12 weeks
 d. 16 weeks
- 376. Page/Sher classification is used for;**
 a. Placenta previa
 b. Abruptio placenta
 c. Eclampsia
 d. None
- 377. True about bacterial vaginosis, is all EXCEPT**
 a. Whiff's test positive
 b. Itchy/pruritus
 c. Clue cells
 d. Grey white discharge
- 378. Distention of fallopian tube on ampullary end is seen in**
 a. Hydrosalpinx
 b. Pyosalpinx
 c. Salpingitis isthmica nodosa
 d. Chronic interstitial salpingitis

379. Most common site of genital TB

- a. Fallopian tube b. Uterus
- c. Cervix d. Ovary

380. Tadpole cells are seen in?

- a. Invasive carcinoma
- b. Koilocytosis
- c. Carcinoma in situ
- d. Mild dyskaryosis

381. Best test for gonorrhea

- a. Nucleic acid amplification
- b. Gram stain
- c. Culture in Thayer martin media
- d. Elisa

382. Fitz hugh Curtis syndrome is seen with?

- a. Chancroid
- b. L.G.V
- c. Chlamydia
- d. Donovanosis

383. In spinnbarkeit:

- a. Mucus can withstand stretching up to 5 cm
- b. Mucus can withstand stretching up to 10 cm
- c. Mucus can withstand stretching up to 15 cm
- d. Mucus can withstand stretching up to 20 cm

384. Most common type of cervical cancer:

- a. Squamous Cell Ca b. Small Cell Ca
- c. Adeno Ca d. Adenoma

385. Best prognostic for endometrial pathology

- a. Transvaginal Ultrasound b. Biopsy
- c. Hysteroscopy d. Fractional Curettage

386. Earliest Presentation of Fallopian Tube Cancer:

- a. Painless watery discharge b. Painless vaginal bleeding
- c. Painful watery discharge d. Painful vaginal bleeding

387. Most common malignant germ cell ovarian tumor:

- a. Yolk Sac Tumors b. Dysgerminoma
- c. Dermoid Cyst d. Brenners

388. Tumor Marker of CA Ovary for follow up

- a. CEA b. PSA
- c. CA 125 d. BETA hCG

389. Most common cause of dysfunctional uterine bleeding:

- a. PID b. Endometriosis
- c. Dermoid Cyst d. Anovulatory

390. Turner syndrome presents with whichdefect?

- a. PDA b. TOF
- c. Coaractation of aorta d. Mitral stenosis

391. In down's syndrome, 2nd trimester quadruple test includes all EXCEPT:

- a. Alpha Fetoprotein b. hCG
- c. Inhibin A d. PAPP

392. Testicular biopsy is best indicated in diagnostic workup of patient with:

- a. Azoospermia b. Oligospermia
- c. Necrospemnia d. Pyospermia

393. A couple presents after four days of having sex, contraceptive recommended.

- a. Oral Contraceptive Pills
- b. CuT 380
- c. Yuzpe Method
- d. Low dose pop with norgesterol

394. Most Common Cause of Hirsutism in Females is:

- a. Metropathica Heamorrhagica
- b. PCOD
- c. Endometriosis
- d. PID

395. Ashermann syndrome is:

- a. Adhesion in uterus post curettage
- b. Adhesion in uterus, post salpingectomy
- c. Adhesion in uterus, post salpingitis
- d. All of above

396. All are emergency contraceptives EXCEPT

- a. Copper I.U.D b. Mifepristone
- c. Levonorgenstrel d. Norplant

397. Essure is:

- a. Male contraception
- b. Transcervical sterilization
- c. Combined injectable contraceptive
- d. Transdermal patch

398. True about Female condom is all EXCEPT:

- a. Single use
- b. Inner ring smaller than outer ring
- c. Protect against P.I.D
- d. Beneficial in immunological infertility

399. Main support of uterus is:

- a. Cardinal ligament b. Broad ligament
- c. Uterocervical ligament d. Pubocervical ligament

400. Presentation when the engaging diameter is Mento-vertical is:

- a. Brow b. Face
- c. Vertex d. Breech

401. WHO modified partogram charting starts at cervical dilatation of:

- a. 2 cm b. 3 cm
- c. 4 cm d. 5 cm

402. HIV transmission is maximum during?

- a. Labor b. Early pregnancy
- c. Late pregnancy d. Post delivery

403. Cause of acidic pH of vagina is due to:

- a. Doderlein Bacilli b. Gardnerella
- c. Mobilincus d. Glycogen

404. Most common cause of obstructed Labor in India is:

- a. Android pelvis
- b. Gynecoid pelvis
- c. Platypelloid pelvis
- d. Anthropoid pelvis

405. At what age the product of conception is called as "Embryo"?
 a. 72 hours b. 1 week
 c. 3 weeks d. 8 weeks
406. Not seen in endometriosis is:
 a. Vaginal discharge b. Dyspareunia
 c. Pelvic pain d. Dysmenorrhea
407. Amniocentesis is done at what intrauterine age:
 a. 10–12 weeks b. 12–20 weeks
 c. 20–25 weeks d. 25–30 weeks
408. Sign seen in USG in monochorionic diamniotic twins is?
 a. Lambda sign
 b. Twin peak sign
 c. T sign
 d. Membrane thickness >2 mm
409. In dizygotic twin there is:
 a. Always same sex
 b. Always different sex
 c. Separate chorion and amnion
 d. None
410. Cervix effacement suggestive of onset of Labor is:
 a. 25 mm b. 30 mm
 c. 35 mm d. 15 mm
411. Most common genital infection in pregnancy is:
 a. Candida b. Trichomonas
 c. Chlamydia d. Gonorrhea
412. Uteroplacental circulation is established after fertilization:
 a. 1 weeks b. 2 weeks
 c. 3 weeks d. 4 weeks
413. Fetus most radiosensitive at:
 a. 8–15 weeks b. 10–15 weeks
 c. 15–20 weeks d. >20 weeks
414. Investigation of choice in post-menopausal bleeding is:
 a. Fractional curettage
 b. D and C
 c. Colposcopy guided endometrial biopsy
 d. PAP smear
415. Amsel criteria for the diagnosis of bacterial vaginosis does not include:
 a. Plenty of lactobacilli
 b. pH > 4.5
 c. Whiff's test positive
 d. Clue cells
416. Billing's method of contraception is a:
 a. Hormonal method
 b. Barrier method
 c. Behavioral method
 d. None
417. Drug of choice for chemotherapy of cervical cancer is:
 a. Cisplatin
 b. Vincristine
 c. Cyclophosphamide
 d. Etoposide
418. Blood volume returns to normal pre pregnant levels, how many weeks after pregnancy?
 a. 1 week b. 3 weeks
 c. 4 weeks d. 6 weeks
419. Most common cause of rupture uterus in India is:
 a. VBAC b. Obstructed Labor
 c. Precipitate Labor d. Multiparity
420. A pregnant woman is on anticoagulant therapy is shifted to heparin at:
 a. 28 weeks
 b. 32 weeks
 c. 36 weeks
 d. At the onset of labor
421. Which of the following is known as pregnancy tumor?
 a. Fundal fibroid with pregnancy
 b. Ovarian tumor with pregnancy
 c. Cervical fibroid with pregnancy
 d. Pyogenic granuloma
422. Puerperal sepsis/infection occurs up to:
 a. 1 week b. 2 weeks
 c. 3 weeks d. 4 weeks
423. Le Forts operation is done in:
 a. Young patient with utero-vaginal prolapse
 b. Elderly patient with utero-vaginal prolapse
 c. Multiparous with utero-vaginal prolapsed
 d. Pregnant patient with utero-vaginal prolapsed
424. In a case of pre-eclampsia Doppler USG will show?
 a. Reversed blood flow in ductus venosus at 22 weeks
 b. Absent blood flow in umbilical artery at 22 weeks
 c. Diastolic notch in umbilical artery at 22 weeks
 d. Increase peak systolic flow velocity in middle cerebral artery
425. First sign of magnesium sulphate toxicity is:
 a. Loss of deep tendon reflexes
 b. Respiratory depression
 c. Cardiac arrest
 d. Decrease urinary output
426. Treatment of choice of Perimenopausal adenomyosis is:
 a. OCPS b. GnRH agonists
 c. LNG IUS d. Hysterectomy
427. Clue cells are seen in:
 a. Bacterial vaginosis b. Herpes virus
 c. Syphilis d. Toxoplasmosis
428. Preterm baby is born before:
 a. 28 weeks b. 32 weeks
 c. 34 weeks d. 37 weeks
429. Most common cardiovascular condition leading to maternal death in pregnancy is:
 a. ASD
 b. Mitral stenosis
 c. Aortic stenosis
 d. Pulmonary hypertension

- 430. First symptom of vulval hematoma is:**
a. Pain b. Itching
c. Retention of urine d. Swelling of vulva
- 431. PAP smear invented by:**
a. John papanicolaou b. George papanicolaou
c. Vladimir papanicolaou d. Ben papanicolaou
- 432. Most common site of ectopic pregnancy is ampulla because:**
a. Fertilisation takes place here
b. It is the widest part
c. It has very thick mucosal layer
d. It has less propulsive activity
- 433. Incidence of breech presentation at term is:**
a. 1% b. 3%
c. 7 d. 10%
- 434. Genital tuberculosis most common disseminates by:**
a. Lymphatic b. Hematogenous
c. Local spread d. None
- 435. Which contraceptive should be used after molar pregnancy:**
a. Barrier b. Hormonal contraceptives
c. IUCD d. Natural method
- 436. Drug of choice for eclampsia is:**
a. Magnesium sulphate b. Clonazepam
c. Antihypertensives d. Beta blockers
- 437. Amniotic fluid volume in polyhydramnios is more than:**
a. 500 mL b. 1000 mL
c. 1500 mL d. 2000 mL
- 438. Prepuberty ratio of corpus of uterus and cervix is:**
a. 1:2 b. 1:1
c. 2:1 d. 3:1
- 439. Serous carcinoma of endometrium is associated with which mutation:**
a. p53 b. PTEN
c. k ras d. p16k
- 440. Surfactant appears in amniotic fluid at:**
a. 20 weeks b. 24 weeks
c. 28 weeks d. 30 weeks
- 441. Single best parameter to assess fetal well being is:**
a. Femur length
b. Head circumference
c. Abdominal circumference
d. Amniotic fluid volume
- 442. RDA of iodine in pregnancy is:**
a. 200 mcg/day b. 220 mcg/day
c. 240 mcg/day d. 260 mcg/day
- 443. Size of ovarian follicle at ovulation is:**
a. 0.5–1 cm b. 1–1.5 cm
c. 1.5–2 cm d. 2–2.5 cm
- 444. Partial mole is:**
a. Haploid b. Diploid
c. Triploid d. Polyploid
- 445. Heart disease with worst prognosis in pregnancy is:**
a. Aortic Stenosis
b. Pulmonary Hypertension
c. Uncorrected fallot
d. Marfan s syndrome with normal aorta
- 446. Usual causative organism of endocervicitis is:**
a. Herpes simplex virus b. Chlamydia
c. Trichomoniasis d. Candida
- 447. First maneuver to be done incase of shoulder dystocia is:**
a. McRoberts b. Wood's corkscrew
c. Lovset d. Zavanelli
- 448. A 33-year-old female presents with history of 6 months amenorrhea. Biochemical investigations showed increased FSH and decreased Estradiol. Diagnosis is:**
a. PCOD b. Hyperprolactinemia
c. Premature menopause d. Ectopic pregnancy
- 449. What is seen in a menopausal women (2018)**
a. Inc FSH and LH b. Dec FSH and LH
c. Inc FSH and Dec LH d. Dec FSH and Inc estrogen
- 450. Postmenopausal cardiac problem is due to: (2018)**
a. Increase in FSH
b. Decrease in estrogen
c. Increase in progesterone
d. Increase in androgen
- 451. Contraindication of CuT insertion are all EXCEPT: (2018)**
a. PID b. Ectopic pregnancy
c. Multiparity d. Suspected pregnancy
- 452. Mittelschmerz pain is noted during: (2018)**
a. Ovulation
b. Menstruation
c. Delivery
d. Copulation

IMAGE-BASED QUESTIONS

453. A 35-year-old lady presents with vaginal discharge. Smears from vaginal discharge show presence of:

- a. Trichomonas
- b. Entamoeba histiolytica
- c. Toxoplasma
- d. Giardia

456. The vaginal smear shows presence of:

- a. Bacterial vaginosis
- b. Candidiasis
- c. Human papilloma virus
- d. Trichomonas vaginalis

454. Identify the instrument shown below:

- a. Sims speculum
- b. Cusco speculum
- c. EB curette
- d. Deaver's retractor

457. Least common site of ectopic pregnancy:

- a. Interstitial part
- b. Isthmus
- c. Ampulla
- d. Fimbrial end

455. Identify the instruments shown in the figure:

- a. Uterine sound
- b. Hegar dilator
- c. Sims self retaining speculum
- d. Interlocking nails

458. The HSG report shows:

- a. Hydrosalpinx
- b. Uterus didelphys
- c. Adenomyosis
- d. Endometriosis

459. The following instrument is called as:

- a. Cusco's speculum
- b. Vulsellum
- c. Sims speculum
- d. Vaginal sling

461. The image shows:

- a. Uterine sound
- b. Vere's needle
- c. Hegar dilator
- d. Curette

460. Which instrument is shown below:

- a. Cusco's speculum
- b. Vulsellum
- c. Sims speculum
- d. Vaginal sling

462. The image shows:

- a. Outlet forceps
- b. Keilland forceps
- c. Piper forceps
- d. Artery forceps

463. Identify the image and its use:

- a. Cervical dilator
- b. Uterine sound
- c. Babcock
- d. Cryotherapy probe

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

OBSTETRICS

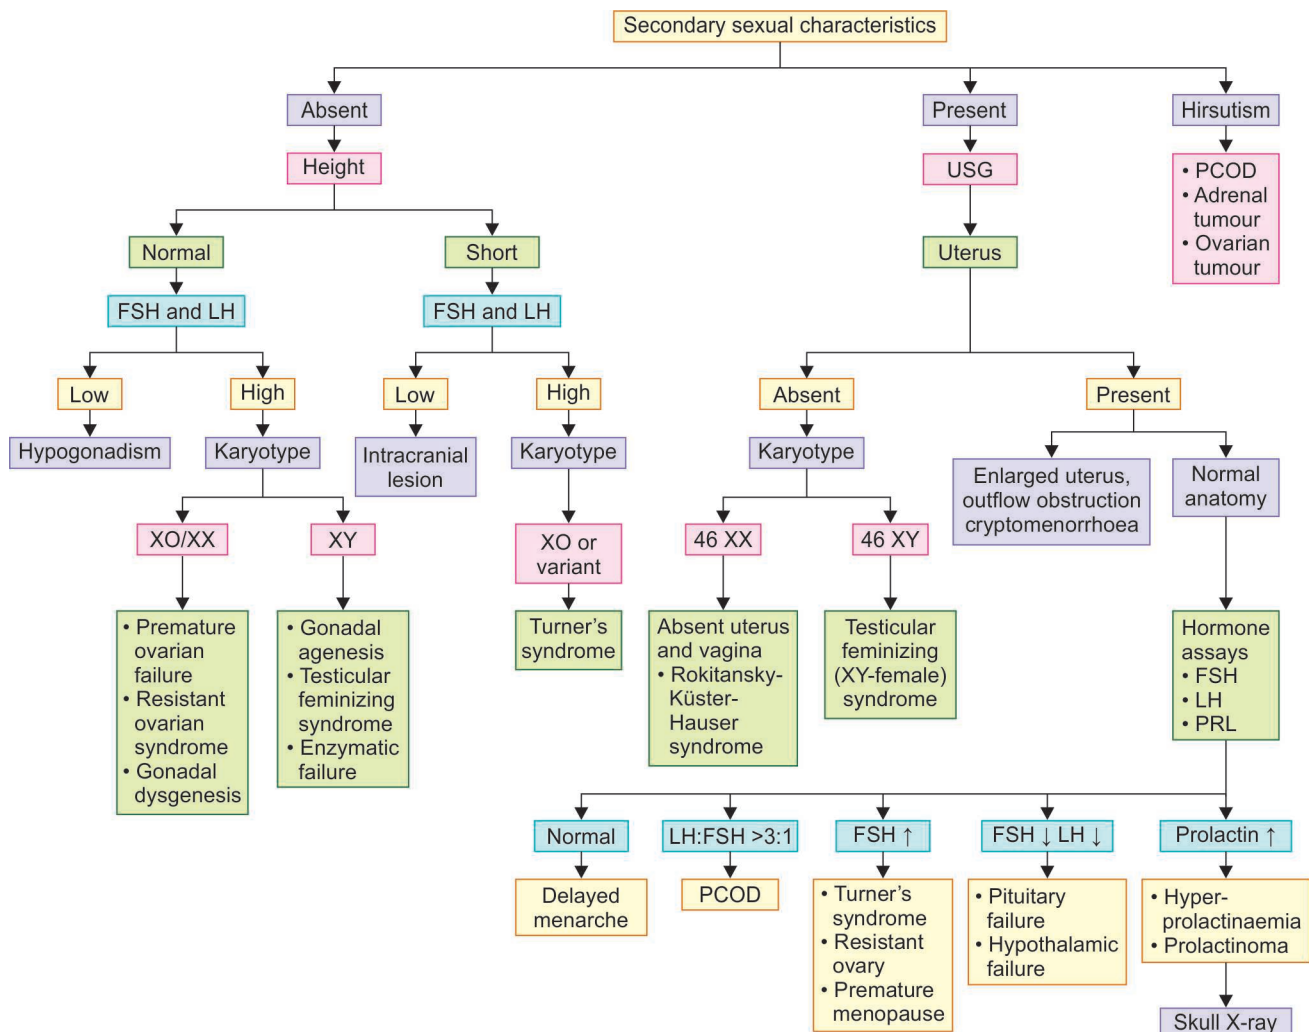

MOST RECENT QUESTIONS 2019

1. Ans. (b) USG

Ref: Shaw's Gynecology 16th ed. P 329

- In a patient with primary amenorrhea and secondary sexual characteristics, we need to rule out conditions like androgen insensitivity syndrome and MRKH syndrome. But before that checking the presence or absence of uterus with help of ultrasonography decides the further steps like karyotyping or hormonal studies.
- Please refer the flowchart below

FLOW CHART: Investigations in amenorrhea

2. Ans. (c) Bed rest and Progesterone

Ref: DC Dutta 9th ed. P 153-54

- The patient is a case of threatened abortion, which can present with brisk bleeding.

- This bleeding usually stops spontaneously upon bed rest.
- Definition of Threatened abortion:** "a clinical entity where the process of miscarriage has started but has not progressed to a state from which recovery is impossible"

FMGE Solutions Screening Examination

- **Treatment:**

- Bed rest and strenuous activity restriction
- Treatment with progesterone induces immunomodulation to shift the Th1 (proinflammatory response) to Th2 (anti-inflammatory response)

- **Note:** Use of hCG is not preferred.

3. Ans. (b) **Hysterosalpingography**

Ref: Shaw's Gynecology 16th ed. P 111-12

- Pelvic inflammatory disease can cause tubal blockage, which can cause infertility.
- Therefore HSG is done to rule out PID induced tubal blockage

Hysterosalpingography (HSG) is employed for the following:

- To study the patency of the fallopian tubes in infertility and postoperative tuboplasty.
- To assess the feasibility of tuboplasty by studying the location and extent of tubal pathology.
- To study uterine anomaly such as septate and cornuate uterus.
- To detect uterine synechiae.
- To detect uterine polyp.
- To study incompetence of internal OS.

FIGURE: Genital tuberculosis—beaded blocked tubes

4. Ans. (c) **Abruptio placenta**

Ref: DC Dutta 9th ed. P 238

- Couvelaire Uterus is also known as uteroplacental apoplexy.
- It leads to severe form of concealed abruptio placentae. There is massive intravasation of blood into the uterine musculature up to the serous coat.
- The condition can only be diagnosed on laparotomy.
- Upon naked eye examination of such uterus, it is dark port wine color which may be patchy or diffuse.
- **Note:** Presence of couvelaire uterus is not an indication per se for hysterectomy.

5. Ans. (d) **Multigravida**

Ref: Shaw's Gynecology 16th ed P 508

- Low parity is an increased risk factor for development of endometrial CA. Out of given choices, multigravida is at least risk of endometrial CA

Endometrial cancer: Etiology and high risk

- Unopposed oestrogen or high level of oestrogen
- Chronic anovulation, PCOD
- Familial predisposition
- Tamoxifen
- Obesity, hypertension, diabetes
- Feminizing ovarian tumour
- Low parity
- Late menopause

6. Ans. (c) **>4**

Ref: DC Dutta 9th ed pg 86

- A pregnant woman with a previous history of four births or more is called grand multipara.

Extra Mile

<ul style="list-style-type: none"> • A nullipara is one who has never completed a pregnancy to the stage of viability. She may or may not have aborted previously. 	<ul style="list-style-type: none"> • A nulligravida is one who is not now and never has been pregnant
<ul style="list-style-type: none"> • A primipara is one who has delivered one viable child. Parity is not increased even if the fetuses are many (twins, triplets) 	<ul style="list-style-type: none"> • A primigravida is one who is pregnant for the first time
<ul style="list-style-type: none"> • A multigravida is one who has previously been pregnant. She may have aborted or have delivered a viable baby 	<ul style="list-style-type: none"> • Multipara is one who has completed two or more pregnancies to the stage of viability or more
<ul style="list-style-type: none"> • A parturient is a women in labor 	<ul style="list-style-type: none"> • A puerpera is a woman who has just given birth

7. Ans. (c) **Gestational Hypertension**Ref: DC Dutta 9th ed P 207**TABLE:** Classification of hypertension in pregnancy (National high blood pressure education program 2000 and ACOG-2013)

Disorder	Definition	Disorder	Definition
Hypertension	BP \geq 140/90 mm Hg measured two times with at least 6-hour interval	Chronic hypertension with superimposed preeclampsia and eclampsia	The common causes of chronic hypertension: <ul style="list-style-type: none"> • Essential hypertension • Chronic renal disease (renovascular) • Coarctation of aorta • Endocrine disorders (diabetes mellitus, pheochromocytoma, thyrotoxicosis) • Connective tissue diseases (Lupus erythematosus) The criteria for diagnosis of superimposed preeclampsia: <ul style="list-style-type: none"> • New onset of proteinuria >0.5 g/24 hours specimen • Aggravation of hypertension • Development of HELLP syndrome • Development of headache scotoma, epigastric pain
Proteinuria	Urinary excretion of >0.3 g protein/24 hours specimen or 0.1 g/L		
Gestational hypertension	BP $>140/90$ mm hg for the first time in pregnancy after 20 weeks, without proteinuria		
Preeclampsia	Gestational hypertension with proteinuria		
Eclampsia	Women with preeclampsia complicated with grand mal seizures and/or coma		
HELLP syndrome	<ul style="list-style-type: none"> • Hemolysis (H) • Elevated liver enzymes (EL) • Low platelet count (LP) 		
Chronic hypertension	Known hypertension before pregnancy or hypertension diagnosed first time before 20 weeks of pregnancy		
Superimposed preeclampsia or eclampsia	Occurrence of new onset of proteinuria in women with chronic hypertension		

8. Ans. (d) **20 million/mL**Ref: Shaw's Gynecology 16th ed. P 243-44**TABLE:** Latest WHO recommendations of normal semen analysis reference values

- Volume: 1.5–5.0 mL
- pH: >7.2
- Viscosity: <3 (scale 0–4)
- Sperm concentration: >20 million/mL
- Total sperm number: >40 million/ejaculate
- Percent motility: $>50\%$
- Forward progression: >2 (scale 0–4)
- Normal morphology: $>50\%$ normal
- Round cells: <5 million/mL
- Sperm agglutination: <2 (scale 0–3)

Source: WHO guidelines

9. Ans. (d) **Premenstrual period**Ref: Shaw Gynecology 16th ed. P 255**ENDOMETRIAL BIOPSY**

- Although endometrial biopsy has been widely replaced for serial ultrasound monitoring, if ever needed, it is preferably done 1 or 2 days before the onset of menstruation.
- The material removed should be fixed immediately in formalin saline and submitted to histological scrutiny.
- Secretory changes prove that the cycle has been ovulatory.

FMGE Solutions Screening Examination

882

10. Ans. (d) Progesterone

- The shown graph in question marked with X is due to progesterone effect in luteal phase.
- Follow the image for better understanding:

11. Ans. (c) Remove IUCD and continue pregnancy

Ref: Shaw's Gynaecology 16th ed. pg. 271, 272

- In patients with in-situ IUCD, pregnancy occurs in 1–3 per 100 women years.
- If this happens, it is important to do ultrasound and rule out ectopic pregnancy.
- The uterine pregnancy can cause severe infection. It is therefore mandatory to remove the IUCD if the tail is visible through the os.
- While doing so, the risk of abortion should be explained to the woman. If the thread of the IUCD is not seen, termination of pregnancy is offered, not because IUCD has any teratogenic effect but because the risk of uterine infection is considerable. Alternatively, the pregnancy is continued after counselling and explaining the risk.

12. Ans. (c) Renal agenesis

Ref: DC Dutta 9th ed. pg. 203, 204

- Oligohydramnios is an extremely rare condition where the liquor amnii is deficient in amount to the extent of less than 200 mL at term.
- Sonographically, it is defined** when the maximum vertical pocket of liquor is less than <2 cm or when amniotic fluid index (AFI) is less than 5 cm (less than 5 percentile).
- Absence of any measurable pocket of amniotic fluid is defined as Anhydramnios. AFI between 5 and 8 is termed as borderline AFI or borderline Oligohydramnios.
- Internal organ malfunction like renal agenesis can cause this problem.

Causes:

Fetal cause	Maternal cause
<ul style="list-style-type: none"> Renal cause (MCC) <ul style="list-style-type: none"> Renal agenesis Polycystic kidney Urethral obstruction Fetal growth restriction Premature rupture of membranes Post-term pregnancy Fetal death Drugs exposure like: PG inhibitor, ACE inhibitor 	<ul style="list-style-type: none"> Hypertension Uteroplacental insufficiency Dehydration Idiopathic

ANATOMY AND PHYSIOLOGY

13. Ans. (c) Syncytiotrophoblast

Ref: DC Dutta 9th ed. P 53-54

- From placenta, syncytiotrophoblast is the principal site of protein and steroid hormone synthesis.
- hCG:**
 - A glycoprotein hormone
 - MW: 36000–40,000 dalton
 - Has 2 subunits: α and β
 - α : Hormone non-specific (92 Amino acid). **Biochemically similar to LH, FSH and TSH.**
 - β : Hormone specific (145 Amino acid). Unique for hCG.
- Functions:**
 - Rescue and maintenance of corpus luteum till 6 weeks of pregnancy
 - Stimulate leydig cell of male fetus (to produce testosterone)
 - Immunosuppressive activity
 - Stimulate both adrenal and placental steroidogenesis
 - Promote secretion of relaxin from the corpus luteum.

Extra Mile

- hCG disappears from circulation within 2 weeks following delivery
- **hPL (Human Placental Lactogen)** aka human chorionic somatomammotropin; Similar to GH and prolactin.
 - First detected during the 3rd week of gestation. Its plasma concentration rises proportionately to placental mass
 - **Func:** Causes maternal lipolysis and promote transfer of glucose and amino acid to the fetus.
- **Pregnancy specific β -1 Glycoprotein (PS β -1G):** Produced by trophoblast cell. Detected in maternal serum 18–20 days after ovulation. Potent immunosuppressor → prevent rejection of conceptus.

14. Ans. (a) **Symphysis pubis to umbilicus**Ref: DC Dutta Obstetrics 8th ed. P 78

DC Dutta states: During progression of pregnancy the height of uterus is:

- Midway between the symphysis pubis and umbilicus at 16th week
- At the level of umbilicus at 24th week and
- At the junction of the lower third and upper two-thirds of the distance between the umbilicus and ensiform cartilage at 28th week.

The level of fundus uteri at different weeks.

Note: The change of uterine shape

15. Ans. (c) **Progesterone effect**Ref: DC Dutta 8th ed. P 114

Dutta states: “Constipation is a quite common ailment during pregnancy. Atonicity of the gut due to the **effect of progesterone**, diminished physical activity and pressure of the gravid uterus on the pelvic colon”

Extra Mile

Reasons of other ailments during pregnancy

- **Leg cramps during pregnancy** may be due to deficiency of diffusible serum calcium or elevation of serum phosphorus.
- **Backache:** Physiological changes that contribute to backache are: joint ligament laxity (relaxin, estrogen), weight gain, hyperlordosis and anterior tilt of the pelvis. It is a common problem (50%) in pregnancy.

16. Ans. (a) **T1**Ref: DC Dutta, 8th ed. pg. 53

- **Dutta states:** “Increased frequency of micturition is noticed at 6–8 weeks of pregnancy which subsides after 12 weeks”.
- Urine frequency increases initially in first trimester. Normally, uterus is anteverted in position and is exaggerated up to 8 weeks.
- This enlarged uterus may lie on the bladder rendering it incapable of filling, clinically evident by increased frequency of micturition. Afterwards, it becomes erect, the long axis of the uterus conforms more or less to the axis of the inlet.

17. Ans. (a) **Rise by 25%**Ref: DC Dutta, 8th ed. pg. 70

- During pregnancy glomerular filtration rate increases, which causes increased renal clearance of iodine.
- **Maternal serum iodine levels fall** due to increased renal loss and also due to transplacental shift to the fetus. These cause hyperplasia of the gland.
- **Therefore** iodine intake during pregnancy should be increased from 100 $\mu\text{g/day}$ to 200 $\mu\text{g/day}$ (as recommended by WHO).
- **There is rise in the basal metabolic rate, which begins at about the third month, reaches a value of +25% during the last trimester.**
- This increase in BMR is probably due to increase in net oxygen consumption of mother and fetus.

18. Ans. (a) **Mentovertical**Ref: DC Dutta, 8th ed. pg. 96

- **Largest fetal head diameter is Mentovertical.**

FMGE Solutions Screening Examination

TABLE: Important diameters of the skull

Diameters	Measurement in cm (Inches)	Attitude of the Head	Presentation
Suboccipitobregmatic —extends from the nape of the neck to the center of the bregma	9.5 cm (3 ¾")	Complete flexion	Vertex
Suboccipito-frontal —extends from the nape of the neck to the anterior end of the anterior fontanel or center of the sinciput	10 cm (4")	Incomplete flexion	Vertex
Occipitofrontal —extends from the occipital eminence to the root of the nose (Glabella)	11.5 cm (4 ½")	Marked deflexion	Vertex
Mentovertical —extends from the midpoint of the chin to the highest point on the sagittal suture	14 cm (5 ½")	Partial extension	Brow
Submentovertical —extends from junction of floor of the mouth and neck to the highest point on the sagittal suture	11.5 cm (4 ½")	Incomplete extension	Face
Submentobregmatic —extends from junction of floor of the mouth and neck to the center of the bregma	9.5 cm (3 ¾")	Complete extension	Face

19. Ans. (d) 12 weeks

Ref: DC Dutta, 8th ed. pg. 32-33

- The placenta is developed from two sources:
 - Fetal component:** The principal component (which develops from the chorion frondosum)

■ **Maternal component** consists of decidua basalis. (Only the decidua basalis and the blood in the intervillous space are of maternal origin.)

- **At 3rd–4th week:** Lacunar spaces become confluent with one another and form a multilocular receptacle lined by syncytium and filled with maternal blood. This space becomes the future intervillous space.
- **At 6th week:** Decidua capsularis becomes thinner and both the villi and the lacunar spaces in the embryonic area get obliterated, converting the chorion into chorion laeve.
- Because of this there is compensatory growth and proliferation of the **decidua basalis** and enormous and exuberant division and subdivision of the chorionic villi in the embryonic pole (**chorion frondosum**).
- **These two, i.e., chorion frondosum and the decidua basalis form the discrete placenta. It begins at 6th week and is completed by 12th week**

FIGURE: Relation of the amniotic cavity, chorionic cavity and uterine cavity of successive stages; (A) End of the 8th week; (B) 10 weeks after the last period; (C) End of the 12th week

20. Ans. (c) Right umbilical vein

Ref: DC Dutta, 8th ed. pg. 37-38

- Placental circulation consists of independent circulation of blood in two systems:
 - **Uteroplacental circulation** (maternal circulation): It is the circulation of the maternal blood through the intervillous space. A mature placenta has a volume of about 500 mL of blood; 350 mL being occupied in the villi system and 150 mL lying in the intervillous space^Q.
 - **Fetoplacental circulation:** The two umbilical arteries carry the impure blood from the fetus. The fetal blood flow through the placenta is about 400 mL/min.
 - **Note:** Of the two umbilical veins, the **right one disappears by the 4th month, leaving behind left umbilical vein**, which carries oxygenated blood from the placenta to the fetus.

- Umbilical artery carry deoxygenated blood from fetus to mother

Extra Mile

TABLE: Summary of intervillous hemodynamics (V. Imp)

• Volume of blood in mature placenta	500 mL
• Volume of blood in intervillous space	150 mL
• Blood flow in intervillous space	500–600 mL/min
• Pressure in intervillous space:	
▪ During uterine contraction	30–50 mm Hg
▪ During uterine relaxation	
• Pressure in the supplying uterine artery	70–80 mm Hg
• Pressure in the draining uterine vein	8 mm Hg

TABLE: Summary of fetal hemodynamics (V. Imp)

• Fetal blood flow through the placenta	400 mL/min	
• Pressure in the umbilical artery	60 mm Hg	
• Pressure in the umbilical vein	10 mm Hg	
• Fetal capillary pressure in villi	20–40 mm Hg	
	Umbilical artery	Umbilical vein
• O ₂ saturation	50–60%	70–80%
• PO ₂	20–25 mm Hg	30–40 mm Hg

21. Ans. (b) Ductus venosus

Ref: DC Dutta, 8th ed. pg. 49

- The umbilical vein carrying the oxygenated blood (80% saturated) from the placenta, enters the fetus at the umbilicus and runs along the free margin of the falciform ligament of the liver. In the liver, it gives off branches to the left lobe of the liver and receives the deoxygenated blood from the portal vein.
- The greater portion of the oxygenated blood, mixed with some portal venous blood, short circuits the liver through the **ductus venosus** to enter the inferior vena cava (IVC) and thence to right atrium of the heart.

TABLE: Hormonal Levels in Different Phases of Menstrual Cycle

NORMAL				
Hormone	Follicular phase	Ovulation	Luteal phase	Menstrual phase
FSH	5–15 mIU/mL	12–30	2–9	3–15 mIU/mL
LH	6–14 mIU/mL	25–100	2–13	3–12 mIU/mL
E ₂	100/200 pg/mL	300–500 pg/mL	100–200	–
Progesterone	1 ng/mL	–	15 ng/mL	–

Contd...

22. Ans. (a) Systemic venous resistance

Ref: DC Dutta, 8th ed. pg. 60

Changes during pregnancy:

- Increased in cardiac output
- Increase in HR
- Increase in plasma volume
- **Decrease in SVR** by (–21%) due to smooth muscle relaxing effect of progesterone, NO, prostaglandins or ANP.
- In spite of the large increase in cardiac output, the **maternal BP** ($BP = CO \times SVR$) is **decreased** due to decrease in SVR. **There is overall decrease in diastolic blood pressure (BP) and mean arterial pressure (MAP) by 5–10 mm Hg**

23. Ans. (c) 4.5–5.5

pH of vagina: Normally it is acidic due to duoderlins bacilli, estrogen. Acidic pH prevents uterus from infection (since age group is not mentioned, we will be considering the adult in reproductive age group)

- **Normal pH throughout reproductive life is 4–4.5**
- pH during pregnancy: Less than 4 (becomes more acidic)
- pH at birth: 5.5–6.0
- pH during pre-pubertal age, menstruation and Menopause is similar: 6.5–7.5

24. Ans. (c) 30–70

Ref: DC Dutta, 8th ed. pg. 7–8

Cervix: Corpus ratio (since age group is not mentioned, we will be considering the adult in reproductive age group)

- **At birth-** 1:1
- **Before puberty-** 2:1
- **After puberty-** 1:2
- **Reproductive life-** 1:3
- **Menopause-** 1:1

25. Ans. (a) Follicular phase

Ref: Shaws, 16th ed. pg. 47

- In follicular phase estradiol level is 100/200 pg/mL and progesterone level is 1 ng/mL, which is least amount together in the menstrual cycle phases.
- Compare the levels from table

NORMAL				
Hormone	Follicular phase	Ovulation	Luteal phase	Menstrual phase
17 ketosteroid	Normal	5–10 mg/daily	–	>25 mg in adrenal hyperplasia
Testosterone	Normal	0.2–0.8 ng/mL	–	>2 ng/mL in ovarian tumors
Androstenedione	Normal	1.3–1.5 ng/mL	–	–
DHEA	Normal	<5 mcg/mL	–	>5 mcg in adrenal hyperplasia
Cortisol	–	<5 mcg/dL	–	–
DHEAS	800 ng/mL	–	–	Adrenal hyperplasia, tumor

26. Ans. (c) Cardinal ligament

Ref: DC Dutta, 8th ed. pg. 7

- Cardinal ligament is also known as Mackenrodt's ligament.
- It is considered as true support of uterus.
- Normal position of uterus is: *Anteversion and Antelexion*
- **Function of cardinal ligament:**
 - Lateral stabilization of cervix at the level of ischial spine
 - Primary vascular conduits of the uterus and vagina
- Other ligaments like round and broad ligament act as a guyrope with a steadying effect on the uterus. *They have no role in preventing descent of uterus.*

27. Ans. (c) Bartholin's gland

Ref: Gray's Basic Anatomy/248

- The orifice of urethra and vagina are associated with opening of glands.
- The ducts of para-urethral glands (**skene's gland**) opens into the vestibule, one on each side of the lateral margin of urethra.
- The ducts of greater vestibular gland (**Bartholin's gland**) open adjacent to the **postero-lateral margin of the vaginal opening** in the crease between the vaginal orifice and remnants of hymen.
- Bartholin gland the female homologues of the bulbourethral glands in men.

Extra Mile

- When bartholin's gland is blocked, a fluid filled cyst named bartholin's cyst develops.
- TOC for bartholin's cyst: **Marsuplization.**

28. Ans. (c) Bimastoid

Ref: DC Dutta, 8th ed. pg. 94-97

TRANVERSE DIAMETERS OF FETAL HEAD

- Biparietal: 9.5 cm
- Bitemporal: 8 cm
- *Bimastoid: 7.5 cm; smallest transverse diameter*
- Super subparietal: 8.5 cm

29. Ans. (d) Mentovertical

Ref: DC Dutta, 8th ed. pg. 94-97

DIAMETERS OF SKULL

- The anteroposterior diameters of the head which may engage are:

Diameters	Measurment (In cm)	Presentation
Suboccipitobregmatic	9.5 cm	Vertex
Suboccipitofrontal	10 cm	Vertex
Occipitofrontal	11.5 cm	Vertex
Mentovertical: extend from mid-point of chin to the highest point on the saggital suture	14 cm	Brow
Submentovertical	11.5 cm	Face
Submentobregmatic	9.5 cm	Face

- The transverse diameters which are concerned in the mechanism of labor are
 - **Biparietal diameter** – 9.5 cm: extends between two parietal eminences.
 - **Super-subparietal** – 8.5 cm
 - **Bitemporal diameter:** 8 cm
 - **Bimastoid diameter** – 7.5 cm

30. Ans. (b) **Intertuberos**

Ref: DC Dutta, 8th ed. pg. 94-97; William's 23rd ed. Chapter 2, Maternal Pelvic Anatomy

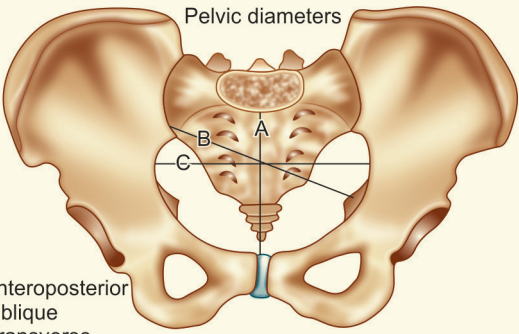

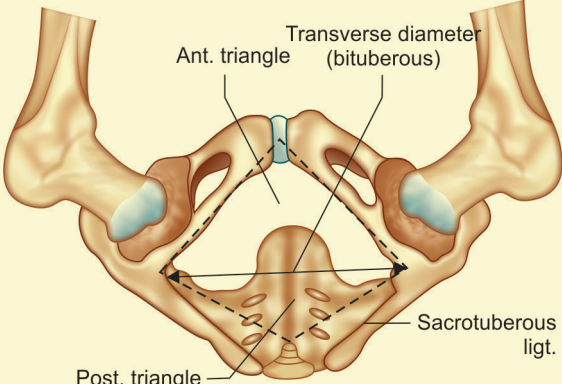

- Most of the students answer interspinous for this question. Obviously interspinous is having the least diameter (10cm), but it belongs to mid pelvis.
- The question is asking about the shortest diameter of **pelvic outlet**, which is intertuberos (diameter between ischial tuberosity) diameter ~ **11 cm**.

PLANES AND DIAMETERS OF THE PELVIS

The pelvis is described as having four imaginary planes:

- The plane of the **pelvic inlet**—the superior strait
- The plane of the **mid pelvis**—the least pelvic dimensions
- The plane of the **pelvic outlet**—the inferior strait
- The plane of greatest pelvic dimension—of no obstetrical significance.

TABLE: Summarized data of maternal Pelvis planes and diameters (all the numerical datas are derived from standard reference i.e. william's 23rd ed.)

Plane	Diameter	Measured Between	Size
Pelvic Inlet  <p>A - Anteroposterior B - Oblique C - Transverse</p>	Transverse	Greatest distance between the linea terminalis on either side	~ 13 cm
	A-P diameter aka true conjugate	Extends from the uppermost margin of the symphysis pubis to the sacral promontory	11cm
	Oblique diameter	Extends from one of the sacroiliac synchondroses to the iliopectineal eminence on the opposite side.	12 cm
Mid Pelvis Measured at level of ischial spine	Interspinous diameter	Between the ischial spines	10 cm
	Anteroposterior	At the level of ischial spine	11.5 cm
Pelvic outlet Makes 2 triangles with common base  <p>Ant. triangle Transverse diameter (bituberos) Post. triangle Sacrotuberous ligt.</p>	Antero-posterior	Coccyx to symphysis pupis	11.5 cm
	Transverse	Between ischial tuberosities	11 cm
	Posterior saggital	Sacro-Coccygeal angle to the midline imaginary line at base	11.5/2 cm

Contd...

Plane	Diameter	Measured Between	Size
Other important pelvic diameters	Obstetrical conjugate	Shortest distance between the sacral promontory and the symphysis pubis	10 cm. obstetrical conjugate is estimated indirectly by subtracting 1.5 to 2 cm from the diagonal conjugate
	Diagonal conjugate	From the lower margin of the symphysis to the sacral promontory	11.5-12 cm

31. Ans. (a) **Transverse**

Ref: DC Dutta, 8th ed. pg. 99-104

- If such questions are asked regardless of pelvic plain, then **transverse diameter of pelvic inlet has largest diameter (13 cm)**. If it is not in option, next best option is oblique diameter (12 cm)
- Smallest diameter regardless of pelvic plain- **Bispinous (10 cm)**
- For more details, please refer to above explanation.

32. Ans. (d) **Sacroctyloid**

Ref: DC Dutta, 8th ed. pg. 101

- **Sacroctyloid—9.5 cm (3¾")**: It is the distance between the midpoint of the sacral promontory to iliopubic eminence (Fig.).
- It represents the space occupied by the biparietal diameter of the head while negotiating the brim in flat pelvis.
- **Other diameter of pelvic inlet:**
 - Anteroposterior: 11 cm
 - Transverse: 13 cm
 - Oblique: 12 cm

FIGURE: Different diameters of the inlet of obstetrical significance. Bispinous diameter is also demonstrated

33. Ans. (c) **Android**

Ref: DC Dutta 8th ed. pg. 99-104

- Prominent ischial spine is seen in case of android type of pelvis.
- Pelvis type most favorable for delivery: **Gynecoid**
- MC type of pelvis in females: **Gynecoid**
- Heart shaped pelvis: **Android**
- Flat pelvis: **Platypelloid**

FIGURE: Types of pelvis

- Pelvis MC associated with face and brow presentation: **Platypelloid**
- Pelvis MC associated with occipitoposterior presentation: **Android**
- Pelvis MC associated with face to pubis delivery: **Anthropoid**

34. Ans. (c) Platelet count

Ref: DC Dutta, 8th ed. pg. 58-59

- During pregnancy, physiological demand increases as the pregnancy advances.
- Plasma volume, RBC count and Hb count increased, but platelet count decreased (*Idiopathic dilutional thrombocytopenia*).
- Following hematological parameters are altered:

Parameters	Alterations
Hb	Increased by: 20%
RBC	Increased by: 20-30%
Blood volume	Increased by: 30-40%
Plasma volume	Increased by: 40-50%
Packed cell volume	Decreased
Platelet count	Decreased (<i>dilutional thrombocytopenia</i>)

- Maximum plasma volume is seen at 36 week AOG: 50%
- Maximum cardiac output: Immediately post partum (highest cardiac output).
- BP fall post partum because of relaxation of all blood vessels.

35. Ans. (d) Factor XI

Ref: DC Dutta, 8th ed. pg. 58; William's Obstetrics 23rd ed. pg. 121-122

- Pregnancy is a hypercoagulable state. All clotting factors are increased during pregnancy except **factor XI and XIII which decreases** (11 and 13).
- Note: Clotting time and bleeding time remains unaffected during pregnancy.

36. Ans. (b) Pregnancy

Ref: Dutta's Obstetrics, 7th ed. pg. 431-438

- Amenorrhea is the absence of menstrual bleeding. It is a normal feature in prepubertal, pregnant, and postmenopausal females.
- **Primary amenorrhea** is defined as the absence of menses by age 16 in the presence of normal developmental and secondary sexual characteristics or by age 14 if secondary sexual characteristics have failed to develop
- **Secondary amenorrhea** refers to the absence of menses for 6 months or more in a women with previously regular menstrual cycles.

Causes

- Primary amenorrhea may result from congenital reproductive tract abnormalities or endocrine disorders that delay the onset of puberty.
 - Ex: HPA dysfunction, Kallman's syndrome, CNS tumors, turner syndrome, mullerian agenesis etc.

- The most common cause of secondary amenorrhea is pregnancy.
- Other causes of secondary amenorrhea can be: Tubercular Endometritis, PCOS, Cushing's disease, Sheehan's syndrome, Uterine synechiae secondary to vigorous curettage.

37. Ans. (a) 3 days after menstruation

Ref: DC Dutta, 8th ed. pg. 56, 7th ed. pg. 540

- **Breast self-examination (BSE)** is a screening method used in an attempt to detect early breast cancer. The method involves the woman herself looking at and feeling each breast for possible lumps, distortions or swelling.
- For **premenopausal women**, the most commonly recommended time is **just after the end of menstruation**, because the breasts are least likely to be swollen and tender at this time.
- According to given options, 3 days after menstruation is the best choice for BSE.
- For postmenopausal or have irregular cycles might do a self-exam once a month regardless of their menstrual cycle.

38. Ans. (d) 2 weeks before next menstruation

Ref: DC Dutta, 8th ed. pg. 22, 7th ed. pg. 19

- Ovulation is a process whereby a secondary oocyte is released from the ovary following rupture of a mature Graffian follicle and becomes available for conception.
- In relation to the menstrual period, the event occurs about 14 days prior to the expected period.

39. Ans. (b) Ductus venosus

Ref: DC Dutta, 8th ed. pg. 36; William's Obstetrics 23rd ed.

Ch: 4

- Ductus venosus carries oxygenated blood from placenta and drains into IVC.
- Ductus arteriosus is a connection between aorta and pulmonary arteries, thereby bypassing lung. Persistence of ductus arteriosus leads to a congenital heart condition called Patent Ductus Arteriosus.
- Foramen ovale is connection between right atrium and left atrium.
- Umbilical artery carries deoxygenated blood from fetus to mother.

40. Ans. (c) Cardinal vein

Ref: DC Dutta, 8th ed. pg. 50

- The cardinal veins form as the basis for the intraembryonic venous part of the circulatory system. Various venous systems appear in various stages of the embryo-

genesis and partially disappear again. Very early in the development two paired systems appear:

- The **superior cardinal veins** bring the blood from the head region via the left and right common cardinal vein
- The **inferior cardinal veins** drain the blood from the lower half of the body into the two common cardinal veins
- From here, the blood is emptied into the **sinus venosus** and into the atrium via the **sinus horns**.

Rest of structures given in option closes AFTER birth, with following sequence:

U- Umbilical vein
F- Foramen ovale
A- Ductus Arteriosus
V- Ductus Venosus

41. Ans. (d) 24 weeks

Ref: DC Dutta, 8th ed. pg. 54, 78; 7th ed pg. 69

Dutta in 8th ed. States

The height of uterus is midway between symphysis pubis and umbilicus at 16 week and at the level of umbilicus at 24th week.

TABLE: Gestational age and fundal height

Gestational age	Fundal height landmark
12 weeks	Pubic Symphysis
24 weeks	Umbilicus
36 weeks	Xiphoid Process of Sternum
37–40 weeks	Regression of fundal height between 36–32 cm

42. Ans. (a) Milk production

Ref: DC Dutta, 8th ed. pg. 136, 574

Milk production is by Prolactin.

EMBRYOLOGY

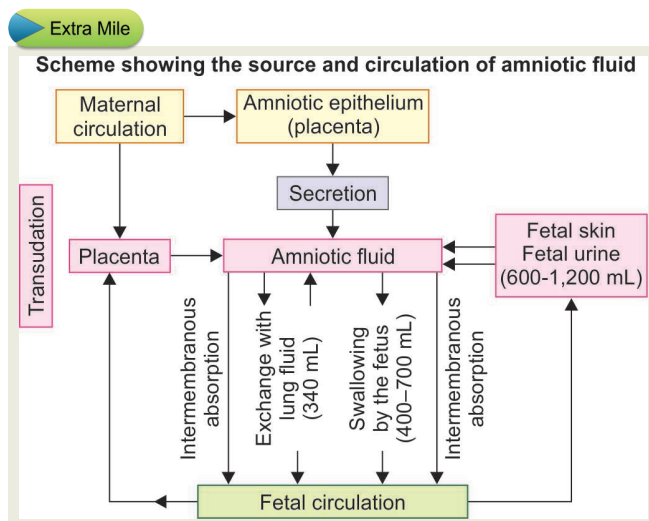

43. 24. Ans. (b) Fetal urine

Ref: DC Dutta 9th ed. P 34

- The exact origin of amniotic fluid is not well understood. It is believed that it is mainly due to mixed maternal and fetal origin.
 - **Early stages:** Skin and placenta
 - **12–14 weeks AOG:** Lung and kidney
 - **20 weeks AOG:** Kidney
- The water in the amniotic fluid is completely changed and **replaced in every 3 hours**

Production	Removal
<ul style="list-style-type: none"> • Transudation of maternal serum across the placental membranes • Transudation from fetal circulation across the umbilical cord or placental membranes • Secretion from amniotic epithelium • Transudation for fetal plasma through the highly permeable fetal skin before it is keratinized at 20th week • Fetal urine: Daily output at term is about 400–1,200 ml • Fetal lung that enters the amniotic cavity add to its volume 	<ul style="list-style-type: none"> • Fetus swallows about 500–1000 mL of liquor every day • Intramembranous absorption of water and solutes (200–500 mL/day) from the amniotic compartment to fetal circulation through the fetal surface of the placenta.

- Volume of amniotic fluid according to AOG:
 - At 12 weeks: 50 mL
 - At 20 weeks: 400 mL
 - At 36–38 weeks: 1 Litre (peak)
 - At **term:** 600–800 mL
 - 43 week: 200 mL

44. Ans. (a) **USG**Ref: DC Dutta Obstetrics 8th ed. P 41

- In general population the investigation modality to screen Down syndrome is USG, which is readily available.
- **Nuchal translucency**—Increased fetal nuchal skin thickness (in the first trimester) >3 mm by TVS is a strong marker for chromosomal anomalies (trisomy 21, 18, 13, triploidy and Turner's syndrome).
- **For confirmation** fetal karyotyping is done.
- **Earliest investigation which can confirm the diagnosis is chorionic villi sampling, which can be done transcervically** between 10 weeks and 13 weeks and **transabdominally** from 10 weeks to term.

TABLE: Prenatal diagnosis: CVS, amniocentesis and cordocentesis

	Chorionic villus sampling	Amniocentesis	Cordocentesis
Time	<ul style="list-style-type: none"> • Transcervical 10–13 weeks • Transabdominal 10 weeks to term 	After 15 weeks (early 12–14 weeks)	18–20 weeks
Materials for study	Trophoblast cells	<ul style="list-style-type: none"> • Fetal fibroblasts • Fluid for biochemical study 	<ul style="list-style-type: none"> • Fetal white blood cells (others— infection and biochemical study)
Karyotype result	<ul style="list-style-type: none"> • Direct preparation: 24–48 hours • Culture: 10–14 days 	• Culture: 3–4 weeks	• Culture: 24–48 hours
Fetal loss	0.5–1%	0.5%	1–2%
Accuracy	Accurate; may need amniocentesis for confirmation	Highly accurate	Highly accurate
Termination of pregnancy when indicated	1st trimester—safe	2nd trimester—risky	2nd trimester—risky
Maternal effects following termination of pregnancy	Very little	More traumatic; physically and psychologically	Same as amniocentesis

Extra Mile

TABLE: Ultrasound markers of chromosomal abnormalities (General sonography)

Observation	Chromosomal abnormality
Head <ul style="list-style-type: none"> ▪ Choroid plexus cyst ▪ Strawberry skull ▪ Hydrocephalus ▪ Holoprosencephaly 	Trisomy 18, 13 triploidy
Face <ul style="list-style-type: none"> ▪ Cleft lip/palate ▪ Micrognathia ▪ Low set ears 	Trisomy 13, 18, Meckel-Gruber syndrome Triploidy
Nuchal translucency >3 mm	Trisomy 21, 18, 13, Turner syndrome
Cardiac defects	Trisomy 13, 18, 21
Renal anomalies <ul style="list-style-type: none"> • Horseshoe kidney • Bilateral dilatation of renal pelvis • Cystic dysplasia 	Trisomy 13, 18, 21 Triploidy
Hands/feet <ul style="list-style-type: none"> ▪ Flexed overlapping fingers ▪ Rockerbottoms/club foot ▪ Polydactyly ▪ Wide gap between 1st and 2nd toes ▪ Clinodactyly ▪ Short femur 	Trisomy 18 Trisomy 13 Trisomy 21
GI system <ul style="list-style-type: none"> ▪ Echogenic bowel ▪ Omphalocele ▪ Duodenal atresia 	Trisomy 13, 18 Trisomy 21
General <ul style="list-style-type: none"> ▪ Early IUGR ▪ Hydrops 	Trisomy 13, 18, 21 Triploidy, 45XO

45. Ans. (c) **Continuous electrical fetal monitoring**

Ref: DC Dutta Obstetrics 8th ed. P 693-94

- Continuous electronic fetal monitoring is done by using ultrasound Doppler effect. The transducers are placed on the maternal abdomen, one over the fundus and the other at a site where the fetal heart sound is best audible.
- Frequency of uterine contractions and uterine pressure are recorded simultaneously by tocodynamometer.
- **Book states:** *"Intermittent auscultation is an effective method. Fetuses with abnormal FHR pattern on auscultation should have EFM."*
- *"EFM is most reliable when FHR pattern is reassuring and when there is fetal acidosis."*

Advantages of EFM over clinical monitoring:

- Accurate monitoring of uterine contractions.
- Significant improvement of perinatal mortality.

- Can detect hypoxia early and can explain the mechanism of hypoxia and its specific treatment.
- Improvement of intrapartum fetal death by threefold.
- It is an important record for medicolegal purpose.

46. Ans. (c) **15–18 weeks**

Ref: DC Dutta Obstetrics 8th ed. P 741

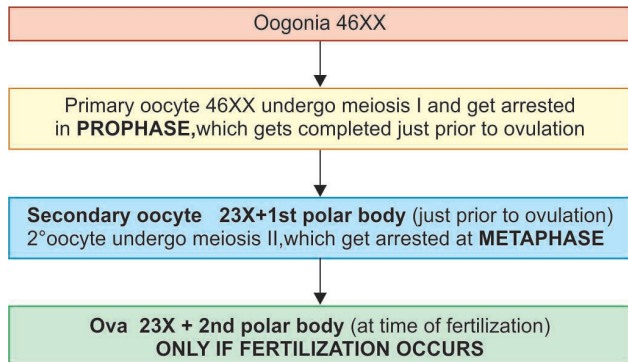

- Amniocentesis is the deliberate puncture of the amniotic fluid sac per abdomen for diagnostic and therapeutic purposes.
- **It is best done in early months at around 15–20 weeks.** For diagnosis of chromosomal and genetic disorders like:
 - Sex-linked disorders
 - Karyotyping
 - Inborn errors of metabolism
 - Neural tube defects.

47. Ans. (c) **20 mm**

Ref: DC Dutta 8th ed./22; Shaw's 15th ed. /Harrison 19/e

- Preovulatory graffian follicle is **18–20 mm**
- Rate of growth of follicle **2–3 mm/day**
- Growth and size of follicle measured by TVS, started on 10th day of cycle (in case of infertility), done alternate day.
- Just prior to ovulation its size of follicle is **18–20 mm**, and endometrium is **trilaminar** in appearance.
- When the egg enters the fallopian tube, it is surrounded by a cumulus of granulosa cells (cumulus oophorus) and intimately surrounded by a clear zona pellucida.
- In most mammals, including humans, the egg is released from the ovary in the metaphase II stage.

Stages of Development of Ovum**48. Ans. (d) Zona reaction attracts the sperms**

Ref: DC Dutta, 8th ed. pg. 23, 7th ed. pg. 21

Once an ovum is fertilized, zona reaction takes place.

- **Zona reaction**—Once sperm penetrates zona pellucida, the ovum become impermeable to other sperms, this prevents polyspermy. *Therefore zona reaction DOESN'T ATTRACT sperm.*
- When more than one sperm manages to enter the ovum (dispermy = 2; triploidy = 3), the fetus nearly always aborts
- 1st Cell division then occurs (20 hour) → gives rise to two-cell embryo

**Complete Steps of Fertilization**

- **Capacitation** - A period of conditioning that occurs in the **female reproductive tract**.
- **Chemotaxis** -sperm are **attracted to an egg** through the process known as chemotaxis
- Binding of **progesterone** + surface receptor on the sperm → increase in intracellular calcium ion concentration → which increases **sperm motility** (chemokinesis).
- **Acrosome reaction** (perforations form in the acrosome) occurs in **ampulla**

- Zonapellucida is a glycoprotein layer surrounding the membrane of oocytes (see image).
- Once sperm reaches ova, there is release of hyaluronidase → **penetration of corona radiata** and cumulus cells by sperm.
- Glycoproteins on the outer surface of the sperm then bind with glycoproteins on the zonapellucida of the ovum.

- Release of acrosin occurs → Acrosin digests the zonapellucida and membrane of the oocyte
- After this Sperm enters the cytoplasm → intracytoplasmic structures, the coronal granules, arrange themselves in an orderly fashion (around the outermost portion of the cytoplasm just beneath the cytoplasmic membrane). Swelling of sperm head then occurs, giving rise to male pronucleus.
- Doing this the egg completes its **second meiotic division**, casting off the **second polar body** to a position **beneath the zonapellucida**.

49. Ans. (c) Prevention of multiple sperm entry

Ref: DC Dutta, 8th ed. pg. 24

- Zona pellucida is a glycoprotein layer surrounding the membrane of oocytes.

FMGE Solutions Screening Examination

- Once sperms reach ova, there is release of hyaluronidase → **penetration of corona radiata** and cumulus cells by sperm.
- Glycoproteins on the outer surface of the sperm then bind with glycoproteins on the zona pellucida of the ovum.
- **Zona reaction:** Once sperm penetrates zona pellucida, the ovum become impermeable to other sperms, this prevents polyspermy.

50. Ans. (d) Fertilization takes place in ampulla

Ref: DC Dutta, 8th ed. pg. 32-36, 7th ed. pg. 21-22

Option A-Placenta is formed by trophoblast which 1st appear at blastocyst stage, hence option A is wrong.

Option B-Implantation starts on 6th day and completes by 10th day

Option C-During initial weeks corpus luteum survival is due to HCG, not due to LH.

Option D-site of fertilization is ampulla.

51. Ans. (a) 5-6 days

Ref: DC Dutta, 8th ed. pg. 25, 8th ed. 25

- Dutta in 8th ed. states that Implantation occurs in the endometrium of the anterior or posterior wall of the body near the fundus on **6th day**, which corresponds to 20th day of a regular normal cycle.
- **Implantation occurs through 4 stages:** Apposition, Adhesion, Penetration, Invasion.
- *Most students got confused here and marked the answer as 7-8 days. But if you read the question again, it is cleverly asking that implantation occurs AFTER. 5-6 days is the single best answer here.*

52. Ans. (b) 5 weeks

Ref: DC Dutta, 8th ed. pg. 734, 7th ed. pg. 68

- 1st radiological investigation for diagnosis of pregnancy is visualisation of gestational sac by TVS.
- **4 ½ weeks**- TVS
- **5 weeks** - by both TVS & TAS

*TVS: Transvaginal scan

*TAS: Transabdominal scan

53. Ans. (a) 15th day

Ref: DC Dutta, 8th ed. pg. 22;

Williams Obstetrics 23rd ed. Ch: 3

- Following ovulation (14th day) the remaining follicular cells left by the ovulated follicle differentiate into the corpus luteum (meaning **yellow body**).
- Corpus luteum secretes progesterone, which causes secretory changes in endometrium.

MENSTRUAL PHASES

Cycle Day	1-5	6-14	15-28
Ovarian phase	Early follicle	Follicular	Luteal
Endometrial phase	Menstrual	Proliferative	Secretory
Estrogen/ Progesterone	Low levels	Estrogen	Progesterone

54. Ans. (b) 48 hours

Ref: DC Dutta, 8th ed. pg. 23, 8th ed. pg. 66, 7th ed. pg. 58-59

hCG

- hCG is a glycoprotein which is synthesized by syncytiotrophoblast of the placenta.
- The half-life of hCG is 36 hours.
- In early pregnancy the doubling time of hCG is 1.4-2 days.
- **It has 2 subunits:**
 - α -biologically similar in LH, FSH and TSH. (i.e. non-specific)
 - β -subunit-unique to HCG. (i.e. specific)
- Structurally it is similar to- FSH, LH, TSH but functionally it is similar to LH (i.e. luteotropic), i.e. helps in maintaining corpus luteum. So, the **main hormone which maintains activity of corpus luteum during pregnancy is hCG** and in **non-pregnant state is LH**.
- It can be detected in material serum as early as 8 days following fertilization/day 22 of menstrual cycle/5 days before missed period by immuno assay.^o
- The level is 100 IU/L or mIU/mL around the time of the expected menses.
- The level progressively rise and reach maximum levels by about 8-10 weeks/70days/1st trimester. It then falls until about 16 weeks and remains at low level up to term.
- HCG disappears from circulation by 2 weeks following delivery.

Action

- Sustains the corpus luteum and thereby maintains the hormonal support to the pregnancy in early weeks.
- Stimulates the leydig cells of the male fetus to produce testosterone and thereby induces development of the male external genitalia

55. Ans. (b) 3rd week

Ref: DC Dutta, 8th ed. pg. 32

- **After interstitial implantation is completed on day 11th**, the blastocyst is surrounded on all sides by lacunar spaces around cords of syncytial cells, called trabeculae.

- On 13th day stem villi develops from the trabeculae which connect the chorionic plate with the basal plate.
- On 13th, 16th and 21st day Primary, secondary and tertiary villi are successively developed respectively from the stem villi.
- Arterio-capillary-venous system in the mesenchymal core of each villus is completed on 21st day (week 3).

Extra Mile

TABLE: Important events following fertilization

'0' hour	Fertilization (day-15 from LMP)
30 hours	Two-cell stage (blastomeres)
40–50 hours	Four-cell stage
72 hours	Twelve-cell stage
96 hours	16 cell stage. Morula enters the uterine cavity
5th day	Blastocyst
4–5th day	Zone pellucida disappears
5–6th day	Blastocyst attachment to endometrial surface
6–7th day	Differentiation of cyto and syncytiotrophoblastic layers
10th day	Synthesis of hCG by syncytiotrophoblast
9–10th day	Lacunar network forms
10–11th day	<ul style="list-style-type: none"> • Trophoblasts invade endometrial sinusoids establishing uteroplacental circulation • Interstitial implantation completed with entire decidual coverage
13th day	Primary villi
16th day	Secondary villi
21st day	Tertiary villi
21st–22nd day	Fetal heart. Fetoplacental circulation

56. Ans. (d) Penile urethra

Ref: Shaw, 16th ed. pg. 1

TABLE: Embryological structure and its derivative in female and male counterparts

Embryological structure	Female derivative	Male derivative
Genital swelling	Labia majora	Scrotum
Genital fold	Labia minora	Penile urethra
Genital ridge	Ovary	Testis
Genital tubercle	Clitoris	Penis

57. Ans. (b) Urogenital sinus

Ref: Shaw, 16th ed. pg. 124

- Vagina is embryologically derived from:
 - Upper 2/3rd: Mesoderm of Mullerian duct
 - Lower 1/3rd: Sinovaginal bulb of endodermal sinus

58. Ans. (b) After 10 weeks from LMP

Ref: DC Dutta, 8th ed. pg. 46

The chronology in the fetal period is expressed in terms of menstrual age and not in embryonic age

Three periods are distinguished in the prenatal development of the fetus.

- **Ovular period or germinal period**—lasts for first 2 weeks following ovulation.
- **Embryonic period**: From 3rd week to 10 weeks following ovulation (8 weeks post conception).
- **Fetal period**: Begins 10 week after ovulation (after 8th week following conception) and ends in delivery.

59. Ans. (a) Ampulla

Ref: DC Dutta, 8th ed. pg. 23

- Fertilization is the process of fusion of the spermatozoon with the mature ovum.
- Almost always, fertilization occurs in the ampullary part of the fallopian tube.

60. Ans. (a) 10 weeks

Ref: DC Dutta, 8th ed. pg. 19, 7th ed. pg. 42

- **Fetal Blood**: Haematopoiesis is demonstrated in the embryonic phase first in the yolk sac by 14th day.
- By 10th week, the liver becomes the major site.
- Gradually, the red cells production sites extend to the spleen and bone marrow and near term, the bone marrow becomes the major site of red cell production.

61. Ans. (d) 7 million

Ref: DC Dutta, 8th ed. pg. 19

- The gonads begin to differentiate. During the 4th or 5th week of development.
- If there is absence of the Y chromosome, the gonads will differentiate into ovaries. As the ovaries differentiate, ingrowths called cortical cords develop where the primordial germ cells collect.
- The primordial germ cells grow and begin to differentiate into oogonia during the 6th to 8th week of female (XX) embryonic development.
- Oogonia then proliferate via mitosis during the 9th to 22nd week of embryonic development.
- By the 8th week of development, there can be up to 600,000 oogonia and up to 7,000,000 by the 5th month of development.

62. Ans. (b) Puberty

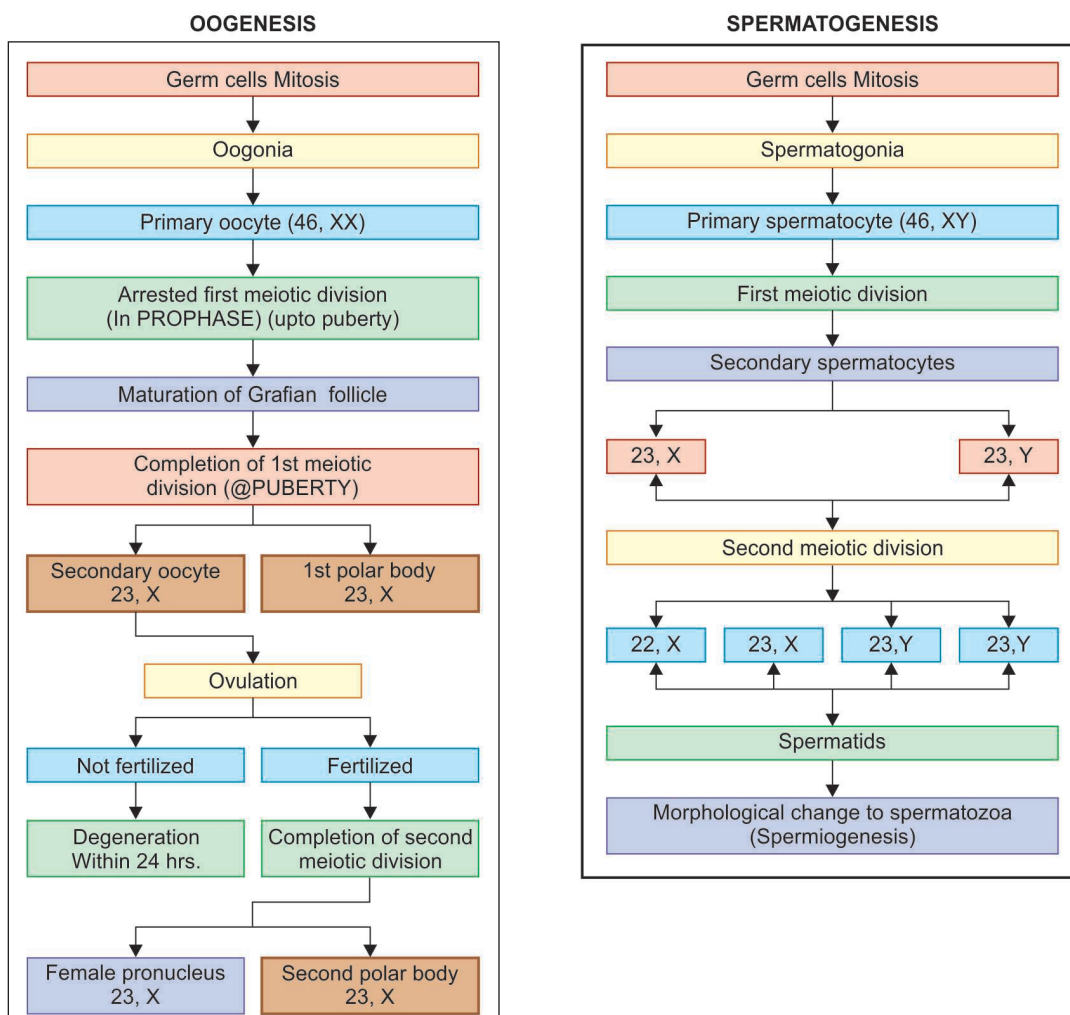

Ref: DC Dutta, 8th ed./19-20, 8th ed./ 21, 7th ed./17 & 19

- **Oogenesis:** The process involved in the development of a mature ovum is called Oogenesis.
- At 20th week AOG, the number of oogonia reaches at its maximum number, about 7 million.
- While the majority of the oogonia continue to divide, some enter into the prophase of the first meiotic division and are called primary oocytes.
- At birth, total number of oocyte is about 2 million.
- The primary oocytes do not finish the first meiotic division until puberty is reached.
- Now, first meiotic division of primary oocyte takes place at puberty, which give rise to secondary oocyte and first polar body.
- These two are of unequal size, the secondary oocyte contains nearly all the cytoplasm and haploid number of

chromosomes (23, X), but the polar body contains scanty cytoplasm and half of the chromosomes (23, X).

- Ovulation takes place soon after the formation of the secondary oocyte.
- 2nd meiotic division of secondary oocyte takes place only after fertilization of ova by the sperm.
- This results in the formation of two unequal daughter cells, each possessing 23 chromosomes (23, X): larger one is the mature ovum and the smaller one is the second polar body containing the equal number of chromosomes.
- The first polar body may also undergo the second meiotic division.
- In the absence of fertilization, the secondary oocyte does not complete the second meiotic division and degenerates as it is.
- Refer to the flowchart below (must remember it. There's question in almost every exam from this topic)

Scheme showing gametogenesis

Extra Mile

- 1st polar body released: At time of puberty/ovulation
- 2nd polar body released: At time of fertilization
- 1st site of fetal hematopoiesis: Yolk sac.

63. Ans. (a) **1st polar body**

Ref: DC Dutta, 8th ed. pg. 19-20; Shaws, 15th ed. pg. 74

PROCESS OF FERTILIZATION

- Certain changes are necessary before the primary oocyte can mature for fertilization. **Oogonia that enter the prophase of the first meiotic division are known as primary oocytes.** Those oogonia which do not begin the first meiotic division and those not surrounded by granulosa layer atrophy.

- At puberty, under the LH surge, primary oocyte completes the first meiotic division and gives rise to secondary oocyte, containing most of the cytoplasm, 23X chromosomes, and a small polar body.
- This secondary oocyte completes its second meiotic division only after fertilization, and gives out second polar body.
- Thus, the first stage of maturation of the oocyte occurs within the graafian follicle, but the second division occurs only after the fertilization in the fallopian tube.
- Please refer to above explanation and flowchart also for detailed explanation.

64. Ans. (c) **1st polar body**

Ref: DC Dutta, 8th ed. pg. 21-22, 8th ed. pg. 21, 7th ed. pg. 17,19

65. Ans. (a) **Decidua basalis**

Ref: DC Dutta, 8th ed. pg. 32

SAILENT FEATURE OF PLACENTA

- Weight-500 g
- Ratio of weight of placenta: Weight of fetus = 1: 6
- Human placenta is discoidal (disc shape) and deciduate (shed off during delivery), hemochoroidal (in contact with maternal blood)
- **Derived forms decidua basalis**
- Placental circulation established at 21-22nd day (same time heart is formed, hence fetal circulation is established.)

66. Ans. (c) **It has umbilical cord attachment site**

Ref: DC Dutta, 8th ed. pg. 34-35, 7th ed. pg. 29

Maternal surface of placenta covered by remnant of the deciduas basalis (compact and spongy layer)

FMGE Solutions Screening Examination

898

Fetal surface	Maternal surface
• Smooth, glistening	• Rough, spongy
• Covered by amnion (above) and chorion (below)	• Covered by remnant of deciduas basalis
• Umbilical cord is attached	• Has 15-20 lobes/cotyledons
• 4/5 of placenta is fetal origin	• 1/5 is maternal origin
• Develops from chorionic sac (chorion frondosum)	• Derived from endometrium (functional layer - Decidua basalis)

LABOR AND DELIVERY

67. Ans. (d) 3rd degree perineal tear

Ref: DC Dutta 9th ed. P 349-50

- Prolapse is protrusion of the vaginal walls at the vaginal orifice during straining.
- In severe cases, the cervix, uterus and whole of the vaginal wall may be pushed down to the level of the vulva or sometimes it may extrude from the vagina
- MC seen in postmenopausal and multiparous women.

Causes of prolapse:

- **Most important cause:** Atonicity and asthenia that follow menopause.
- Birth injury (overstretching causes atonicity).
 - Book states: "A perineal tear is less harmful than the excessive stretching of the pelvic floor muscles and ligaments that occurs during childbirth"
 - Patient with complete perineal tear exercises her levator muscles continuously to obtain sphincteric control over rectum. This tones up all ligamentary support in pelvis in addition to pelvic floor muscles.
 - A complete perineal tear therefore **not followed by prolapse**
- Delivery done by untrained dais/midwives
- Prolong 2nd stage of labour (cause undue stretching of pelvic floor muscles)
- Congenital weakness of pelvic floor muscles
- Ventouse extraction of the fetus before the cervix is fully dilated (causes overstretching of both Mackenrod's ligaments and the uterosacral ligaments)
- Prolonged bearing down in the second stage and Credé's method of downward vigorous push on the uterus to expel the placenta (it may weaken the ligamentary supports of the genital tract).
- Delivery of a big baby
- Precipitated labour and fundal pressure may also be responsible for prolapse
- Rapid succession of pregnancies
- Raised intra-abdominal pressure due to chronic bronchitis

- Surgical procedures: Abdominoperineal excision of the rectum and radical vulvectomy.

Extra Mile

- Use of forceps is protective against prolapse
- **Classification of Prolapse**
 - **Anterior vaginal wall**
 - Upper two-third Cystocele
 - Lower one-third Urethrocele
 - **Posterior vaginal wall:**
 - Upper 1/3rd: Enterocele (pouch of Douglas hernia)
 - Lower 2/3rd: Rectocele

Cystourethrocele

68. Ans. (c) Immediate LSCS

Ref: DC Dutta 8th ed. P 267

- In this case fetal distress and maternal condition does not warrant tocolytic or wait and watch policy. Therefore immediate CS should be performed.

INDICATIONS OF CESAREAN SECTION

- **When an urgent termination is indicated and the cervix is unfavorable** (unripe and closed).
- **Severe preeclampsia** with a tendency of prolonged induction—delivery interval.
- **Associated complicating factors**, such as elderly primigravidae, contracted pelvis, malpresentation, etc.

Extra Mile

Common Indications for Induction of Labor (IOL)

- Postmaturity
- Pre-eclampsia/eclampsia
- Intrauterine fetal death
- Premature rupture of the membranes
- Congenital malformation of the fetus
- Antepartum hemorrhage
- Chronic hydramnios

TABLE: Dangers of indication of labor

Maternal	Fetal
• Psychological upset when there is induction failure and cesarean section is done	• Iatrogenic prematurity
• Tendency of prolonged labor due to abnormal uterine action	• Hypoxia due to uterine dysfunction
• Increased need of analgesia during labor	• Prolonged labor
• Increased operative interference	• Operative interference
• Increase morbidity	

69. Ans. (a) **Ritodrine**Ref: DC Dutta 8th ed. P 583

- **Preterm labor and delivery** can be delayed by drugs in order to improve the perinatal outcome. These agents are known as tocolytic agents.
- The commonly used drugs are:
 - **Betamimetics:** Ritodrine, Isoxuprine. Causes relaxation of uterus.
 - **Prostaglandin synthetase inhibitors/COX inhibitor:** Indomethacin, sulindac.
 - **Magnesium sulfate:** Act as **competitive inhibitor** of calcium ion.
 - **Calcium channel blockers:** Nifedipine, nicardipine.
 - **Oxytocin receptor antagonists:** Atosiban. Used as IV infusion.
 - **Nitric oxide donors:** Glyceryl trinitrate (used as patches).
 - Progesterone.

70. Ans. (d) **Vertex**Ref: DC Dutta 8th ed. P 87

- **Anterior, posterior, right or left position** is referred in relation to the maternal pelvis, with the mother in erect position.
- **Vertex occupying the left anterior quadrant of the pelvis is the most common one** and is called left occipitoanterior (LOA). This is the first vertex position.

The position and relative frequency of the vertex at the onset of labor

TABLE: Pelvic diameter and presenting part

Diameters	Measurement (in cm)	Presentation
Suboccipitobregmatic	9.5 cm	Vertex
Suboccipitofrontal	10 cm	Vertex
Occipitofrontal	11.5 cm	Vertex
Mentovertical: Extend from mid-point of chin to the highest point on the sagittal suture	14 cm	Brow
Submentoververtical	11.5 cm	Face
Submentobregmatic	9.5 cm	Face

71. Ans. (d) **Tubal ostia**Ref: William's Obstetrics, 23rd ed. Ch: 18

- The normal contractile wave of labor originates near the uterine end of one of the fallopian tubes (tubal ostia). Thus, these areas act as "pacemakers"

- The right pacemaker usually predominates over the left and starts most contractile waves.
- Contractions spread from the pacemaker area throughout the uterus at 2 cm/sec, depolarizing the whole organ within 15 seconds. This depolarization wave propagates downward toward the cervix.
- Intensity is greatest in the fundus, and it diminishes in the lower uterus.

72. Ans. (c) **Fetal head is engaged**Ref: DC Dutta, 8th ed. pg. 153

- Since the type of pelvis may vary from one woman to another (gynaecoid, android, anthropoid and platypelloid), the only effective measure of fetal head descent that reflects engagement is the suprapubic assessment of how much of the fetal skull remains palpable.
- The amount of fetal head felt suprapubically in finger breadth is assessed by placing the radial margin of the index finger above the symphysis pubis successively until the groove of the neck is reached.
- Progressive descent of the head can be usefully assessed abdominally by estimating the number of "fifths" of the head above the pelvic brim
- **Dutta states:** "when the fetal head is **one-fifth** above (pelvic brim), only the sinciput can be felt abdominally and nought-fifths represents a head entirely in the pelvis with no poles felt abdominally"

73. Ans. (a) 1/5th of the fetal head palpableRef: DC Dutta, 8th ed. pg. 153, 7th ed. pg. 131

74. Ans. (b) Can damage brain

Ref: DC Dutta, 8th ed. pg. 97

FIGURE: Diagrammatic representation showing the principle of moulding of the head

- **Moulding is alteration of the shape of the fore-coming head while passing through the resistant birth passage during labor.**
- There is very **little alteration** in size of the head.
- Normally, an alteration of **4 mm in skull diameter** commonly occurs.
- It doesn't complicate the delivery, instead it enables the head to **pass more easily**, through the birth canal.
- **Mechanism:** There is compression of the engaging diameter of the head with corresponding elongation of the diameter at right angle to it (Fig.)
- During the process, the parietal bones tend to overlap the adjacent bones, viz.
 - Posteriorly with occipital bone behind
 - Anteriorly, with frontal bones and the
 - At sides, with temporal bones
- **Molding disappears within few hours after birth.**

GRADING

- **Grade-1**—The bones touching but not overlapping
- **Grade-2**—Overlapping but easily separated and
- **Grade-3**—Fixed overlapping (*most severe form*)

Importance:

- **Slight molding is inevitable and beneficial.** It enables the head to **pass more easily**, through the birth canal.
- Extreme molding can result in severe intracranial disturbance in the form of **tearing of tentorium cerebelli or subdural haemorrhage.**
- Can tell the presenting part while delivery.

FIGURE: Types of molding in cephalic presentations (shown by dotted line): (A) Vertex presentation with well flexed head; (B) Vertex presentation with deflexed head (sugar loaf head); (C) Face presentation; (D) Brow presentation

75. Ans. (b) 100–120 mm Hg

Ref: William's Obstetrics, 23rd ed. Ch.18 intrapartum Assessment (Internal Uterine Pressure Monitoring)

- A fluid-filled plastic catheter with its distal tip located above the presenting part is used to measure amniotic fluid pressure between and during contractions.
- Clinical labor usually commences when uterine activity reaches values between **80 and 120 Montevideo units**. This translates into approximately three contractions of 40 mm Hg every 10 minutes ($40 \times 3 = 120$).
- **During the first 30 weeks**, uterine activity is comparatively quiescent. Contractions are seldom greater than 20 mm Hg.
- **During first-stage labor**, uterine contractions increase progressively in intensity from approximately **25 mm Hg** at commencement of labor to **50 mm Hg** at the end.
- **DC Dutta states:** "intrauterine pressure is raised to 40–50 mm Hg during 1st stage and about 100–120 mm Hg in second stage of labor during contractions. In spite of diminished pain in 3rd stage, the pressure is probably the same as that in second stage i.e. 100–120 mm Hg"
- Uterine contractions are clinically palpable only after their intensity exceeds 10 mm Hg. Moreover, until the intensity of contractions reaches 40 mm Hg, the uterine wall can readily be depressed by the finger. At greater intensity, the uterine wall then becomes so hard that it resists easy depression.
- Uterine contractions usually are not associated with pain until their intensity *exceeds* 15 mm Hg, presumably because this is the minimum pressure required for distending the lower uterine segment and cervix.

TABLE: Uterine Pressure in a Nutshell

Period	Contraction pressure
During the first 30 weeks	20 mm Hg
First stage of labor	40–50 mm Hg
2 nd stage of labor	100–120 mm Hg
3 rd stage of labor	100–120 mm Hg
Contraction felt clinically	>10 mm Hg
Contraction associated with pain	15 mm Hg
Pressure required for distending lower uterine segment	15 mm Hg

76. Ans. (a) 50 mm Hg

Ref: William's Obstetrics, 23rd ed. pg. ch 18

- According to the given options, 50 mmHg is best answer that can be chosen.
- Please refer to above explanation.

77. Ans. (a) 7 kg

- No definite literature or data was found on this question. However we tried to come out with this answer with little bit of physics.
- Please convert the mm H₂O pressure to kg per mm square it will be almost around 6.79755. Close to 7 kg
- The volume of amniotic fluid controls the pressure inside the uterus. As the volume of amniotic fluid decreases, the pressure inside the uterus increases. While the pressure inside the uterus increases, the amount of force exerted on the fetus increases as well. This can be demonstrated by the following formula:

$$P (\text{pressure}) = F (\text{force}) / A (\text{area})$$

(Pressure can be in the unit of a Pascal or Newton/meter². Standard pressure is 1 atm (atmosphere) or 1.01×10^5 Pa (Pascals). Normal intrauterine pressure is considered any measurement 20 mm over water pressure.)

78. Ans. (b) 2 hours

Ref: DC Dutta, 8th ed. pg. 153

Stages of Labor	Duration	
	Primipara	Multipara
Stage I: From uterine contraction to full cervical dilatation (10 cm)	12 hours	6 hours
Stage II: Full dilatation to delivery of baby	2 hours	30 mins
Stage III: Delivery of baby to placental delivery	15 mins	15 mins
Stage IV: 1 hour post partum to rule out PPH and vulvar hematoma.	1 hour	1 hour

79. Ans. (a) 30 minutes

Ref: William's 23rd ed. Chapter 17, Normal Labor and Delivery; Preadmission and Admission Electronic Fetal Heart Rate Monitoring

- American Academy of Pediatrics and American College of Obstetricians and Gynecologists (2007) recommend that during the first stage of labor, in the absence of any abnormalities, the fetal heart rate should be checked immediately after a contraction at least every 30 minutes and then every 15 minutes during the second stage.

- If continuous electronic monitoring is used, the tracing is evaluated at least every 30 minutes during the first stage and at least every 15 minutes during second-stage labor.
- For women with pregnancies at risk, fetal heart auscultation is performed at least every 15 minutes during the first stage of labor and every 5 minutes during the second stage.
- Given the above options, every 30 minutes monitoring is the best choice.

80. Ans. (d) 4 hours

Ref: Williams, 23rd ed. Ch: 17

- On admission, the cervical dilatation should be plotted on the partogram, provided the diagnosis of Labor has been made.
- A partogram was designed by the World Health Organization (WHO) for use in developing countries
- The partograph is similar for nulliparas and multiparas.
- Labor is divided into a latent phase (8 hrs), and an active phase. The active phase starts at 3 cm dilatation, and progress should be no slower than 1 cm/hr.
- An alert line is drawn at 1 cm/h once the active phase of Labor has been reached, and an action line is then drawn parallel and to the right of this.
- Pelvic examination is done at 4 hours.

81. Ans. (c) 3rd stage of labor

Ref: High risk pregnancy 4th ed. by James et. al, ch 75- Normal third stage of Labor

There are four stages of labor

- The first stage is from the onset of true labor to complete dilation of the cervix.
- The second stage is from complete dilation of the cervix to the birth of the baby.
- The third stage is from the birth of the baby to delivery of the placenta.
- The fourth stage is from delivery of the placenta to stabilization of the patient's condition, usually at about 6 hours postpartum.

PROSTAGLANDINS

- Prostaglandin F (PGF), PGF_{2α}, and oxytocin are the biochemical agents primarily involved in the third stage of labor.
- During the first and second stages of labor, only PGF_{2α} and oxytocin are significantly raised in maternal plasma compared with pre-labor concentrations.
- At 5 minutes after birth, maternal PGF and PGF_{2α} concentrations peak at about twice the levels found at

FMGE Solutions Screening Examination

902

the commencement of the second stage. A rapid increase in prostaglandin concentrations is also found in umbilical cord venous blood, suggesting that this postpartum prostaglandin surge originates in the placenta.

- After placental separation, the concentrations decrease but at rates slower than the metabolic clearance of prostaglandin, indicating that its production continues in the decidua and myometrium.
- Plasma oxytocin also drops to prelabor levels within 30 minutes of delivery, unless sustained by exogenous infusion.

Extra Mile

Hormones	Peak level at:
Oxytocin	At birth
Prolactin	Levels decrease during labor but then rise steeply at the end of labor and peak with birth

82. Ans. (b) **800–1000 mL**

Ref: Williams Obstetrics, 24th ed. pg. 250

NORMAL AMNIOTIC FLUID VOLUME

- Amniotic fluid volume increases as the age of gestation increases:
 - 10 weeks: 30 mL
 - 16 weeks: 200 mL
 - 3rd trimester: 800 mL
- Amniotic fluid is maximum at 28–36 week age of gestation (1000 mL).
- This fluid is approximately 98-percent water. A full-term fetus contains roughly 2800 mL of water, and the placenta another 400 mL, such that the term uterus holds nearly 4 liters of water.
- Fetal urine production begins between 8 and 11 weeks, but it does not become a major component of amniotic fluid until the second trimester.

TABLE: In order to attempt any question related to this topic we have summarized this table of the amount of amniotic fluid, fetal weight according to gestational age (*william's OB 23rd ed. Ch 21*).

Weeks' Gestation	Fetus wt (g)	Amniotic fluid (mL)	Placenta (g)
16 weeks	100	200	100
28 weeks	1000	1000	200
36 weeks	2500	900–1000	400
40 weeks	3300	800	500

Note: If question formed as amniotic fluid is maximum at then single best answer will be 36 weeks.

- This latter observation explains why fetuses with lethal renal abnormalities may not manifest severe oligohydramnios until after 18 weeks.
- **Fetal urination is the primary amniotic fluid source by the second half of pregnancy.**
- By term, fetal urine production may exceed 1 liter per day—such that the entire amniotic fluid volume is recirculated on a daily basis. Fetal urine osmolality is significantly hypotonic to that of maternal and fetal plasma and similar to that of amniotic fluid.

83. Ans. (b) **34–36 weeks**

Ref: Williams Obstetrics, 24th ed./250

Please refer to above explanation

84. Ans. (d) **Cervical length**

Ref: Dutta's Obstetrics 7th ed. 523

- **Bishop score is used to predict** success rate of the induction of the labor
- **Bishop score includes:** (Note: it doesn't include length of cervix)
 - Dilation of the cervix.
 - Position of the cervix.
 - The presenting part of the fetus
 - Consistency of the cervix

85. Ans. (c) **Clavicle**

Ref: "Clavicle fracture in labor: risk factors and associated morbidities". J Perinatol (Dec '01)

- **Clavicle fractures are the most frequently encountered birth injury (0.5%).**
- **Brachial plexus** is also injured during child birth due to its stretch. The brachial plexus is stretched when the head is pulled in one direction and the arm in the opposite.
- **Femur fractures** also occur in as the leg is awkwardly twisted during delivery. These are rare injuries that are much less common than clavicle fractures.

86. Ans. (c) **Variable deceleration**

Ref: Dutta's Obstetrics, 7th ed. pg. 612

- Deceleration is transient decrease in FHR below the baseline by 15 bpm or more and lasting for more than or equal to 15 secs.
- Three basic type of deceleration are observed:
 - **Early Deceleration:** Due to head compression
 - **Late deceleration:** Uteroplacental insufficiency and fetal hypoxia
 - **Variable deceleration:** Cord compression (MC type)

87. Ans. (c) **Uteroplacental insufficiency**

Ref: Dutta's Obstetrics, 7th ed. pg. 612

Please refer to above explanation

88. Ans. (b) **Variable deceleration**

The given partogram shows variable deceleration. Now compare the different partograms

FETAL MONITOR PATTERNS**REASSURING PATTERN****VARIABLE DECELERATIONS****LATE DECELERATION WITH VARIABILITY LOSS****SEVERE VARIABLE DECELERATIONS**89. Ans. (c) **Extension to rectum**

Ref: DC Dutta, 8th ed. pg. 649-50, 5th ed. pg. 606

- **Episiotomy:** is defined as a surgical incision of the perineum made to increase the diameter of the vulval outlet during child- birth (and not the whole birth canal).
- **Types of episiotomy:** (Only the median or mediolateral episiotomy are done commonly).
 - Medio-lateral
 - Median
 - Lateral
 - 'J' shaped

Median	Mediolateral
<ul style="list-style-type: none"> • Muscles are not cut • Blood loss is less • Repair is easy • Healing is superior • Dyspareunia is rare • Extension, if occurs, may involve rectum • Incision cannot be extended 	<ul style="list-style-type: none"> • Muscles are cut • Blood loss is more • Repair is difficult • Healing is less superior • Dyspareunia is more • Relative safety from rectal involvement from extension • Incision can be extended

90. Ans. (d) **2 hours**

Ref: Dutta 8th ed. pg. 154-156

- **Secondary arrest** is defined when the **active phase of labor (cervical dilatation)** commences normally but stops or **slows significantly for 2 hours** or more prior to the full dilatation of the cervix.
- It is commonly **due to malposition or cephalopelvic disproportion**.

'Cessation of active phase of dilatation by more than 2 hours is defined as arrest': Danforth.

ANTEPARTUM AND POSTPARTUM PERIOD91. Ans. (b) **Naegele's formula**

Ref: DC Dutta 9th ed. P 88

- Calculation of the expected date of delivery is done according to **Naegele's formula**
- 1st day of LMP +9 months + 7 days

Extra Mile

- **Cardiff "count 10" formula:** fetal movement count. If <10 kicks in 12 hours on two successive days → Fetal compromise.
- **Hadlock formula and Shepard formula:** For fetal weight estimation according to gestational age using fetal biometric data (BPD, Head circumference, Abdominal circumference and femur length)
- **Johnsons formula:** Also for fetal weight estimation.
 - Height of uterus above symphysis pubis minus 12
- **Crichton's Fifth formula:** Assessment of progressive descent of fetal head.

FMGE Solutions Screening Examination

904

- Count 3 calendar month back from 1st day of LMP +7 days
- For IVF pregnancy, date of LMP is 14 days prior to date to embryo transfer
- Based on formula labor starts on expected date in 4%. Its prediction range is about 50% with 7 days on either side of EDD.

92. Ans. (d) Discoid uterus

Ref: DC Dutta Obstetrics 8th ed. P 143-44

- The 3rd stage of labor comprises of placental separation, its descent into lower segment and its expulsion.
- After the birth of the baby, the uterus measures about 20 cm (8") vertically and 10 cm (4") anteroposteriorly and the shape become discoid (before separation).

Signs Before and After Placental Separation

- **Before separation:** Uterus becomes *discoid in shape*, firm in feel and nonballotable.
 - Fundal height reaches slightly below the umbilicus
- **After separation:**
 - Uterus becomes globular firm and ballotable
 - The fundal height is slightly raised
 - Sudden gush of vaginal bleeding upon separation
 - Permanent lengthening of the cord.

Extra Mile

- **The separation is facilitated partly** by uterine contraction and mostly by weight of the placenta as it descends down from the active part.
- There are two types of separation of placenta:
 - Marginal separation:** Also known as Mathews-Duncan separation and starts from the margin. It is the most common type.
 - Central separation:** Also known as **Schultze** separation. Starts at center, blood accumulates retroplacentally until whole of the placenta gets detached.

93. Ans. (b) TIBC increased

Ref: DC Dutta, 8th ed. pg. 304

- Total iron requirement during pregnancy is estimated approximately 1,000 mg
- This iron need is not squarely distributed throughout the pregnancy but mostly limited to the third trimester.
- Pregnancy is an inevitable iron deficiency state.
- There is **decreased** serum iron, serum ferritin (storage form of iron) and reduced serum iron: Serum TIBC ratio.
- TIBC is increased (as serum iron is decreased).

Extra Mile

TABLE: Normal blood values in non-pregnant and pregnant state

Blood values	Non-pregnant	Second half pregnancy
Hemoglobin (Hb)	14.8 gm/100 mL	11–14 gm/100 mL
Red blood cells (RBC)	5 million/cu mm (mm ³)	4–4.5 million/mm ³
Packed cell volume (PCV) (Hematocrit)	39–42%	32–36%
Mean corpuscular hemoglobin (MCH)	27–32 micromicron (picogram-pg)	26–31 pg
Mean corpuscular volume (MCV)	75–100 cubic micron (μ ³)	75–95 μ ³
Mean corpuscular hemoglobin concentration (MCHC)	32–36%	30–35%
Serum iron	60–120 μg/100 mL	Slightly lowered (65–75 μg/100)
Total iron binding capacity (TIBC)	300–350 μg/100 mL	Increased (300–400 μg/100 mL)
Saturation percentage (Ratio-serum Iron: TIBC)	30%	Less than 16%
Serum ferritin	20–30 μg/L (mean)	15 mg/L (mean)

94. Ans. (c) Oxytocin

Ref: Textbook of Gynecology by Rao, pg. 17;
DC Dutta, 8th ed. pg. 17

- **Oxytocin** primarily results in stimulation of **two specific types of muscular contraction:**
 - Uterine muscular contraction during parturition
 - Breast lactiferous duct myoepithelial contraction during milk let down reflex.

FIGURE: (A) Structure of the basic unit of the mammary gland; (B) Structure of adult female breast

A Brief on Breast Functional Anatomy

- The **areola** is central, pigmented portion of breast with a diameter of about 2.5 cm.
- Accessory glands located around the periphery of the areola are **Montgomery glands** (they can secrete milk).
- The **nipple** accommodates about 15–20 lactiferous ducts and their openings.
- Each milk duct (**lactiferous duct**) dilates to form lactiferous sinus at about 5–10 mm away from its opening in the nipple. Lactiferous sinus acts as reservoir of milk.
- The lining epithelium of the duct near the opening is stratified squamous. Each alveolus is lined by columnar epithelium where milk secretion occurs.
- **Myoepithelial cells** are the network of branching longitudinal striated cells which surround the alveoli and the smaller ducts. There is a dense network of capillaries surrounding the alveoli. These are situated between the basement membrane and epithelial lining.
- **Contraction of these cells (in response to oxytocin) squeezes the alveoli and ejects the milk into the larger duct.**

95. Ans. (b) **TAS**

Ref: DC Dutta, 8th ed. pg. 733

- For screening transabdominal sonography is the best modality. However if question framed as “best investigation” or “earliest detection” then the answer will be transvaginal sonography.

96. Ans. (c) **21 days**

Ref: DC Dutta, 8th ed. pg. 32

- Placental circulation is established by 21 days
- Fetal circulation is established by 21 days

Extra Mile

- Weight of placenta at term: **500 gm**
- Functional unit of placenta: **Lobule**
- Surface area of placenta at term: 12m²
- Placenta takes over function of corpus luteum at 8 weeks (8–10 weeks)

97. Ans. (c) **Nuchal translucency**

Ref: DC Dutta, 8th ed. pg. 735

- **Nuchal translucency** is a fluid behind the neck of the fetus. It is an anechoic space visible and seen in all fetuses between 11–14 weeks of age
- The most common cause of increased nuchal translucency (>3 mm) is **aneuploidy** where **TURNER syndrome** is the most common cause followed second by **Down syndrome**.
- The reason why it is seen in 11–14 weeks is because at that time fetal lymphatics are developing and peripheral resistance is high and gradually disappears.
- **Remember:** Cystic hygroma which is seen in Turner syndrome is high incidence is due to defective development of lymphatics.

98. Ans. (b) **100 mg iron + 500 mcg folic acid**

Ref: DC Dutta, 8th ed. pg. 241

- **Adult** iron + folic acid tablet given in pregnancy: 1 tab/day × 100 days
- **Kids** iron + folic acid tablet given: 1 tab/day × 100 days per year- 0 to 5 years of age.

Iron and Folic Acid Tablet Content

	Iron	Folic acid
Adult tab	100 mg	500 mcg
Kids tab (1/5 th)	20 mg	100 mcg

99. Ans. (c) **Non-stress test**

Ref: DC Dutta, 8th ed. pg. 122

NON-STRESS TEST (NST)

- In NST, continuous electronic monitoring of fetal heart rate with fetal movements are noted.
- There is an observed association of FHR acceleration with fetal movements, which when present, indicates a healthy fetus.
- It can reliably be used as a screening test.
- The FHR accelerations associated with fetal movements is basically *reflex mediated*.
- It should be noted that the test is valuable to identify the fetal wellness rather than illness.

FMGE Solutions Screening Examination

906

Interpretation

- **Reactive (Reassuring)**—two or more accelerations of more than 15 beats per minute which lasts for 15 seconds or more in a 20 minute observation.
- **Non-reactive (Non-reassuring)**—Absence of any fetal reactivity.

Contraction stress test (CST) is based to observe the response of the fetus at risk for utero placental insufficiency in relation to uterine contractions.

100. Ans. (a) FHR deceleration

Ref: Dutta's Obstetrics, 7th ed. pg. 109

Biophysical Profile Scoring (Manning – 1992)				
Observation for 30 minutes Normal score: 2 Abnormal: 0			BPP score	Interpretation
Parameters	Minimal normal criteria	Score		
Non stress Test (NST)	Reactive pattern	2	8–10	No fetal asphyxia
Breathing movements	≥1 episode lasting > 30 sec	2	6	Suspect Chronic asphyxia
Gross body movement	≥3 discrete body/limb movements	2	4	Suspect Chronic asphyxia
Fetal muscle tone	≥1 episode of extension (limb or trunk) with return of flexion	2	0–2	Strongly suspect asphyxia
Amniotic fluid	≥1 pocket measuring 2 cm in two perpendicular planes	2		

101. Ans. (b) 10–12 cm

MATERNAL CHANGES DURING PREGNANCY

- Both ovaries are enlarged due to increased vascularity
- Uterus weight increases from 50 gm in non-pregnant state to 1000 gm at term.
- Capacity, shape and blood flow of uterus increases during pregnancy
- Formation of lower uterine segment: After 12 weeks, the isthmus (0.5 cm) starts to expand gradually to form the lower uterine segment **which measures 10 cm in length at term** (7.5–10 cm according to Dutta).
- The vagina becomes soft, warm, and moist with increased secretion and violet in color (Chadwick's sign) due to increased vascularity.

Difference between upper uterine segment and lower uterine segment

	Upper uterine segment	Lower uterine segment
Peritoneum	Firmly-attached	Loosely-attached
Myometrium	3 layers; outer longitudinal, middle oblique and inner circular	2 layers; outer longitudinal and inner circular
Decidua	Well-developed	Poorly-developed
Membranes	Firmly-attached	Loosely-attached
Activity	Active, contracts, retracts and becomes thicker during labor	Passive, dilates, stretches and becomes thinner during Labor

102. Ans. (a) 6 weeks

Ref: DC Dutta 8th ed. pg. 74-75

The pelvic changes during pregnancy are diverse and appear different at different periods:

Signs	At AOG
Palmer's sign: Regular and rhythmic uterine contraction	4-8 weeks
Vaginal sign: Softened vaginal wall with copious mucoid discharge	6 th week
Goodell's sign: Cervix feels soft and congested	6 th week
Hegar's sign: Uterus is enlarged and soft; cervix empty.	6-10 weeks
Oslander sign: Increased pulsation at lateral fornices	8 th week
Chadwick's sign or Jacquemier's sign: Dusky hue of the vestibule and anterior vaginal wall (due to local vascular congestion)	8 th week
Piskacek's sign: Asymmetrical enlargement of the uterus if there is lateral implantation	8 th week

103. Ans. (b) 8th week

Please refer to above explanation.

104. Ans. (d) Perinatal mortality rate

Ref: DC Dutta 8th ed./687

- **Perinatal period** is from 28th week age of gestation to 7th day of newborn life.
- Perinatal mortality rate includes late fetal deaths and early neonatal deaths.
- A better obstetric care will be able to diagnose any fetal stress which will result in early intervention, which will certainly help in delivering a healthy baby.
- Therefore an obstetric will mostly affect Perinatal mortality rate.

105. Ans. (b) 7 April, 2016

Ref: DC. Dutta's Textbook of Obstetrics, 8th ed. pg. 83-108

- Calculation of the expected date of delivery is done according to **naegele's formula**
- 1st day of LMP +9 months + 7 days
- Count 3 calendar month back from 1st day of LMP +7 days
- Here LMP= 30th June

■ EDD

30th June 2015
+7 day +9 month
7th April, 2016

106. Ans. (c) 3 weeks

Ref: DC Dutta, 7th ed. pg. 146

■ LOCHIA

- It is the vaginal discharge for the first fortnight during puerperium.
- It has 3 phases, which may extend upto 3 weeks.
 - Lochia rubra: 1-4 days; red in color
 - Lochia serosa: 5-9 days; the color is yellowish or pink or pale brownish
 - Lochia alba: 10-15 days; pale white color
- Duration of the Lochia alba beyond 3 weeks suggests local genital lesion

107. Ans. (a) Placental site

Ref: Dutta's Obstetrics, 7th ed. pg. 433

■ PUERPERAL SEPSIS

- An infection of the genital tract which occurs as a complication of delivery is termed puerperal sepsis.
- Sources of infection may be endogenous where organisms are present in the genital tract before delivery.

Mode of Infection

- Puerperal sepsis is generally a wound infection.
- Placental site being a raw surface in the endometrium is the most common site for infection.
- Other causes of puerperal sepsis may be laceration of the genital tract or may be CS section wound infection by organisms like anaerobic strep, E. Coli, staph etc.
- *Anaerobic streptococcus is the most common cause of Puerperal sepsis.*
- The primary sites of infections are: Uterus, Perineum, Vagina, Cervix.

108. Ans. (b) Uterus becomes discoid

Ref: DC Dutta, 7th ed. pg. 131-312

Clinical Course of Third Stage of Labor

- Third stage includes separation, descent and expulsion of the placenta with its membrane.

Signs before and after placental separation

- **Before Separation:** uterus becomes *discoid in shape*, firm in feel and non-ballotable.
 - Fundal height reaches slightly below the umbilicus
- **After Separation:**
 - Uterus becomes globular firm and ballotable
 - *The fundal height is slightly raised*
 - Sudden gush of vaginal bleeding upon separation.
 - Permanent lengthening of the cord.

109. Ans. (a) Gushing of blood

Ref: D.C Dutta, 7th ed. pg. 131-312

Please refer to above explanation.

110. Ans. (b) Fundus of the uterus below umbilicus

Ref: D.C Dutta, 7th ed. pg. 131-312

111. Ans. (c) Puerperal sepsis

Ref: D.C Dutta, 7th ed. pg. 432, 433, 435

■ PUERPERAL PYREXIA (FEVER)

- A rise of temperature reaching 100.4°F (39°C) or more on 2 separate occasions at 24 hours apart (excluding first 24 hours) within first 10 days following delivery is called *puerperal pyrexia*.
- **Causes of pyrexia are:** Puerperal sepsis, Urinary tract infection, Mastitis, Infection of caesarean section wound, Pulmonary infection, Septic pelvic thrombophlebitis etc.

■ PUERPERAL SEPSIS

- An infection of the genital tract which occurs as a complication of delivery is termed puerperal sepsis.
- Sources of infection may be endogenous where organisms are present in the genital tract before delivery.
- *Anaerobic streptococcus is the most common cause of Puerperal sepsis.*
- The primary sites of infections are: Perineum, Vagina, Cervix, Uterus
- *Remember: A case of puerperal pyrexia is considered to be due to genital unless proved otherwise.*

112. Ans. (a) Haemorrhage

Ref: Dutta's Obstetrics, 7th ed. pg. 411

- Most common Indirect cause of maternal mortality in India: Anemia

FMGE Solutions Screening Examination

908

- Most common cause of maternal mortality in India: Post partum hemorrhage (PPH)
- Most common direct cause of MMR: PPH

Direct maternal mortality	Indirect maternal mortality
It results from obstetric complication of pregnant state (pregnancy, labor and puerperium) from interventions or incorrect treatment.	It results from previous existing disease or disease that develops during pregnancy.
Ex: PPH, Obstructed labor, Sepsis	Anemia, HTN, gestational DM, Epilepsy

113. Ans. (d) **Anemia**

Please refer to above explanation.

114. Ans. (d) **Increased prolactin level**

Ref: DC Dutta, 8th ed. pg. 171, 614; 6th pg. 148
Breast feeding increases the levels of prolactin which lead to the following consequences:

- Reduced ovarian response to FSH leading to **hypo-estrogenic state**
- Suppression of LH release thereby **preventing LH surge and inhibiting ovulation**
- **Reduces GnRH secretion**

115. Ans. (c) **1000 g**

Ref: Dutta's Obstetrics, 7th ed. pg. 144.

- Immediately following delivery, the uterus becomes firm and retracts with alternate hardening and softening.
- Immediately postpartum the uterus weighs about 1000 g and measures about $20 \times 17 \times 7.5$ cm.
- **6 weeks post partum**, its measurement is almost similar to that of non-pregnant state and **weighs about 60 g**.

116. Ans. (b) **4 weeks**

Ref: DC Dutta, 8th ed. pg. 53-54

- Heart rate returns to pre-pregnant value at around 4 weeks postpartum

117. Ans. (d) **4 weeks**

Ref: Dutta's Obstetrics, 7th ed. pg. 53

- The cardiac output (CO) starts to increase from 5th week of pregnancy, reaches its peak **40-50% at about 30-40 weeks**.
- CO is lowest in the sitting or supine position and highest in the right or left lateral or knee chest position.
- It increases further during labor (+50%) and immediately following delivery (+70%) over the pre-labor values.
- Within 1-2 hours following birth, the cardiac output is

estimated to be about 500 ml/min and Hr ~ 120-140/min

- **CO returns to pre labor values one hour after delivery.**
- *It returns to the pre-pregnancy level in 4 weeks time.*

118. Ans. (b) **12-14 days**

Ref: Dutta's Obstetrics, 7th ed. pg. 144-145

- Uterus becomes pelvic organ in about 2 weeks after normal delivery.
- The rate of involution of uterus after delivery is 1.25 cm or half inch/day.
- **It regains its pre-pregnancy size at the end of 6 weeks.**

Extra Mile

- During pregnancy, uterus remains pelvic organ till 2 week of pregnancy. Thereon, it starts to ascend in abdomen.

119. Ans. (b) **Vasa previa**

Ref: Dutta's Obstetrics, 7th ed. pg. 259

VASA PREVIA

- In a vilamentous insertion of cord, the leash of blood vessels may traverse through membranes overlying the internal OS, in front of the presenting part. This condition is called Vasa previa.
- Rupture of the membranes involves the overlying vessels and leads to vaginal bleeding.
- This vaginal bleeding is, thus, entirely from fetal blood and may result in fetal exsanguination and even death.

120. Ans. (b) **Rupture of uterus**

Ref: William's, 23rd ed. Ch 35

- **Postpartum hemorrhage** has been defined as the loss of 500 mL of blood or more after completion of the third stage of labor.
- According to the given case scenario, ruptured uterus is the only indication to do immediate hysterectomy.
- Other given options like pre-eclampsia, atonic uterus or involution of uterus may present with post delivery hemorrhage, but they are not an indication for immediate hysterectomy and managed conservatively first.
- **Pre-eclampsia:** Because of the poorly contractile nature of the lower uterine segment, there may be uncontrollable hemorrhage following placental removal. When bleeding is not controlled by conservative means, other methods like oversewing the implantation site, bilateral internal iliac artery ligation or uninterrupted chromic sutures is the next best choice (*William's 23rd*). If such conservative methods fail, and bleeding is brisk, then hysterectomy is necessary.
- **Uterine atony** is the most common cause of obstetrical hemorrhage. Managed initially with oxytocin, ergot

derivatives, Prostaglandin analogues (PGF₂α). If no effect with conservative management then hysterectomy is the choice.

- **Note:** For women whose placenta previa is implanted anteriorly in the site of a prior hysterotomy incision, there is an increased likelihood of associated placenta accreta and need for hysterectomy.
- **Inversion of the uterus** most often associated with immediate life-threatening hemorrhage. The recently inverted uterus with placenta already separated from it may often be replaced simply by pushing up on the fundus with the palm of the hand and fingers in the direction of the long axis of the vagina followed by fluid infusion and blood transfusion. If no relief then reduction via laparotomy is performed.

121. Ans. (c) III

Ref: DC Dutta, 7th ed. pg. 422-23

PERINEAL TEARS

1 st degree	Is a laceration of the vaginal mucosa and the perineal skin but not the underlying fascia and muscle.
2 nd degree	Involves the vaginal mucosa perineal skin and the fascia and muscles of the perineal body.
3 rd degree	Involves the vaginal mucosa skin and perineal body and the anal sphincter is also disrupted
4 th degree	In addition the rectal mucosa is also torn.

ABORTION AND THIRD TRIMESTER BLEEDING

122. Ans. (b) Cervical incompetence

Ref: DC Dutta 9th ed. P 161

- The patient in the given case is of 2nd trimester abortion. Cervical incompetence is the most common cause that can be suspected for this patient

TABLE: Common causes of miscarriage

1 st trimester	2 nd trimester
<ul style="list-style-type: none"> • Genetic factors (50%) • Endocrine disorders like thyroid abnormalities, diabetes • Immunological disorder • Infections • Unexplained 	<ul style="list-style-type: none"> • Anatomical abnormalities <ul style="list-style-type: none"> ■ Cervical incompetence ■ Mullerian fusion defect-bicornuate/separate uterus ■ Uterine synechiae ■ Uterine fibroid • Maternal medical illness • Unexplained

Cervical Incompetence/Insufficiency

- Causes of cervical incompetence can be:
 - Congenital uterine abnormalities
 - **Acquired:** More common.
 - ◆ History of D&C or D and E operation
 - ◆ Cervix amputation
 - ◆ Vaginal operative delivery through undilated cervix
 - ◆ Multiple gestations
- Patient usually present with history of mid-trimester, painless cervical dilatation and escape of liquor amnii followed by painless expulsion of the product of conceptus.
- Passage of 6–8 number hegar dilator without resistance and pain is highly suggestive

Treatment:

- **Cerclage operation:** Two types of operation are in current use during pregnancy
 - Shirodkar
 - McDonald
- **Principle:** It reinforces the weak cervix by a nonabsorbable tape, placed around the cervix at the level of internal os.
- **Time of operation:** Around 14 weeks of pregnancy or at least 2 weeks earlier than the previous miscarriage, as early as the 10th week.
- **Removal of stitch:** The stitch should be removed at 37th week or earlier if labor pain starts (preferably in OT).

Extra Mile

TABLE: Types of miscarriage and the diagnostic features

Type	Symptoms	Uterine Size	Cervix (Ext. Os)	Ultrasonography
Threatened	<ul style="list-style-type: none"> • Vaginal bleeding present • Pelvic pain 	Corresponds to gestational age	Closed	<ul style="list-style-type: none"> • Fetus alive • Retroplacental hemorrhage+
Inevitable	<ul style="list-style-type: none"> • Vaginal bleeding present • Pelvic pain 	Same or smaller	Open with palpable conceptus	<ul style="list-style-type: none"> • Fetus often dead • Retroplacental hemorrhage+
Incomplete	Vaginal bleeding (may be heavy)	Smaller	Open	Products of conception partly retained

Contd...

Type	Symptoms	Uterine Size	Cervix (Ext. Os)	Ultrasonography
Complete	Vaginal bleeding—trace or absent	Smaller	Closed	Uterine cavity empty
Missed	Vaginal bleeding—trace, brownish in color	Smaller	Closed	Blighted ovum or fetus without cardiac activity
Septic	Vaginal discharge: purulent, foul smelling with features of sepsis	Variable, may be larger	Open	Products of conception retained, presence of foreign body (\pm), free fluid in the peritoneal cavity/POD

123. Ans. (a) TrisomyRef: Williams 24th ed. P 370

- Approximately 50% of miscarriages during first trimester are anembryonic. The other 50% are embryonic miscarriages.
 - Anembryonic:** With no identifiable embryonic elements.
 - Embryonic:** Display a developmental abnormality of the zygote, embryo, fetus, or at times, the placenta.
- Of 50% embryonic miscarriages, 25% of all abortion are aneuploid abortions (*abnormal chromosome number*). The remaining cases are euploid (*abnormal chromosome development*) abortions.

Chromosomal aneuploidy	Incidence %
Trisomy	22–32
Monosomy X (45,X)	5–20
Triploidy	6–8
Tetraploidy	2–4
Structural anomaly	2

Note: Most common cause of first trimester bleeding: Abortion**124. Ans. (a) Spontaneous abortion**Ref: DC Dutta, 8th ed. pg. 185-86

- Spontaneous abortion** is the expulsion or extraction from its mother of an embryo or fetus weighing 500 g or less when it is not capable of independent survival
- Incidence:**
 - About 75% miscarriages occur before the 16th week and of these **about 80% occur before the 12th week of pregnancy.**

Common Causes of Miscarriage

- First trimester:**
 - Genetic factors (50%)- MCC.**
 - Endocrine disorders (LPD, thyroid abnormalities, diabetes).

- Immunological disorders (autoimmune and alloimmune).
- Infection.
- Unexplained.
- Second trimester:**
 - Anatomic abnormalities—
 - Cervical incompetence (congenital or acquired).
 - Mullerian fusion defects (bicornuate uterus, septate uterus).
 - Uterine synechiae
 - Uterine fibroid.
 - Maternal medical illness
 - Unexplained
- Third trimester:** Most common cause of bleeding is: Abruption placenta > placenta previa

125. Ans. (a) TrisomyRef: Williams 24th ed. pg. 370

- Approximately 50% of miscarriages during first trimester are anembryonic. The other 50% are embryonic miscarriages.
 - Anembryonic:** With no identifiable embryonic elements.
 - Embryonic:** Display a developmental abnormality of the zygote, embryo, fetus, or at times, the placenta.
- Of 50% embryonic miscarriages, 25% of all abortion are aneuploid abortions (*abnormal chromosome number*). The remaining cases are euploid (*abnormal chromosome development*) abortions.

Chromosomal aneuploidy	Incidence %
Trisomy	22–32
Monosomy x (45, X)	5–20
Triploidy	6–8
Tetraploidy	2–4
Structural anomaly	2

Note: Most common cause of first trimester bleeding: Abortion

126. Ans. (c) **Chromosomal abnormalities**Ref: Dutta, 6th ed. pg. 160

With respect to first trimester abortions, 75% of the abortions take place before 16th week and out of these, about 75% occur before the 8th week of pregnancy.

- **Chromosomal abnormality in the conceptus is the commonest cause of miscarriage.**
- **Autosomal trisomy** particularly **Trisomy 16** is the commonest cause for spontaneous abortion.

127. Ans. (c) **Uterus size small to AOG, cervix open**Ref: Dutta's Obstetrics, 7th ed. pg. 163

- In Inevitable abortion, condition is progressed to a stage from where continuation of pregnancy is not possible.
- Patient usually presents with bleeding per vaginum with **size of uterus smaller than age of gestation and open cervix.**
- **USG finding:** Dead fetus

Extra Mile

Abortion	Size of uterus	Cervix OS	USG finding
Threatened	Equal to AOG	Closed	Fetus alive
Missed	Smaller than AOG	Closed	Dead fetus
Incomplete	Smaller than AOG	Open	Retained products of conception
Complete	Smaller than AOG	Closed	Uterine Cavity empty

128. Ans. (a) **Dilatation and evacuation**Ref: D.C Dutta, 7th ed. pg. 161-162**INEVITABLE MISCARRIAGE**

- It is the clinical type of abortion where the changes have progressed to a state from where continuation of pregnancy is impossible.
- **Clinical feature:**
 - Increased vaginal bleeding
 - Aggravation of pain in the lower abdomen
 - Dilated internal OS
- **Treatment**
 - Before 12 weeks
 - ◆ *Dilatation and evacuation* followed by curettage using analgesia or under general anaesthesia
 - ◆ Alternative, suction evacuation followed by curettage is also done.
 - **After 12 weeks:** Product of conception is evacuated by Oxytocin drip which increases uterine contraction.

129. Ans. (c) **200 mg mifepristone + 400 mcg misoprostol**Ref: D.C Dutta, 7th ed. pg. 173-174

Following are the indications for termination under the MTP Act:

- **To save the life of the mother (Therapeutic or medical termination):** Ex: Grade 3-4 cardiac disease, malignant HTN, CGN, cervical or breast malignancies etc.
- **Social indications:** To prevent grave injury to the physical and mental health of the pregnant woman.
- **Humanitarian ground:** Pregnancy because of rape or incest.
- **Eugenic:** Substantial risk of the child being born with serious physical and mental abnormalities so as to be handicapped in life.

Remember

- Termination is permitted up to 20 weeks of pregnancy. When the pregnancy exceeds 12 weeks, opinion of two medical practitioners is required

Medical Methods of First Trimester Abortion

- 200 mg of mifepristone orally is given on day 1. On day 3, misoprostol (PGE₁) 400 µg orally or 800 µg vaginally is given for the MTP.

130. Ans. (c) **Mifepristone 200 mg + Misoprostol 400 mcg oral**Ref: Dutta's Obstetrics, 7th ed. pg. 173**Medical methods of first trimester abortion**

- 200 mg of mifepristone orally is given on day 1.
- On day 3, misoprostol (PGE₁) 400 µg orally or 800 µg vaginally is given for the MTP.

131. Ans. (c) **Misoprostol + Tamoxifen**Ref: Dutta's Obstetrics, 7th ed. pg. 173

- 200 mg of mifepristone orally is given on day 1. On day 3, misoprostol (PGE₁) 400 µg orally or 800 µg vaginally is given for the MTP.
- Tamoxifen is an estrogen antagonist, which is basically used in breast cancer.

132. Ans. (d) **Type II posterior**Ref: DC Dutta 8th ed./283-84; William's 23rd ed. Ch. 35.**PLACENTA PREVIA**

Placenta previa is used to describe a placenta that is implanted over or very near the internal cervical os. There are several possibilities:

- **Total placenta previa**—the internal os is covered completely by placenta
- **Partial placenta previa**—the internal os is partially covered by placenta

FMGE Solutions Screening Examination

- **Marginal placenta previa**—the edge of the placenta is at the margin of the internal os
- **Low-lying placenta**—the placenta is implanted in the lower uterine segment such that the placental edge does not reach the internal os, but is in close proximity to it.
 - **Low lying placenta type II is posteriorly located and is considered dangerous because it** can be compressed by the presenting part and this will cause severe fetal asphyxia and sometimes fetal death.
- **Vasa previa**—the fetal vessels course through membranes and present at the cervical os

133. Ans. (b) Placenta previa

Ref: DC Dutta, 8th ed./290, Williams 22nd ed./ 822-823

- **MacAfee and Johnson Regimen** is a Conservative Management in Placenta Previa: This consists of complete bed rest, tocolysis, and close observation of patient.
- Steroids are generally given to enhance lung maturity.
- **To undertake this regimen (to wait and watch) all three criteria should be fulfilled:**
 - Mother should be hemodynamically stable
 - There should be no fetal distress
 - Pregnancy less than 36 weeks of gestation.
- If any of the criteria is not met then the patient should be delivered by LSCS.

Extra Mile

- Classification of abruption placentae: page/sher's/classification
- **Zuspan regimen** for the treatment of eclampsia using Magnesium sulphate (zuspan aka sibai)
- **Other regimens using MgSO₄ for treatment of eclampsia are** Pritchard's regimen (intramuscular)
- Sibai regimen (intravenous)
- Most appropriate treatment of eclampsia: MgSO₄

134. Ans. (a) Caesarean section

Ref: DC Dutta, 8th ed. pg. 290-92; William's, 23rd ed. Chapter 35.

- Placenta previa-placenta located at LUS.
- One of the most common cause of APH.
- In case of centrally located placenta previa –mode of delivery is always CS.

Management of placenta previa depends on its type- 4 types

Indication for termination (by vaginal/CS)	Indication for conservative management
<ul style="list-style-type: none"> • POG-37 weeks or beyond • Pt continuously bleeding • Fetal distress • Hemodynamically unstable mother • Pt is active Labor • IUD • Congenital malformation of baby which are incompatible with life 	Done in patient who do not obey previous 7 rule
Termination by vaginal delivery or CS (depending on type of PP) <div> Type I Type II Type III Type IV </div>	Ma caffe's protocol for conservative management <ul style="list-style-type: none"> • Bed rest • Monitor vitals-mother and baby • Blood transfusion (if needed)
Type 1 (low lying)-vaginal delivery Type 2 (marginal)-vaginal if placenta anterior, CS-if posterior Type 3 (incomplete/partial)- always CS Type 4 (complete/central)- always CS	If POG <34 weeks- give betamethasone 12 mg IM 2 dose, 24 hrs apart, for lung maturity.

Mark CS as management option for placenta previa if any of following points give in Question

- Mother unstable
- Fetal distress
- Major degree of PP-type 3 (incomplete/partial), type 4 (complete/central)

135. Ans. (b) Battledore placenta

Ref: William's Obstetrics, 23rd ed. Ch: 27

- Normally, the cord usually is inserted at or near the center of the fetal surface of the placenta.
- Cord insertion at the placental margin is sometimes referred to as a **Battledore placenta**. It is found in about 7% of term placentas.
- **Velamentous insertion:** This type of insertion is of considerable clinical importance. The umbilical vessels spread within the membranes at a distance from the pla-

central margin, which they reach surrounded only by a fold of amnion. As a result, vessels are vulnerable to compression, which may lead to fetal anoxia. Incidence: 1%

136. Ans. (a) Placenta accreta

Ref: Williams Obstetrics, 23rd ed. Ch 35.

- The nitabuch layer is a zone of fibrinoid degeneration in which invading trophoblasts meet the decidua. *If the decidua is defective, as in placenta accreta, the Nitabuch layer is usually absent.*

Extra Mile

- **Placenta accreta** indicates that villi are attached to the myometrium.
- **Placenta increta**, villi actually invade the myometrium.
- **Placenta percreta** defines villi that penetrate through the myometrium and to or through the serosa.

137. Ans. (a) Placenta previa

Ref: Williams Obstetrics, 23rd ed. Ch 35.

Absence of nitabuch membrane can lead to placenta accreta, increta or percreta.

138. Ans. (b) β -hCG level

Ref: DC Dutta, 8th ed. pg. 227

Hydatiform moles are abnormal pregnancies characterized histologically by aberrant changes within the placenta. Specifically, the chorionic villi in these placentas show varying degrees of trophoblastic proliferation and edema of the villous stroma. **They are of two types: Partial and complete.**

Complete mole	Partial mole
<ul style="list-style-type: none"> • A molar pregnancy with some normal and some swollen villi plus fetal, cord, and/or amniotic membrane elements. • <i>Fetal tissue absent.</i> • Karyotype: 46, XX or 46, XY • Villous edema: diffuse • Typical clinical presentation: Molar gestation • Postmolar malignant sequelae- 15-20% 	<ul style="list-style-type: none"> • A molar pregnancy with swelling of all placental villi. • <i>Fetal tissues are present.</i> • Karyotype: 69, XXX or 69, XXY • Villous edema: focal • Typical clinical presentation: Missed abortion • Postmolar malignant sequelae- 2-4%

Investigation

- Diagnosing in first-trimester is now common because of the routine use of serum β -hCG measurements (*as they produce excess β -hCG due to trophoblastic proliferation*) and transvaginal sonography.

- Although β -hCG levels are helpful, *the diagnosis of molar pregnancy more frequently is found sonographically* because of the identifiable diffuse swelling and enlargement of the chorionic villi.

- **Appearance on USG:** Snow storm appearance

Treatment

- Suction curettage is the preferred method of evacuation regardless of uterine size in patients who wish to remain fertile.

POSTMOLAR SURVEILLANCE

- Gestational trophoblastic neoplasia (GTN) develops after approximately 15-20 % of complete moles and 2-4% in partial moles.
- **Postmolar surveillance with serial quantitative serum β -hCG levels is the standard.**

Extra Mile

- GTD INCLUDES: H.Mole, Invasive mole, ChorioCA, PSTT (Placental Site Trophoblastic Tumor)
- **MC site of metastasis of GTD: Lungs**

139. Ans. (b) 46 XY

Ref: DC Dutta, 8th ed. pg. 230

Please refer to above explanation.

140. Ans. (c) Lungs

Please refer to above question.

141. Ans. (a) Complete mole

Ref: DC Dutta, 8th ed. pg. 226-30

THECA LUTEIN CYST

- Theca lutein cysts yellow colored cyst seen in H. mole **due to high circulating levels of hCG.**
- Size: microscopic to 10 cms size.
- **Theca lutein cyst are also seen in case of:**
 - Fetal hydrops
 - Placental hypertrophy
 - Multifetal pregnancy

142. Ans. (a) Beta hCG

MONITORING

- After suction Evacuation: We send **weekly serum β -hCG.** Till they Become Normal.

Avg. time for hCG to Came Back to Normal

- After a complete Mole – 9 weeks
- After a partial Mole – 7 weeks
- After a Molar – 9 weeks
- Once hCG is Normal
- We send hCG values Monthly \times 6 months

FMGE Solutions Screening Examination

914

143. Ans. (a) 1%

Ref: William's Obstetrics 23/table 26-3

Types of prior uterine incisions and risk of uterine rupture

Prior incision	Rupture rate (percentage)
1. Classical	4-9%
2. T-shaped	4-9%
3. Low-vertical	1-7%
4. Low-transverse	0.2-1.5%

TWIN PREGNANCY

144. Ans. (c) Diamniotic, Dichorionic

Ref: DC Dutta 9th ed. P 189**TABLE:** Division of zygote and types of twinning

Division of Zygote on/after	Types of Twining
Within 72 hours/3 days	Dichorionic, Diamniotic
Between 4 and 8 days	Monochorionic, Diamniotic
Between 8 and 12 days	Monochorionic, Monoamniotic
>12 days	Siamese, Conjoined Twins

145. Ans. (b) Monochorionic, Diamniotic

Ref: Dutta, 8th ed. pg. 233**TABLE:** Division of zygote and types of Twinning

Division of Zygote on/ after	Types of Twining
Within 72 hours/3 days	Dichorionic, Diamniotic
Between 4 – 8 days	Monochorionic, Diamniotic
Between 8 – 12 days	Monochorionic, Monoamniotic
>12 days	Siamese, Conjoined Twins

Extra Mile

- Most common type of twinning is dizygotic twins: 69%
- Monozygotic twins in: 31%
- **MC TYPE OF TWIN GESTATION:** Diamniotic Monochorionic (70–75%)
- **Least common type of twin gestation:** Conjoined twins (<1%)
- **Hellin rule** is associated with multiple pregnancy as per which chance of twins is 1 in 80 pregnancies, triplets 1 in 80² and so on. It can result in complications
- **Prematurity** is the **commonest fetal complication**
- **Post partum hemorrhage** is the **commonest maternal complication**.
- **Twin to twin transfusion syndrome** is seen in: MC-DA

146. Ans. (b) Diamniotic, monochorionic

Ref: Dutta, 8th ed. pg. 233

147. Ans. (c) A vertex, B vertex

Ref: Dutta, 7th ed. pg. 202-203

- Vertex twin i.e. both baby in vertex presentation has best prognosis.

Presentations

- Both vertex (Most common) 60%
- Vertex (1st) – Breech (2nd) 20%
- Breech (1st) – Vertex (2nd) 10%
- Both Breech 8-10%

Mode of Delivery in twin presentation

- **Vertex Twin:** Mode of Delivery is Vaginal i.e. (V_x-V_x)
- **1st Breech & 2nd vertex** *C.S
 - Interlocking most commonly seen with this presentation
 - After coming head of 1st twin gets locked with forecoming Head of 2nd Twin
- **1st Twin Vertex and 2nd Any:** Vaginal Delivery
- **1st Twin Transverse:** C.S

148. Ans. (a) 10 weeks

Ref: D.C Dutta, 8th ed. 237

Dutta 8th ed states: “sonography in multifetal pregnancy is done for confirmation of diagnosis as early as **10th week AOG**”. It also helps in assessing:

- Viability of fetuses
- Chorionicity (*Lambda or twin peak sign*)
- Pregnancy dating
- Fetal growth monitoring
- Fetal anomalies
- Placental localization
- Amniotic fluid volume

Extra Mile

- Chorionicity of placenta is best diagnosed at 10–13th week AOG by USG
- **Lambda or Twin peak sign:** Indicates dichorionic placenta. In dichorionic twins there is thick septum between the two gestational sacs. It is best identified at the base of membrane where a triangular projection is seen.

149. Ans. (c) Young female

Ref: Dutta, 7th ed. pg. 202

Twin pregnancy associated with increased maternal age.

The incidence of Dizygotic twins increases with:

- Increasing maternal age

- Increasing parity
- Family history of twinning
- Ovulation induction with clomiphene citrate or gonadotrophins.

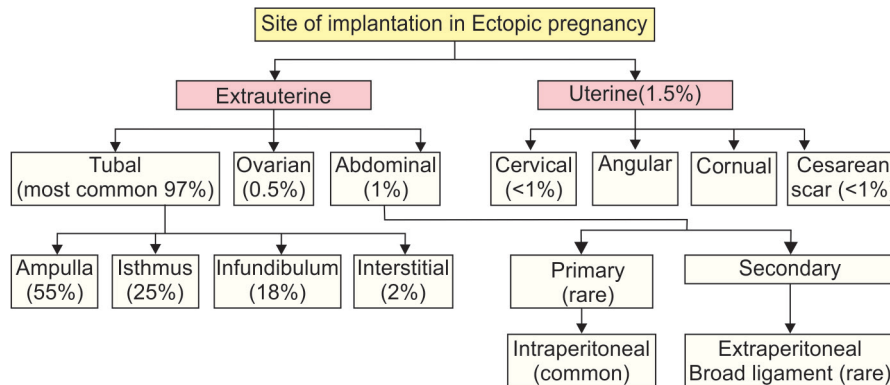

ECTOPIC PREGNANCY

150. Ans. (b) Isthmus

Ref: DC Dutta 9th ed. P 170

- Most common site of ectopic pregnancy is Ampullary part of the fallopian tube
- **Least common variety of ectopic tubal pregnancy: Interstitial**

Sites of Implantation

152. Ans. (c) Interstitial

Ref: DC Dutta 8th ed. pg. 214

- **Interstitial ectopic pregnancy is the rarest variety of tubal pregnancy.** Because of the thick and vascular musculature of the uterine wall with greater distensibility, the fetus grows dissecting the muscle fibers for a longer period (12-14 weeks) before termination occurs.

FIGURE: Interstitial pregnancy

- The usual termination is rupture. It is **associated with massive intraperitoneal hemorrhage** due to its combined vascularization by the uterine and ovarian arteries.

153. Ans. (b) **Laparoscopy with salpingostomy**

Ref: DC Dutta, 8th ed. pg. 217-18

- The USG finding of empty uterus indicates this case as ectopic pregnancy.

Table: Management of unruptured ectopic pregnancy can be done by:

Medical management: methotrexate 50 mg/ m ² IM	Expectant management	Surgical management
<ul style="list-style-type: none"> Serum hCG level should be <3000 IU/L Gestational sac size <3.5 cm Hemodynamically stable patient Tubal diameter should be less than 4 cm without any fetal cardiac activity There should be no intra-abdominal hemorrhage 	<ul style="list-style-type: none"> If sac size <3 cm HCG < 1000 IU/L and subsequent levels are falling 	<ul style="list-style-type: none"> Laparoscopy is preferred over laparotomy Salpingostomy is preferred over salpingectomy

Note: If patient presents with unstable vitals or if laparoscopy is contraindicated, then laparotomy is advised.

154. Ans. (a) **Medical management**

Ref: DC Dutta, 8th ed. pg. 217-18

155. Ans. (a) **Pain**

Ref: Dutta Obs, 7th ed. pg. 182; William Obs, 22nd ed. pg. 258

- An ectopic pregnancy is one in which the fertilized ovum is implanted and develops outside the normal endometrial cavity.
- Classic Triad of Ectopic Pregnancy**
 - Pain (100%)**
 - Amenorrhea (75%)**
 - Bleeding per vaginum (70%)**

Note: Triad is present only in 50% case of ectopic

- Most common/Consistent** finding of Ectopic pregnancy: **Pain**

Symptoms

- Nausea and Vomiting
- Lower Abdominal pain/generalized Abdomen pain
- Shoulder tip pain (25%)
- Syncopal attacks (10%)

156. Ans. (a) **Ectopic pregnancy**

Ref: Dutta Obs, 7th ed. pg. 182; William Obs, 22nd ed. pg. 258

157. Ans. (b) **TVS**

Ref: DC Dutta, 8th ed. pg. 213

- Investigation of choice in a case of ectopic pregnancy/suspected case of ectopic pregnancy is Transvaginal scan.
- Findings raising suspicion of ectopic on TVS:
 - Empty uterine cavity: most important**
 - Finding of complex adnexal mass
 - Fluid (echogenic) in the pouch of Douglas.
 - Adnexal mass clearly separated from the ovary.
 - Rarely cardiac motion may be seen in an unruptured tubal ectopic pregnancy.

Extra Mile

- Estimation of B-hCG:** Urine pregnancy test—ELISA is sensitive to 10-50 mIU/mL and is positive in 95% of ectopic pregnancies. **A single estimation of B-hCG level either in the serum or in urine confirms pregnancy but cannot determine its location.**
- Gold standard for diagnosis of ectopic pregnancy:** Laparoscopy

158. Ans. (c) **Methotrexate 50 mg IM**

Ref: DC Dutta, 8th ed. pg. 216

Dutta states: "For systemic therapy of ectopic pregnancy, a single dose of methotrexate (MTX) 50 mg/M² is given intramuscularly."

159. Ans. (a) **Vomiting**

Ref: Dutta Obs, 7th ed. pg. 182; William Obs, 22nd ed. pg. 258

CLASSIC TRIAD OF ECTOPIC

- Pain+ Amenorrhea+ Bleeding per vaginum**
- Triad is present only in 50% case of ectopic
- M.C/Consistent** finding of Ectopic → **pain**

Symptoms

- Nausea & Vomiting
- Lower Abdom. pain/generalized Abdom pain
- Shoulder tip pain Syncopal attacks

160. Ans. (c) **A negative pregnancy test excludes the diagnosis**

Ref: DC Dutta 8th ed./212, Williams Obst. 21st ed./ 892

- Ectopic pregnancy:** Pregnancy that occurs outside the endometrial lining of uterus.
- Risk factors for ectopic pregnancy include previous ectopic pregnancies and conditions like tubal surgery, tubercular infection that disrupt the normal anatomy of the Fallopian tubes.
- Previous salpingitis/tubal disease is the most common cause of ectopic pregnancy.
- Among contraceptives, use of progestasert is the most common cause of ectopic pregnancy.

- The major health risk of ectopic pregnancy is rupture leading to internal bleeding.
- It can be diagnosed by Beta HCG level. It doesn't rise as fast as it rises in uterine pregnancy.
- ***It can also be diagnosed by pregnancy test, but a negative pregnancy test doesn't rule out the diagnosis of ectopic pregnancy.***
- On transvaginal scan presence of an adnexal mass and the absence of an intrauterine pregnancy increases the likelihood of an ectopic pregnancy.
- ***Methotrexate is considered as drug of choice for ectopic pregnancy.***

161. Ans. (a) Transvaginal USG

Ref: DC Dutta, 8th ed. pg. 212, Williams Obst, 21st ed. pg. 892

Diagnosis of Ectopic Pregnancy

- Most definite diagnosis of pregnancy is by demonstrating intrauterine sac.
- An absence of the intrauterine sac in a patient who is complaining of pain, bleeding and positive pregnancy test raise the suspicion of ectopic pregnancy.
- By doing **transvaginal USG, ectopic pregnancy can be ruled out.** If the USG demonstrates live intrauterine fetus then ectopic pregnancy is very unlikely.
- On the other hand, if the uterus is empty, an ectopic pregnancy can be diagnosed based on the visualization of an adnexal mass separate from the ovaries.
- **Beta-hCG** also helps in diagnosis of pregnancy. It is positive in virtually 100% of ectopic pregnancies.
- A positive test only confirms pregnancy and does not indicate whether it is intrauterine or extrauterine (ectopic).
- *In normal pregnancy beta-HCG should double up every 2 days but in ectopic pregnancy the rate of increase of beta HCG is slow.*

CULDOCENTESIS

- Culdocentesis is the transvaginal passage of a needle into the posterior cul-de-sac in order to determine whether free blood is present in the abdomen.
- This procedure will reveal non-clotted blood if intra-abdominal bleeding has occurred.
- Clotted bloods signify ruptured ectopic pregnancy.
- If culdocentesis is positive, laparoscopy or laparotomy should be performed immediately.

162. Ans. (a) Beta hCG < 5000

Ref: DC Dutta, 8th ed. pg. 209

CRITERIA FOR MEDICAL MANAGEMENT OF ECTOPIC PREGNANCY USING METHOTREXATE

Absolute Requirements

- Hemodynamic stability
- No evidence of acute intra-abdominal bleeding
- Reliable commitment to comply with required
- Follow-up care

Preferable Requirements

- Absent or mild pain
- Serum beta hCG level less than 10,000 IU/L (*best results seen with hCG < 2000 IU/L*)
- Absent embryonic heart activity
- Ectopic gestational mass less than <3.5 cm in diameter.

MALPRESENTATION, DIFFICULT DELIVERY AND INSTRUMENTATION

163. Ans. (a) 10–15 mm Hg

Ref: Shaw's Gynecology 16th ed. P 93-94

- Laparoscope is a rigid telescope varying in diameter between 4 mm and 10 mm and it is 30 cm long.
- CO₂ machine to create pneumoperitoneum is specially designed for laparoscopy. About 100 mL/min is instilled into the peritoneal cavity, maintaining intraperitoneal pressure **below 15 mm Hg**.
- About 1000 mL is required for adequate pneumoperitoneum.

164. Ans. (d) Uterus surface

Ref: Shaw's Gynecology 16th ed. P 103-104

- Hysteroscopy is a diagnostic and therapeutic modality for the intrauterine pathology.
- It can visualize the OS, cervix, endometrium and their associated pathologies like fibroids, endometrial polyps, endometrial TB, adhesion of septum, *in situ* placed or misplaced IUCD.
- It cannot visualize the outer surface of uterus.
- For the procedure the uterine cavity is distended with CO₂ at the rate of 70 mL/min and pressure less than 100 mm Hg, or with saline, dextrose, hyskon or glycine 1.5%.
- **Types of hysteroscopes:**
 - **Microhysteroscope:** Provides magnification of 30–150 times.
 - **Contact hysteroscope:** A diagnostic tool without distending medium.

Contraindications of Hysteroscopy

- During menstruation, view is obscured and infection rate increases.
- Genital tract infection.

FMGE Solutions Screening Examination

- Pregnancy.
- Scarred uterus and enlarged uterus more than 12 weeks size form relative contraindications.
- Cervical stenosis can cause cervical tear and uterine perforation.
- **Cardiopulmonary disorders:** Due to risk of fluid overload or anesthesia risk.

165. Ans. (c) ECV done after 34 weeks

Ref: DC Dutta 8th ed. P 435

- Breech is the most common malpresentation, with reduced incidence as the age of gestation progresses (20% at 28th week and drops to 5% at 34th week and to 3–4% at term).
- Thus in 3 out of 4, **spontaneous correction into vertex presentation occurs by 34th week.**
- So external cephalic version (ECV) **should not be done before 34 weeks.**
- They are **not** associated with any specific congenital anomaly.
- There are two varieties of breech presentation (see Fig.):
 - Complete
 - Incomplete

Complete (Flexed Breech)

- Thighs are flexed at hips and legs at knees.
- **Presenting part:** Two buttocks, external genitalia and two feet.
- **It is commonly present in multiparae (10%).**

Incomplete: Three varieties are possible:

- **Breech with extended legs (Frank breech):** In this condition, **thighs are flexed on the trunk and legs are extended at the knee joints** (see Fig. A). The presenting part consists of the two buttocks and external genitalia only.
 - **It is commonly present in primigravidae**, about 70% (due to tight abdominal wall and good uterine tone).

FIGURE: Varieties of breech presentation—(A) Breech with extended legs (Frank breech); (B) Flexed breech (Complete breech); (C) Footling presentation

- **Footling presentation (25%):** Both thighs and legs are partially extended bringing the legs to present at brim.
- **Knee presentation:** Thighs are extended but the knees are flexed, bringing the knees down to present at the brim. Footling and knee presentation are not so common.

166. Ans. (a) Acromion

Ref: DC Dutta, 8th ed. pg. 454

- When the long axis of the fetus lies perpendicularly to the maternal spine or centralized uterine axis, it is called transverse lie.
- In transverse lie, acromion is the presenting part/most prominent part upon vaginal examination.

Extra Mile

Presentation	Presenting part
Face	Mentum
Shoulder	Acromion
Breech	Sacrum
Cephalic	Vertex

167. Ans. (b) Mentum

Ref: DC Dutta, 8th ed. pg. 449

- Face is a rare variety of cephalic presentation where the **presenting part** is the face.
- **There is complete extension of the head** so that the occiput is in contact with the back. **The denominator is mentum.**
- Face presentation results most likely from complete extension of deflexed head of a vertex presentation.

Note: Most common fetal cause of face presentation is anencephaly.

168. Ans. (b) Caesarean section

Ref: DC Dutta 8th ed./441–42, Williams 22/e/571

- Because Breech presentation with footling has very high incidence of cord prolapse, delivery by caesarean section is recommended in these patients.

Indication of C.S in breech are:

- Big baby (Wt > 3.5 kg.)
- Hyperextension of head (stargazing fetus)
- **Footling presentation (risk of cord prolapse)**
- Suspected pelvic contraction
- Severe IUGR

169. Ans. (b) Head with hand

Ref: DC Dutta, 7th ed. pg. 397

COMPOUND PRESENTATION

When a cephalic presentation is complicated by the presence of:

- A hand or a foot or both alongside the head or
- Presence of one or both hands by the side of the breech, it is called compound presentation.
- **The commonest one being the head with hand**
- *Rarest one being the presence of head, hand and a foot.*
- The incidence is about 1 in 600.

Causes of Compound Presentation

- Prematurity (commonest),
- Contracted pelvis
- Pelvic tumors
- Multiple pregnancy
- Macerated fetus
- High head with premature or early rupture of the membranes.

170. Ans. (b) **Partial extension**

Ref: William's Obstetrics, 23rd ed. Ch 17

CEPHALIC PRESENTATIONS

Vertex presentation

Complete flexion
Brow presentation

Poor flexion
(extension)

Military presentation

Moderate flexion
Face presentation

Full extension

- In cephalic presentation, the fetal head may assume a position between these extremes:

- **Vertex presentation:** Head is flexed sharply so that the chin is in contact with the thorax. The occipital fontanel is the presenting part, and this presentation is referred to as a *vertex* or *occiput presentation*.
- **Sinciput/Military presentation:** Partially flexed head in some cases, with the anterior (large) fontanel, or bregma, as presenting.
- **Brow presentation:** head is partially extended (see Fig).
- These two presentations (sinciput and brow) are usually transient. As labor progresses, sinciput and brow presentations almost always convert into vertex or face presentations by neck flexion or extension, respectively.
- **Face presentation:** Much less commonly, the fetal neck may be sharply extended so that the occiput and back come in contact, and the face is foremost in the birth canal, giving it the *face presentation*.

171. Ans. (a) **Face presentation**

Ref: DC Dutta 8th ed./449, Dutta's Obstetrics P 392

ABNORMAL PRESENTATIONS

Face

Brow

Breech

Shoulder

FMGE Solutions Screening Examination

920

FACE PRESENTATION

- Seen in 0.5% of cases.
- With this presentation, the head is hyperextended so that the occiput is in contact with the fetal back, and the chin (mentum) is presenting.
- The fetal face may present with the chin (mentum) anteriorly or posteriorly, relative to the maternal symphysis pubis

Etiology

- Causes of face presentations are numerous and include conditions that favor extension or prevent head flexion:
 - Preterm infants
 - Anencephalic fetuses naturally present by the face
 - In contracted pelvis or large fetuses
 - High parity is a predisposing factor to face presentation

172. Ans. (a) Polyhydramnios is a cause

Ref: William's Obstetrics 23rd ed. Ch 20, Abnormal Labor

- For this question, most of the students usually go for 'D' shoulder dystocia is a threat for this condition. But remember one thing that shoulder dystocia usually results in longitudinal lie, where head of the baby is born and rest of the body below neck is stuck. It occurs can be secondary to contracted pelvis, macrosomic baby etc.
- This is a clear case of transverse lie (as seen in image).

TRANSVERSE LIE

- Transverse lie is seen in 0.3% of the cases.
- In this position, the long axis of the fetus is approximately perpendicular to that of the mother.
- In a transverse lie, the shoulder is usually positioned over the pelvic inlet. The head occupies one iliac fossa, and the breech the other (as seen in question).
- This creates a *shoulder presentation* in which the side of the mother on which the acromion rests determines the designation of the lie as right or left acromial.

Etiology

- Women with four or more deliveries have a 10-fold incidence of transverse lie compared with nulliparas.
- **Common causes of transverse lie include:**
 - Abdominal wall relaxation from high parity
 - Preterm fetus
 - **Placenta previa** (NOT abruption placentae)
 - Abnormal uterine anatomy
 - **Hydramnios, and**
 - Contracted pelvis.

Diagnosis

- A transverse lie is usually recognized easily, often by inspection alone.
- The abdomen is unusually wide, whereas the uterine fundus extends to only slightly above the umbilicus

Management: Active labor in a woman with a transverse lie is usually an indication for cesarean delivery.

173. Ans. (a) Amniocentesis

Ref: DC Dutta, 8th ed. pg. 248-50

174. Ans. (b) Previous CS of more than 2

Ref: Dutta's Obstetrics, 7th ed. pg. 330

Recommendations of American college of obstetricians & Gynecologists (ACOG) for vaginal birth after cesarian delivery (VBAC):

Indications

- **No more than 1 previous lower segment transverse scar**
- Availability of anesthesia and personnel for emergency cesarean delivery.
- Clinically adequate pelvis
- No history of previous uterine rupture or other uterine scars.
- Availability of physician throughout active labor.

Contraindications

- Prior classical or T-shaped uterine incision.
- Previous 2 or more LSCS
- History of uterine rupture.
- Medical or obstetrical complications that preclude vaginal birth. Ex: pre-eclampsia, placenta previa, malpresentation etc.
- Limited resources for emergency CS. Ex: lack of surgeon, anesthesia, or nursing staff.

175. Ans. (c) Transverse lie of second fetus in a twin pregnancy

Ref: DC Dutta, 7th ed. pg. 585

- In other words, this question actually asking about condition where ICV can be performed.
- **The only indication of ICV is the transverse lie in case of the second baby of twins.**
- **INTERNAL VERSION:** is always a podalic version and is almost always completed with the extraction of the fetus.
 - It is most commonly employed for the delivery of a second twin after the vaginal birth of the first.
- **CONDITIONS for ICV**
 - The cervix must be fully dilated
 - Amniotic fluid must be adequate for intrauterine fetal manipulation
 - Alive fetus.
- **CONTRAINDICATIONS:** it must not be attempted in neglected obstructed labor even if the baby is living.

176. Ans. (d) PIH

Ref: DC Dutta, 7th ed. pg. 379-380 and 583

- External Cephalic version is done to bring the favorable cephalic pole in the lower pole of the uterus.
- **INDICATIONS of ECV:**
 - Breech presentation
 - Transverse lie

- **Benefits of ECV:**

- Reduces maternal morbidity due to caesarean or vaginal breech delivery
- Reduces the incidence of breech presentation at term.
- Reduces the number of caesarean delivery
- The success rate of external version is about 60%

- **CONTRAINDICATIONS OF ECV**

- Multiple pregnancy
- Previous caesarean delivery
- Antepartum hemorrhage
- Fetal causes like hyperextension of the head, dead or large fetus (> 3.5kg).
- Ruptured membranes
- Known congenital malformation of the uterus
- Contracted pelvis
- *Obstetric complications like Severe pre-eclampsia, obesity, Elderly primigravida, Bad obstetric History (BOH).*

Note: Breech with extended legs is not a contraindication for external version.

177. Ans. (d) Hydramnios

Ref: DC Dutta, 7th ed. pg. 379-380 and 583

- It's asking here about condition where ECV can be performed.
- Hydramnios always helps in bringing the favorable cephalic pole in the lower pole of the uterus.
- Please refer to the previous Explanation.

178. Ans. (c) Fetus is at station + 2

Ref: DC Dutta, 7th ed. pg. 573

TABLE: Classification for operative vaginal (forceps /ventouse) delivery (ACOG-2000)

Procedure	Criteria
Outlet	Scalp is visible at the introitus without separating the labia. Fetal skull at the level of the pelvic floor or on the perineum. Sagittal suture is in direct AP diameter or in the right or left occiput anterior or posterior position.
Low	Leading point of the fetal skull (station) is at +2 cm or more but has not yet reached the pelvic floor. Rotation is <45 degree Rotation is >45 degree
Mid	Fetal head is engaged. Head is 1/5 palpable per abdomen but presenting part is above +2 cm station.
High	Head is not engaged. <i>This type is not included in classification</i>

DISEASES DURING PREGNANCY

179. Ans. (c) Parvovirus B19

Ref: DC Dutta 9th ed. P 200, 313

- Hydrops fetalis is the most serious form of Rh hemolytic disease
- Hemolysis produces → severe anemia → Damage to liver → leading to hypoproteinemia → Causing generalized edema/Hydrops fetalis, ascites and hydrothorax.
- Hydrops fetalis is due to:
 - Rh immunization
 - Non-immune hydrops
 - Cardiothoracic anomalies
 - Fetal cirrhosis and
 - Fetal infections with TORCH and Parvovirus B19 infection.
- Incidence is 13 times higher in Rh +ve males
- **USG:** Budha position (with halo around head due to edematous scalp)
- To counter the adversity of hypoxia due to hemolysis there is **Hyperplasia of placental tissue** as well.
- Cause of fetal death: **Cardiac failure**

180. Ans. (b) 140

Ref: DC Dutta 9th ed. P 263

- As a screening method for high risk pregnant patients, 50 gram oral glucose challenge test is done regardless of meal or time of the day.
- Done between 24 and 28 weeks of pregnancy
- A plasma glucose value of 140 mg% at 1 hour is considered as a cut-off point

Extra Mile

TABLE: Criteria for diagnosis of GDM with 100 gm oral glucose (O'Sullivan and Mahan modified by Carpenter and Coustan) and national diabetes data group

GTT: Venous Plasma (mg/dL)		
Time	Carpenter & Coustan	NDDG
Fasting	95	105
1 hour	180	190
2 hours	155	165
3 hours	140	145
GDM is diagnosed when any two values are met or elevated		

TABLE: Criteria for diagnosis of impaired glucose tolerance and diabetes with 75 gm oral glucose (American Diabetes Association)

Time	Normal Tolerance	Impaired Glucose Tolerance	Diabetes
Fasting	<100	≥100 and <126	≥126
2 hours post: glucose	<140	≥140 and < 200	≥200

FMGE Solutions Screening Examination

181. Ans. (c) 46 XX both paternal origin

Ref: DC Dutta 9th ed. P 181

- Complete mole commonly has 46XX karyotype (in 85%), the molar chromosome are derived entirely from the father.
 - Less commonly the chromosomal pattern may be 46Xy or 45X
- An empty ovum is fertilized by a haploid sperm, which duplicates its own chromosome after meiosis → Phenomenon called **Androgenesis**.
- Complete mole shows paternal: maternal ratio of 2:0, whereas partial mole shows 2:1 ratio.

TABLE: Important features of complete and partial moles

Features	Complete Mole	Partial Mole
Embryo/Fetus	Absent	Present
Hydropic degeneration of villi	Pronounced and diffused	Variable and focal
Trophoblast hyperplasia	Diffuse	Focal
Uterine size	More than the date (30-60%)	Less than the date
Theca lutein cysts	Common (25-50%)	Uncommon
Karyotype	46, KX (85%), Paternal in origin	Triploid (90%), diploid (10%)
β-hCG	High (>50,000)	Slight elevation (<50,000)
Classic clinical symptoms	Common	Rare
Risk of persistent GTN	20%	<5%
Immunostaining (p57 ^{KF2})	Negative	Positive

182. Ans. (b) Thiopentone sodium

Ref: DC Dutta, 8th ed. pg. 270

- During pregnancy when fits are multiple, recurring at varying intervals **in quick succession, it is called status eclampticus**.

Treatment of status eclampticus

- Thiopentone sodium 0.5 g** dissolved in 20 mL of 5% dextrose is given intravenously very slowly.
- If the procedure fails**, use of complete anesthesia, muscle relaxant and assisted ventilation may be employed.
- In unresponsive cases**, cesarean section in ideal surroundings may be a lifesaving attempt.

183. Ans. (a) Mannitol

Ref: DC Dutta, 8th ed. pg. 275

- A deeply unconscious patient with raised intracranial pressure needs steroid and/or diuretic therapy.
- DOC for eclampsia: MgSO₄.

184. Ans. (b) Heart disease

Ref: DC Dutta, 8th ed. pg. 256

- Pre-eclampsia** is a multisystem disorder of unknown etiology characterized by development of hypertension to the extent of **140/90 mm Hg** or more with proteinuria after the 20th week in a previously normotensive and non-proteinuric woman.
- The incidence in primigravidae is about 10% and in multigravidae 5%.

Etiopathogenesis of Pre-eclampsia

- Hypertension:** The underlying basic pathology is **endothelial dysfunction** and intense **vasospasm**, affecting almost all the vessels, particularly those of uterus, kidney, placental bed and brain. The basic underlying pathology remains as **endothelial dysfunction** and **vasospasm**.

Risk Factors for Pre-eclampsia

- Primigravida: Young or elderly (first time exposure to chorionic villi)
- Family history: Hypertension, preeclampsia
- Placental abnormalities:
 - Hyperplacentosis: Excessive exposure to chorionic villi-(molar pregnancy twins, diabetes
 - Placental Ischemia)
- Obesity: BMI > 35 kg/m², insulin resistance
- Pre-existing vascular disease
- New paternity
- Thrombophilias [antiphospholipid syndrome, protein C, S deficiency, Factor V leiden]

185. Ans. (a) Nifedipine

Ref: KDT, 6th ed. pg. 323

- Nifedipine is a calcium channel blocker which is used as an alternative drug for premature labor.
- Influx of calcium ions play an important role in uterine contractions. CCB's reduce tone of myometrium and oppose contractions.
- These drugs especially Nifedipine can postpone labor only if started early enough.
- In emergency situation, Ritodrine (β₂ selective agonist) is considered as the drug of choice to suppress preterm labor.

Extra Mile

- **Drug of choice for hypertension in pregnancy:** LABETALOL
- **Drug of choice for epilepsy in pregnancy-** LAMOTRIGINE

186. Ans. (d) **Labetalol**

Ref: Dutta Obs, 7th ed. 228, William Obs, 22nd ed. pg. 728

187. Ans. (b) **ACE inhibitors**

Ref: KDT, 6th ed. 553; Williams, 24th ed, pg. 1025

- ACE's are the drugs which inhibit the conversion of angiotensin-I to angiotensin-II. They can cause severe fetal malformations when given in the second and third trimesters.
- **These include:** Hypocalvaria and renal dysfunction and are also teratogenic and because of this, they are not recommended during pregnancy
- **Angiotensin-receptor blockers act in a similar manner.** But, instead of blocking the production of angiotensin-II, they inhibit binding to its receptor. *They are presumed to have the same fetal effects as ACE inhibitors and thus are also contraindicated.*

Antihypertensive to be avoided during pregnancy	Antihypertensive safer during pregnancy
<ul style="list-style-type: none"> • ACE inhibitors (Ex- captopril, enalapril etc.) • Angiotensin antagonist (losartan, telmesartan) • Thiazide diuretics (Ex- hydrochlorthiazide) • Furosemide • Propanolol • Nitroprusside 	<ul style="list-style-type: none"> • Hydralazine • Methyldopa • Atenolol • Metoprolol • Labetalol- DOC • Nifedipine • Prazosin and Clonidine

Drugs and their respective risk

- **Diuretics:** Tend to reduce blood volume; increase risk of placental infarcts, fetal wastage, stillbirth.
- **ACE inhibitors, AT1 antagonists:** growth retardation and fetal damage risk.
- **Propanolol:** Causes low birth weight, neonatal hypoglycemia and bradycardia.
- **Nitroprusside:** Contraindicated in eclampsia.

188. Ans. (a) **Angiotensin receptor blockers**

Ref: KDT 6th ed. pg. 553

Please refer to above explanation.

189. Ans. (a) **Folic acid supplementation**

Ref: DC Dutta, 8th ed. pg. 585

- Use of anti- epileptic drugs like phenytoin, valproate and even phenobarbitone has been shown in pregnancy to contribute to acquire folic acid deficiency.

- If a lady is deficient in folic acid at the time of her pregnancy, then the baby most likely will born with neural tube defect.
- Traditionally we study that folic acid should be taken peri-conceptionally 2 months before and 3 months later to pregnant status at dose of 400 micrograms.
- However with the use of anti-epileptics drugs like phenytoin, valproate etc. the dose of folic acid needs to be supplemented at a dose of 4 mg once per day.

190. Ans. (c) **MRI**

Ref: William's Gyne, chapter 12- Breast Diseases; Breast CA screening

MAGNETIC RESONANCE IMAGING

- This screening option has recently been evaluated among genetically high-risk women. It is particularly attractive in this group of women, who develop breast cancer at a rate of 2 percent per year between the ages of **25 and 50**, a time during which mammography sensitivity is reduced by dense breast tissue.
- **In general, MR imaging shows higher sensitivity and specificity than mammography.**
- *In the case given, patient is a 42 year primigravida, which in-itself is at high risk of developing congenital anomaly. By giving tests like mammography, condition can be worsened. Hence MRI is considered as the best modality of screening. Also it has higher sensitivity and specificity than other given tests.*

SCREENING MAMMOGRAPHY

- Considered as screening IOC.
- This radiographic test is currently the best available and most thoroughly validated breast cancer screening test available.
- At this time, it is generally accepted that for women aged 50 to 69 years, screening mammography reduces breast cancer mortality.

Screening Sonography: This modality identifies mammographically occult breast cancer in less than 1 percent of women.

191. Ans. (a) **Bile acid**

Ref: William's 23rd ed. Ch 50, Hepatic GB and pancreatic disorders; Intrahepatic cholestasis of Pregnancy

INTRAHEPATIC CHOLESTASIS OF PREGNANCY

- This disorder also has been referred to as recurrent jaundice of pregnancy, cholestatic hepatosis, and icterus gravidarum.
- It is characterized clinically by pruritus, icterus, or both.

**Pathogenesis**

- The cause of obstetrical cholestasis is unknown, but it probably occurs in genetically susceptible women.
- Whatever the inciting cause(s), bile acids are cleared incompletely and accumulate in plasma. *Of note, total bile acid concentration may already be elevated 10- to 100-fold in normal pregnancy.*
- Even *before* bile acid levels increase, associated dyslipidemia is apparent
- Total cholesterol levels are significantly higher compared with those of normal pregnancy, and *low-density lipoprotein (LDL) cholesterol levels become elevated earliest.*
- **Hyperbilirubinemia** results from retention of conjugated pigment, but total plasma concentrations rarely exceed 4 to 5 mg/dL.
- **Alkaline phosphatase** is usually elevated even more so than in normal pregnancy.
- **Serum transaminase** levels are normal to moderately elevated but seldom exceed 250 U/L
- Liver biopsy shows mild cholestasis with bile plugs in the hepatocytes and canaliculi of the centrilobular regions, but without inflammation or necrosis.

Note: These changes disappear after delivery but often recur in subsequent pregnancies or with estrogen-containing contraceptives.

192. Ans. (c) Placenta previa

Ref: Willaims, 24th ed. pg. 827

- Disseminated intravascular coagulation (DIC) aka consumptive coagulopathy is a pathologic disruption of the finely-balanced process of hemostasis.
- Massive activation of the clotting cascade results in widespread thrombosis, *which leads to depletion of platelets and coagulation factors and excessive thrombolysis, because all the clotting factors and platelets are consumed in intravascular coagulation.* The end result is multiorgan failure and hemorrhage.
- **Placental Abruption:** is the most common cause of severe consumptive coagulopathy in obstetrics
- **Causes of DIC in pregnancy:**
 - Placental abruption (NOT placenta previa): most common cause.
 - Amnionic-fluid embolism.
 - Sepsis
 - Thrombotic microangiopathies
 - Acute kidney injury
 - Pre- eclampsia and
 - HELLP (Hemolysis, Elevated liver enzyme levels, low Platelet count) syndromes.

193. Ans. (d) Hyponatremia

Ref: DC Dutta's Textbook of Obstetrics, 7th ed. pg. 222

HELLP syndrome is rare complication of pre-eclampsia (10-15%), but can also develop without maternal hypertension.

- **H-Hemolysis (bilirubin >1.2 mg/dl)**
- **EL-Elevated Liver enzyme** (ASL and ALT >70 IU/L), LDH >600 IU/L, Bilirubin (>1.2mg/dl)
- **LP-Low Platelets (1, 00, 000/mm³)**

194. Ans. (c) Fluconazole 150 mg

Ref: Shaws, 15th ed. pg. 352

CANDIDAL (MONILIAL) VAGINITIS

- It is a fungal infection caused by yeast-like microorganisms called Candida or Monilia.
- The commonest species causing human disease is Candida albicans

Clinical Features

- Vulval itching is the most common symptom, accompanied by vaginal irritation, dysuria, or both
- Thick curdy or flaky vaginal discharge.

Diagnosis

- Essentially based on clinical findings. But the diagnosis can be confirmed on microscopic examination of a smear of the vaginal discharge treated with 10% KOH solution.
- Pap smear shows **thick red-stained hyphae and dark red spores.**

Treatment

- **A single dose of fluconazole 150 mg has been found to be very effective.**
- Ideally, both partners should be treated and the underlying predisposing factor corrected to give long-term relief.
- Recurrent infection requires fluconazole orally 150 mg every 72 hours for 3 doses.

195. Ans. (a) Pre-eclampsia

Ref: William's Obstetrics 23rd ed. Ch 34.

GESTATIONAL HYPERTENSION CRITERIA

- Systolic BP >140 or diastolic BP >90 mm Hg for first time during pregnancy
- No proteinuria
- BP returns to normal before 12 weeks postpartum
- Final diagnosis made only postpartum
- May have other signs or symptoms of preeclampsia, for example, epigastric discomfort or thrombocytopenia.

PREECLAMPSIA

- BP >140/90 mm Hg **after 20 weeks'** gestation
- Proteinuria >300 mg/24 hours or >1+ dipstick

Eclampsia: Symptoms of pre-eclampsia + seizures *that cannot be attributed to other causes in a woman with preeclampsia.*

196. Ans. (a) **Diuretics**

Ref: KDT, 6th ed. pg. 553

- Diuretics are contraindicated in preeclampsia as they are teratogenic.

Antihypertensives in Pregnancy

Safe	Contraindicated
Labetalol-DOC	ACE inhibitors
Calcium Channel blockers	
Hydralazine	Diuretics
Alpha methylodopa	Reserpine
Sodium nitroprusside+/-	Loratidine

197. Ans. (d) **MgSO₄**

Ref: DC Dutta, 8th ed. pg. 271, Dutta Obs, 6th ed. pg. 235

Medical Management

- **Seizure treatment**
 - The drug of choice for the control and prevention of convulsions is Pritchard's regimen i.e. magnesium sulphate.

Extra Mile

- DOC in eclampsia – MgSO₄
- 2nd DOC in eclampsia is hydralazine.

198. Ans. (c) **Hospitalization and observation**

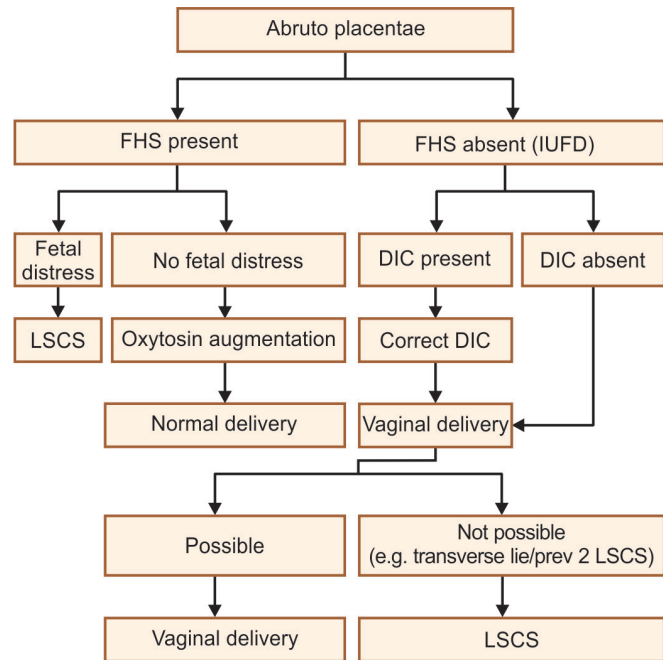

Ref: DC Dutta, 8th ed. pg. 264-65

- Given these options, the best choice is hospitalization and do the observation under supervision conservatively.
- As the AOG is premature, CS or induction of labor can complicate the baby's outcome.

199. Ans. (a) **Presence of fetal cardiac activity**

Ref: DC Dutta, 8th ed. pg. 264

Please follow the flowchart given

200. Ans. (c) **Congenital heart disease**

Ref: Danforth's Obstetrics and Gynecology, 10th ed. pg. 249-250

- In **infant of diabetic mother**, maternal hyperglycemia causes fetal hyperglycemia. In response of that, there is fetal β cell hyperplasia, which secretes enough insulin to counteract excess insulin coming from mother. This excess glucose causes glycogen and fat deposition leading to fetal macrosomia (20-25%).
- Soon after birth, when the cord is clamped and cut, there is cessation of glucose supply from mother while there is still higher insulin production in neonate, leading to a Hypoglycemia (25-40%).
- **Danforth's OBG states** "Most frequent type of malformation involves central nervous system, cardiovascular system, gastrointestinal, genitourinary, and skeletal anomalies, with **cardiovascular system being the most common**"
- This ventricular wall and septal hypertrophy is thought to be due to glucose toxicity (from mother) and hyperinsulinemic state of the fetus.
- **Other fetal complications:**
 - Neonatal hyperbilirubinemia: 20-25%
 - Myocardial and septal hypertrophy: 10%
 - Congenital sacral agenesis: ~1%

**201. Ans. (a) Propylthiouracil***Ref: DC Dutta 7th ed. pg. 287; Harrison's 19th ed. pg. 2297*

- For the hyperthyroidism during pregnancy the mainstay of treatment in 1st trimester is PTU or methimazole.
- Methimazole is preferable avoided during first trimester of pregnancy if PTU is available.
- Methimazole and carbimazole is avoided due to fetal aplasia cutis and other defects such as choanal atresia.
- Because of its rare association with hepatotoxicity, propylthiouracil should be limited to the first trimester and then maternal therapy should be converted to methimazole (or carbimazole).

FETAL GROWTH AND DEVELOPMENT**202. Ans. (b) CRL***Ref: DC Dutta 8th ed. P 81, 84*

- Assessment of age of gestation can also be done by first day of last menstrual period. It is greater than the postconception (fertilization) age by 2 weeks.
- The length is more reliable criterion than the weight to calculate the age of the fetus.
- In the **first trimester**, CRL (mm) + 6.5 = gestational age in weeks.
- **Best fetal parameter to find out AOG in 1st trimester:** CRL (Crown rump length). Variation \pm 5 days.
- **Best fetal parameter to find out AOG in 2nd trimester:** BPD (Biparietal diameter). Most accurate when done between 12 and 20 weeks.
- **Best fetal parameter to find out AOG in 3rd trimester:** Femur length. Less reliable, variation \pm 16 days.

203. Ans. (a) 11 weeks*Ref: DC Dutta, 8th ed. pg. 48*

Dutta states: "Breathing movements are identified by 11 weeks but are irregular until 20th week. Their frequency varies from 30–70 per minute and is dependent on the maternal blood sugar concentration."

204. Ans. (a) Straight into mother's blood by simple diffusion*Ref: DC Dutta, 8th ed. pg. 41*

Mechanisms involved in the transfer of substances across the placenta are:

- **Respiratory function:** Although the fetal respiratory movements are observed as early as 11 weeks, there is no gaseous exchange. Intake of oxygen and output of carbon dioxide take place by **simple diffusion** across the fetal membrane.

- **Excretory function:** Waste products from the fetus such as urea, uric acid, and creatinine are excreted in the maternal blood by **simple diffusion**.
- **Nutritive function:**
 - **Glucose**, the principal source of energy is transferred to the fetus by **facilitated diffusion**.
 - **Amino acids** are transferred by active transport
 - **Lipids, triglycerides and fatty acids** are transferred from mother and synthesized in fetus as well.
 - **Water and electrolytes** such as sodium, potassium and chloride cross through the fetal membrane by simple diffusion, whereas calcium, phosphorus and iron cross by **active transport**.
 - **Hormones:** Insulin, steroids from the adrenals, thyroid, chorionic gonadotropin or placental lactogen cross the placenta at a very slow rate.

- **Neither parathormone nor calcitonin cross the placenta.**

205. Ans. (a) Liver*Ref: DC Dutta, 8th ed. pg. 47; PubMed*

- Hematopoiesis is **first started in the yolk sac** by 14th day.
- **By 10th week, the liver becomes the major site.** The great enlargement of the early fetal liver is due to its erythropoietic function. Gradually, the red cell production sites extend to the spleen and bone marrow
- Near term, the bone marrow becomes the major site of red cell production.
- During the first half, the hemoglobin is of fetal type (α -2, γ -2) but from 24 weeks onwards, adult type of hemoglobin (α -2, β -2) **appears and at term about 75–80% of the total hemoglobin is of fetal type (HbF).**

206. Ans. (a) Umbilical artery*Ref: DC Dutta, 8th ed. pg. 36*

- Deoxygenated blood from fetus to mother is carried via umbilical artery.
- Oxygenated blood is via umbilical vein.

207. Ans. (a) 6–7 weeks*Ref: DC Dutta, 8th ed. pg. 734*

- Cardiac activity be assessed at the earliest by trans-vaginal scan by 5 weeks
- Cardiac activity be assessed by trans-abdominal scan by 6 weeks
- Fetal heart sound can be assessed by Doppler- 10 weeks
- Fetal heart sound can be assessed by stethoscope-18 weeks

208. Ans. (a) 7 cm

Ref: DC Dutta 7th ed./41; William's Obstetrics 22nd ed./91

- To determine the length of the fetus, the measurement is commonly taken from the vertex to the coccyx (crown-rump length) in earlier weeks of gestation.
 - By the end of the 12th week of pregnancy, when the uterus usually is just palpable above the symphysis pubis, the crown-rump length of the fetus is 6 to 7 cm.
 - At 16th week, CRL: 12 cm and the weight is about 110 gm.
 - At 28th week, CRL: 25 cm and the weight is about 1100 gm.
 - At 32nd week, CRL: 28 cm and the weight is about 1800 gm.
 - At 36th weeks, CRL: 32 cm and the weight is about 2500 gm.
- From the end of 20th week onwards, the measurement is taken from the vertex to the heel (crown-heel length).

Extra Mile

- Best fetal parameter to find out AOG in 1st trimester: CRL (Crown Rump length)
- Best fetal parameter to find out AOG in 2nd trimester: BPD (Biparietal diameter)
- Best fetal parameter to find out AOG in 3rd trimester: Femur Length.

209. Ans. (a) 60 mm

Ref: DC Dutta 7th ed./41; William's Obstetrics 22nd ed. pg. 91

- By the end of the 12th week of pregnancy, when the uterus usually is just palpable above the symphysis pubis, the crown-rump length of the fetus is 6 to 7 cm i.e. 60 to 70 mm.
- Please refer to above explanation for more details.

210. Ans. (a) 4-16 weeks

Ref: Dutta's Obstetrics, 7th ed. pg. 647

RADIATION HAZARDS

- Teratogenicity:** Diagnostic range of radiation exposure (<5 Rads) is not associated with any congenital malformation.
- Oncogenicity:** Dividing cells particularly in **first trimester** are more sensitive to injury from radiation. Diagnostic radiation with fetal exposure is associated with an increased risk of malignancy.
- Genetic damage and intrauterine death**

NOTE: radiation during early stage of pregnancy can damage the embryo. This risk can be minimized by using the "10 day rule". This rule states that: "No women should be exposed to X-Ray for a non-urgent indication outside 10 days from her last period during reproductive period"

211. Ans. (b) Megaloblastic anemia

Ref: Dutta's Obstetrics, 7th ed. pg. 268-69

- This is a bit confusing question though. But if we read the question carefully it is asking the outcome of combined vit B12 and folate deficiency, which is Megaloblastic anemia according to the question.
- Neural tube defect is due to deficiency of folic acid (Vit B9).
- Abruption placentae can be secondary to Vit B12 deficiency.

INTRAUTERINE FETAL DEATH

212. Ans. (b) Obstructed labor

Ref: D.C Dutta, 7th ed. pg. 322-323

INTERAUTERINE FETAL DEATH (IUD)

- All fetal deaths weighing 500 gram or more occurring during pregnancy (antepartum death) or during labor (intrapartum).
- It is least likely caused by maternal factors like prolonged or obstructed labor, or due to uterine rupture.
- IUFD most commonly caused by fetal factors like Rh incompatibility, chromosomal abnormalities etc.

Causes of IUD

MATERNAL: 5-10% <ul style="list-style-type: none"> Hypertensive disorder in pregnancy Diabetes in pregnancy Anti-phospholipid syndrome Thrombophilias Abnormal labor: Prolonged or obstructed labor, ruptured uterus Post term pregnancy Lupus Erythematosus 	FETAL: 25-40% <ul style="list-style-type: none"> Chromosomal abnormalities Rh-incompatibility Non immune hydrops Growth restriction
PLACENTAL: 20-35% <ul style="list-style-type: none"> Antepartum haemorrhage Cord accident TTTS Placental insufficiency 	IATROGENIC <ul style="list-style-type: none"> External cephalic version Drugs
	IDIOPATHIC: 25-35%

213. Ans. (b) Robert's sign

Ref: Dutta's Obstetrics, 7th ed. pg. 324

- Robert's sign** refers to the presence of a gas shadow within the heart or the greater vessels, in cases of fetal death.
 - It is a rare sign caused by postmortem blood degeneration, usually seen 1-2 days after death

- **Spalding sign:** Overlapping of skull bone. *Also a sign of fetal demise.*
- **Goodell's sign:** Softening of the vaginal part of the cervix during the first trimester
- **Von Braun-Fernwald's sign:** Softening of the uterine fundus at the site of implantation at 4–5 weeks gestation.
- **Osiander sign:** Increased pulsation at lateral fornices of vagina seen at ~8th week of pregnancy.

Extra Mile

Robert Pelvis: aka transversely contracted pelvis. Ala of both the sides are absent and sacrum is fused with innominate bones.

214. Ans. (a) **Cord prolapsed**

Ref: Dutta's Obstetrics, 7th ed. pg. 398

- Most common cause of intrapartum fetal death is cord prolapsed. Overall perinatal mortality is 15–50%.
- In other cases like abruption, Eclampsia, there are chances that we can terminate the pregnancy via emergency CS. But once there is cord prolapsed, there is sudden hypoxia to fetus leading to death.

215. Ans. (d) **Ectopic pregnancy**

Ref: DC Dutta, 8th ed. pg. 204, 216, 228, 486, 588

- DOC for ectopic pregnancy → Methotrexate

MISCELLANEOUS

216. Ans. (c) **It has 4 to 6 lobes**

Ref: William's obstetrics, 23rd ed. Implantation, Embryogenesis and Placental development

PLACENTAL GROWTH

- In the first trimester, placental growth is more rapid than that of the fetus.
- By approximately 17th weeks period of gestation, placental and fetal weights are approximately equal.
- By term, placental weight is approximately one sixth of fetal weight.

- The average placenta at term is 185 mm in diameter and 23 mm in thickness, **with a volume of 497 mL and a weight of 508 g.** These measurements vary widely.
- From the maternal surface, the number of slightly elevated convex areas, **called lobes, varies from 10 to 38.**
- Lobes are incompletely separated by grooves of variable depth that overlie *placental septa*, which arise from folding of the basal plate.
- Although grossly visible lobes are commonly referred to as cotyledons.
- **The total number of placental lobes remains the same throughout gestation**, and individual lobes continue to grow—although less actively in the final weeks.

217. Ans. (c) **FSH**

Ref: D.C Dutta, 6th ed. pg. 56

- There is a significant fall in the level of serum estradiol from 50–300 pg/ml before menopause to 10–20 pg/ml after menopause
- This decrease the negative feedback effect on hypothalamic-pituitary axis resulting in increase in FSH.
- The increase in FSH is also due to diminished inhibin.

218. Ans. (c) **Chloramphenicol**

Ref: DC Dutta, 8th ed. pg. 587–89

- Chloramphenicol causes grey baby syndrome due to bone marrow suppression.

Antibiotics which are safe in pregnancy-

- Cephalosporin
- Penicillin
- Erythromycin or macrolide group

219. Ans. (b) **IgG**

Ref: Robbin's, 9th ed. pg. 198–199

220. Ans. (c) **3 months**

Ref: DC Dutta, 8th ed. pg. 735

221. Ans. (c) **300 µg**

Ref: DC Dutta, 8th ed. pg. 387, 721

GYNECOLOGY

ANATOMY, MENARCHE AND MENOPAUSE

222. (d) **Increased FSH, decreased estrogen**

Ref: Shaw, 16th ed. pg. 66 – 67

- Menopause is a retrospective diagnosis as it takes 12 months of amenorrhoea to confirm that menopause has set in.

- Menopause normally occurs between the ages of **45 and 50 years**, the **average age being 47 years.**
- At the time of menopause there is cessation of ovarian activity and a fall in the oestrogen and inhibin levels → cause a rebound increase in the secretion of FSH and LH by the anterior pituitary gland.
- The FSH level may rise as much as 50-fold and LH 3–4 folds.

- There is 50% reduction in androgen production and 66% reduction in oestrogen at menopause
 - There is a significant fall in the level of serum estradiol from 50–300 pg/ml before menopause to 10–20 pg/ml after menopause

Extra Mile

Prediction of approaching menopause:

- A fall in the level of inhibin B (not inhibin A) causes a rise in follicle-stimulating hormone (FSH) level.
- A fall in the level of anti-müllerian hormone suggests low ovarian reserve and low antral follicular count.
- Rise of FSH level more than normal luteinizing hormone (LH) level.

223. Ans. (c) 14

Ref: DC Dutta 7th ed. P 371

- The normal upper limit of menarche is 15 years.
- According to recent recommendation, primary amenorrhea is defined as:
 - Absence of menses by 14 years of age in absence of sexual characters.
 - Absence of menses by 16 years of age regardless of presence of secondary sexual characteristics.

224. Ans. (a) Pelvic irradiation

Ref: DC Dutta 7th ed. P 376

- Secondary amenorrhea is defined as: “absence of menstruation for 6 months or more in a woman in whom normal menstruation has been established”
- **Book states:** “Amenorrhea in a woman with reproductive age should be considered as pregnancy unless proved otherwise”. Therefore, pregnancy is considered as most common cause of amenorrhea in a woman of reproductive age.
- **Note:** Amenorrhea is physiological before puberty, during pregnancy and lactation and following menopause.
- **The most common cause of secondary amenorrhea** (pathological) is hypothalamic dysfunction. Pelvic irradiation is one of the causes of hypothalamic dysfunction.
 - Kallmann syndrome and imperforate hymen are usually associated with primary amenorrhea.
 - Diabetes and hypothyroidism is the systemic cause of secondary amenorrhea.
- **MCC of cryptomenorrhea** is imperforate hymen.
- **MCC of primary amenorrhea** is gonadal failure, abnormal chromosomal pattern, developmental defect of genital tract and disturbed action of HPO axis.

225. Ans. (d) Anti-müllerian hormone

Ref: Shaw's Gynecology 16th ed, P 65–66, 260

Test for ovarian reserve is indicated in:

- Women >35 years of age, smokers, presence of only one ovary and unexplained infertility.
- It involves standard day 3 FSH estimation, along with administration of 100 mg CC from day 5 to day 9, repeat FSH on day 10. FSH values must be the same as on day 3 of the cycle.

Prediction of approaching menopause:

- A fall in the level of inhibin B (not inhibin A) causes a rise in follicle-stimulating hormone (FSH) level.
- A fall in the level of anti-müllerian hormone suggests low ovarian reserve and low antral follicular count.
- Rise of FSH level more than normal luteinizing hormone (LH) level.

Anti-müllerian Hormone (AMH)

- AMH is a peptide secreted by the sertoli cells in the testis and granulosa cells in the ovary.
- During intrauterine life AMH inhibits the development of müllerian system in males. Absence of AMH results in hermaphrodite.
- In the female it helps in the follicular development and oocyte maturation.
 - Normal value is 2–6.8 ng/mL
 - **Poor ovarian reserve:** 1 ng/mL
 - **PCOD and hyperstimulation syndrome:** 0.10 ng/mL
- Estimation of serum AMH is used in the study of ovarian reserve in an infertile woman and a woman with secondary amenorrhea.
- Its level is related to precocious and delayed puberty, infertility and premature menopause.
- Its level is related and reflects the number of growing follicles.

226. Ans. (b) Class II

Ref: Shaw's 16th ed. P 118

American fertility society classification system classified müllerian malformations into 6 classes:

- **Class I (agenesis, hypoplasia).** Uterus is absent in total agenesis. Partial agenesis is identified as unicornuate uterus. In hypoplasia, the endometrial cavity is small with reduced intercornual distance of less than 2 cm.
- **Class II (unicornuate uterus)** appears **banana-shaped** without the rounded fundus and triangular-shaped uterine cavity. If present, rudimentary horn presents as a soft tissue mass with similar myometrial echogenicity. Obstruction in the rudimentary horn is recognized as haematometra on one side.
- **Class III (uterus didelphys).** The two horns are widely separated, but vaginal septum is difficult to identify.

FMGE Solutions Screening Examination

- **Class IV (bicornuate uterus)** shows two uterine cavities, with concave fundus, with fundal cleft greater than 1 cm, and this differentiates between the bicornuate and the septate uterus. The intercornual distance is more than 4 cm.
- **Class V (septate uterus)** shows a convex or flattened fundus. The intercornual distance is normal (<4 cm) and each cavity is small.
- **Class VI (arcuate uterus)** with no fundus is of no clinical importance.

227. Ans. (b) **Growth of breast**

Ref: Shaw, 16th ed. pg. 56

Thelarche

- The first sign of puberty is the development of the breasts. Breast budding usually appears between the ages of 9–11 years.
- It is indicative of the competency of the hypothalamic–pituitary–ovarian axis.

228. Ans. (a) **GnRH**

Ref: Shaw, 16th ed. pg. 56

Endocrine mechanisms underlying puberty: These have been highlighted in the following:

- **Early in puberty**, the sensitivity of the gonadostat to the negative effects of low estradiol (E2) gradually decreases.
- **Late in puberty**, maturation of positive E2 feedback initiates the LH surge.
- Basal levels of pituitary gonadotropins **increase throughout puberty** due to enhanced hypothalamic GnRH pulse amplitude rather than frequency.

229. Ans. (b) **45**

Ref: Shaw, 16th ed. pg. 66

- Menopause is defined as the time of cessation of ovarian function resulting in permanent amenorrhoea.
- Menopause is a retrospective diagnosis as it takes 12 months of amenorrhoea to confirm that menopause has set in.
- Menopause normally occurs between the ages of **45 and 50 years**, the **average age being 47 years**.

Extra Mile

- **Climacteric** is the phase of waning ovarian activity, and may begin 2–3 years before menopause and continue for 2–5 years after it. The climacteric is thus a phase of adjustment between the active and inactive ovarian function.
- Menopause setting **before the age of 40** is known as **premature menopause**.
- Menopausal age is NOT related to menarche, race, socioeconomic status, number of pregnancies and lactation, or taking of oral contraceptives.

230. Ans. (c) **Appearance of Secondary sexual...**

Ref: Shaw's, 16th ed. pg. 59

- **Precocious puberty:** This is defined as the appearance of any of the **secondary sexual characteristics before the age of 8 years** or the **occurrence of menarche before the age of 10 years**
- Precocious puberty in females is pubertal changes before the age of 8 years.
- In males it is onset of puberty before the age of 9 years

231. Ans. (a) **Increase FSH**

Ref: Yen and Jaffe's Reproductive Endocrinology, pg. 155

- FSH levels increase with age, before increases in LH or decrease in estradiol and a number of studies have demonstrated an inverse relationship between increase in FSH and decreasing inhibin B in association with reproductive aging."
- **Ref states:** "Reproductive aging is associated with decline in fertility that **begins in third decade**, which accelerates after age 35. A gradual decrease in pool of ovarian follicles which first accelerates around the same age would appear to underlie this decline in fertility. **It is also at age 35 that an increase in FSH is first seen.**"

Extra Mile

- The first evidence of primordial follicle appears at about 20 weeks of fetal life. The fetal ovary contains **7 million primordial follicles** but most degenerate, and the **newborn contains only 2 million follicles**.
- At birth, about 2 million follicles seen are reduced to **400,000 at puberty**;
- **Only 400 follicles are available during the childbearing period for fertilization.**

232. Ans. (c) **Hematocolpos**

Ref: Shaws, 15th ed. pg. 96-98

- **Hematocolpos** is a medical condition in which the vagina fills with menstrual blood. It is often caused by the combination of menstruation with an imperforate hymen.
- **Hematometra:** A related disorder is, where the uterus is filled with menstrual blood.
- **Pyometra:** a type of uterine infection. Disease of the dogs, but has been also noted in humans.
- **Hematosalpinx:** bleeding and collection of blood in fallopian tube. MCC is tubal (ectopic) pregnancy.

INFECTION

233. Ans. (b) Leads to Infertility

Ref: Harrison 20th ed. Page 1319 - 1321

- The chlamydia species are classified mainly into 4 species:
 - C. trachomatis*
 - C. pneumonia*
 - C. psittaci* (separated into 3 species: *C. psittaci*, *C. felis*, *C. abortus*)
 - C. pecorum* (the last species being found in ruminants)

Infections associated with Chlamydia trachomatis

- Trachoma:** *C. trachomatis* (serotype A, B, Ba and C)- can cause ocular infection trachoma and adult inclusion conjunctivitis.
- Oculogenital infections (serotype D – K)**
 - Transmitted during sexual contact or from mother to baby during childbirth. Associated with:
 - Female:** Cervicitis, salpingitis, acute urethral syndrome, endometritis, ectopic pregnancy, infertility, pelvic pain and PID.

* Untreated PID and High levels of antibody to human heat-shock protein have been associated with tubal factor infertility and ectopic pregnancy.

- Males:** Urethritis, proctitis, and epididymitis
- Infants:** Conjunctivitis (inclusion body conjunctivitis) and pneumonia
- LGV (L1, L2, L3)**
 - Characterized by acute lymphadenitis with bubo formation and/or acute hemorrhagic proctitis.

Extra Mile

- C. pneumoniae* is a common cause of human respiratory diseases, such as pneumonia and bronchitis
- It mainly causes atypical pneumonia as seen with mycoplasma pneumonia
- The clinical spectrum of *C. pneumoniae* infection includes acute pharyngitis, sinusitis, bronchitis, and pneumonitis, primarily in young adults

234. Ans. (a) Chlamydia

Ref: Harrison 20th ed. Page 1319 - 1321

Refer to above explanation

Extra Mile

TABLE: Contraindications of gastric lavage

	Symptoms signs	Examination findings	pH	Wet mount
Normal	White floccular or curdy, odorless	Discharge present in dependent portions of vagina	3.8–4.5	Normal
Bacterial vaginosis	Increased white thin discharge, increased odor	Thin whitish gray homogenous discharge sometimes frothy	>4.5 basic	Clue cells >20% shift in flora, amine odor after KOH smear
Candidiasis	Increased white thick discharge, pruritus, dysuria, burning	Thick curdy discharge, vaginal erythema	<4.5 Acidic	Hyphae or spores
Trichomonas	Increased yellow frothy discharge, increased odor, pruritus, dysuria	Yellow frothy discharge with or without vaginal or cervical erythema	>4.5 Basic	Motile trichomonads Increased white cells

235. Ans. (c) Cryosurgery

Ref: Shaw's Gynecology 16th ed. 173-74

- The patient in this case is a case of cervicitis.
- Acute cervicitis:** More commonly secondary to STD (chlamydia trachomatis, gonorrhoea), septic abortion and puerperal sepsis.
- Chronic cervicitis:** More common than acute variant. Usually due to traumatic childbirth, D&C or a sequel of STD.

Clinical features:

- Profuse mucoid vaginal discharge, which can be blood stained
- Postcoital bleeding
- Antepartum haemorrhage
- Low backache, abdominal pain and dyspareunia

Upon examination:

- Cervical erosion
- Erosion takes the form of a reddened area around the external os, with its inner margin continuous with

FMGE Solutions Screening Examination

the endocervical lining and with a well-defined outer margin.

- In chronic cases cervix is fibrosed, bulky with nabothian follicles around the area of erosion
- **Treatment:**
 - **Diathermy cauterization:** Tissues of cervix are coagulated and columnar epithelium is destroyed. It also destroys all infection lying in the depths of the racemose glands and in due course healthy epithelium grows down from the upper part of the cervical canal to cover the raw area.
 - ◆ Require opening of cervical os and anaesthesia
 - **Cryosurgery:** More preferred nowadays. Safer than cautery as it is painless and avoids accidental burn in vagina. Doesn't require anaesthesia
 - ◆ The refrigerants used in cryosurgery are carbon dioxide (-78°C), Freon (-81°C), nitrous oxide (-88°C) and nitrogen (-186°C).
 - ◆ **Disadvantage:** extensive tissue destruction \rightarrow hypokalemia
 - **Laser therapy:** Highly preferred in chronic cervicitis.
 - ◆ Fast healing and accurate/precise excision or burning of tissue
 - **Conization operation:** Preferred if above methods are ineffective or if there is extensive area involved.
 - **Policresulen:** One gram of Policresulen contains 360 mg of protein. It coagulates necrotic, pathologically altered tissue without destroying the healthy tissue.
 - ◆ Contraindicated during pregnancy

- Candidiasis is a fungal infection caused by yeast-like microorganisms called *Candida* or *Monilia*.
- The most common species causing human disease is *Candida albicans*. It can be sexually transmitted.

Risk Factors

- These include promiscuity, immunosuppression, HIV, pregnancy, steroid therapy, following long-term broad-spectrum antibiotic therapy, oral contraception pills, diabetes mellitus, poor personal hygiene and obesity.

Clinical Features

- **Pruritus vulva is the cardinal symptom:** It is often accompanied by vaginal irritation, dysuria, or both, and **passage of thick curdy or flaky discharge**.
- Speculum examination reveals vaginal wall congestion with **curdy discharge** often visible at the vulval mucocutaneous junction and in the posterior fornix.

Diagnosis

- Microscopic examination 10% KOH mount
- Culture on **Sabouraud agar** or **Nickerson's medium** helps to identify *Candida*.
- Pap smear shows thick red-stained hyphae and dark red spores.

Treatment

- **DOC:** Fluconazole 150 mg single dose. Both partners should be treated.
- Local intravaginal application of antifungal agents such as imidazole, miconazole, clotrimazole, butoconazole or terconazole vaginal pessaries or creams used for 3–6 days is very effective.

236. Ans. (a) Hematogenous

Ref: Shaw's Gynecology 16th ed. P 188

- The general distribution of involvement of reproductive organs in cases of genital TB are as follows:
 - **Fallopian tube:** 90–100%
 - **Endometrium:** 50–60%
 - **Ovaries:** 20–30%
 - **Cervix:** 5–15%
 - **Vulva and vagina:** <1%
- The tubal mucosa is the most favorable nidus for **bloodborne** spread of the disease resulting in endosalpingitis—usually bilateral.
- It is the earliest lesion with a propensity for transluminal spread to the ovary and endometrium.
- Hence, fallopian tubes play the central role in the initiation and dissemination of pelvic tuberculosis.
- **Radiological appearance:** Tobacco pouch appearance.

237. Ans. (b) Candida vaginitis

Ref: Shaw's 16th ed. P 164

Extra Mile

- **Trichomoniasis** present with typical discharge, which is profuse, thin, creamy or slightly green in color, irritating and frothy. Itchy tender, angry looking vaginal walls and strawberry vagina.
- **Chlamydia infection** (a STD) is usually asymptomatic but may develop vaginal discharge, dysuria and **increased frequency** of micturition, and at times cervicitis. Sometimes, chlamydia may cause Reiter's syndrome with arthritis, skin lesions, conjunctivitis and genital infection.
- **Gonococcal vulvovaginitis** presents with urinary frequency and dysuria, dyspareunia, rectal discomfort, vaginal discharge. Vulvovaginal/perineal infection often results in inflammation, discharge, irritation causing pruritus and dysuria.

238. Ans. (c) 100.4°F

Ref: DC Dutta 8th ed. P 500

- Puerperal pyrexia is defined as a rise of temperature reaching **100.4°F (38°C)** or more (measured orally) on two separate occasions at 24 hours apart (excluding first 24 hours) within first 10 days following delivery.

Causes of Puerperal Pyrexia

- Puerperal sepsis
- **Urinary tract infections:** Cystitis, pyelonephritis
- Mastitis, breast abscess
- **Wound infections:** CS or episiotomy
- **Pulmonary infections:** Atelectasis, pneumonia
- Septic pelvic thrombophlebitis
- A recrudescence of malaria or pulmonary tuberculosis
- **Others:** Pharyngitis, gastroenteritis

239. Ans. (a) Chlamydia

Ref: Shaw's Gynecology 16th ed. P 181

- Pelvic inflammatory disease is a leading cause of tubal obstruction and the most common associated organism is chlamydia.
- **Shaw's states:** "Chlamydial infection causes more damage to the mucosa and the wall of the tube than gonorrhoea, leading to fibrosis and tubal blockage"
- **Other causes** of tubal obstruction can be: Gonorrheal infection, tuberculosis of uterus and fallopian tube, postoperative

240. Ans. (a) Pregnancy

Ref: Shaw, 16th ed. pg. 177-78, 183

- Pelvic inflammatory disease (PID) implies inflammation of the upper genital tract involving the fallopian tubes as well as the ovaries.
- The most common cause of PID is *sexually transmitted diseases* (STD).
- Gonococcal and chlamydial infections are most common, the incidence of the two varying in different communities. **Chlamydia being the commonest.**

Indications for hospitalization in PID

- The mild cases of acute PID are treated at home with antibiotics.
- Moderate and severe cases of PID need hospitalization.
- Those who need the diagnosis to be confirmed also require to be admitted for investigations.
- Those who need intravenous therapy need admission.

241. Ans. (a) Infertility

Ref: Shaw, 16th ed. pg. 188

- Most common site of genital TB is fallopian tube: 90–100%

Other sites:

- Endometrium: 50–60%
- Ovaries: 20–30%
- Cervix: 5–15%
- Vulva and vagina: 1%

Clinical feature:

- **Infertility:** This is an important presenting symptom. In fact, in 35–60% cases it may be the only complaint for which the patient seeks medical attention.

- **Menstrual irregularity:** This has been observed in 10–40% of cases. The menstrual disturbances reported include menorrhagia, menometrorrhagia, intermenstrual bleeding, oligomenorrhoea, hypomenorrhoea, amenorrhoea and even postmenopausal bleeding.

Chronic pelvic pain:

- Vaginal discharge
- Abdominal mass
- Fistula
- Ectopic pregnancy

242. Ans. (b) >3 infection in a year

Ref: Katz Comprehensive Gynecology, 5th ed. Ch 22

Katz states: "Recurrent vulvo-vaginitis (bacterial vaginosis/ vulvovaginal candidiasis) is defined as three or more documented episodes in one year"

243. Ans. (a) Bacterial vaginosis

Ref: Shaws, 15th ed. pg. 309

Gardnerella (Bacterial) Vaginosis

- **Bacterial vaginosis** is termed vaginosis rather than vaginitis, because it is associated with alteration in the normal vaginal flora rather than due to any specific infection.
- Bacterial vaginosis is a vaginal infection caused by **Gardenella vaginalis**.
- Bacterial vaginosis is diagnosed on the basis of the following findings:
 - Vaginal secretions are gray and thinly coat the vaginal walls.
 - The pH of these secretions is **higher than 4.5** (usually 4.7 to 5.7).
 - Microscopy of the vaginal secretions reveals an **increased number of clue cells, and leukocytes are conspicuously absent.**
 - The addition of 10% KOH to the vaginal secretions (**the "whiff" test**) releases a fishy, amine-like odor.
- This infection can cause PID, chorioamnionitis, premature rupture of membrane (PROM) and preterm Labor.

Treatment: Metronidazole 500 mg BD × 1 week is effective

244. Ans. (d) Gardenella vaginalis

Ref: Shaws's, 15th ed. pg. 309

245. Ans. (b) Bacterial vaginosis

Ref: Shaws, 15th ed. pg. 309

246. Ans. (c) Protozoa

Ref: Shaws, 15th ed. pg. 308-310

FMGE Solutions Screening Examination

934

TRICHOMONIASIS

- Most common in clinical practice. Patients complain of pruritus.
- Vulvae harbour this organism. Infection is sexually transmissible, it can be acquired.
- It is not uncommon during pregnancy and is often associated with gonococcal infection.
- **The Trichomonas is a protozoan**, actively motile and is anaerobic. *Trichomonas vaginalis*, is the type found in the vagina.

Symptoms

- 20% remain asymptomatic. 70% show profuse, thin, creamy or slightly green in color, irritating and frothy discharge.
- The vaginal walls are tender, angry looking and the discharge causes pruritus and inflammation of the vulva.
- There are often multiple small punctate strawberry spots (*strawberry vagina*).
- Urinary symptoms, such as dysuria and frequency, and a low-grade urethritis, Abdominal pain, low backache and dyspareunia may also be complained of if pelvic infection occurs.

Diagnosis

- The culture is 98% reliable. Trichomonas may also be diagnosed on a smear stained for cytology.

Treatment

- Metronidazole 200 mg oral TDS \times 1 week both the partners
- The recent modality of treatment is to shorten the duration of therapy by giving 2 g metronidazole for 1 day only.

247. Ans. (c) Infection seen when vaginal pH is < 4.5

Ref: Shaws, 15th ed. pg. 308-310

- After reading this question, usually we get this tendency to mark option D, which says bacterial vaginosis is NOT a STD, but this statement is true.
- Bacterial vaginosis is a vaginal infection caused by *Gardenella vaginalis* (NOT a STD).
- **Bacterial vaginosis is diagnosed on the basis of the following findings:**
 - Vaginal secretions are gray and thinly coat the vaginal walls.
 - The pH of these secretions is **higher than 4.5** (usually 4.7 to 5.7).
 - Microscopy of the vaginal secretions reveals an **increased number of clue cells, and leukocytes are conspicuously absent.**

- The addition of KOH to the vaginal secretions (*the "whiff" test*) releases a fishy, amine-like odor.

Extra Mile

- Most common vaginal infections during pregnancy is candidiasis
- Bacterial vaginosis (BV) is the most common vaginal infection in women of childbearing age
- Genital human papillomavirus the most common sexually transmitted infection.

248. Ans. (a) Bacterial vaginosis

Ref: Shaws, 15th ed. pg. 309

249. Ans. (b) Gardenella

Ref: Shaws, 15th ed. pg. 131-132

- Whiff test or amine test is done for gardenella (bacterial) vaginosis.
- It is performed by adding a small amount of potassium hydroxide (KOH) to a microscopic slide containing the vaginal discharge. **A characteristic fishy odor is considered a positive whiff test** and is suggestive of bacterial vaginosis.

250. Ans. (b) Urethra

Ref: Shaws, 15th ed. pg. 350

CHLAMYDIA

- Chlamydial infection is common in young, sexually active women. The incubation period is 6-14 days. It is sexually transmitted by vaginal and rectal intercourse.
- Chlamydia trachomatis is a small gram-negative bacteria, an obligate intracellular parasite that appears as intra cytoplasmic inclusion body, and is of two varieties, one that causes lympho granuloma venereum (LGV) and the other of non-LGV, which causes non-specific lower genital tract infection.
- Often, the infection is asymptomatic but may develop vaginal discharge, dysuria and frequency of micturition, and at times cervicitis.
- **In asymptomatic cases, Chlamydia resides most commonly in urethra.**
- Sometimes, chlamydia may cause Reiter's syndrome with arthritis, conjunctivitis and genital infection associated with skin lesions. (*can't see, can't pee & can't walk*)

The cervix is the first site of infection. Ascending upwards causes salpingitis and infertility

Diagnosis

- The use of fluorescein-conjugated monoclonal antibody in immunofluorescence tests on smears prepared from urethral and cervical secretion allows a direct diagnosis of the infection to be made.

**Note:**

- Cervical ectopy with bleeding on touch and mucopurulent discharge is seen when the cervix is infected.
- Chlamydial infection and gonococcal infection often coexist and both attack the columnar epithelium of the genital tract and urethra. **Urine can be cultured in suspected chlamydial infection.**

Treatment

- Tetracycline 500 mg and clindamycin 500 mg 6 hourly × 2 weeks is effective.

251. Ans. (a) Pain

Ref: Katz: Comprehensive Gynecology, 5th ed. Ch 23, Tuberculosis William's gynecology, ch 18

- Pelvic TB are uncommon, but when occurs, it involves **fallopian tube in most of the cases.**
- Without pasteurization of milk, bovine tuberculosis produces primary infections in the human gastrointestinal tract. This leads to Subsequent lymphatic or hematogenous dissemination results in pelvic tuberculosis.
- **The clinical presentations of this chronic infection are:**
 - **Mild to moderate chronic abdominal and pelvic pain occur (in 35% patients)**
 - Infertility and abnormal uterine bleeding.
 - Often times, the advanced cases presents with ascites while some women may be asymptomatic.
 - The remaining patients have bilateral adnexal masses and mild adnexal tenderness, with an inability to manipulate the adnexa because of scarring and fixation.

252. Ans. (c) Hydrosalpinx

Ref: Williams Gynecology, ch. 9, Pelvic mass; Fallopian Tube pathology

HYDROSALPINX

- Results secondary to chronic PID.
- **Grossly, the fine fimbria and tubal ostia are obliterated and replaced by a smooth, clubbed end.** The ballooned, thin walls of the elongated tube are whitish and translucent, and the tube is typically distended with a clear serous fluid.
- Depending on the degree and location of the ipsilateral ovary, the hydrosalpinx may be adhered to it.
- Hydrosalpinx may be found in asymptomatic women during pelvic examination or incidentally during sonography or HSG done for other indications. Some women note infertility or chronic pelvic pain.

Treatment

- For women not wishing to preserve fertility, laparoscopic treatment may include lysis of adhesions and salpingectomy.
- In women who desire fertility, surgical intervention depends on the degree of tubal damage.

Extra Mile

- **HYSTEROSALPINGOGRAPHY:** To study the patency of the fallopian tubes in infertility and postoperative tuboplasty and also employed to study uterine anomalies.
- **If in the question, clubbing of ampullary end is asked, the answer would be tuberculosis.**

253. Ans. (d) Mycobacterium tuberculosis

Ref: Shaws 15th ed. /158-159; DC Dutta 8th ed./ 158-159

TB is also an important cause of **infertility**. Other salient features about TB are as follows:

- Most common presentation of genital TB is infertility.
- HSG is contraindicated in case of genital TB
- Best time to do HSG is **within 10 days** of LMP.
- Vaginal epithelium is resistant to TB.
- MC mode of spread of genital TB is **hematogenous**.
- TB salpingitis belong to stage V of PID.
- Conception rate even after treatment of genital TB is quite low.

254. Ans. (a) IUCD insertion

Ref: William's Gynecology ch 3

- IUCD acts by causing local inflammation at endometrial site. It increases the risk of PID in female.
- Oral contraceptives decreases the risk of PID.

TABLE: Pelvic Inflammatory Disease Risk Factors

Douching
Single status
Substance abuse
Multiple sexual partners
Lower socioeconomic status
Recent new sexual partner (s)
Younger age (10 to 19 years)
Other sexually transmitted infections
Sexual partner with urethritis or gonorrhea
Previous diagnosis of pelvic inflammatory disease
Not using mechanical and/or chemical contraceptive barriers
Endocervical testing positive for <i>N. Gonorrhoeae</i> or <i>C. Trachomatis</i>

255. Ans. (d) Laparoscopy

Ref: Shaws, 15th ed. pg. 451, DC Dutta, 8th ed. pg. 451

- Laparoscopy is helpful in confirming the diagnosis as well as to know extent of disease.
- It is the current criterion standard for the diagnosis of PID. No single laboratory test is highly specific or sensitive for the disease.

• **Other investigations are-**

- ESR
- Hemogram

CERVICAL CANCER

256. Ans. (b) **HPV 16**

Ref: Shaw's Gynecology 16th ed. P 485

- Women with STD, HIV infection, herpes simplex virus 2 infection, human papilloma virus (HPV) infection (16, 18, 31, 33) or condylomata have a high predisposition to cancer.
- Out of these HPV is now considered the most important cause.
- Most commonly caused by **HPV 16 and 18**

Other causes/risk factors for cervical cancer:

- Coitus before the age of 18 years
- Multiple sexual partners
- Delivery of the first baby before the age of 20 years
- Multiparity
- Poor personal hygiene
- Poor socioeconomic status
- Smoking and alcohol abuse
- COC and progestogens use over 8-year periods
- Exposure to diethylstilbestrol

Extra Mile

- Average age for cervical CA: 35–45 years
- **Gardasil** is a quadrivalent vaccine against HPV 16, 18, 31, 38 to be given to adolescents at 0, 2 and 6 months intramuscularly in the deltoid muscle.
- **Cervarix** is bivalent against HPV 16, 18 to be given (0.5 mL) at 0, 1 and 6 months. Immunity is expected to last 10 years.

257. Ans. (a) **Squamous cell CA**

Ref: Shaws, 15th ed. pg. 964

- The two most common histologic subtypes of cervical cancer are squamous cell and adenocarcinoma.
- Of these, **squamous cell tumors predominate, comprise 85 percent** of all cervical cancers, and arise from the ectocervix
- Adenocarcinomas comprise **10 to 15 percent** of cervical cancers and arise from the endocervical mucus-producing glandular cells.

258. Ans. (b) **Oral contraceptives decreases the risk of cervical cancer**

Ref: Williams Gynecology chapter 29-30

For this question, most of the students claimed option "D" but according to william's "Lower educational attainment, older

age, obesity, smoking, and neighborhood poverty are independently related to lower rates of cervical cancer screening, which contribute to increased risk of cervical cancer".

- **Use of combined oral contraceptives doesn't decrease the risk, but it increases the risk.** COC users and women who are within 9 years of use have a significantly higher risk of developing both squamous cell and adenocarcinoma of the cervix (*william's gyne*).
- In women who are positive for cervical HPV DNA and who use COCs, risks of cervical carcinoma increase by up to fourfold compared with women who are HPV-positive and never users of COCs.
- *Both active and passive cigarette smoking increases the risk of cervical cancer.*
- An increased number of sexual partners and early age of first intercourse have been shown to increase cervical cancer risks.
- *Abstinence from sexual activity and barrier protection during sexual intercourse have been demonstrated to decrease cervical cancer incidence.*

TABLE: Risk Factors for Cervical Neoplasia

Behavioral risk factors	Demographic risk factors	Medical risk factors
<ul style="list-style-type: none"> • Infrequent or absent cancer screening Pap tests • Early coitarche • Multiple sexual partners • Male partner who has had multiple sexual partners • Tobacco smoking • Dietary deficiencies 	<ul style="list-style-type: none"> • Ethnicity (Latin American countries, U.S. minorities) • Low socioeconomic status • Age 	<ul style="list-style-type: none"> • Cervical high-risk human papillomavirus infection • Parity • Immuno-suppression

TABLE: Summarized staging of Cervical CA

Stage I	Tumor confined to the cervix
Stage IA	Microinvasion (preclinical)
Stage IB	All other cases confined to the cervix
Stage IIA	Tumor spread to the upper two thirds of the vagina
Stage IIB	Tumor spread to paracervical tissue but not to the pelvic walls
Stage IIIA	Tumor spread to the lower third of the vagina
Stage IIIB	Tumor spread to the pelvic wall or obstruction of either ureter by tumor
Stage IV	Tumor spread to the mucosa of the bladder or rectum or outside the pelvis.

259. Ans. (b) HPV 16 and 18

Ref: Shaws, 15th ed. pg. 952

- Women with STD, HIV infection, herpes simplex virus 2 infection, human papilloma virus (HPV) infection (16, 18, 31, 33) or condylomata have a high predisposition to cancer.
- Of these, HPV is now considered the most important cause, *most commonly cause by HPV 16 and 18*
- Most HPV infection 16, 18 are symptomless in young women and clear within 2 years.
- Persistent infection is the cause of cancer of the cervix in 70-90% cases.

260. Ans. (a) HPV 16

Ref: Shaws, 15th ed. pg. 952

- HPV 16 and 18 are most commonly associated with cervical cancer.
- HPV 31, 33, 35, 51 are also associated with cervical cancer, but are relatively less commonly.

261. Ans. (b) Pap smear

Ref: Shaws, 15th ed. pg. 957; International Journal of Obstetrics and Gynecology 2006

Cervix cancer is the second most common cause of female specific cancer after breast cancer

- **Primary prevention** of a disease requires warding it off before the pathogenic process can occur. In the case of cervical cancer, this would require that infection of the will be cervix prevented. It could be achieved either by complete abstinence from sexual activity or *with a vaccine*.
- **Secondary prevention** stops the progression of disease once it has already started. A good example of secondary prevention is cytologic screening to detect cervical cancer precursors, followed by treatment to prevent progression to cancer.

Diagnosis

- Diagnosis of cervical dysplasia is mainly based on cytological screening of the population and by signs and symptoms:
 - Many are asymptomatic.
 - Some complain of postcoital bleeding or discharge.
 - On inspection, the cervix often appears normal, or there may be cervicitis or an erosion which bleeds on touch.
 - Some present with postmenopausal bleeding.
- Routine cytological screening or Pap smear Should be done to all women above the age of 21 years who are sexually active for at least 3 years. In all women with abnormal Pap tests showing mild dysplasias, it is important to treat any accompanying inflammatory

pathology and repeat the Pap test. If it persists to be abnormal, consider **colposcopic** examination and selective biopsies.

262. Ans. (b) Papanicolaou smear

Ref: Shaw's Gynae, 15th ed. pg. 403

- Pap smear is taken from cervix, with Arye spatula, rotated 360° to pick up cells from squamo-columnar junction. Vaginal smear for hormonal evaluation is taken from lateral fornix
- The objective of screening is to reduce the incidence and mortality from cervical cancer
- Pap smear test has been effective reducing the incidence of cervical cancer by 80% and the mortality by 70%.
- *Please refer to above explanation also.*

263. Ans. (d) All of the above

Ref: Shaws, 15th ed. pg. 403

The latest recommendations for cervical CA screening are:

- All women should begin cervical cancer screening at age 21 years.
- **Women between the ages of 21 and 29 should have a Pap test every 3 years.** They should not be tested for HPV unless it is needed after an abnormal Pap test result.
- **Women between the ages of 30 and 65 should have both a Pap test and an HPV test every 5 years.** This is the preferred approach, but it is also acceptable to have a Pap test alone every 3 years.
- **Women over age 65 who have had regular screenings with normal results should not be screened for cervical cancer.** Women who have been diagnosed with cervical pre-cancer should continue to be screened.
- Women who have had their uterus and cervix removed in a hysterectomy and have no history of cervical cancer or pre-cancer should not be screened.
- Women who have had the HPV vaccine should still follow the screening recommendations for their age group.
- Women who are at high risk for cervical cancer may need to be screened more often. Women at high risk might include those with HIV infection, organ transplant, or exposure to the drug DES. They should talk with their doctor or nurse.

ENDOMETRIAL AND FALLOPIAN TUBE CANCER

264. Ans. (a) Increased risk of endometrial carcinoma

Ref: Shaw's Gynecology 16th ed. P 554

- Tamoxifen is a selective estrogen receptor modulator, given for breast CA treatment.

FMGE Solutions Screening Examination

938

- Tamoxifen given to women with breast cancer increases the risk of endometrial hyperplasia and cancer to two- to three-folds. It also increases the risk of ovarian CA.
- Raloxifene has no adverse effect on the endometrium.
- Tamoxifen is effective in primary and secondary prevention of breast cancer.
- It prevents spread to the other breast and recurrence by 50% and mortality by 25%.
- It is also bone (decrease risk of osteoporosis) and cardioprotective.
- Side effects (two-fold increase) are hot flushes, vaginal dryness (anti-E₂ action), endometrial hyperplasia, polyp, endometrial carcinoma and sarcoma. Other side effects are: DVT, retinopathy, ischemic heart disease.

Extra Mile

Risk Factors for Endometrial Cancer

- Endogenous estrogen dependent
- Nulliparity, low parity
- Polycystic ovary syndrome (PCOS)
- Early menarche, late menopause
- Functioning ovarian tumors
- Obesity, hypertension, diabetes, hyperlipidemia
- Exogenous estrogen
- Unopposed estrogen therapy
- Tamoxifen therapy
- Hered.ary

265. Ans. (d) Estradiol

Ref: Shaw's Gynecology 16th ed. P 409

- Endometriosis is ectopic benign endometrial tissues outside the cavity of the uterus, which responds to ovarian hormones.
- Usual sites of ectopic endometrial tissue is pelvic endometriosis (pelvic peritoneum, pouch of Douglas, uterosacral ligament), rectovaginal endometriosis, ovary, appendix, pelvic lymph nodes, or at the scar site known as scar endometriosis.
- Symptoms can range from simple abdominal pain, dysmenorrhea, dyspareunia to infertility.

Treatment

- Endometriosis is estrogen dependent. Hormones act on the receptors in the endometriotic tissue and cause their atrophy and shrinkage.
- The purpose of administration of various hormones or drugs is to act as antiestrogens.
 - Continuous administration of gonadotropin analogue is useful in precocious puberty to down regulate and suppress pituitary gonadotropins. It causes atrophy of the endometriotic tissue in 90% cases. Drugs are: Goserelin, buserelin, nafarelin, cetrorelix, leuprolide.
 - Aromatase inhibitors available are letrozole (2.5 mg), anastrozole (1–2 mg) and toremifene (12.5 mg) daily

for 6 months. It has antiestrogenic activity inhibiting conversion of androgen to estrogen.

- **Combined OCP:** Intermittently or continuously, oral contraceptives may alleviate the disease. Not used much due to side effects.
- **Oral progestogens:** They exert an antioestrogenic effect and their continuous administration causes decidualization and endometrial atrophy. Drugs commonly in use are: Norethisterone 5.0–20.0 mg daily, or dydrogesterone 10–30 mg daily. *This hormone does not prevent ovulation and is suitable for a woman trying to conceive.*
- Mifepristone has some beneficial influence on shrinkage of fibroids and endometriosis (10–25 mg daily for 3 months).
- Raloxifene, 60 mg daily used in endometriosis, do not cause endometrial hyperplasia.
- **Note:** Estradiol being the estrogen agonist will aggravate the symptoms. Hence should not be given.

266. Ans. (c) PET-CT

Ref: Shaw's 16th ed. 510

Radiological Tests in Endometrial CA

- PET-CT reveals metabolic activity in the tissue and is a gold standard for staging.
- CT has a predictable rate of 85% in studying the extent of spread of the lesion. Hypodensity in the myometrium suggests myometrial infiltration.
- MRI is superior to CT in detecting myometrial involvement and nodal enlargement with 90% detection rate and without radiation hazard.
- Sonosalpingography is very useful in detecting endometrial polyps which could be malignant.
- Ultrasound is useful in studying the endometrial thickness, irregular line, detecting polyps and associated ovarian tumor or ovarian metastasis.

267. Ans. (c) Dysmenorrhea

Ref: Shaw, 16th ed. pg. 420

Adenomyosis

- This condition is also termed as uterine endometriosis. It is observed frequently in elderly women aged more than 40.
- The disease often coexists with uterine fibromyomas, pelvic endometriosis (15%) and endometrial carcinoma.

Clinical presentation

- Some are asymptomatic, others present with **menorrhagia** and progressively increasing dysmenorrhoea.
- **Other symptoms:** Pelvic discomfort, backache and dyspareunia
- **Clinical examination** reveals a painful symmetrical enlargement of the uterus that rarely exceeds that of a 3-month pregnancy and is often mistaken for a myoma.

- A myoma is rarely painful. Therefore, a **painful, symmetrical enlargement of the uterus should suggest the diagnosis of adenomyosis.**
- **Shaw states:** "If a patient gives a history of menorrhagia with accompanying dysmenorrhoea, one should always consider the possibility of adenomyosis"

Investigation:

- MRI is superior to ultrasound.

Treatment

- Since most women are elderly and past the age of childbearing, **total hysterectomy** is the treatment.

268. Ans. (c) 40

Ref: Shaws, 15th ed. pg. 151

POSTMENOPAUSAL BLEEDING

- Postmenopausal bleeding and abnormal premenopausal and perimenopausal bleeding the primary symptoms of endometrial carcinoma.
- Normally a 1-year period of amenorrhea after the age of 40 is considered as menopause. However, vaginal bleeding occurring anytime after 6 months of amenorrhoea in a menopausal age should be considered as postmenopausal bleeding and investigated.
- Even without amenorrhoea or irregular bleeding, if a woman over the age of 52 years continues to menstruate, she needs investigations to rule out endometrial hyperplasia and malignancy of the genital tract.
- **Thirty to fifty percent of postmenopausal bleeding is attributed to malignancy of the genital tract, the most common being endometrial cancer, cervical cancer and ovarian tumors.**
- Common benign conditions are endometrial hyperplasia and polypi.

269. Ans. (c) Atypical

Ref: Shaw's Gynaecology, 15th ed. pg. 724

ENDOMETRIAL HYPERPLASIA

This occurs in:

- Anovulatory cycles with unopposed oestrogen acting on the endometrium
- Metropathia haemorrhagica
- Obese women
- Polycystic ovarian disease
- a woman on tamoxifen
- feminizing ovarian tumors
- Hyperplasia may be simple hyperplasia, glandular or atypical hyperplasia.
- Simple hyperplasia is at a risk of endometrial cancer in 2% and glandular hyperplasia in 4-10%. **Atypical hyperplasia, however, has the tendency to develop carcinoma in as much as 60-70%.**

Extra Mile

- 80% cases of simple hyperplasia respond to progestogens, response of atypical hyperplasia is only 50%, but with the risk of malignancy.
- For this reason, atypical endometrial hyperplasia should be treated by hysterectomy and not merely by ablative technique.

270. Ans. (b) Biopsy

Ref: Dutta's Obstetrics, 7th ed. pg. 341 and 345

Diagnosis of Endometrial Carcinoma

- Postmenopausal bleeding is considered to be due to endometrial carcinoma unless proven otherwise.
- **Endometrial biopsy:** Histology is the definitive diagnosis
- Papanicolaou smear not a reliable test for endometrial CA. It is Positive only in 30 per cent cases of endometrial cancer.
- **Ultrasound and color Doppler (TVS):** Findings suggestive of endometrial carcinoma are:
 - Endometrial thickness ≥ 4 mm
 - Hyperechoic endometrium with irregular outline.
 - Increased vascularity
 - Intrauterine fluid
- **Hysteroscopy:** helps in direct visualization of endometrium and to take target biopsy.
- **Fractional curettage:** is not only the definite method of diagnosis but can detect the extent of growth.

Prognosis

- Tumors showing poor prognosis are:
 - Poorly undifferentiated
 - Greater myometrial penetration
 - Lymphovascular space invasion
- Aneuploid tumors: worst prognosis

TABLE: Most of the prognostic factors given below in the table can be evidenced by endometrial biopsy

Prognostic factors in endometrial carcinoma

- Age at diagnosis: Older the patient poorer the prognosis.
- Stage of the disease
- **Histologic type:**
 - Typical adenocarcinomas- better prognosis;
 - Papillary serous, clear cell carcinoma-poor prognosis.
- Histologic differentiation.
- Histologic grade: Grade 3 tumors have 5 times more risk of recurrence and low 5 year survival rate.
- Myometrial penetration.
- Lymphovascular space invasion.
- Lymph node metastasis.

271. Ans. (c) **Simple hysterectomy**

Ref: William's Gyne. Ch 33

Surgical treatment options for patients with endometrial cancer:

- Simple Hysterectomy
- BSO (Bilateral salpingo oophorectomy)
- Radical hysterectomy
- Vaginal hysterectomy
- Almost three quarters of patients are stage I at diagnosis.
- **In general, an extrafascial ("simple") hysterectomy is sufficient**, but radical hysterectomy may be preferable for women with clinically obvious cervical extension of endometrial cancer.
- **Contraindications of primary surgery include:** a desire to preserve fertility, massive obesity, high operative risk, and clinically unresectable disease.
- Vaginal hysterectomy with or without BSO is another option for those women who cannot undergo systematic surgical staging because of comorbidities.

Extra Mile

"Just so you don't miss any further question on endometrial CA staging, following table has been summarized"

TABLE: FIGO staging for endometrial CA

I A	Tumor confined to the uterus, no or < ½ myometrial invasion
I B	Tumor confined to the uterus, > ½ myometrial invasion
II	Cervical stromal invasion, but not beyond uterus
III A	Tumor invades serosa or adnexa
III B	Vaginal and/or parametrial involvement
III	Metastasis to pelvic and paraaortic lymph nodes
III C1	Pelvic node involvement
III C2	Para-aortic involvement
IV-A	Tumor invasion bladder and/or bowel mucosa
IV-B	Distant metastases including abdominal metastases and/or inguinal lymph nodes

Note:

- Paclitaxel (Taxol), doxorubicin (Adriamycin) and cisplatin (TAP) **chemotherapy** is the adjuvant treatment of choice for advanced endometrial cancer.
- In practice, **cytotoxic chemotherapy frequently is combined with radiotherapy** in patients with advanced endometrial cancer.
- **Primary radiation therapy** usually is considered only in rare instances when a patient is an exceptionally poor surgical candidate.

272. Ans. (a) **Painless watery discharge**

Ref: Shaws, 15th ed. pg. 999

FALLOPIAN TUBE CANCERS

- Primary cancer of the fallopian tubes is uncommon and account for only 0.3%.
- The tumor is often an adenocarcinoma though choriocarcinoma may develop in a tubal ectopic pregnancy or in a tubal mole.
- The tumor is highly malignant and spreads rapidly through lymphatics to the pelvic organs..

FIGO classification does not exist, Erez classification is as follows:

- **Stage I:** The tumor is limited to the mucosa and muscle.
- **Stage IIA:** The serosa is breached but the tumor has not spread to other organs.
- **Stage IIB:** The tumor invades the pelvic organs.
- **Stage III:** Metastasis outside the pelvis but within the abdominal cavity.
- **Stage IV:** Extra-abdominal metastasis is present.

Clinical features

- The tumor occurs in menopausal women, most of them of them are nulliparous.
- **The early symptom is painless watery discharge per vagina**, which may at times be amber-colored. Sooner or later, postmenopausal bleeding develops.
- A lump may be too small to be felt on clinical examination.
- **Pain is a late symptom.**

273. Ans. (c) **IIa**

Ref: Refer to staging Shaws, 15th ed. pg. 421

OVARIAN CANCER

274. Ans. (a) **Granulosa cell tumor**

Ref: Shaw 16th ed. P 442

- Granulosa cell tumor is an estrogen secreting tumor, characterized histopathologically by **Call exner body**.

Extra Mile

Ovarian tumor	HPE characteristics
• Serous cystadenoma	Psammoma bodies
• Clear cell tumor	Hobnail cell
• Yolk sac tumor	Schiller duval bodies
• Granulosa cell tumor	Call exner bodies
• Krukenberg tumor	Signet ring cell

275. Ans. (c) Ovary

Ref: Shaws, 16th ed. pg. 430

Lutein Cysts of the Ovary

Two types of lutein cysts are recognized:

- Granulosa lutein cysts found within the corpus luteum.
- Theca lutein cysts associated with trophoblastic disease and chorionic gonadotropin therapy.

Corpus Luteum (Granulosa Lutein) Cysts

- Corpus luteum cysts are functional, non-neoplastic enlargements of the ovary.
- **Clinical presentation:** local pain, tenderness or delayed menstruation. These cysts are often palpable clinically.
- Ultrasound reveals **spider-web-like structure** with or without a clot.

Theca Lutein Cysts

- **Theca lutein cysts (TLC)**, also known as **hyperreactio luteinalis (HL)**, are a type of **functional ovarian cyst**. They are typically multiple and **seen bilaterally** and filled with straw-colored fluid.
- It is commonly associated with hydatidiform moles, choriocarcinoma and gonadotropin (hCG) or clomiphene therapy.
- The cysts spontaneously regress after elimination of the mole, therapeutic curettage, treatment of choriocarcinoma or discontinuation of gonadotropin therapy.

276. Ans. (c) Clear cell tumor

Classification of ovarian tumor

Epithelial tumor (80%)	Germ cell tumor	Sex cord tumor
<ul style="list-style-type: none"> • Clear cell tumor • Brenner's tumor • Serous tumor (MC) • Endometrioid tumor • Mucinous tumor Mn: CBSE-M	<ul style="list-style-type: none"> • Choriocarcinoma • Dysgerminoma • Endodermal sinus tumor • Polyembryoma • Teratoma (MC) Mn: C- DEPT:	<ul style="list-style-type: none"> • Theca cell tumor • Granulosa cell tumor • Androblastoma • Gynandroblastoma • Arrhenoblastoma Mn: The GAGA

277. Ans. (b) Teratoma

Ref: Williams Gynae, 1st ed. Ch 36

- Germ cell tumors arise from the ovary's germinal elements and comprise a third of all ovarian neoplasms.
- The **mature cystic teratoma**, also called **dermoid cyst**, is by far the most common subtype. This accounts for 95% of all germ cell tumors and is **clinically benign**.
- In contrast, **malignant germ cell** tumors comprise fewer than 5 percent of malignant ovarian cancers in Western countries and include *dysgerminoma*, *yolk sac tumor*, *immature teratoma*, and other less common types.

Extra Mile

- Overall, MC ovarian tumor: **Epithelial cell tumor**
- Overall, MC benign tumor of the ovary: **Dermoid cyst**
- MC benign epithelial tumor of the ovary: **Serous cystadenoma**
- MC malignant ovarian tumor: **Serous cystadenocarcinoma**
- **MC germ cell tumor: Mature Teratoma (Dermoid Cyst)**
- Most common ovarian tumor associated with pregnancy: **Dermoid Cyst**
- Most common ovarian tumor which undergo torsion: **Dermoid cyst**
- MC malignant germ cell tumor: **Dysgerminoma**
- Ovarian tumor mostly in young age: **Dysgerminoma**
- Ovarian tumor metastasized to contralateral tumor: **Granulosa cell tumor**

278. Ans. (b) Dysgerminoma

Ref: Shaws, 15th ed. pg. 933

Please refer to above explanation.

YOLK SAC TUMORS

- Yolk sac tumors account for 20% of all malignant ovarian germ cell tumors
- *Microscopically Schiller-Duval bodies* are pathognomonic when present.

279. Ans. (a) Papillary serous cystadenoma

Ref: William's Gynecology, Ch 35; Epithelial tumors of ovary

TABLE: Epithelial Ovarian Tumor Cell Types
(Katz: Comprehensive Gynecology, 5th ed.)

Ovarian Cancers	Approximate Frequency (%)
Serous	35–40
Mucinous	6–10
Endometrioid	15–25
Clear cell (mesonephroid)	5–10
Brenner	Rare

SEROUS TUMORS

- Serous tumors are the most frequent ovarian epithelial tumors. **The malignant forms account for 40% or more of ovarian cancers.**
- During frozen section evaluation, *psammoma bodies* are **essentially pathognomonic** of an ovarian-type serous carcinoma

MUCINOUS ADENOCARCINOMAS

- About 5 to 10 percent of true epithelial ovarian cancers are mucinous adenocarcinomas

FMGE Solutions Screening Examination

- These cells resemble cells of the endocervix or may mimic intestinal cells, which can pose a problem in the differential diagnosis of tumors that appear to originate from the ovary or intestine.

ENDOMETRIOID ADENOCARCINOMAS

- About 15 to 25 percent of epithelial ovarian cancers are endometrioid adenocarcinomas, *the second most common histologic type*.

CLEAR CELL TUMORS

- Comprising 5 to 10 percent of epithelial ovarian cancers, *clear cell adenocarcinomas are the most frequently associated with pelvic endometriosis*.
- Microscopically **hobnail cells** are characteristic finding. These are cells with abundant glycogen and nuclei of the cells protrude into the glandular lumen.

BRENNER TUMOR

- These tumors constitute only 2% to 3% of all ovarian tumors.
- Brenner tumors consist of cells that resemble the transitional epithelium of the bladder and Walthard nests of the ovary.

280. Ans. (b) Serous cyst adenocarcinomaRef: Shaws, 15th ed. pg. 422

- Most common ovarian tumor: Serous Cystadenoma (50%)
- *Malignant form of serous cystadenoma is serous cystadenocarcinoma.*
- Largest ovarian tumor: Mucinous cystadenoma
- Clear cell tumor is a malignant ovarian tumor of epithelial origin, characterized histopathologically by **Hobnail Cell**.
- Granulosa cell tumor is an estrogen secreting tumor, characterized histopathologically by **Call exner body**.

Extra Mile

Ovarian tumor	HPE characteristics
Serous cystadenoma	Psammoma bodies
Clear cell tumor	Hobnail cell
Yolk sac tumor	Schiller duval bodies
Granulosa cell tumor	Call exner bodies
Krukenberg tumor	Signet ring cell

281. Ans. (b) Ovary is the primary siteRef: Shaws, 15th ed. pg. 424

- **Choriocarcinoma** is a highly malignant tumor arising from the chorionic epithelium.

- *About 3-5 per cent of all patients with molar pregnancies develop choriocarcinoma.*
- The primary site is usually anywhere in the uterus (*secondary involvement*).
- *Rarely, it starts in the tube or ovary.*
- The lesion is usually localized nodular type.
- **Spread:** The common sites of metastases are lungs (80%), Anterior vaginal wall (30%), brain (10%), liver (10%).

Symptoms

- Irregular vaginal bleeding, at times brisk
- Continued amenorrhoea.
- **Lung:** Cough, breathlessness, haemoptysis.
- **Cerebral:** Headache, convulsion, paralysis or coma.
- **Liver:** epigastric pain, jaundice.
- **Chest X-ray:** Shows 'cannon ball' shadow or 'snow storm' appearance due to numerous tumor emboli.

282. Ans. (c) ChoriocarcinomaRef: Shaws, 15th ed. pg. 424**CHORIOCARCINOMA**

- Generally, choriocarcinoma is a part of a mixed germ cell tumor. Its origin as a teratoma can be confirmed in prepubertal girls, when the possibility of its gestational origin can be definitely excluded. The tumors are very vascular.
- *Histologically the tumor shows adimorphic population of syncytiotrophoblasts and cyto-trophoblasts.* It secretes large quantities of human chorionic gonadotropin (hCG) hormone, which forms an ideal tumor marker in the diagnosis and management of the tumor. The tumor is highly malignant, and metastasizes by bloodstream to the lungs, brain, bones and other organs.

283. Ans. (a) ChemotherapyRef: Shaws, 15th ed. pg. 124-125

- The treatment of choice of choriocarcinoma is mainly chemotherapy both for local and distal metastasis.
- The drug of choice for the same is **methotrexate**. It is given orally 5 mg five times a day for 5 days.
- Side effects of Methotrexate are ulcerative stomatitis, gastric hemorrhage, skin reaction, alopecia, bone marrow suppression, Liver and Kidney damage.

284. Ans. (c) CA 125Ref: Shaws, 15th ed. pg. 422-928

- Tissue markers such as CA-125 and NB/70k are useful mainly in the follow-up of certain tumors.
- **CA-125** is a glycoprotein and surface cell antigen which is secreted by the malignant epithelial tumors.

- Level of CA-125 more than 35 U/ml suggests malignant and residual tumor, and indicates the need of chemotherapy.
- CA-125 is also raised in abdominal tuberculosis and endometriosis.
- CEA (carcinoembryonic antigen) more than 5 mg/l is seen in mucinous ovarian tumor.
- **NOTE:** CA-125 is raised in only 50% cases in Stage I and 90% in Stage II ovarian cancer.

VULVAR AND VAGINAL CANCER

285. Ans. (d) **HPV**

Ref: William's Gynecology Ch 31

HPV (16, 18) most common cause of vulvar carcinoma.

- HPV infects the female → vulva, vagina, and cervix
- Male → urethra, penis, and scrotum.
- Both genders → Perianal, anal, and oropharyngeal area.

Salient Features of Vulvar Cancer

MC site- labia majora and minora	
MC symptom pruritus.	
MC type- SCC, epidermoid type (same for vaginal CA)	
MC implicated factor- HPV 16, 18.	
Premalignant lesion of vulva	
<ul style="list-style-type: none"> • VIN (MC) vulvar intraepithelial lesion • /ts ds • Condyloma acuminata 	<ul style="list-style-type: none"> • Lichen sclerosis • Erythroplasia of querat • Bowen disease (type of VIN)
MC mode of spread- lymphatic	
1 st LN- Superficial inguinal LN	
2 nd LN- Deep inguinal LN	

286. Ans. (c) **Stage II**

Ref: Shaws 15 ed. p-941

Carcinoma of the Vulva (FIGO staging 2008)

Stage I	Tumor confined to the vulva
I a	Lesions ≤ 2 cm in size, confined to the vulva or perineum and with stromal invasion ≤ 1 mm, no nodal metastasis
I b	Lesions > 2 cm in size or with stromal invasion > 1.0 mm, confined to the vulva or perineum, with negative nodes
Stage II	Tumor of any size with extension to adjacent perineal structures (1/3rd lower urethra, 1/3rd lower vagina, anus) with negative nodes
Stages III	Tumor of any size with or without extension to adjacent perineal structures (one-third lower urethra, one-third lower vagina, anus) with positive inguino-femoral lymph nodes

Contd...

IIIA	<ul style="list-style-type: none"> • With lymph node metastasis (≥ 5 mm) or • 1-2 lymph node metastasis(es) (< 5 mm)
IIIB	<ul style="list-style-type: none"> • With two or more lymph node metastases (≥ 5 mm) or • 3 or more lymph node metastases (< 5 mm)
Stage IV A	Tumor involving any of the following: <ul style="list-style-type: none"> • Upper urethral and/or vaginal mucosa, bladder mucosa, rectal mucosa, or fixed to pelvic bone, or • Fixed or ulcerated inguino-femoral lymph nodes.
Stage IV	Distant metastasis including pelvic lymph nodes

Note: According to old FIGO staging (1995) for vulvar CA (as mentioned in William's), only in stage III there is involvement of adjacent organs like lower urethra and/or the vagina or the anus. So don't be confused, and mark answers according to latest staging as mentioned above.

287. Ans. (b) **Stage II**

Ref: William's Gynecology, Ch 31

288. Ans. (b) **Simple partial vulvectomy without lymph-adenectomy**

Ref: William's Gynecology Ch: 31

FIGO Staging of Vulvar cancer	Treatment
Stage I: Tumor confined to the vulva, Negative nodes IA: size < 2cm; stromal invasion < 1mm IB: size > 2cm; stromal invasion > 1mm	Microinvasive surgery: Simple/wide local excision. No Lymphadenectomy required
Stage II: Tumor of any size, with spread to lower urethra, lower vagina or anus with negative nodes	
Stage III: II + Regional lymph node metastasis (inguinal, femoral)	
Stage IVA: Tumor invades upper urethra, upper vagina, bladder mucosa, rectal mucosa + Nodes	Radical vulvectomy or Modified radical vulvectomy + inguinofemoral lymphadenectomy RT + Surgery
Stage IVB: Vulvar cancer with distant metastasis including pelvic lymph nodes	
	Stage IVB: Palliative therapy

Extra Mile

- **Radical Vulvectomy:** An operation that removes the entire vulva, including subcutaneous and fatty tissue, the labia minora and majora, perineal skin, and clitoris, to treat cancer.
- **Skinning Vulvectomy:** An operation that removes the skin of the vulva, including the labia majora and minora, the clitoris, and perineal skin.

289. Ans. (b) **Partial vulvectomy**

Ref: Shaws, 15th ed. pg. 943; William's Gynecology Ch 31,
Invasive CA of Vulva

Please refer to above explanation.

290. Ans. (c) **Vaginal carcinoma**

- Primary vaginal carcinoma is rare and comprises only 1 to 2 percent of all gynecologic malignancies.
- The most common histologic type of primary vaginal cancer is squamous cell carcinoma, followed by adenocarcinoma.
- Vaginal carcinoma has no direct role in infertility.

Causes of Infertility

Infertility factors	%
Male factor	30% (most common cause)
Ovarian/anovulation factors	25%
Tubal/uterine factors	25%
Cervical factors	10%
Unexplained	10%

DYSFUNCTIONAL UTERINE BLEEDING (DUB) AND DYSMENORRHEA291. Ans. (b) **Presence of endometrium at ectopic locations**

Ref: Shaw's Gynecology 16th ed. P 409-410

- Endometriosis is the occurrence of ectopic benign endometrial tissues outside the cavity of the uterus.
- The ectopic endometrial tissue responds to ovarian hormones.
- **Note:** PID closely mimics endometriosis

Endometriosis	Adenomyosis
<ul style="list-style-type: none"> • It is also a cause of DUB • Presence of endometrium outside uterus • MC site: Ovary Rarest site: CNS • It presents as chocolate cyst of ovary • Present with menorrhagia, pain, Infertility. • MC symptom: Congestive dysmenorrhea • Gold standard Inv: Laparoscopy (diagnostic + therapeutic) 	<ul style="list-style-type: none"> • Also a cause of DUB • Presence of endometrial gland in myometrium • Seen in patients around 40 years • Present with menorrhagia, dysmenorrhea and pain but <i>no Infertility</i> • Uterus is tender and enlarged: 12-14 week size • Diagnosed with Histopathology • Treatment of choice: Hysterectomy

292. Ans. (b) **Endometriosis**

Ref: Shaw's Gynecology 16th ed. P 409-410

Refer to above explanation

293. Ans. (a) **No clinical significant pelvic pathology is found**

Ref: Shaw's Gynecology 16th ed. P 471

- Dysmenorrhea means cramping abdominal pain accompanying menstruation. It can be of 2 types:
- **Primary dysmenorrhea:**
 - These are not associated with any identifiable pelvic pathology.
 - Pathogenesis of pain is attributed to a biochemical derangement.
 - It affects more than 50% postpubescent women in the age group of 18–25 years with ovulatory cycles.
- **Secondary dysmenorrhea:**
 - These are associated with the presence of organic identifiable pelvic pathology, i.e. fibroids, adenomyosis, pelvic inflammatory disease (PID) and endometriosis.
 - Unilateral dysmenorrhea occurs in a rudimentary horn of a bicornuate uterus.
 - It is also seen in some women wearing intrauterine contraceptive device (IUCD) and in cases of cervical stenosis.

TABLE: Differentiating features of primary and secondary dysmenorrhea

Differentiating features	Primary	Secondary
Onset	Within 2 years of menarche	20–30 years, maybe pre- and postmenstrual
Description	Cramping—hypogastrium, back, inner thighs	Variable dull ache
Symptomatology	Nausea, vomiting, diarrhea, headache, fatigue	Dyspareunia, infertility, menstrual disorders
Pelvic findings	Normal	Variable, depending on cause
Etiology	Excessive myometrial contraction, ischemia, excessive prostaglandin production	Endometriosis, PID, adenomyosis, fibroids, pelvic vein congestion
Management	Reassurance, analgesics, NSAIDs, antispasmodics, OC pills, in rare cases, surgery—Cotte's operation or laparoscopic uterosacral nerve ablation (LUNA)	Treatment directed to the cause

294. Ans. (d) **Anovulatory**Ref: Shaws, 15th ed. pg. 301-307

- Dysfunctional uterine bleeding is irregular, abnormal uterine bleeding that is not caused by a tumor, infection or **pregnancy**.
- Dysfunctional uterine bleeding is a disorder that occurs most frequently in women at the beginning and end of their reproductive lives.
- It is of 2 types:
- **Ovulatory**: after adolescent years and before perimenopausal years.
- **Anovulatory**: postmenarcheal, premenopausal.
- Half of the cases occur in women over 45 years of age and about one fifth occur in women under age 20.
- Dysfunctional uterine bleeding is diagnosed when other causes of uterine bleeding have been eliminated.
- Failure of the ovary to release an egg (*anovulatory*) during the menstrual cycle occurs in about 70% of women with DUB. This is probably related to a hormonal imbalance.

Extra Mile

- **Normal menstruation duration**: 28 +/- 7 days, mean of 4 days duration, not more than 7 days
- **Menorrhagia or hypermenorrhagia**: prolonged (>7 days) or excessive (>80 ml) bleeding at regular intervals
- **Metrorrhagia**: bleeding in irregular but frequent intervals, variable amount
- **Menometrorrhagia**: Prolonged bleeding at irregular intervals
- **Polymenorrhagia**: bleeding in regular intervals < 21 days
- **Oligomenorrhagia**: Regular intervals > 35 days

Endometriosis	Adenomyosis
<ul style="list-style-type: none"> • It is also a cause of DUB. • Presence of endometrium outside uterus. • MC site: ovary Rarest site: CNS • In ovary, it present at chocolate cyst ovary. • Present with menorrhagia, pain, Infertility. • MC symptom: Congestive Dysmenorrhea. • Gold standard Inv: Laparoscopy (diagnostic + therapeutic) 	<ul style="list-style-type: none"> • Also a cause of DUB • Presence of endometrial gland in myometrium • Seen in patients around 40 years. • Present with menorrhagia, dysmenorrhea and pain BUT <i>no Infertility</i>. • Uterus is tender and enlarged: 12- 14 week size. • Diagnosed with Histopathology. • Treatment of choice: Hysterectomy

295. Ans. (c) **Metrorrhagia**Ref: Shaw, 15th pg. 283296. Ans. (a) **Pelvic and abdomen USG**Ref: William's Gynecology 1st ed. Ch 11

- **Dysmenorrhea** is Cyclic pain with menstruation and accompanies most menses. This pain is classically described as cramping and is often accompanied by low backache, nausea and vomiting, headache, or diarrhea.
 - **Primary dysmenorrhea** describes cyclic menstrual pain without an identifiable associated pathology.
 - **Secondary dysmenorrhea** is cyclic menstrual pain which may frequently complicates endometriosis, leiomyomas, PID, adenomyosis, endometrial polyps, and menstrual outlet obstruction.
- The above given case is a patient of chronic pelvic pain secondary to dysmenorrhea.
- First line drug/DOC in dysmenorrhea is: NSAIDs
- If NSAIDs doesn't relieve the symptom, further work-up must be performed to rule out other pathologies.
- The next best choice for this patient is Pelvic and abdominal ultrasonography.

297. Ans. (a) **Progesterone**Ref: Shaws, 15th ed. pg. 303-304

- Puberty menorrhagia is anovulatory. Therefore our first line or **DOC in puberty menorrhagia is cyclical progestin therapy**.

FIBROID298. Ans. (a) **Pedunculated**Ref: Shaw's Gynecology 16th ed. P 410-402

- Myomectomy is the most common surgical procedure done for fibroids during caesarean section
 - *Myomectomy* refers to the removal of fibroids, leaving the uterus behind
- Pedunculated myomas can easily be removed and hemostasis can be secured at the same time without endangering mother's life.
- **Vaginal myomectomy**:
 - Indicated in submucous fibroid
 - In Cervical fibroids and pedunculated fibroid polypus
 - If more than 50% submucous fibroids project into the cavity
- **Hysteroscopic myomectomy**
 - Hysteroscopic myomectomy has become possible for **submucous fibroids** not removable by the simple vaginal route.
 - The fibroid is excised either by cautery, laser or resectoscope. It is best done under laparoscopic guidance to avoid uterine perforation.

FMGE Solutions Screening Examination

946

Extra Mile

- Anterior and posterior fibroids lodged in the pouch of Douglas cause increase in frequency and retention of urine
- Broad ligament fibroids can cause hydronephrotic and hydronephrosis

299. Ans. (b) Large size

Ref: Shaw's 16th ed. P 397

- In torsion very severe abdominal pain is experienced.
- **Book states:** "Acute pain is seen when a fibroid is complicated by torsion, hemorrhage and red degeneration."
- Pain in a rapidly growing fibroid in an elderly woman may be due to sarcoma.
- Sarcomatous change in a myoma is extremely rare and is usually associated with intramural and submucous tumors which have a higher potential for sarcomatous change than subserous tumors.
 - It is more commonly seen in a postmenopausal woman when it is observed that the tumor grows suddenly, causing pain and postmenopausal bleeding.
- A large fibroid may be observed as an abdominal tumor which grows slowly or not at all over a long period. A rapid growth only occurs during pregnancy, due to oral contraceptive hormones and malignancy. As many as 50% women are asymptomatic. These fibroids are detected during gynecological check-up or ultrasound done for unrelated symptoms.

Extra Mile

Table: Clinical symptomatology and complications associated with uterine fibromyomas

- Menstrual disturbances—menorrhagia, polymenorrhagia, intermenstrual bleeding, continuous bleeding, postmenopausal bleeding
- Infertility
- Pain—spasmodic dysmenorrhea, backache, abdominal pain
- Lump in the abdomen or mass protruding at the introitus
- Pressure symptoms on adjacent viscera—bladder, ureters, rectum
- Pregnancy losses, postpartum hemorrhage, uterine inversion
- Vaginal discharge

300. Ans. (a) Leiomyoma

Ref: Shaw's 16th ed. P 507

- Most common benign tumor of uterus is leiomyoma (fibroid).
- Most common malignant tumor of uterus is endometrial carcinoma.
- **Overall most common uterine tumor:** Leiomyoma.

Endometrial CA

- Endometrial cancer is 20–25% of all genital cancers in the developed countries (*in developing countries cervical CA still predominates due to poor screening*).
- The peak incidence of endometrial cancer is 55–70 years, 20–25% occur in perimenopausal women and only 5% develop in women below the age of 45 years.
- Seventy-five percent of the tumors are localized in the uterus when diagnosed and surgery is the cornerstone in its management.
- **There are two varieties of endometrial cancer:**
 - **Type I are estrogen-dependent** and account for 90% growths. The source of estrogen may be endogenous or exogenous. They are well-differentiated with good prognosis.
 - **Type II are estrogen-independent** and develop in atrophic endometrium. They are mostly undifferentiated with poor prognosis. P₃ mutations are recognized in type II tumors.

301. Ans. (b) Cervical

Ref: Shaw's, 16th ed. pg. 392

- The distribution of myoma/Fibroid in the body of the uterus is broadly classified as follows (Figure):
- Intramural (interstitial) 75%
- Submucous 15%
- Subserous 10%
- The majority of myomas arise in the uterus. Tumors can therefore be classified as uterine and extrauterine.
- The uterine growth is further divided into those that arise from the body and those that arise from the cervix.

FIGURE: Varieties of submucous fibroid. Various anatomical sites of fibromyomas

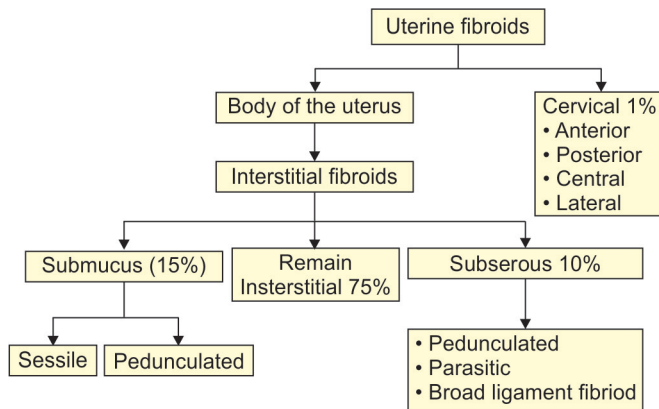

Cervical Fibroid

- Cervical fibroid is a single fibroid encountered in 1% of all fibroids. It may develop as a central, anterior, posterior fibroid or grow laterally in the broad ligament.

Symptoms

- A cervical fibroid exerts pressure on the bladder, ureter and in rare cases on the rectum. A woman may feel a lump in the lower abdomen. **During pregnancy, it can cause retention of urine.** Obstructed Labor occurs if the cervical fibroid lies below the presenting part.

302. Ans. (c) Subserous fibroid

Ref: Shaws, 15th ed. pg. 359

- Uterine fibroids are noncancerous growths of the uterus that often appear during childbearing years. It is aka leiomyomas
- They aren't associated with an increased risk of uterine cancer and almost never develop into cancer.

Types

- Intramural fibroids** are located within the wall of the uterus and are the **most common type**.
- Subserosal fibroids** are located underneath the mucosal (peritoneal) surface of the uterus and can become very large. They can also grow out in a papillary manner to become pedunculated fibroids.
 - Therefore hysteroscopic excision is not possible.
 - It can be resected laposcopically or by open laparotomy.
- Submucosal fibroids** are located in the muscle beneath the endometrium of the uterus and distort the uterine cavity; even small lesions in this location may lead to bleeding and infertility
- Cervical fibroids** are located in the wall of the cervix (neck of the uterus)

303. Ans. (a) Subserous fibroid

Ref: Shaws, 15th ed. pg. 359

Please refer to above explanation.

304. Ans. (a) Conservative management

Ref: Shaws, 15th ed. pg. 364;
William Obstetrics 23rd ed. Ch 40

- Uterine leiomyomas (**fibroids**) are common benign smooth muscle tumors. Their incidence during pregnancy is probably about 2 percent and depends on population characteristics and the frequency of routine sonography.
- Treatment of symptomatic myomas consists of analgesia and observation.** Most often, signs and symptoms abate within a few days, but inflammation may stimulate labor.
- Surgery is **rarely** necessary during pregnancy.

305. Ans. (d) All of the above

Ref: Shaws, 15th ed. pg. 359; Williams Gynecology Ch: 9

- Leiomyomas are benign smooth muscle neoplasms that typically originate from the myometrium. They are often referred to as uterine myomas, and are incorrectly called **fibroids** because the considerable amount of collagen contained in many of them creates a fibrous consistency.
- Drugs used to decrease the size of the fibroid:
 - GnRH analogue (Buserelin, Nafarelin, Goserelin, Triptorelin, Leuporelin acetate)
 - GnRH antagonist: Cetrorelix, Ganirelix
 - Mifepristone (anti-progesterone)
 - Danazol

CHROMOSOMAL ANOMALIES

306. Ans. (b) Tall stature

Ref: Shaws, 15th ed. /110-111; Harrison 19/e 635;
William's Gynecology, Ch 16

Short stature

**In turner syndrome**

- Deletion of genetic material from an X chromosome accounts for about two thirds of gonadal dysgenesis which leads to a condition called turner syndrome (XO).
- A 45, X karyotype is found in about half of these patients, most of whom have associated somatic defects including **short stature, webbed neck**, low hairline, shield-shaped chest, widening of long bones, STREAK GONADS, renal anomalies (Horse-shoe kidney) and cardiovascular defects (COA).
- Other features of turners syndrome is summarized in the image given.

307. Ans. (d) **All of the above**

Ref: Shaws, 15th ed. /110-111, Harrison, 19th ed. pg. 635;
DC Dutta, 6th ed. pg. 422-423

Please refer to above explanation.

308. Ans. (a) **45 XO**

Ref: Shaws 15th ed. /110-111; Harrison 19/e 635;
William's Gynecology Ch 16

309. Ans. (c) **Coarctation of aorta**

Ref: Shaws, 15th ed. pg. 111, DC Dutta, 6th ed. pg. 422-423

- Cardiac anomaly seen with turner syndrome is *coarctation of aorta*.
- Single most common cause of increased mortality in children with Turner's syndrome: **Cardiovascular abnormalities (COA)**
- Single most important cause of primary amenorrhea: **Turner's syndrome**.

310. Ans. (d) **PAPP**

- The triple test measures the following three levels in the maternal serum: (sensitivity 71%)
 - Alpha-fetoprotein (AFP)
 - Human chorionic gonadotropin (hCG)
 - Unconjugated estriol (UE3)
- **Quadruple test include:** triple test + Inhibin A: increases sensitivity upto 80%

The levels may indicate increased risk for certain conditions:

AFP	UE3	hCG	Associated conditions
Low	Low	High	Down's syndrome
Low	Low	Low	Trisomy 18 (Edward's syndrome)
High	-	-	NTD, omphalocele, gastrochisis

311. Ans. (b) **Mullerian agenesis**

Ref: William's Gynecology chapter 19-20

MULLERIAN AGENESIS

- Congenital absence of both uterus and vagina is referred as *müllerian aplasia, müllerian agenesis*, or *Mayer-Rokitansky-Küster-Hauser syndrome*.
- In classic müllerian *agenesis*, patients have a **shallow vaginal pouch**, only measuring up to 1.5 inches deep. **In addition, the uterus, cervix, and upper part of the vagina are absent.**
- Typically, a portion of the distal fallopian tubes are present. **In addition, normal ovaries are present**, given their separate embryonic origin.
- Most patients with müllerian *agenesis* have only small rudimentary müllerian bulbs without endometrial activity.
- Surgical excision of symptomatic rudimentary bulbs is required. With müllerian *agenesis*, traditional conception is impossible, but pregnancy may be achieved using sophisticated technology involving oocyte retrieval, fertilization, and implantation into a surrogate.

Extra Mile

- **Klinefelter syndrome, 47, XXY**, is a common sex chromosome abnormality associated with maternal age and occurs in 1/1000 live male births.
 - **Clinical features** include tall gynecoid stature, gynecomastia (with an increased risk for breast cancer), and testicular atrophy and low IQ.
- **Gonadal dysgenesis:** is the most common cause of primary amenorrhea. It is most frequently due to a chromosomal disorder or deletion of all or part of an X chromosome.

In order to figure out all the MCQs based on absence or presence of breast/uterus, following table is summarized: (Katz: Comprehensive Gynecology, 5th ed.)

Absent breast development; uterus present

- 45, X (Turner's syndrome)
- 46, X, abnormal X (e.g., short- or long-arm deletion)
- Mosaicism (e.g., X/XX, X/XX, XXX)
- 46, XX or 46, XY pure gonadal dysgenesis
- Kallman syndrome
- 17 α -hydroxylase deficiency with 46, XX
- Pituitary failure
- Hypothalamus failure

Present breast development; uterus absent

- Androgen resistance (*testicular feminization*)
- Congenital absence of uterus (*utero-vaginal agenesis*)

Absent breast development; uterus absent

- 17, 20-desmolase deficiency
- Agonadism
- 17 α -hydroxylase deficiency with 46, XY karyotype

Breast development; uterus present

- Hypothalamic etiology
- Pituitary etiology
- Ovarian etiology
- Uterine etiology

312. Ans. (c) **Ovaries and uterus are absent**

Ref: Shaws 15th ed. /101

■ FEMALE PSEUDOHERMAPHRODITISM

- Results from excessive androgen exposure of an embryo or fetus
- Müllerian-inhibiting substance is not produced.
- The karyotype is 46, XX and ovaries are present.
- Because müllerian-inhibiting substance is not produced, the ovaries and female internal ductal structures such as the **uterus, cervix, and upper vagina are present**
- Clitoral hypertrophy will be more pronounced along with fused posterior labia.
- These patients are fertile

Extra Mile

Male Pseudohermaphroditism

- Insufficient androgen exposure of a fetus destined to be a male leads to male pseudohermaphroditism.
- The karyotype is 46, XY and testes are present.
- The uterus is generally absent as a result of normal embryonic MIS production.
- These patients are most often sterile from abnormal spermatogenesis and have a smaller or inadequate phallus for sexual function.

TROPHOBLASTIC TUMORS

313. Ans. (a) **Lung**

Ref: Katz Comprehensive Gynecology, 5th ed. Ch 35

- **Choriocarcinoma** is a highly malignant tumor arising from the chorionic epithelium.
- About 3-5% of all patients with molar pregnancies develop choriocarcinoma.
 - The primary site is usually anywhere in the uterus (*secondary involvement*).
 - Rarely, it starts in the tube or ovary.
 - The lesion is usually localized nodular type.
 - **Spread:** The common sites of metastases are **lungs (80%)**, Anterior vaginal wall (30%), brain (10%), liver (10%)

Symptoms

- Irregular vaginal bleeding, at times brisk
- Continued amenorrhoea
- **Lung:** Cough, breathlessness, haemoptysis
- **Cerebral:** Headache, convulsion, paralysis or coma
- **Liver:** Epigastric pain, jaundice
- **Chest X-ray:** Shows 'cannon ball' shadow or 'snow storm' appearance due to numerous tumor emboli.

314. Ans. (b) **Serial serum β hCG level**

Ref: Katz Comprehensive Gynecology, 5th ed. Ch 35

Postmolar Surveillance

- Gestational trophoblastic neoplasia (GTN) develops after approximately 15–20% of complete moles and 2–4% in partial moles.
- **Postmolar surveillance with serial quantitative serum β -hCG levels** is the standard.

315. Ans. (d) **Chorioangioma**

- **Chorioangioma the most common tumor of the placenta**
- It is a benign vascular tumor of placental origin, and is usually found incidentally.
- They are thought to arise as a malformation of the primitive angioblastic tissue of the placenta.
- *The angiomas are perfused by the fetal circulation. Therefore when they are large, they may represent a significant impediment to fetal cardiac activity.*
- These angiomas may also sequester platelets and can in turn give a fetal thrombocytopenia
- They can also cause increase in levels of maternal serum alpha-fetoprotein (MSAFP) and may prompt sonographic evaluation.

TABLE: Modified WHO Classification of Gestational Trophoblastic Disease

Molar lesions	Nonmolar lesions
<ul style="list-style-type: none"> • Hydatidiform mole <ul style="list-style-type: none"> ■ Complete ■ Partial • Invasive mole 	<ul style="list-style-type: none"> • Choriocarcinoma • Placental site trophoblastic tumor • Epithelioid trophoblastic tumor

- **Choriocarcinoma:** A morphologic term applied to a highly malignant type of trophoblastic neoplasia in which both the cytotrophoblast and syncytiotrophoblast grow in a malignant fashion.
 - Chorionic villi are absent. These tumors tend to be hemorrhagic and necrotic
- **H. Mole:** A placental abnormality involving swollen placental villi and trophoblastic hyperplasia with loss of fetal blood vessels. There are two types: partial and complete.
 - **Partial:** A molar pregnancy with swelling of all placental villi partial. *Fetal tissues are present.*
 - **Complete:** A molar pregnancy with only villi, cord, and/or amniotic membrane elements.
- **Placental-Site Trophoblastic Tumor** A rare type of GTD arising in the uterus that secretes human placental lactogen and human chorionic gonadotrophin (hCG).
- **Note:** Persistent abnormal bleeding following normal pregnancy, abortion, or ectopic pregnancy should lead

to a consideration of the diagnosis of GTD. *The finding of pulmonary nodules on chest radiograph after normal pregnancy suggests GTD.*

INFERTILITY AND CONTRACEPTION

316. Ans. (b) IUD

Ref: DC Dutta 9th ed. P 498

- The best contraceptive method postplacental and postabortion is IUD
- IUD is the most effective reversible contraceptive methods.
- IUD is generally contraindicated in unmotivated persons, but since in this case the patient herself doesn't wish to conceive in near future, IUD is preferred.

Advantages of IUD:

- Ease of insertion
- Prevent uterine synechiae
- Longer action and inexpensive
- Contraceptive effect is reversible by simply removal of IUD
- Free of systemic metabolic side effects as seen with pills
- No need for continuous motivation (as seen with pills or barrier method). Only a single act of motivation is required.

Ideal IUD Candidate:

- In monogamous relationship
- Has borne at least one child
- No history of PID
- Has normal menstrual period
- Willing to check the IUD tail
- Has access to follow up and treatment

Timing of Insertion

- During menstruation or within 10 days of beginning of a menstrual period (diameter of cervical canal is greater)
- Can be done during the **first week after the delivery** before she leaves hospital (*immediate postpartum insertion*).
 - Special care required during first week as it has greater risk of perforation
- **Loop insertion:** Convenient time for loop insertion is 6–8 weeks after delivery (*postpuerperal insertion*)
- Can also be taken up immediately after first trimester abortion
 - IUD insertion after second trimester is NOT recommended → Increased risk of infection

317. Ans. (b) 6 weeks

Ref: DC Dutta 9th ed. P 623; Shaw's Gynecology 16th ed. P 273

- Within 6 weeks postpartum OCP's are contraindicated if the mother is lactating. In a lactating mother OCP can be started after 6 weeks (42 days) after delivery.
 - In the early phase of post-partum there is increased coagulability, which can be worsened due to estrogen containing hormonal contraceptives. Moreover lactation can also be affected.
- **The book states:** "In a nonlactating woman, OC can be started after 3 weeks of delivery, but can be given soon after an abortion, MTP or an ectopic pregnancy"
- **Note:** Contraceptive of choice during lactation: Mini-pill (aka Lactation pill)

Extra Mile

TABLE: Contraindications of combined oral contraceptives (WHO/FRM/FPP-2001)

Absolute			Relative
(A) Circulatory diseases (past or present) Thromboembolic disorder (current or past) <ul style="list-style-type: none"> • Arterial or venous thrombosis • Severe hypertension, stroke • Valvular heart disease, ischemic heart disease, angina • Diabetes with vascular complications • Focal migraine • Severe hypercholesterolemia • Smokers over age 35 years 	(B) Diseases of the liver <ul style="list-style-type: none"> • Active liver disease • Liver adenoma, carcinoma • Liver tumors 	(C) Others <ul style="list-style-type: none"> • Pregnancy • Undiagnosed genital tract bleeding • Estrogen-dependent neoplasm; e.g. breast cancer • Breast-feeding (within 6 weeks postpartum) • Major surgery or prolonged immobilization 	<ul style="list-style-type: none"> • Age >40 years • Smoker or <35 years history of jaundice • Diabetes • Gallbladder disease • Hyperlipidemia • Postbreast cancer • Breastfeeding (postpartum 6 weeks to 6 months) • Sickle cell disease • CIN

318. Ans. (b) Semen analysis, Tubal patency test, Ovulation test

Ref: Shaw's Gynecology 16th ed. P 240-42

- Infertility implies apparent failure of a couple to conceive, while sterility indicates absolute inability to conceive, for one or more reasons.
- If a couple fails to achieve pregnancy after 1 year of 'unprotected' and regular intercourse, it is an indication to investigate the couple.

PATHOLOGY OF INFERTILITY

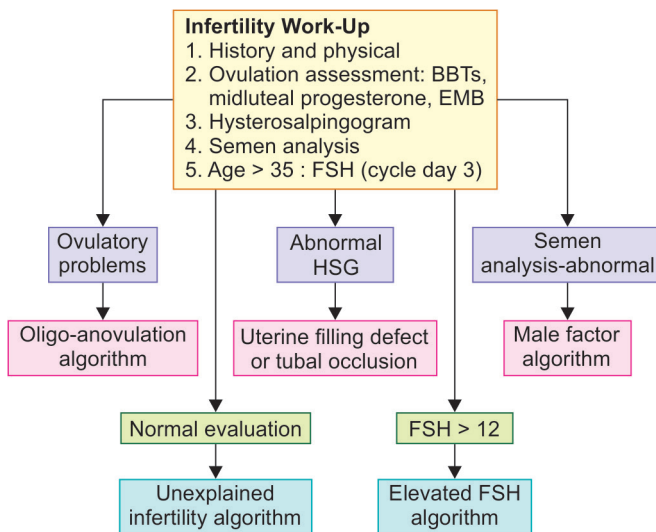

- 1/3rd cases: male is directly responsible
- 1/3rd cases: both partners are at fault
- 1/3rd cases female is directly responsible

Faults in the Male. The factors involved include:

- Disorders of spermatogenesis—50% (Ex: Hypothalamic disorder, Kallmann syndrome, orchitis etc.)
- Obstruction of the efferent ducts—30%
- Disorders of sperm motility—15% (Kartagener syndrome)
- Sexual dysfunction- Unexplained—15% (premature ejaculation, impotence, hypospadias)

Initial work-up in an infertile couple is:

- History and physical examination
- Ovulation assessment
- Hysterosalpingogram (to check tubal patency)
- Semen analysis

Note: Please refer to textbook for the complete discussion of all the algorithm

Extra Mile

Semen analysis

- It is the most important part of the male investigation.
- The best specimen is one obtained by masturbation in the vicinity of the laboratory (condom specimen is discouraged)
- Specimen best collected after a 3–5 days of abstinence.

WHO 2010 Semen Analysis

- Total volume, 2 mL (1.5 mL)
- PH—7.2–7.8
- Viscosity-3 (scale 0–4)
- Sperm concentration 20 million/mL or more (15 million/mL)
- Sperm count, >40 million/per ejaculate or more. Ten motile sperms per high field are considered normal.
- Motility >50% or more with progressive motility
- Morphology. 14% strict criteria (4%)
- Viability >75% or more (50%)
- White blood cells <1 million/mL
- Round cells <5 million/mL
- Sperm agglutination <2
- Pus cells: Absent
- **Postcoital test (Sims' or Huhner's test, PCT):** Postcoital (2 hs), cervical mucus collected study the sperm antibody in cervical mucus
- **Miller-Kurzrok test:** To study the penetration of sperms under the microscope.
 - Penetration less than 3 cm at 30 minutes is abnormal
- **Testicular biopsy:** Indicated in azoospermia to distinguish between testicular failure and obstruction in the vas deferens.
- **FSH level:** A high FSH level denotes primary gonadal failure

319. Ans. (b) Age <35 years

Ref: Shaw's Gynecology 16th ed. P 275

OCP Pills are contraindicated in:

- Cardiac disease, hypertension, smoker >35 years.
- **Diabetes:** Because carbohydrate tolerance may be reduced
- **History of thrombosis, myocardial infarct, sickle cell anemia, severe migraine:** OCP increases the risk of thrombosis and therefore it can worsen these pathologies.
- **Chronic liver diseases such as cholestatic jaundice of pregnancy, cirrhosis of liver, adenoma, porphyrias:** Adenomas have been reported and though they are benign, rupture of a hepatoma can be fatal.
- **Breast cancer:** OCP is proved to increase the risk of breast cancer in a high-risk woman. The progestogen component of OCP has a high potential for breast cancer.
- **Gallbladder disease:** Gallbladder function may be adversely affected.
- Gross obesity.
- Patient on enzyme-inducing drugs like rifampicin, and antiepileptic except sodium valproate.
- 4–6 weeks prior to planned surgery.
- **Lactating woman:** As lactation is suppressed with combined pills.
- **Monilial vaginitis:** As oral pills are associated with monilial vaginitis

FMGE Solutions Screening Examination

952

Book states: The woman can take OC for several years up to the age of 35, and thereafter until 45 years if she is healthy, slim and nonsmoker.

320. Ans. (a) Hepatic adenoma

Ref: Shaw's Gynecology 16th ed. P 274

Book states: "Liver adenomas have been reported and though they are benign, rupture of a hepatoma can be fatal. Because the hormones are metabolized in the liver, chronic liver diseases and recent jaundice contraindicate the use of OCP".

- OCP has no adverse effect on thyroid.
- It has shown to increase the risk of malignant breast CA if started in young, nulliparous females.
- No adverse effect is noted on uterine fibroids, and it is oestrogen singly that increases their size.
- It has shown to increase the risk of monilial vaginitis and endocervical CA and pituitary adenoma.

321. Ans. (c) Progesterone only pills

Ref: Shaw's Gynecology 16th ed. P 275

- Minipill/Progestogen-only pill (POP). The low-dose POP (norethisterone 350 mcg, norgestrel 75 mcg or LNG 30 mcg) have been introduced to avoid the side effects of estrogen in the combined pills.
- Given as once daily dosing, to be started within 5–7 days of menstruation and taken at the same time every day (with a leeway of 3 hours either early or late).
- Contraceptive agent of choice during lactation is POP.

TABLE: Advantages and disadvantages of POP

Advantages	Disadvantages
<p>They are recommended to:</p> <ul style="list-style-type: none"> • Lactating women • Women over 35 years • Those with focal migraine • Those intolerant to estrogen or estrogen contraindicated • Diabetic, hypertensive woman, sickle cell anemia • Faster return of fertility than COC users because ovulation is not suppressed in all cases (suppressed in 40%) 	<ul style="list-style-type: none"> • Strict daily compliance • Irregular bleeding • Amenorrhea • Depression • Headache • Weight gain • More failure rate than COCP (2–3/100 women years) • Ectopic pregnancy

Contraindications of COCP

- Previous ectopic pregnancy
- Ovarian cyst, breast and genital cancers
- Abnormal vaginal bleeding
- Active liver and arterial disease
- Porphyria
- Liver tumor
 - Because of osteopenia, it is contraindicated in adolescents and young women.

322. Ans. (a) Clomiphene citrate

Ref: Shaw's 16th ed. P 258

- Anovulation is a common problem encountered in infertility.
- **Clomiphene citrate (CC).**
 - Ovulation should be induced with CC, with a dose of 50 mg/day starting from day 2 to day 6 of the cycle for 5 days.
 - Ovulation is monitored by serial ultrasound monitoring of the follicular size, and occurrence of ovulation.
 - If the response to 50 mg CC is not satisfactory, the dose of CC should be increased to 100 mg/day from day 2 to day 6.
- If clomiphene therapy fails following 6–8 cycles, FSH and hCG therapy is recommended.
- In hypothalamic disorder, GnRH is given to stimulate the pituitary FSH and LH and the folliculogenesis monitored.

323. Ans. (c) Used for emergency contraception

Ref: Shaw, 16th ed. pg. 279

RU 486 (Mifepristone)

- RU 486 is a steroid with an affinity for progesterone receptors. It does not prevent fertilization but by blocking the action of progesterone on the endometrium, it causes sloughing and shedding of decidua and prevents implantation. It is **not teratogenic**.
- A single dose of 25–50 mg is effective in preventing pregnancy in 99.1% cases (failure rate 0.9%). It causes delayed menstruation. Can be **used for emergency contraception**.
- **Ectopic pregnancy is not avoided.** The drug is expensive as compared to LNG.
- Studies have shown that it is 95% effective during the first 50 days of pregnancy.

324. Ans. (b) Vaginal bleeding

Ref: DC Dutta, 8th ed. pg. 618

- **MC complication of IUD insertion:** Vaginal bleeding

Complication of IUD:

Early complication	Remote complication
<ul style="list-style-type: none"> • Vaginal bleed • Crampy pain • Syncopal attack • Partial or complete perforation 	<ul style="list-style-type: none"> • Pain • Abnormal menstrual bleeding • PID • Spontaneous expulsion • Perforation

325. Ans. (c) 10% of infertile couples

Ref: Shaw, 15th pg. 202, 209

Definition of infertility: Inability to conceive even after 1 year of unprotected sexual intercourse.

Relative Prevalence of Cause of Infertility

- Male Factor 25–40%
- Female Factor 40–55 %
- Both 10%
- Unexplained 10%
 - **Disorders of the spermatogenesis** are the most common cause of **male infertility**.
 - **Ovarian causes** are the most common cause of **female infertility**.

Extra Mile

- WHO cut off limit for sperm count is 20 million/ml.
- Post coital test (Sim's or Huhner's test) is done for cervical factor of infertility
- Effective sperm count is 50 million/ml.
- Testicular biopsy can differentiate obstructive lesion at vas deferens from testicular failure.
- Most treatable form of infertility is anovulation.
- **Best investigation** for tubal patency is **laproscopic chromotubation**.
- Clomiphene citrate is the ovulation induction agent of choice
- **Ferning of cervical mucus** occurs due to **estrogen**.
- Bromocriptine is used to treat hyperprolactinemia.
- Ovarian hyperstimulation syndrome is most commonly the side effect of human menopausal gonadotropin injections used for ovulation induction.

326. Ans. (a) **Azoospermia**Ref: Shaws, 15th ed. pg. 203

- Azoospermia is defined as complete absence of sperm from the ejaculate.
- It is present in about 1% of all men and in approximately 15% of infertile men.
- Azoospermia is different from aspermia, in that aspermia is the complete absence of seminal fluid emission upon ejaculation.
- In order to distinguish between obstructive and non-obstructive causes of azoospermia, **diagnostic testicular biopsy is indicated for patients with normal testicular size, at least one palpable vas deferens and a normal serum follicle-stimulating hormone level**.
- **Testicular biopsy is indicated in azoospermic men** with a normal-sized testis and normal findings on hormonal studies to rule out ductal obstruction.

Relative indications for testicular biopsy

- Ruling out partial obstruction in patients with severe oligospermia
- Evaluating patients with hypogonadotropism to select those likely responsive to treatment.
- Respond to gonadotropin replacement retrieving spermatozoa in azoospermic patients undergoing IVF or ICSI.

Extra Mile

- **Aspermia**: Absence of semen
- **Azoospermia**: Absence of sperm
- **Hypospermia**: Low semen volume
- **Oligozoospermia**: Low sperm count
- **Asthenozoospermia**: Poor sperm motility
- **Teratozoospermia**: Sperm carry more morphological defects than usual
- **Necrozoospermia**: All sperm in the ejaculate are dead

327. Ans. (b) **CuT 380**Ref: Shaws, 15th ed. pg. 549**COPPER-T IUCD**

- Can be Inserted within 5 days of intercourse
- **MOA**: prevents implantation of a fertilized ovum.
- **Advantages**:
 - It can be inserted as late as 5 days after the unprotected intercourse.
 - cheap.
 - **Failure rate is EXCEPTIONALLY low which is 0.1%.**
 - It is long lasting, can remain as ongoing contraceptive method for 3 to 5 years.

Contraceptive	Failure rate	Method/time of administration
CuT	0.1%	Inserted within 5 days of UNPROTECTED sex
Levonorgestrel (LNG)	1.1%.	One tablet should be taken within 72 hours of unprotected sex and another 12 hours later.
Combined pill	3.2 per 100 woman years	Taken within 72 hours of intercourse followed by 2 tablets taken 12 hours later (Yuzpe and Lancee method)
RU 486 (mifepristone)	Failure rate 0.9%	Single dose of 10 mg
Ethinylloestradiol	failure rate 0 to 1.5%	1 mg daily for 5 days, starting within 72 hours of unprotected sex (Haspels and Andriesse method)

328. Ans. (a) **0.1% to 0.3%**Ref: Shaw 15th ed. pg. 240

The most popular technique of tubal ligation is Pomeroy technique (a type of minilaprotomy; abdominal incision should be less than 5 cm). The failure rate is **only 0.4%**. **Catgut suture** is being used for this method of sterilization.

329. Ans. (b) **10 years**Ref: Shaw, 15th ed. pg. 227-8

Name of device	Effective period
• CuT 380A	10 years
• Nova T-Silver	5 years
• Multiload 375	5 years
• Multiload 250	3 years

330. Ans. (d) They are lipid friendly

Ref: D.C Dutta, 7th ed. pg. 543-545

- Levonorgestrel is a progestin which is used in combined OCP with estrogen.
- The combined oral steroidal contraceptives is the most effective reversible method of contraception.
- The commonly used progestins are either levonorgestrel or norethisterone or desogestrel.
- *Lipid friendly, third generation progestins are namely desogestrel, gestodene, norgestimate.*
- The oestrogens are principally confined to either ethinyl-oestradiol or menstrol.
- **Composition in OCP:** Levonorgestrel 0.15 + Ethinyl oestradiol 30
- It should normally be started on day one of the cycle.
- One tablet is to be taken daily preferably at bed time for consecutive 21 days. It is continued for 21 days and then has a seven days break.
- *Thus a simple regime of "3 weeks ON and 1 week off" is to be followed.*

331. Ans. (d) Contraceptive failure

Ref: Park's PSM, 21st ed. pg. 472

- Pearl index is used to measure the contraceptive efficacy/ contraceptive failure.
- It is defined as the number of failures per 100 women-years (HWY) of exposure.

$$PI = \frac{\text{Total accidental pregnancies}}{\text{Total months of exposure}} \times 1200$$

- Another method used to measure contraceptive failure/ efficacy is *life table analysis*.
- Life table analysis: calculates failure rates for each month of use.

332. Ans. (c) Protect from breast cancer

Ref: D.C Dutta, 8th ed. pg. 625

BENEFITS OF COMBINED ORAL CONTRACEPTIVES (COCs)

- **Contraceptive benefits:**
 - Protection against unwanted pregnancy (*failure rate- 0.1 per 100 women year*)
 - Convenient to use
 - Not intercourse related
 - Reversibility
 - Improving maternal and child health care

• **Non-contraceptive benefits:**

- Improvement of menstrual abnormalities
- Reduction of dysmenorrhea (40%)
- Reduction of menorrhagia (50%)
- Reduction of premenstrual tension syndrome (PM)
- Prevention of malignancies like Endometrial cancer (50%), Epithelial ovarian cancer 50%, Colorectal cancer (40%).
- It increases risk of breast CA, cervical CA

333. Ans. (b) Protection against cervical cancer

Ref: D.C Dutta, 7th ed. pg. 547

334. Ans. (c) Prevent release of ovum from ovary

Ref: DC Dutta, 8th ed. pg. 622

- Combined OCP is in combination with estrogen and progesterone. It acts by inhibiting ovulation.

POLYCYSTIC OVARIAN SYNDROME (PCOS)/STEIN LEVANTHAL SYNDROME

335. Ans. (b) PCOS

Ref: Shaw's Gynecology 16th ed. P 145-46

- MCC of hirsutism is: PCOS
- *Polycystic ovarian syndrome accounts for 70 to 80% of cases of hirsutism, with idiopathic hirsutism being the second most frequent cause.*
- In a female, hirsutism is defined as the presence of coarse, dark, terminal hairs distributed in a male pattern.
- Hirsutism in PCOS is secondary to hyperandrogenism.

Latest Definition of PCOS (*To include two out of three of the following*)

- Oligomenorrhea or anovulation
- Clinical and/or biochemical signs of **hyperandrogenism**
- Polycystic ovaries (with the exclusion of related disorders)

Signs and Symptoms/Consequences

- Patients with PCOS, complaints stem from varied endocrine effects and may include:
 - Menstrual irregularities, infertility, manifestations of androgen excess, or other endocrine dysfunction.

Short-term consequences	Long-term consequences
<ul style="list-style-type: none"> • Irregular menses • Hirsutism/acne androgenic alopecia • Infertility • Obesity • Metabolic disturbances • Abnormal lipid levels/ glucose intolerance 	<ul style="list-style-type: none"> • Diabetes mellitus • Cardiovascular disease • Endometrial cancer

336. Ans. (c) PCOD

Ref: Shaw's Gynecology 16th ed. P 145-46

PCOD

In PCOD, upon USG:

- There are enlarged ovaries (increased size and stroma).
- Ovarian volume will be more than 10 mm³.
- It shows 12 or more small follicles each of 2–9 mm in size placed peripherally.

Note: In PCOD, there is hyperandrogenism. Androgen suppresses the growth of the dominant follicle and prevents apoptosis of smaller follicles which are normally destined to disappear in the late follicular phase. Hence there are increased numbers of follicles.

Turner's Syndrome

- In Turner syndrome, either the short arm of X chromosome is deleted or the nucleus possesses only 45 chromosomes, i.e. 22 pairs of autosomes plus a sex chromosome XO.
- Sometimes, it is also referred as ovarian agenesis or gonadal dysgenesis because of presence of undifferentiated stromal cells with absence of sex cells, known as **streak gonads**.
- The ovaries in Turner syndrome do not contain graafian follicles, so estrogen is not produced.
- In primary amenorrhea, there is failure of HPO axis causing absence of ovarian follicles.
- In Klinefelter syndrome, there are masculine gonads.

337. Ans. (b) PCOD

Ref: Shaws, 15th ed. pg. 274; William's Gyne, Ch 17 PCOD

Please refer to above explanation for more details

Extra Mile

- **Ferriman-Gallwey Scoring System:** To quantify the degree of hirsutism
- **Most common areas affected with excess hair growth in women with PCOS include:** the upper lip, chin, sideburns, chest, and linea alba of the lower abdomen.
- Hirsutism should be distinguished from **hypertrichosis**, which is a generalized increase in lanugo, that is, the soft, lightly pigmented hair associated with some medications and malignancies.

338. Ans. (a) PCOS

Ref: Shaws, 15th ed. pg. 115-116

- **GARLAND/NECKLACE pattern on USG:** PCOS
- **Comet tail appearance:** Adenomyomatosis
- **Snowstorm appearance:** Choriocarcinoma

339. Ans. (d) Combined OCP

Ref: Williams Gynecology Ch 17

- Polycystic ovarian syndrome is also called Androgen insensitivity syndrome, where there is excess of androgen in female patient.
- Elevated androgen levels play a major role in determining the type and distribution of hair. Within a hair follicle, testosterone is converted by the enzyme 5 α -reductase to dihydrotestosterone (DHT).
- Although both testosterone and DHT convert short, soft vellus hair to coarse terminal hair, **DHT is markedly more effective than testosterone**. Conversion is irreversible, and only hairs in androgen-sensitive areas are changed in this manner to terminal hairs. As a result the most common areas affected with excess hair growth in women with PCOS include the upper lip, chin, sideburns, chest, and linea alba of the lower abdomen.
- A first-line treatment for menstrual irregularities is combination oral contraceptive pills (COCs), which will induce regular menstrual cycles. In addition, COCs reduce androgen levels, thereby, decreasing the severity of hirsutism.
- Specifically, COCs suppress gonadotropin release, which results in decreased ovarian androgen production. Moreover, the estrogen component increases SHBG levels. The progestin component antagonizes the endometrial proliferative effect of estrogen, thus reducing risks of endometrial hyperplasia due to unopposed estrogen.

PROLAPSE

340. Ans. (c) Needs to be changed every 3 months

Ref: Shaw's Gynecology 16th ed. P 356; DC Dutta 9th ed. P 293

- Ring pessary is used for prolapse
- The ring pessary is made of soft plastic polyvinyl chloride material and is available in different sizes.
- It is inserted using gel
- Pregnant woman with prolapse needs a ring pessary in the first trimester of pregnancy
 - Uterus grows abnormally, the prolapse gets reduced, and the pessary can then be removed.
- **Current indications for use of pessary are:**
 - A young woman planning a pregnancy
 - During early pregnancy
 - Puerperium
 - Temporary use while clearing infection and decubitus ulcer
 - A woman unfit for surgery
 - In case a woman refuses for surgery

341. Ans. (c) Pessary

Ref: Shaw's Gynecology 16th ed. P 359-60

- Pessary is the conservative treatment for prolapse.
- All other choices are surgical repair

FMGE Solutions Screening Examination

TABLE: Management of genital prolapse

956	Nulliparous	Abdominal sling operations
	Pregnancy Postnatal	Ring pessary up to 16 weeks • Ring pessary and pelvic floor exercises for 3-6 months • Surgery if required thereafter
	Young woman <40 years	Conservative vaginal surgery (fertility sparing surgery) • Cystocele, rectocele repair
		• Manchester repair • Sling operation
	Woman beyond 40 years and multipara	Vaginal hysterectomy and pelvic floor repair

Extra Mile

Surgeries of prolapse

- **Anterior colporrhaphy:** To repair cystocele and cystourethrocele
- **Posterior colporrhaphy:** to repair rectocele and deficient perineum
- **Fothergill's Repair (Manchester Operation):** Anterior colporrhaphy with amputation of cervix
 - Preserves menstrual and childbearing functions
- **Shirodkar's Procedure:** Anterior colporrhaphy and attachment of Mackenrodt ligaments to the cervix on each side is exposed
 - The cervix is not amputated and subsequent pregnancy complications avoided
- **Le Fort's Repair:** reserved for the very elderly menopausal patient with an advanced prolapse.
- **Sling operation:** best for nulliparous prolapse
 - Abdominal sling operation
 - Khanna sling operation
 - Abdominal wall cervicopexy

MISCELLANEOUS

342. Ans. (b) **Estrogen**Ref: Shaws, 15th ed. pg. 66-67

- HRT stands for Hormone Replacement Therapy
- Estrogen plays a key role throughout the body. It affects the brain, the bones, the skin, the heart, the blood vessels, and more. While estrogen levels lower gradually during natural menopause, they plummet with surgical menopause (*hysterectomy*).
- Hormone therapy after surgery—either with estrogen and progestin or with estrogen alone—is a way to counteract the supply of estrogen lost due to hysterectomy.
- **Women who have both the uterus and ovaries removed usually just get estrogen replacement therapy (ERT) alone.**
- **Combination therapy with both estrogen and progestin is considered in patients who have undergone oophorectomy (removal of ovaries).** That's because estrogen alone can increase the risk of cancer in the uterus. Adding progestin removes this risk.
- HRT using a combination of estrogen and progestin *can also be used* after a hysterectomy if widespread *endometriosis* is found at the time of surgery.
- **Note:** testosterone replacement is considered in patients who do not respond to estrogen alone. Some doctors recommend testosterone replacement along with estrogen replacement because testosterone helps in energy levels, mood and libido.

Factors in favor of taking HRT include:

- Family history of osteoporosis
- High risk category related to osteoporosis
- Family history of heart disease
- High risk category related to heart disease
- Severe climacteric symptoms
- Post hysterectomy

343. Ans. (c) **CO₂**Ref: Shaws, 15th ed. pg. 492

Pneumoperitoneum is created with CO₂ or nitrous oxide. CO₂ is preferred because nitrous oxide can cause explosion in the presence of volatile anaesthetic drug.

ANSWERS TO BOARD REVIEW QUESTIONS

FMGE Solutions Screening Examination

960

449. Ans. (a) **Inc FSH and LH**Ref: Shaw's 16th ed. P 66

- Menopause normally occurs between the ages of 45 and 50 years, the average age being 47 years.
- Menopause setting before the age of 40 is known as premature menopause.
- At menopause ovarian activity declines. Cessation of ovarian activity and a fall in the oestrogen and inhibin levels cause a rebound increase in the secretion of FSH and LH by the anterior pituitary gland. The FSH level may rise as much as 50-fold and LH 3–4 fold.
- There is 50% reduction in androgen production and 66% reduction in oestrogen at menopause

450. Ans. (b) **Decrease in estrogen**Ref: Shaw's 16th ed. P 66-67

- **Oestrogen is cardioprotective by maintaining:**
 - High level of high density lipoprotein (HDL)
 - Lowering the low density lipoprotein (LDL) and triglycerides.
- Oestrogen deficiency therefore can cause atherosclerosis, ischaemic heart disease and myocardial infarction.
- Oestrogen prevents atherosclerosis through its antioxidant property.

Extra Mile

- Oestrogen level of over 40 pg/mL exerts bone and cardioprotrophic effect.
- Level below 20 pg/mL may predispose to osteoporosis and ischaemic heart disease
- Post menopausal Alzheimer's disease is also related to decreased level of estrogen

451. Ans. (c) **Multiparity**Ref: Shaw's Gynecology 13th ed. P 270

- **Copper T (CuT) is a copper containing IUCD with copper wire of surface area 200 to 250 mm** is wrapped round the vertical stem of a polypropylene frame.

- Available CuT devices are: CuT 200, Copper 7, Multiload Copper 250, CuT 380, CuT 220 and Nova-T.
- These copper devices are more expensive than inert devices and exert a better contraceptive effect, with fewer side effects.
- It is preferred in multiparous women.

Contraindications of IUCD

- Suspected pregnancy
- Pelvic inflammatory disease (PID), lower genital tract infection
- Presence of fibroids—because of misfit
- Menorrhagia and dysmenorrhoea, if Copper T is used
- Severe anaemia
- Diabetic women who are not well controlled—because of slight increase in pelvic infection
- Heart disease—risk of infection
- Previous ectopic pregnancy
- Scarred uterus
- Preferably avoid its use in unmarried and nulliparous patients because of the risk of PID and subsequent tubal infertility
- LNG IUCD in breast cancer
- Abnormally shaped uterus, septate uterus

Extra Mile

- Mirena (32 x 32 mm) contains 52 mg LNG, eluting 20 mcg daily. It can be retained for 5 years,
- Failure rate of mirena: 0.1–0.4 per 100 woman years.

452. Ans. (a) **Ovulation**

- **Mittelschmerz pain** (intermenstrual pain) is one sided lower abdominal pain associated with ovulation, which occurs during mid cycle or 14 days before the next menstrual cycle.
- It usually lasts a few minutes to few hours.

ANSWERS TO IMAGE-BASED QUESTIONS453. Ans. (a) **Trichomonas**

The image shows presence of anaerobic flagellated protozoan parasite, which causes vaginitis in women with development of greenish malodorous discharge.

454. Ans. (b) **Cusco speculum**455. Ans. (b) **Hegar dilator**456. Ans. (a) **Bacterial vaginosis**

The image shows *presence of clue cells* which are vaginal epithelial cells, coated with bacteria. The patient presents with whitish vaginal discharge with a fishy odor.

457. Ans. (a) **Interstitial part**

The image shows a fallopian tube with ovary seen close to the fimbrial end of the tube. The chances of ectopic pregnancy is highest in ampulla (choice c), and least in interstitial part (Choice a).

458. Ans. (a) **Hydrosalpinx**

459. Ans. (c) **Sims speculum**

460. Ans. (b) **Vulsellum**

461. Ans. (a) **Uterine sound**

462. Ans. (a) **Outlet forceps**

Keilland forceps

Piper forceps

463. Ans. (d) **Cryotherapy probe**

The shown image is cryotherapy probe.
Used in cervical cancer

EAR AND ITS DISEASES

MOST RECENT QUESTIONS 2019

1. **Narrowest part of airway in infant:**
 - a. Glottis
 - b. Subglottis
 - c. Supraglottis
 - d. Epiglottis
2. **A 15 year boy presents with recurrent episodes of epistaxis, unilateral obstruction of nostril. Most likely cause:**
 - a. Nasal polyp
 - b. Angiofibroma
 - c. Nasopharyngeal CA
 - d. Pharyngitis
3. **Abductor of vocal cord:**
 - a. Posterior cricoarytenoid muscle
 - b. Interarytenoid muscle
 - c. Cricothyroid muscle
 - d. Thyroarytenoid muscle
4. **In ranula management which of the following step is correct?**
 - a. Excision of ranula and sublingual gland duct
 - b. Excision of only the cystic swelling
 - c. In large ranula marsupialization not preferred
 - d. In small ranula marsupialization is preferred
5. **High tracheostomy is done in which condition?**
 - a. Laryngeal carcinoma
 - b. Laryngeal stenosis
 - c. Respiratory obstruction
 - d. Foreign body
6. **A patient presented with profound sensorineural deafness, not responding to hearing aids, with intact auditory nerve function. Which of the following procedure is preferred in this patient?**
 - a. BAHA
 - b. Cochlear implant
 - c. Brainstem implant
 - d. Tympanoplasty
7. **A patient presented with nasopharyngeal CA with bilateral LN, epistaxis and hearing loss. What is the most common cause of deafness in this patient:**
 - a. Nerve deafness
 - b. Ossicular damage
 - c. Serous otitis media
 - d. Auditory canal obstruction

8. **Nasal mass with extension from maxillary sinus is most likely a case of:**
 - a. Antrochoanal polyp
 - b. Ethmoid polyp
 - c. Glomus tumor
 - d. Rhinoscleroma

ANATOMY OF AURICLE AND EXTERNAL AUDITORY CANAL & EMBRYOLOGY

9. **Which of the following is the derivative of first pharyngeal arch:** *(Recent Pattern Question 2018-19)*
 - a. Stapedius muscle
 - b. Anterior belly of digastric muscle
 - c. Posterior belly of digastric muscle
 - d. Hyoid bone
10. **What is the Ossicles-lever ratio?** *(Recent Pattern Question 2018)*
 - a. 1.3:1
 - b. 1.8:1
 - c. 21:1
 - d. 14:1
11. **Endolymph is secreted by:** *(Recent Pattern Question 2018)*
 - a. Basilar membrane
 - b. Reissner's membrane
 - c. Stria vascularis
 - d. Tectorial membrane
12. **Surgical landmark for mastoid antrum:** *(Recent Pattern Question 2017)*
 - a. Korner septum
 - b. MacEwen's triangle
 - c. Fallopian triangle
 - d. Antral triangle
13. **Which muscle arises from 4th pharyngeal arch:** *(Recent Pattern Question 2016)*
 - a. Cricothyroid
 - b. Cricoarytenoid
 - c. Posterior cricoarytenoid
 - d. Thyroarytenoid
14. **Ear lobule is made of:**
 - a. Skin only
 - b. Cartilage
 - c. Skin with fat
 - d. Fibrous tissue
15. **All of the following nerves supply auricle of ear EXCEPT?**
 - a. Greater auricular nerve
 - b. Lesser petrosal nerve
 - c. Auriculotemporal nerve
 - d. Lesser Occipital nerve

16. All of the following nerves supply the medial aspect of auricle EXCEPT:
 - a. Greater auricular nerve
 - b. Lesser occipital nerve
 - c. Facial nerve
 - d. Auriculotemporal nerve
 17. Major portion of auricle is supplied by:
 - a. Greater auricular nerve
 - b. Lesser occipital nerve
 - c. Facial nerve
 - d. Auriculotemporal nerve
 18. Arnold nerve is a branch of:
 - a. Vagus nerve
 - b. Hypoglossal nerve
 - c. Glossopharyngeal nerve
 - d. Trigeminal nerve
 19. Jacobson's nerve is a branch of:
 - a. Vagus nerve
 - b. Hypoglossal nerve
 - c. Glossopharyngeal nerve
 - d. Trigeminal nerve
 20. Which of these is not a derivative of 3rd pharyngeal/branchial arch:
 - a. Lesser cornu
 - b. Greater cornu
 - c. Stylopharyngeus
 - d. Lower hyoid
 21. Greater cornu of hyoid is derived from which branchial arch:
 - a. I
 - b. II
 - c. III
 - d. IV
 22. Which of the following intrinsic laryngeal muscles is not derived from branchial arch VI:
 - a. Cricothyroid muscle
 - b. Interarytenoid muscle
 - c. Thyroarytenoid muscle
 - d. Cricothyroid muscle
 23. Thyroid cartilage is derived from which branchial arch:
 - a. II and III
 - b. III and IV
 - c. IV and V
 - d. IV and VI
 24. Stapes is derived from which branchial arch:
 - a. I
 - b. II
 - c. III
 - d. IV
 25. All are derived from branchial arch EXCEPT:
 - a. Ultimobranchial body
 - b. Stapes
 - c. Laryngeal cartilage
 - d. Mandible
 26. All are true about external auditory meatus EXCEPT:
 - a. It extends from the bottom of concha to tympanic membrane & measures 24 cms in length
 - b. Fissure of santorini in cartilaginous part can transmit infection to the parotid or superficial mastoid infection.
 - c. Foramen of Huschke may present from Antero-inferior part of bony canal
 - d. Outer 1/3rd is bony and inner 2/3rd is cartilaginous
 27. Length of cartilaginous part of external auditory canal:
 - a. 1.5 cm
 - b. 2.4 cm
 - c. 8 cm
 - d. <1 cm
 28. Foramen of Huschke is a congenital pathology located between:
 - a. Bony part of EAC and submandibular gland
 - b. Cartilaginous part of EAC and submandibular gland
 - c. Bony part of EAC and parotid gland
 - d. Cartilaginous part of EAC and parotid gland
 29. All are true about external ear EXCEPT:
 - a. Auricle is made up of frame work of single yellow elastic cartilage covered with skin
 - b. Area between tragus and crus of helix without cartilage is incisura terminalis
 - c. Cartilage from the tragus can be used in reconstructive surgery of nose
 - d. Composite grafts of cartilage & skin from pinna cannot be used for correction of defects of nasal ala
 30. What is the length of external auditory canal?
 - a. 2.5 cm
 - b. 1.5 cm
 - c. 1 cm
 - d. 2 cm
 31. Ceruminous glands are seen in which part of external auditory canal:
 - a. 2/3 outer and 1/3 inner
 - b. 1/3 outer and 2/3 inner
 - c. 1/3rd outer
 - d. 2/3rd inner
 32. Retromolar trigone is located at:
 - a. Posterior part of mandible
 - b. Ascending ramus of mandible
 - c. Submandibular area
 - d. Digastric muscle
- ## ANATOMY OF MIDDLE EAR & INNER EAR
33. Which is the peripheral receptor of hearing?

(Recent Pattern Question 2017)

 - a. Organ of corti
 - b. Ampulla
 - c. Utricle
 - d. Semicircular canal
 34. The semi-circular canal is responsible for:

(Recent Pattern Question 2017)

 - a. Hearing
 - b. Balance
 - c. Cough reflex
 - d. Sneezing reflex
 35. Promontory is seen in which wall of middle ear?

(Recent Pattern Question 2017)

 - a. Anterior
 - b. Medial
 - c. Posterior
 - d. Lateral
 36. Eustachean tube opens in:

(Recent Pattern Question 2017)

 - a. Nasopharynx
 - b. Oropharynx
 - c. Trachea
 - d. Laryngopharynx
 37. Stria vascularis is present in:

(Recent Pattern Question 2016)

 - a. Cochlea
 - b. Sacculle
 - c. Utricle
 - d. Semi-circular canals
 38. Autoconia is seen in:

(Recent Pattern Question 2016)

 - a. Utricle
 - b. Superior semicircular canal
 - c. Lateral semicircular canal
 - d. Cochlea
 39. Least blood supply goes to:

(Recent Pattern Question 2016)

 - a. Handle of malleus
 - b. Body of incus
 - c. Long process of incus
 - d. Stapes

40. Corda tympani is seen on which wall of middle ear:

- a. Anterior wall b. Medial wall
- c. Posterior wall d. Lateral wall

41. Anterior wall of middle ear is also known as:

- a. Outer wall b. Mastoid wall
- c. Carotid wall d. Jugular wall

42. Which of the following is not a content of medial wall of middle ear?

- a. Oval window
- b. Round window
- c. Processus cochleariformis
- d. Aditus ad antrum

43. Tegmen tympani separates middle ear from:

- a. Anterior cranial fossa b. Posterior cranial fossa
- c. Middle cranial fossa d. Superior cranial fossa

44. Otosclerosis is seen which wall of middle ear:

- a. Anterior b. Posterior
- c. Lateral d. Medial

45. Tensor tympani is inserted in:

- a. Tympanic membrane b. Malleus
- c. Incus d. Stapes

46. Fallopian canal contains which cranial nerve?

- a. 5 b. 6
- c. 7 d. 8

47. Length of internal acoustic meatus:

- a. 5 mm b. 1 cm
- c. 2 cm d. 3 cm

48. Shortest length of middle ear:

- a. 2 mm b. 4 mm
- c. 6 mm d. 1 cm

49. Bill's bar divides:

- a. Facial nerve and cochlear nerve
- b. Facial nerve and superior vestibular cochlear nerve
- c. Facial and inferior vestibule cochlear nerve
- d. Superior and inferior vestibule cochlear nerve

50. Cochlea main function is:

- a. Balancing b. Hearing
- c. Otolith organ d. Olfaction

51. All are required for balancing EXCEPT:

- a. Visual system b. Olfactory system
- c. Proprioception d. Vestibule and cochlea

52. Cupula is seen in:

- a. Saccule
- b. Utricle
- c. Semicircular canal
- d. Cochlea

53. Stria vascularis are seen in:

- a. Vestibule
- b. Utricle
- c. Cochlea
- d. Middle ear

TESTS OF AUDITORY SYSTEM

54. Why is cold water not used in syringing?

(Recent Pattern Question 2018-19)

- a. Cold water leads to wax impaction
- b. Cold water leads to foreign body impaction
- c. Can cause tympanic membrane rupture
- d. Can cause vertigo

55. In audiometry a notch is seen at 4000 Hz. This is most likely due to: *(Recent Pattern Question 2018-19)*

- a. Otosclerosis
- b. Meniere's disease
- c. Noise induced hearing loss
- d. Age related hearing loss

56. Maximum tolerable noise according to Government of India guidelines: *(Recent Pattern Question 2018)*

- a. 85 dB, 8 hrs/day for 5 days per week
- b. 90 dB in 8 hrs/day for 5 days per week
- c. 95 dB, 8 hrs/day for 5 days per week
- d. 115 dB, 8 hrs/day for 6 days per week

57. The graph for otosclerosis in tympanometry is:

(Recent Pattern Question 2017)

- a. Ad b. As
- c. A d. B

58. Which test is used for screening for neonatal deafness?

(Recent Pattern Question 2017)

- a. Tuning fork test b. ABR
- c. Impedance audiometry d. Tympanometry

59. Otoacoustic emission comes from:

(Recent Pattern Question 2017)

- a. Utricle b. Cochlea
- c. Saccule d. Semicircular canal

60. Tone decay is seen in: *(Recent Pattern Question 2017)*

- a. Otosclerosis b. Glue ear
- c. Ossicular disruption d. Acoustic neuroma

61. Gelle test is done for: *(Recent Pattern Question 2016)*

- a. Otosclerosis b. Senile deafness
- c. Traumatic deafness d. Congenital deafness

62. Negative Rinne test indicates:

(Recent Pattern Question 2016)

- a. Meniere's disease b. CSOM
- c. BPPV d. Sensorineural hearing loss

63. Pure tone audiometry symbol 'X' is used for

(Recent Pattern Question 2016)

- a. Right ear, air conduction
- b. Right ear, bone conduction
- c. Left ear, air conduction
- d. Left ear, bone conduction

64. Most common frequency of tuning fork used in ENT:

- a. 256 Hz b. 512 Hz
- c. 1024 Hz d. 2048 Hz

65. Which of the following is the best tuning fork to do Rinne's and Weber's tests?

- a. 128 Hz
- b. 256 Hz
- c. 512 Hz
- d. 1024 Hz

66. All of the following are tuning fork test EXCEPT:

- a. Gelle test
- b. Rinne test
- c. Schwabach's test
- d. Pure tone audiometry

67. Otoacoustic emissions are derived from:

- a. Tympanic membrane
- b. Ossicles
- c. Cochlea
- d. Vestibule

68. Sensorineural deafness in neonates is best diagnosed by:

- a. ABR
- b. Audiometry
- c. Tympanometry
- d. Electrocochleography

69. Caloric test is done for assessing:

- a. Vestibular function
- b. Auditory function
- c. Tactile function
- d. Ocular function

70. Calorie test with warm and cold water stimulates which of the following structures?

- a. Sacculle
- b. Lateral semicircular canal
- c. Superior semicircular canal
- d. Posterior semicircular canal

71. Vestibular function is tested by:

- a. Fistula test
- b. Acoustic reflex
- c. Galvanic stimulation
- d. Impedance Audiometry

DISEASES OF EAR, TREATMENT AND REHABILITATION

72. Mainstay of treatment of Glue ear:

(Recent Pattern Question 2018-19)

- a. Antibiotics
- b. Nasal decongestants + Antibiotics
- c. Myringectomy + Gromet insertion
- d. Myringotomy + Gromet insertion

73. The drug whose side effect is cochleotoxicity:

(Recent Pattern Question 2018)

- a. Kanamycin
- b. Streptomycin
- c. Gentamycin
- d. Minocycline

74. Most common cause of facial nerve palsy:

(Recent Pattern Question 2018)

- a. Idiopathic Bell's palsy
- b. Herpes zoster oticus
- c. Mastoid surgery
- d. Chronic suppurative otitis media

75. Flamingo pink appearance of tympanic membrane is seen in:

(Recent Pattern Question 2018)

- a. Glomus tumor
- b. Otosclerosis
- c. Acoustic neuroma
- d. Cholesteatoma

76. Ear pain, tinnitus and vertigo along with feeling of blocked ear is a feature of: (Recent Pattern Question 2018)

- a. Gradenigo's syndrome
- b. Cantrell disease
- c. Costen syndrome
- d. Lermoyez syndrome

77. A patient presents with symptoms of facial nerve palsy and bulla on tympanic membrane and meatus. Possible diagnosis: (Recent Pattern Question 2017)

- a. Bells' palsy
- b. Ramsay hunt syndrome
- c. Herpes oticus
- d. Melkersson syndrome

78. Granulomatous lesion in tympanic membrane and middle ear lateral wall is seen in: (Recent Pattern Question 2016)

- a. CSOM
- b. Bullous myringitis
- c. Chronic myringitis
- d. Herpes zoster otiticus

79. Ventilation tube is put in the ear in cases of:

(Recent Pattern Question 2016)

- a. Otosclerosis
- b. Labrynthitis
- c. Serous otitis media
- d. CSOM

80. Impaction of wax is treated by:

(Recent Pattern Question 2016)

- a. Syringing
- b. Softening followed by syringing
- c. Instrumentation
- d. Suction

81. In tympanic membrane perforation, graft is taken from temporalis muscle fascia. What type of graft this:

(Recent Pattern Question 2016)

- a. Autograft
- b. Allograft
- c. Xenograft
- d. Isograft

82. Normal hearing range:

- a. 20–20,000 Hz
- b. 30–30,000 Hz
- c. 200–2000 Hz
- d. 300–3000 Hz

83. According to WHO moderate hearing loss is defined at:

- a. 30–40 dB
- b. 41–60 dB
- c. 56–70 dB
- d. 71–90 dB

84. Noise induced hearing loss is seen maximum at:

- a. 1–2 khz
- b. 3–4 khz
- c. 5–6 khz
- d. 7–10 khz

85. Myringitis bullosa is commonly caused by:

- a. Bacteria
- b. Virus
- c. Fungi
- d. Protozoa

86. Bullous myringitis is caused by:

- a. Virus
- b. Bacteria
- c. Fungus
- d. Autoimmune

87. Acute otitis media is most commonly caused by:

- a. Streptococcus pneumoniae
- b. Hemophilus influenzae
- c. Staphylococcus aureus
- d. Klebsiella pneumoniae

88. Which of the following is resorbed in otitis media development:

- a. Pus
- b. Blood
- c. Air
- d. All of the above

89. According to TOS classification of chronic otitis media in which stage is the retraction pocket adherent to the handle of malleus and full extent of the retraction pocket can be clearly seen.
 - a. Stage 1
 - b. Stage 2
 - c. Stage 3
 - d. Stage 4
90. All are extracranial complications of chronic otitis media EXCEPT:
 - a. Ossicular damage
 - b. Petrositis
 - c. Gradenigo syndrome
 - d. Lateral sinus thrombophlebitis
91. Most common intracranial manifestation of late chronic otitis media:
 - a. Brain abscess
 - b. Cerebellar abscess
 - c. Lateral sinus thrombophlebitis
 - d. Labyrinthine fistula
92. Most common extracranial complication of CSOM:
 - a. Meningitis
 - b. Ossicle damage
 - c. Mastoiditis
 - d. Labyrinthine fistula
93. Most common type of hearing loss in TB otitis media
 - a. Conductive hearing loss
 - b. SNHL
 - c. Presbycusis
 - d. Hyperacusis
94. Which one of the following is classical sign of tubercular otitis media?
 - a. Marginal perforation of tympanic membrane
 - b. Multiple perforation of pars tensa
 - c. Large central perforation of tympanic membrane
 - d. Attic perforation
95. Which of the following ear ossicle is 1st to get affected in otitis media?
 - a. Long process of incus
 - b. Stapes
 - c. Handle of malleus
 - d. Body of malleus
96. Gardenigo's syndrome involves which cranial nerve:
 - a. CN IV, V
 - b. CN V, VI
 - c. CN VII, VIII
 - d. CN IX, X
97. Which is not a component of Gardenigo's syndrome:
 - a. Deafness
 - b. Ear discharge
 - c. Retroorbital pain
 - d. Double vision
98. Which is a causative organism for malignant otitis externa:
 - a. Virus
 - b. Bacteria
 - c. Fungi
 - d. Protozoa
99. Malignant otitis externa affects which cranial nerve:
 - a. 7th
 - b. 8th
 - c. 9th
 - d. 10th
100. Ramsay hunt syndrome is due to:
 - a. Herpes zoster virus
 - b. Herpes simplex virus
 - c. Varicella zoster
 - d. Pseudomonas
101. What will be the probable site of lesion causing slowly progressive facial palsy?
 - a. Skull
 - b. Parotid
 - c. Geniculate ganglion
 - d. Middle ear
102. Schwartz's sign is seen in:
 - a. Otosclerosis
 - b. Meniere's disease
 - c. Retrocochlear lesion
 - d. None
103. Carhart's notch dips at:
 - a. 2 Hz
 - b. 200 Hz
 - c. 2000 Hz
 - d. 2000 MHz
104. Which of the following is earliest and consistent symptom of glomus tumor?
 - a. Hoarseness
 - b. Tinnitus
 - c. Otorrhea
 - d. Dysphagia
105. Hennebert sign is seen in:
 - a. Otosclerosis
 - b. Vestibular neuritis
 - c. Menier's disease
 - d. Rotatory nystagmus
106. Hearing defect in menier's disease:
 - a. Hyperacusis
 - b. Hypoacusis
 - c. Diplacusis
 - d. Paracusia Willi
107. In case of BPPV, which semicircular canal is affected:
 - a. Lateral semicircular canal
 - b. Posterior semicircular canal
 - c. Anterior semicircular canal
 - d. Superior semicircular canal
108. Referred pain in the ear is commonly from:
 - a. Mandibular cancer
 - b. Carcinoma of tongue
 - c. Laryngeal cancer
 - d. Maxillary carcinoma
109. Trotter's triad consists of all of the following EXCEPT:
 - a. Palatal paralysis
 - b. Trigeminal Neuralgia
 - c. Sensorineural deafness
 - d. Conduction deafness
110. Which of the following is most prominent symptom of acoustic neuroma?
 - a. Ataxic gait
 - b. Diplopia
 - c. Sensorineural hearing loss
 - d. Parasthesia
111. Which one of the following is not a feature of adenoid hypertrophy?
 - a. Dull expression
 - b. Open mouth
 - c. Pinched up nose
 - d. Crowding of lower tooth
112. Adenoidectomy is contraindicated in:
 - a. Glue ear
 - b. Recurrent rhinosinusitis
 - c. Mouth breathing
 - d. Cleft palate
113. All of the following are the indications of adenoidectomy EXCEPT?
 - a. Obstructive sleep apnea
 - b. Allergic rhinitis
 - c. Recurrent glue ear
 - d. Prior to orthodontic treatment
114. Adenoidectomy with Grommet insertion is treatment of choice for:
 - a. Serous otitis media in adults
 - b. Serous otitis media in children
 - c. Adenoiditis in children
 - d. Otitis interna in children

115. A 5-year-old child presents to your clinic with complaint of recurrent respiratory tract infection. Mother complains about this recurrent infection, mouth breathing and decreased hearing. Treatment of choice for this condition is:

- a. Myringoplasty b. Adenoidectomy
- c. Grommet insertion d. Myringotomy

116. Graft used for tympanoplasty:

- a. Antral fascia b. Temporalis fascia
- c. Preauricular fascia d. Postauricular fascia

117. Electrode of cochlear implant is passed via:

- a. Round window
- b. Oval window
- c. Lateral semicircular canal
- d. Around the auditory nerve

NOSE AND PARANASAL SINUSES

118. Most common symptom of Nasopharyngeal cancer:

(Recent Pattern Question 2018-19)

- a. Airway Obstruction b. Conductive hearing loss
- c. Neck swelling d. Epistaxis

119. Continuous watery discharge from nose after trauma is most likely a feature of: *(Recent Pattern Question 2018-19)*

- a. CSF otorrhea b. Common colds
- c. CSF Rhinorrhea d. Anterior epistaxis

120. After a head trauma a patient is unable to smell coffee and asafoetida but can smell ammonia. Which of the following statements is true about the patient

(Recent Pattern Question 2018-19)

- a. Ammonia is used for testing olfactory nerve
- b. The Olfaction system is not damaged
- c. Ammonia irritates trigeminal nerve
- d. All of the above

121. A male trauma patient admitted was to hospital with watery discharge from nose. On investigation it showed damage in cribriform plate. What is the possible diagnosis? *(Recent Pattern Question 2018)*

- a. CSF rhinorrhea b. Vasomotor rhinitis
- c. Allergic rhinitis d. Atrophic rhinitis

122. Young operation is done in:

(Recent Pattern Question 2018)

- a. Otosclerosis b. Atrophic rhinitis
- c. Viral rhinitis d. Rhinitis sicca

123. Direct branch of internal carotid artery in Kiesselbach's plexus: *(Recent Pattern Question 2018)*

- a. Sphenopalatine artery
- b. Anterior ethmoidal artery
- c. Superior labial artery
- d. Greater palatine artery

124. Samter's triad includes: *(Recent Pattern Question 2017)*

- a. Allergy, asthma, nasal polyp
- b. Allergy, asthma aspirin intolerance
- c. Aspirin sensitivity, asthma, nasal polyp
- d. Allergy, polyp, bronchiectasis

125. Which of the following is best to prevent rhinitis medicamentosa? *(Recent Pattern Question 2017)*

- a. Give oral drug to relieve symptoms
- b. Nasal drop withdrawal
- c. Antihistaminic
- d. Shift to nasal steroids

126. Which is the most common cancer of paranasal sinus?

(Recent Pattern Question 2017)

- a. Squamous cell CA b. Basal cell CA
- c. Adenoid cystic CA d. Melanoma

127. Sphenoid sinus opens into:

- a. Superior meatus b. Middle meatus
- c. Inferior meatus d. Supreme meatus

128. Location of the nasolacrimal duct:

- a. Inferior meatus b. Superior meatus
- c. Sphenothmoidal recess d. Middle meatus

129. Nasolacrimal duct opens into:

- a. Mouth opposite to 2nd molar
- b. Middle meatus of the nose
- c. Superior meatus of the nose
- d. Inferior meatus of the nose

130. Antrochoanal polyp opens in which meatus:

- a. Middle meatus b. Superior meatus
- c. Inferior meatus d. Sphenothmoidal recess

131. What is the likely source of infection for Pus from sphenothmoidal recess?

- a. Sphenoid sinus b. Ethmoidal sinus
- c. Maxillary sinus d. Frontal sinus

132. Which sinus opens in inferior meatus:

- a. Maxillary sinus
- b. Frontal sinus
- c. Anterior ethmoidal sinus
- d. None

133. Kiesselbach's plexus does not involve:

- a. Superior labial artery b. Anterior ethmoidal artery
- c. Greater palatine artery d. Posterior ethmoidal artery

134. Which of the following vessel of Little's area is not a branch of external carotid artery?

- a. Sphenopalatine artery
- b. Greater palatine artery
- c. Anterior ethmoidal artery
- d. Superior labial artery

135. Which of the following is not an etiologically derived cause for epistaxis:

- a. Nose picking
- b. Intra nasal tumours
- c. Vascular disorders or blood dyscrasias
- d. Hereditary hemorrhagic telangiectasia

- 136. Esthesioneuroblastoma arises from:**
 a. Olfactory epithelium b. Ethmoid sinus
 c. Maxillary sinus d. Sphenoid sinus
- 137. All of the following paranasal sinuses are present at birth EXCEPT:**
 a. Maxillary sinus b. Ethmoid sinus
 c. Sphenoid sinus d. None
- 138. Sinus absent at the birth:**
 a. Maxillary sinus b. Ethmoidal sinus
 c. Frontal sinus d. Temporal sinus
- 139. Radiological evidence of frontal sinus can be seen at:**
 a. 2 years b. 4 years
 c. 6 years d. 8 years
- 140. Sphenoid sinus reaches adult size at:**
 a. 5 years b. 10 years
 c. 15 years d. 28 years
- 141. Ethmoid sinus reaches adult size at:**
 a. 5 years b. 8 years
 c. 10 years d. 12 years
- 142. Largest sinus:**
 a. Frontal sinus b. Maxillary sinus
 c. Ethmoidal sinus d. Aphenoid sinus
- 143. Caldwell luc's operation is done for:**
 a. Frontal sinusitis b. Maxillary sinusitis
 c. Ethmoid sinusitis d. Sphenoid sinusitis
- 144. Young's operation is done for:**
 a. Atrophic rhinitis b. Vasomotor rhinitis
 c. Antro-choanal polyp d. Allergic rhinitis
- 145. Which one of the following is a cause of nasal obstruction in Atrophic Rhinitis:**
 a. Secretions b. Deviated nasal septum
 c. Polyp d. Crusting
- 146. Which of the following is the most common presentation of nasopharyngeal carcinoma:**
 a. Epistaxis b. Lymphadenopathy
 c. Nasal obstruction d. Apnea
- 147. Miculicz and Russel body upon biopsy is seen in:**
 a. Rhinophyma b. Rhinoscleroma
 c. Rhinosporidiosis d. Rhinolith
- 148. Rhinophyma is associated with which of the following:**
 a. Hypertrophy of sebaceous gland
 b. Infection of hair follicles
 c. Congenital deformity of the nose
 d. Hypertrophy of sweat gland
- 149. Cause of rhinosporidiosis:**
 a. Bacterial b. Viral
 c. Fungal d. Protozoa
- 150. A patient presents to you with big nasal cavity, thick crust formation and woody hard external nose. What is the probable diagnosis?**
 a. Vasomotor rhinitis b. Rhinoscleroma
 c. Rhinosporidiosis d. Atrophic rhinitis

- 151. Woody induration of rhinoscleroma is initially seen at which stage:**
 a. Catarrhal stage b. Strophic stage
 c. Granulomatous stage d. Cicatricial stage
- 152. Rhinoscleroma is caused by:**
 a. Virus b. Bacteria
 c. Fungus d. Anaerobes
- 153. Most common fractured bone on face:**
 a. Nasoethmoid bone b. Zygomatic bone
 c. Nasal bone d. Mandible
- 154. Chevallet fracture of nasal septum is:**
 a. Horizontal fracture b. Vertical fracture
 c. Comminuted fracture d. Serpentine fracture
- 155. Impact of force in case of jarjavy septal fracture is from:**
 a. Above b. Below
 c. Front d. Behind
- 156. Most common site of fracture of mandible is:**
 a. Neck of condyle b. Angle of mandible
 c. Symphysis d. Ramus

THROAT/PHARYNX

- 157. A patient presented with 3 days history of fever, throat pain, difficulty in deglutition with deviation of uvula. Most likely diagnosis: (Recent Pattern Question 2018-19)**
 a. Quinsy b. Pre-tracheal abscess
 c. Retopharyngeal abscess d. Epiglottitis
- 158. Hypoglossal nerve supplies all of these muscle EXCEPT: (Recent Pattern Question 2018-19)**
 a. Palatoglossus b. Styloglossus
 c. Genioglossus d. Hyoglossus
- 159. Picket fence fever is seen in: (Recent Pattern Question 2018-19)**
 a. Lateral sinus thrombophlebitis
 b. Quinsy
 c. Laryngitis sicca
 d. Croup
- 160. Which of the following is NOT a premalignant lesion/condition: (Recent Pattern Question 2018-19)**
 a. Chronic hypertrophic candidiasis
 b. Oral submucosal fibrosis
 c. Lichen planus
 d. Aphthous ulcer
- 161. The treatment of nasopharyngeal carcinoma: (Recent Pattern Question 2018)**
 a. Chemoradiation b. Surgery
 c. Chemotherapy d. Radiation
- 162. All of the following is seen when superior laryngeal nerve is damaged EXCEPT: (Recent Pattern Question 2018)**
 a. Aspiration b. Stridor
 c. Bowed vocal cords d. Loss of pitch

163. Recurrent laryngeal nerve supplies all EXCEPT:

(Recent Pattern Question 2018)

- a. Cricothyroid b. Cricoarytenoid
- c. Aryepiglottic d. Interarytenoid

164. Most common site for laryngeal web is:

- a. Supraglottic b. Subglottic
- c. Glottis level d. Epiglottis level

165. A 15-year-old boy presented with history of fever since 2 days, unable to swallow the food with muffled voice. On examination it is noted that right tonsil is shifted to midline. What is the diagnosis?

(Recent Pattern Question 2018)

- a. Quinicy
- b. Acute tonsillitis
- c. Parapharyngeal abscess
- d. Acute retropharyngeal abscess

166. Juvenile recurrent laryngeal papillomatosis is caused by:

(Recent Pattern Question 2018)

- a. EBV b. HSV
- c. HPV d. VZV

167. A 60-year-old man presents with right sided ear pain and dysphagia. Diagnosis: *(Recent Pattern Question 2017)*

- a. Achalasia cardia
- b. Lower esophageal carcinoma
- c. Carcinoma of pyriform sinus
- d. Postcricoid carcinoma

168. Passavant's ridge is formed by:

(Recent Pattern Question 2017)

- a. Palatopharyngeus b. Cricopharyngeus
- c. Genioglossus d. Stylopharyngeus

169. Omega shaped glottis is seen in:

(Recent Pattern Question 2017)

- a. Laryngeal TB b. Laryngomalacia
- c. Tracheal stenosis d. Laryngeal malignancy

170. Peritonsillar abscess management:

(Recent Pattern Question 2017)

- a. Drainage
- b. Analgesic plus antibiotic
- c. Analgesic with antibiotic and drainage
- d. Wait and watch

171. Elective tracheostomy is done in:

(Recent Pattern Question 2017)

- a. Deep burn of chest wall b. Radiation burn of face
- c. Burn of head and neck d. Acid burn on ingestion

172. High tracheostomy is done in:

(Recent Pattern Question 2017)

- a. Carcinoma larynx b. Laryngomalacia
- c. Thyroid surgery d. Diphtheria infection

173. A singer presents with sore throat, GERD and vocal nodule. Medical treatment:

(Recent Pattern Question 2017)

- a. Direct laryngoscopy
- b. PPI
- c. Microscopic laryngeal surgery
- d. Speech therapy plus PPI

174. Narrowest part of glottis in pediatric age group:

(Recent Pattern Question 2017)

- a. Lower part of thyroid cartilage
- b. Upper part of thyroid cartilage
- c. Glottis d. Epiglottis

175. Head and neck tumour stage III according to TNM classification involves: *(Recent Pattern Question 2016)*

- a. Unilateral mobile lymph nodes <3 cm
- b. Unilateral mobile lymph node >3 cm
- c. Bilateral mobile lymph nodes <6 cm
- d. Bilateral mobile lymph nodes >6 cm

176. Abductor of vocal cords: *(Recent Pattern Question 2016)*

- a. Cricothyroid b. Posterior cricothyroid
- c. Posterior cricoarytenoid d. Interarytenoid

177. Mouse nibbled vocal cord is seen in:

(Recent Pattern Question 2016)

- a. Laryngeal CA b. Laryngeal TB
- c. Laryngeal papilloma d. Vocal cord palsy

178. Hot potato voice is seen in: *(Recent Pattern Question 2016)*

- a. Acute epiglottitis b. Antrochoanal polyp
- c. Peri-tonsillar abscess d. Carcinoma larynx

179. Narrowest part of airway in a child:

(Recent Pattern Question 2016)

- a. Glottis b. Supraglottis
- c. Subglottis d. Epiglottis

180. Nasopharyngeal angiofibroma is most commonly seen in:

- a. Elderly males b. Females
- c. Young males d. Infants

181. A 13-year-old child presents with 3 year history of gradual swelling of maxilla with medial displacement of turbinates with mild proptosis. What is the most likely diagnosis:

- a. Olfactory neuroblastoma b. Angiofibroma
- c. Carcinoma of maxilla d. Fibrous dysplasia

182. Crypts are seen in:

- a. Tonsils b. Adenoids
- c. Lymph nodes d. Parotids

183. Mallampati score is done for assessing:

- a. Size of the airway
- b. Oral cavity of patient for intubation
- c. Mobility of neck
- d. Size of Ryle's tube

184. Which of the following muscle is not supplied by recurrent laryngeal nerve:

- a. Cricothyroid b. Lateral cricoarytenoid
- c. Thyroarytenoid d. Posterior cricoarytenoid

185. Which one of the following is an abductor of vocal cords:

- a. Posterior cricoarytenoid b. Transverse arytenoids
- c. Cricothyroid d. Aryepiglotticus

186. Recurrent laryngeal nerve supplies all EXCEPT:

- a. Cricothyroid b. Thyroaretenoid
- c. Lateral cricoaretenoid d. Posterior cricoaretenoid

- 187. Warthins tumor is seen in:**
a. Submandibular gland b. Parotid gland
c. Sublingual gland d. All of the above
- 188. Glossopharyngeal nerve supplies:**
a. Glossopharyngeus muscle
b. Stylopharyngeus muscle
c. Anterior 2/3 of the tongue
d. All of the above
- 189. Omega shaped epiglottitis is seen in:**
a. Epiglottitis b. Laryngomalacia
c. Epiglottis CA d. Tuberculosis
- 190. Thumb sign is seen in:**
a. Acute laryngitis
b. Acute epiglottitis
c. Acute laryngo trachea bronchitis
d. Acute tonsillitis
- 191. Bezold's abscess is in relation to:**
a. Digastric muscle
b. Sternocleidomastoid muscle
c. Behind the mastoid
d. Submandibular region
- 192. Which of the following sites represents the location of Bezold abscess?**
a. Digastric triangle
b. Sternocleidomastoid muscle
c. Infra temporal region
d. Sub mandibular region
- 193. All are complication of tonsillitis EXCEPT:**
a. Otitis media
b. Abscess
c. Malignant change
d. Subacute bacterial endocarditis
- 194. Which of the following cyst doesn't move upon deglutition:**
a. Ranula b. Thyroglossal cyst
c. Sublingual dermoid cyst d. Thymic cyst
- 195. In the early stage of which of the following carcinoma, no lymphatics involved:**
a. Glottic CA b. Infraglottic CA
c. Supraglottic CA d. Hypopharyngeal CA
- 196. Radiation therapy is mostly useful for:**
a. Glottis CA b. Epiglottis CA
c. Sub-glottis CA d. Supraglottis CA
- 197. Hot potato voice is seen in all EXCEPT:**
a. Quinsy b. Carcinoma thyroid
c. Carcinoma tonsil d. Streptococcus pharyngitis
- 198. Transillumination test is positive in:**
a. Branchial cyst b. Thymic cyst
c. Ranula d. Thyroglossal duct cyst
- 199. Male patient with female like voice. This condition is called:**
a. Puberphonia b. Androphonia
c. Rhinolalia aperta d. Rhinolalia clausa
- 200. Female patient with male like voice. Type of thyroplasty done:**
a. I b. II
c. III d. IV
- 201. In a patient with vocal cord paralysis, the surgeon is afraid of aspiration. Thyroplasty done in order to prevent aspiration:**
a. Type I b. Type II
c. Type III d. Type IV
- 202. Most common complication of tracheostomy:**
a. Hemorrhage
b. Tracheal stenosis
c. Recurrent laryngeal nerve damage
d. Infection

BOARD REVIEW QUESTIONS

- 203. Dysphagia lusoria is caused by:**
a. Abdominal aorta b. Thoracic aorta
c. Aberrant right subclavian artery
d. None of the above
- 204. Glomus jugulare are seen in:**
a. Hypotympanum b. Promontory
c. Epitympanum d. None of these
- 205. Endolymphatic sac decompression is treatment for:**
a. Meniere's disease b. Facial nerve injury
c. Osteosclerosis d. Otitis media
- 206. A pregnant lady comes to ENT OPD with hearing loss, tinnitus and soft spoken voice. Most probable diagnosis is:**
a. Otosclerosis b. Meniere's disease
c. Retrocochlear hearing loss
d. Malingering
- 207. A patient on ATT develops tinnitus and hearing loss due to:**
a. Isoniazid b. Pyrazinamide
c. Streptomycin d. Rifampicin
- 208. Most superior sinus in the face is?**
a. Frontal sinus b. Ethmoid sinus
c. Maxillary sinus d. Sphenoid sinus
- 209. Most common fractured bone in the face is:**
a. Nasal b. Malar
c. Zygomatic d. Temporal
- 210. Where is electrode kept in cochlear implant:**
a. Round window b. Oval window
c. Scala vestibule d. Scala tympani
- 211. Otosclerosis shows which kind of tympanogram?**
a. Low compliance b. High compliance
c. Normal compliance d. No effect on compliance

- 212. Bony nasal septal perforation is seen in:**
 a. Tuberculosis b. Syphilis
 c. Leprosy d. Rhinosporidiosis
- 213. Foramen of huschke is present in:**
 a. Bony part of external auditory canal
 b. Cartilaginous part of external auditory canal
 c. Middle ear, anterior wall
 d. Middle ear, posterior wall
- 214. "Dilator tubae" muscle is a portion of:**
 a. Tensor tympani b. Levator veli palatini
 c. Tensor veli palatini d. Salpingopharyngeus
- 215. Ostmann's pad of fat is related to:**
 a. Ear lobule
 b. Opening of eustachian tube
 c. Closing of eustachian tube
 d. Mastoid process
- 216. Which of the following test for Eustachean tube function utilizes negative pressure?**
 a. Catheterization b. Valsalva test
 c. Politzer test d. Toynbee's test
- 217. Van der hoeve syndrome is related with:**
 a. Glomus tumor b. Facial nerve paralysis
 c. Otosclerosis d. Cholesteatoma
- 218. Most common tumor of ear:**
 a. Squamous cell CA b. Basal cell CA
 c. Glomus tumor d. Acoustic neuroma
- 219. A female patient is having male like voice. Thyroplasty of choice:**
 a. Type 1 b. Type 2
 c. Type 3 d. Type 4
- 220. In the early stage of which of the following carcinoma, no lymphatics are involved:**
 a. Glottic CA b. Infraglottic CA
 c. Supraglottic CA d. Hypopharyngeal CA
- 221. Otalgia in tonsillitis. Nerve involved:**
 a. Glossopharyngeal nerve b. Trigeminal nerve
 c. Facial nerve d. Vagus nerve
- 222. Which is most effective in glue ear:**
 a. Antibiotics b. Nasal Decongestants
 c. Steroids d. Tympanoplasty
- 223. Malignant otitis externa is a:**
 a. Autoimmune condition b. Pre-malignant condition
 c. Malignant condition d. Infective condition
- 224. Brown sign is seen in:**
 a. Glomus tumor b. Meniere's disease
 c. Acoustic neuroma d. Otosclerosis
- 225. Toynbee's muscle is:**
 a. Stapedius b. Tensor tympani
 c. Scalenus minimus d. Levatorani
- 226. Rhinosporidiosis is caused by:**
 a. Protozoal infection b. Viral infection
 c. Bacterial infection d. Fungal infection
- 227. First branch of the facial nerve is:**
 a. Greater petrosal nerve b. Lesser petrosal nerve
 c. Chorda-tympani nerve d. Nerve to the stapedius
- 228. The pressure difference that can cause atmosphere and middle ear barotraumas is:**
 a. 60 mm Hg b. 60-70 mm Hg
 c. 70-80 mm Hg d. >90 mm Hg
- 229. Common age for otosclerosis is:**
 a. 5-10 years b. 10-20 years
 c. 20-30 years d. 30-45 years
- 230. Earliest symptom of glomus tumor is:**
 a. Pulsatile tinnitus b. Deafness
 c. Headache d. Vertigo
- 231. Stapedius muscle is supplied by:**
 a. 5th nerve b. 6th nerve
 c. 7th nerve d. 8th nerve
- 232. 'Trench mouth' is:**
 a. Sub mucosal fibrosis
 b. Tumor at uveal angle
 c. Ulcerative lesion of the tonsil
 d. Retention cyst of the tonsil
- 233. A diabetic patient presents with black necrotic mass filling the nasal cavity. Most likely fungal infection is:**
 a. Rhinosporidiosis b. Aspergillosis
 c. Mucormycosis d. Candidiasis
- 234. Nasal perforation in bony part is seen in:**
 a. Syphilis b. Tuberculosis
 c. Wegner's granuloma d. Allergic rhinitis
- 235. Carhart's notch is seen in:**
 a. Otosclerosis b. Acoustic neuroma
 c. Meniere's disease d. CSOM
- 236. Only abductor of the vocal cord is:**
 a. Lateral cricoarytenoid b. Posterior cricoarytenoid
 c. Cricothyroid d. Thyroarytenoid
- 237. The most common location of vocal nodules is:**
 a. Junction of the ant: 1/3 and posterior 2/3
 b. Junction of the ant: 2/3 and posterior 1/3
 c. Junction of the posterior ¼ and ant: 2/3
 d. Anterior commissure
- 238. Caldwell luc operation is done in:**
 a. Maxillary sinusitis b. Ethmoidal sinusitis
 c. Sphenoidal sinusitis d. Frontal sinusitis
- 239. 'Steeple sign' on AP radiograph is seen in:**
 a. Laryngotracheobronchitis
 b. Epiglottitis
 c. Retrobulbar abscess
 d. Laryngeal diphtheria
- 240. Mastoid tip is involved in:**
 a. Bezold abscess
 b. Luc's abscess
 c. Citelli's abscess
 d. Parapharyngeal abscess

- 241. Most common organism causing CSOM:**
- Moraxella catarrhalis
 - Hemophilus influenzae
 - Streptococcus pneumoniae
 - Pseudomonas
- 242. Recurrent polyp are seen in:**
- Antrochoanal polyp
 - Ethmoidal polyp
 - Nasal polyp
 - Hypertrophic turbinate
- 243. Acute tonsillitis is caused commonly by:**
- Parainfluenza virus
 - Beta-hemolytic streptococcus
 - Staphylococcus aureus
 - Moraxella
- 244. A 17-year-male presented with swelling in the cheek with recurrent epistaxis. Most likely diagnosis:**
- Angiofibroma
 - Carcinoma nasopharynx
 - Rhabdomyosarcoma
 - Ethmoidal polyp
- 245. Oro-antral fistula is seen most commonly in:**
- Dental extraction
 - Carcinoma maxilla
 - Mucocele of the maxilla
 - Fracture of the maxilla
- 246. Most common intracranial complication of CSOM:**
- Lateral sinus thrombosis
 - Meningitis
 - Temporal lobe abscess
 - Orbital cellulitis
- 247. Mikulicz cell is seen in:**
- Rhinoscleroma
 - Rhinosporidiosis
 - Aspergillosis
 - TB
- 248. Reactionary hemorrhage occurs within:**
- 24 hours
 - 48 hours
 - 72 hours
 - 5 days
- 249. Bill's bar divides:**
- Facial nerve and cochlear nerve
 - Facial nerve and superior vestibular nerve
 - Facial and inferior vestibule cochlear nerve
 - Superior and inferior vestibule cochlear nerve
- 250. Most common type of hearing loss in TB otitis media:**
- Conductive hearing loss
 - SNHL
 - Presbycusis
 - Hyperacusis
- 251. Antrochoanal polyp opens in which meatus:**
- Middle meatus
 - Superior meatus
 - Inferior meatus
 - Sphenoethmoidal recess
- 252. Young's operation is done for:**
- Atrophic rhinitis
 - Vasomotor rhinitis
 - Antro-choanal polyp
 - Allergic rhinitis
- 253. Degree of Eustachian tube from horizontal line is:**
- 35°
 - 45°
 - 55°
 - 65°
- 254. Space of Tucker is seen in:**
- Larynx
 - Oesophagus
 - Femoral canal
 - Laparoscopic approach to hernia
- 255. Which of the following syndrome is associated with Anosmia?**
- Kallmann's syndrome
 - Turner's syndrome
 - Down's syndrome
 - Klinefelter's syndrome
- 256. Bryce's sign is seen in:**
- Laryngocele
 - Post cricoid carcinoma
 - Angiofibroma
 - Chronic tonsillitis
- 257. Isthmus of thyroid corresponds to which tracheal rings?**
- 1-3
 - 2-4
 - 4-6
 - 6-8
- 258. A patient presents with diplopia, fever and ear discharge. The most probable diagnosis is:**
- CSOM
 - Meningitis
 - Lateral sinus thrombosis
 - Petrositis
- 259. Ground glass appearance of maxillary sinus is seen in:**
- Maxillary sinusitis
 - Maxillary carcinoma
 - Maxillary polyp
 - Maxillary fibrous dysplasia
- 260. Mucocele is commonest in which among the following sinuses?**
- Frontal
 - Maxillary
 - Ethmoid
 - Sphenoid
- 261. Schuller's view and law's view is for:**
- Sphenoid sinus
 - Mastoid air cells
 - Foramen ovale and spinosum
 - Carotid canal
- 262. Most common nerve damage in maxillary fracture:**
- Supraorbital nerve
 - Infraorbital nerve
 - Facial nerve
 - Lingual nerve
- 263. SADE's classification is used for:**
- Cholesteatoma
 - Pars Flaccida
 - Pars Tensa
 - ASOM
- 264. Who described Meniere's disease first?**
- Arthur Toynbee
 - Valsalva
 - Prosper Meniere
 - MacEwan
- 265. Cochlear aqueduct connects:**
- Middle ear to subarachnoid space
 - Inner ear to middle ear
 - Inner ear to subarachnoid space
 - Inner ear to nasal cavity
- 266. Mouse nibbled appearance of vocal cord is seen in:**
- Vocal cord palsy
 - Vocal nodules
 - Larynx Ca
 - TB larynx
- 267. Gutzmann pressure test is done for:**
- Laryngomalacia
 - Puberphonia
 - Laryngeal polyps
 - Vocal cord palsy
- 268. Inability to vocalise is:**
- Aphonia
 - Mutism
 - Alogia
 - Dysarthria
- 269. Otolith organs are concerned with function of:**
- Vestibular reflex
 - Position sense
 - Linear acceleration
 - Angular acceleration
- 270. Frequency range in normal human hearing is:**
- 20-4000 Hz
 - 20-8000 Hz
 - 20-10000 Hz
 - 20-20000 Hz

- 271. As per Factory Act in India maximum audible tolerance is:**
- 90 dB for 6 hours
 - 90 dB for 8 hours
 - 85 dB for 6 hours
 - 85 dB for 8 hours
- 272. Imaging study of choice for para nasal sinuses is:**
- USG
 - CT scan
 - X-ray PNS
 - FDG PET scan
- 273. Semicircular canal perceives:**
- Linear acceleration
 - Angular acceleration
 - Both
 - None
- 274. Most common site of carcinoma of paranasal sinus is:**
- Frontal
 - Ethmoid
 - Maxillary
 - Sphenoid
- 275. Most common cause of acute otitis media in children is:**
- Staphylococcus aureus
 - Streptococcus pneumonia
 - Haemophilus influenzae
 - Moraxella catarrhalis
- 276. Treatment of choice of nasopharyngeal carcinoma is:**
- Surgery
 - Chemotherapy
 - Radiotherapy
 - Medical management
- 277. Location of adenoids on pharyngeal wall is:**
- Superiorly
 - Laterally
 - Inferiorly
 - Posteriorly
- 278. Otosclerosis presents with:**
- Conductive deafness
 - Sensorineural deafness
 - Mixed hearing loss
 - Fluctuating hearing loss
- 279. Most common part affected in otosclerosis is:**
- Anterior part of foot plate of stapes
 - Posterior part of foot plate of stapes
 - Middle part of foot plate of stapes
 - Annular ligament of stapes
- 280. Rhinitis sicca is characterised by:**
- Drying of anterior 1/3rd of the nasal cavity
 - Drying of middle 1/3rd of the nasal cavity
 - Drying of the posterior 1/3rd of the nasal cavity
 - Drying of the nasal septum
- 281. Vidian neurectomy is done in:**
- Allergic rhinitis
 - Vasomotor rhinitis
 - Atrophic rhinitis
 - Rhinitis medicamentosa
- 282. Crooked nose is due to:**
- Deviated Ala
 - Deviated septum
 - Hump in nasal septum
 - Deviated dorsum and septum
- 283. Intrinsic laryngeal muscle having life saving action, leading to passage of air through glottis: (2018)**
- Lateral cricoarytenoid
 - Posterior cricoarytenoid
 - Cricothyroid
 - Interarytenoid
- 284. CSOM patient with hectic picket fence fever, rigor and tenderness around mastoid. This is typical sign of: (ENT) (2018)**
- Meningitis
 - Petrositis
 - Abscess
 - Lateral sinus thrombophlebitis
- 285. Most common site of laryngeal web: (2018)**
- Anterior laryngeal wall
 - Posterior laryngeal wall
 - Supraglottis
 - Subglottis
- 286. Most common organism causing fungal infection of ear: (2018)**
- Candida albicans
 - Aspergillus Niger
 - Mucormycosis
 - Aspergillus fumigatus
- 287. Most common cause of SNHL: (2018)**
- Noise induced
 - Mennier's disease
 - Labyrinthitis
 - Presbycusis

IMAGE-BASED QUESTIONS

288. A 21-year-old college student presents with hot potato voice and trismus. Throat examination was done. Clinical diagnosis is:

- a. Quinsy
- b. Epiglottitis
- c. Infectious mononucleosis
- d. Chronic tonsillitis

291. Diagnosis based on your otoscopic finding:

- a. Acute otitis media
- b. Chronic otitis media
- c. Serous otitis media
- d. Serous otitis externa

289. The shown image is section taken from:

- a. Cochlea
- b. Vestibule
- c. Semicircular canal
- d. Bill's bar

292. A 14-year-male from Chhattisgarh presented with swelling of nose which is increasing gradually from last 3-4 months. Upon examination, nose has woody touch. Possible diagnosis:

- a. Rhinoscleroma
- b. Rhinophyma
- c. Rhinosporidiosis
- d. Rhinohyperplasia

290. Diagnosis based on your otoscopic finding:

- a. Acute otitis media
- b. Chronic otitis media
- c. Serous otitis media
- d. Serous otitis externa

293. Diagnosis:

- a. Vocal cord nodule
- b. Vocal cord polyp
- c. Vocal cord granuloma
- d. Papilloma

294. This patient was prepared for surgery. Your senior resident did this marking before proceeding the incision. What is the name of this:

- a. Ohngren's line
- b. Weber fergusson incision
- c. Lederman incision
- d. Frontal sinusotomy

296. The given image is used for:

- a. Cleaning the external auditory canal
- b. Visualizing the whole external ear
- c. Packing ear canal or nasal cavity
- d. Checking the mobility of tympanic membrane

295. A 13-year-old patient presented with history of recurrent epistaxis. Upon general evaluation you noted the swelling of cheek. Most likely diagnosis:

- a. Rhinoscleroma
- b. Angiofibroma
- c. Antral polyp
- d. Ethmoidal polyp

297. The below given sign is seen in:

- a. Otosclerosis
- b. Cholesteatoma
- c. Lateral sinus thrombophlebitis
- d. Laryngeal pathology

298. Spot diagnosis:

- a. Tongue tie
- b. Potato tumor
- c. Ranula
- d. Thyroglossal cyst

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

EAR AND ITS DISEASES

MOST RECENT QUESTIONS 2019

1. Ans. (b) Subglottis

Ref: Dhingra's ENT 6th ed. P 285

- Book states: "infants larynx is small and conical. The diameter of cricoid cartilage is smaller than the size of glottis, making subglottis the narrowest part."
- Note: in adults the dimensions of glottis-subglottis is same and larynx is cylindrical. However glottis is considered as the narrowest part of adult larynx

TABLE: Difference between adult and pediatric larynx

	Adult larynx	Pediatric larynx
Location	C3–C6	High in neck At rest: C3 or C4 While swallowing: C1 or C2
Cartilage	Soft	Softer
Thyroid cartilage	Elevated at thyroid angle	Flat
Shape	Cylindrical	Conical
Length of vocal cord	Female: 15–19 mm Male: 17–23 mm	Female: 6 mm Male: 8 mm

Note: In contrary to what book says, there are recent studies that says that the narrowest portion of child larynx is same as adult i.e. glottis.

- However many anatomist are still not agreeing to this.
- We are therefore referring here the textbook to answer this question.

2. Ans. (b) Angiofibroma

Ref: Dhingra's ENT 6th ed. P 246–47

- Angiofibroma is a benign vascular tumor of nasopharyngeal area.
- It is the most common pharyngeal tumor of adolescent male, mostly in second decade of life.
- This tumor is thought to be testosterone dependent
- MC site: Sphenopalatine foramen

CLINICAL FEATURE

- MC clinical feature: Recurrent epistaxis
- Progressive nasal obstruction and denasal speech
- Otitis media with effusion and conductive hearing loss
- Hollman miller sign/Antral sign: Cheek swelling-Pathognomonic feature

- Frog eye sign: Proptosis
- IOC:** CECT
Treatment: Surgical excision

3. Ans. (a) Posterior cricoarytenoid muscle

Ref: Dhingra's ENT 6th ed. P 283

- The only abductors of vocal cord is posterior cricoarytenoid muscle

MUSCLES OF LARYNX

Intrinsic muscles of Larynx: Attaches laryngeal cartilage with each other

Muscles acting on vocal cord	Muscles acting on Laryngeal inlet
<ul style="list-style-type: none"> • Abductors: Posterior cricoarytenoid • Adductors <ul style="list-style-type: none"> ▪ Lateral cricoarytenoid ▪ Interarytenoid ▪ Thyroarytenoid (external part) • Tensors: <ul style="list-style-type: none"> ▪ Cricothyroid ▪ Vocalis muscle (internal part of thyroarytenoid) 	<ul style="list-style-type: none"> • Opener of laryngeal inlet <ul style="list-style-type: none"> ▪ Thyroepiglottic muscle (part of thyroarytenoid) • Closers of laryngeal inlet <ul style="list-style-type: none"> ▪ Interarytenoid ▪ Aryepiglottic muscle

Extrinsic muscles of vocal cord: Connects larynx with neighbouring structure

- **Elevators of larynx:**
 - **Primary elevator:** Stylopharyngeus, Salpingopharyngeus, Palatopharyngeus and Thyrohyoid
 - **Secondary elevator:** Mylohyoid (main), Digastric muscle, Stylohyoid and Geniohyoid
- **Depressors:**
 - Sternohyoid, Sternothyroid and Omohyoid

4. Ans. (a) Excision of ranula and sublingual gland duct

Ref: Dhingra's ENT 6th ed. P 224

- Ranula is cystic translucent lesion at the floor of mouth on one side of frenulum.
- It pushes the tongue upwards
- Arises due to obstruction of sublingual salivary gland duct.
- Sometimes when it extends into the neck → Known as plunging ranula

TREATMENT

- If small: Complete surgical excision of cyst and its duct
- If large: Marsupialization preferred

5. Ans. (a) Laryngeal carcinoma

Ref: Dhingra's ENT 6th ed. P 316-17

Types of Tracheostomy

- **Emergency tracheostomy:** Done in emergency/urgent setting. Vertical midline incision made in 2nd and 3rd tracheal rings
 - **Elective/Routine tracheostomy/Tranquil:** Planned procedure. Transverse incision
 - **Permanent tracheostomy:** May be required in bilateral abductor paralysis or laryngeal stenosis
- Tracheostomy is also classified on the basis of site:**
- **High tracheostomy:** Done above level of isthmus. Damages first tracheal ring
 - Complication: Perichondritis
 - Only indication: Laryngeal CA (*total laryngectomy is anyway required*)
 - **Mid tracheostomy:** Preferred type. Done through 2nd or 3rd tracheal ring. Divides thyroid isthmus
 - **Low tracheostomy:** Done below the level of isthmus. A difficult one, not generally recommended.

6. Ans. (b) Cochlear implant

Ref: Dhingra's ENT 6th ed. P 125

- In the above patient of profound SNHL, cochlear implant is preferred.
- Indication of cochlear implant:
 - Bilateral Severe/profound SNHL
 - Intact auditory nerve system
- Implant has external and internal component (image). Electrode array is placed in scala tympani of cochlea.

Illustration of cochlear implant components. The external parts are shown on the left, the internal components of the implant on the right. The scheme in the middle shows the position of the cochlear implant components *in situ*

7. Ans. (c) Serous otitis media

Ref: Dhingra's ENT 6th ed. P 250-51

- In a patient with nasopharyngeal CA, most common clinical presentation is cervical lymphadenopathy.
- Upon superior invasion it can invade floor of skull invading several cranial nerve
- First cranial nerve to be involved: CN 6
- An anterior growth can cause eustachian tube obstruction → serous otitis media/glue ear
- **Clinical feature:** Trotter's triad
 - Soft palate palsy (due to CN 10 invasion)
 - Deep facial pain (due to CN 5 invasion)
 - Conductive hearing loss (due to eustachian tube obstruction)
- **Note:** in adult patient with unilateral glue ear, nasopharyngeal CA should be ruled out first.

8. Ans. (a) Antrochoanal polyp

- The mentioned case is very much suggestive of antrochoanal polyp.
- These are the single polyp originated from maxillary sinus and protrudes into nasal cavity.

ANATOMY OF AURICLE AND EXTERNAL AUDITORY CANAL & EMBRYOLOGY

9. Ans. (b) **Anterior belly of digastric muscle**

Ref: Diseases of ENT, by Dhingra, 6th ed. Pg. 285

TABLE: Derivatives of branchial/pharyngeal arches

1st Branchial arch	2nd Branchial arch	3rd Branchial arch	4th Branchial arch	6th Branchial arch
<ul style="list-style-type: none"> Malleus and Incus Maxilla Mandible Muscle of mastication Anterior belly of digastric muscle Tensor tympani muscle Sphenomandibular ligament 	<ul style="list-style-type: none"> Stapes (except foot plate) Upper half of body of hyoid Lesser cornu of hyoid Muscle of facial expression Posterior belly of digastric muscle Stylohyoid ligament 	<ul style="list-style-type: none"> Lower part of body of hyoid Greater cornu of hyoid Stylopharyngeus muscle Common carotid artery 	<ul style="list-style-type: none"> Upper thyroid cartilage Cricothyroid muscle Extrinsic laryngeal and pharyngeal muscle 	<ul style="list-style-type: none"> Lower half of thyroid cartilage Arytenoid cartilage All intrinsic laryngeal muscle except cricothyroid
Nerve: Mandibular branch of CN 5th	Facial Nerve	Glossopharyngeal nerve	Vagus + Superior Laryngeal nerve	Vagus + Recurrent laryngeal nerve

Note: Laryngeal cartilage like cricoid, coneiform, corniculate are formed due to fusion of Branchial arch 4 and 6.

- Epiglottic cartilage derived from hypobranchial eminence.

10. Ans. (a) **1.3 : 1**

Ref: Dhingra's ENT 6th ed. P 15

- Handle of malleus is 1.3 times longer than long process of incus, providing a mechanical advantage of 1.3, giving the **ossicular-lever ratio of 1.3:1**
- Hydraulic action of tympanic membrane:** The total area of tympanic membrane is 21 times bigger than footplate of stapes (3.2 mm), giving it a ratio of **21:1**
- As we know that only 2/3rd of tympanic membrane is effective, it gives an effective aerial ratio of 14:1
- Therefore **total transformation ratio** is: $14 \times 1.3 = 18.2:1$

11. Ans. (c) **Stria vascularis**

Ref: Dhingra's ENT 6th ed. P 9

- Cochlea is divided into 3 compartments:** Scala tympani, scala media and scala vestibuli by the two membranes **basilar membrane and Reissner's membrane**.
- Another membrane, i.e. **stria vascularis** is present on the wall of scala tympani and secretes endolymph.

12. Ans. (b) **MacEwen's triangle**

Ref: Dhingra's ENT, 6th ed. pg. 5

- Mastoid antrum is the largest air cell of mastoid. Its depth is ~15 mm from skin due to the thick plate of bone over it.
- Antrum is marked externally on the surface of mastoid by **Suprameatal triangle/MacEwen's triangle**.

Extra Mile

- Development of mastoid is from squamous and petrous bone. Persistence of petrosquamous suture is known as **Korner's septum**.

13. Ans. (a) **Cricothyroid muscle**

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 285

For explanations Please refer to above Table.

14. Ans. (c) **Skin with fat**

Ref: Dhingra's ENT, 6th ed. pg. 2, 5th ed. pg. 3-4

- The entire pinna is made of one yellow elastic cartilage except lobule and incisura terminalis.
 - Lobule** is made of fat tissue covered with skin.
 - Incisura terminalis:** Located between tragus and crus of helix. Can be used to gain access in external auditory meatus without cutting the cartilage.

15. Ans: (b) **Lesser petrosal nerve**

Ref: Dhingra's ENT, 6th ed. pg. 4

NERVE SUPPLY OF AURICLE/PINNA

Lateral Surface

- Greater Auricular nerve**
- Vagus (Arnold's nerve) + Facial Nerve:** Supplies concha
- Auriculotemporal nerve**

Medial Surface

- **Lesser occipital nerve:** Supplies upper 1/3rd
- **Greater auricular nerve:** Supplies lower 2/3rd
- **Vagus (Arnold's nerve) + Facial nerve:** Supplies conchal protrusion medially (see Image)

16. Ans. (d) Auriculotemporal nerve

Ref: Dhingra's ENT, 6th ed. pg. 4

- Auriculotemporal nerve supplies only on the lateral aspect of auricle.

17. Ans. (a) Greater auricular nerve

Ref: Dhingra's ENT 6th ed. pg. 4

- Greater auricular nerve has major contribution of auricle. It supplies major portion on lateral aspect as well as on the medial aspect.

18. Ans. (a) Vagus nerve

Ref: Dhingra's ENT, 6th ed. pg. 4

- **Arnold's nerve** is the auricular branch (also known as the mastoid branch) of the vagus nerve (CN X).
- It originates from the superior ganglion of the vagus nerve
- Arnold's nerve along with facial nerve innervates concha of auricle and the external acoustic meatus (*posterior and inferior wall*).

19. Ans. (c) Glossopharyngeal nerve

Ref: Dhingra's ENT, 6th ed. pg. 4

- Jacobson's nerve is a branch of glossopharyngeal nerve (CN- IX) in middle ear.
- It supplies medial aspect of tympanic membrane.

20. Ans. (a) Lesser cornu

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

21. Ans. (c) III

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

- Lower part of hyoid and greater cornu of hyoid is derived from branchial arch III.
- Upper part of hyoid and lesser cornu of hyoid is derived from branchial arch II

22. Ans. (d) Cricothyroid muscle

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

- All intrinsic laryngeal muscles is derived from branchial arch VI EXCEPT cricothyroid muscle.
- Cricothyroid muscle is derived from branchial arch IV.

23. Ans. (d) IV and VI

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

- Thyroid cartilage is derived from branchial arch IV and VI.
 - Upper part: Branchial arch IV
 - Lower part: Branchial arch VI

24. Ans. (b) II

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

- Ear ossicles are derived from branchial arch I and II
- Malleus and incus: BA-I
- Stapes: BA-II

25. Ans. (a) Ultimobranchial body

Ref: Inderbir Singh's Embryology, 7th ed. pg. 119-120

- In humans, the ultimobranchial body is an embryological structure that gives rise to the calcitonin-producing cells—also called **parafollicular cells or C cells**—of the thyroid gland.
- In humans, this body is a derivative of the ventral recess of the **fourth pharyngeal pouch**.
- **Stapes:** from 2nd Branchial arch
- **Laryngeal cartilage:** from 6th branchial arch
- **Mandible:** from 1st branchial arch

26. Ans. (d) Outer 1/3rd is bony and inner 2/3rd is cartilaginous

Ref: Dhingra's ENT, 6th ed. pg. 4-5

- In External auditory canal /meatus: **outer 1/3rd is cartilaginous, inner 2/3rd is bony**. Length is 8 mm and 16 mm respectively.
- EAC extends from bottom of concha to tympanic membrane having a total length of 24 mm.
- **Congenital pathologies associated with EAC:**
 - **Fissure of santorini:** From anterior wall of cartilaginous part of EAC to parotid gland
 - **Foramen of Huschke:** From anteroinferior wall of bony part of EAC to parotid gland
- **Note:** Any infection in parotid gland can spread to EAC or vice versa through these congenital pathologies.

27. Ans. (d) <1 cm

Ref: Dhingra's ENT, 6th ed. pg. 4-5

- **Total Length of EAC:** 24 mm (2.4 cm)
 - **Outer 1/3rd is cartilaginous: 8 mm (0.8 cm)**
 - **Inner 2/3rd is bony: 16 mm (1.6 cm)**

28. Ans. (c) Bony part of EAC and parotid gland

Ref: Dhingra's ENT, 6th ed. pg. 2

• **Congenital pathologies associated with EAC:**

- **Fissure of santorini:** From anterior wall of cartilaginous part of EAC to parotid gland
- **Foramen of Huschke:** From anteroinferior wall of bony part of EAC to parotid gland

29. Ans. (d) **Composite grafts of cartilage & skin from pinna are not used for correction of defects of nasal ala**

Ref: Dhingra's ENT, 6th ed. pg. 2

- Composite grafts of cartilage & skin from pinna are used sometimes for correction of defects of nasal ala.
- All other statements mentioned above are true.

Extra Mile

- CARTILAGE from the tragus, perichondrium from the tragus or concha and fat from lobule are frequently used for reconstructive surgery of middle ear.
- Tragal cartilage can be used to correct the depressed nasal bridge
- Incisura terminalis is area between tragus and crus of helix. It is devoid of cartilage.

30. Ans. (a) **2.5 cm**

Ref: Dhingra's ENT, 5th ed. pg. 4

- Length of external auditory canal- 24 mm (2.4 cm)
- Shape: S-shaped
- Outer 1/3rd cartilaginous part (8 mm)
- Inner 2/3rd: Bony part (16 mm)

31. Ans. (c) **1/3rd outer**

Ref: Dhingra's ENT, 5th ed. / 4

- Outer 1/3rd of EAC is cartilaginous. It has hair follicles and ceruminous glands which secretes sebum.

32. Ans. (b) **Ascending ramus of mandible**

Ref: Dhingra's ENT, 5th ed./227

- Retromolar trigone is a triangular area of mucosa covering **anterior surface of the ascending ramus of mandible.**
- Base of retromolar trigone is posterior to the last molar while its apex is adjacent to the tuberosity of maxilla.

ANATOMY OF MIDDLE EAR & INNER EAR

33. Ans. (a) **Organ of corti**

Ref: Dhingra's ENT, 6th ed. pg. 9, 10

- Organ of corti is sensory organ of hearing.

34. Ans. (b) **Balance**

Ref: Dhingra's ENT, 6th ed. pg. 9, 17

- There are 3 semicircular canals; the posterior, lateral and superior. They all lie in planes at right angles to each other.
- It is responsible for *balancing angular acceleration.*
- Macula, present in utricle and saccule is responsible for balancing linear acceleration.

35. Ans. (b) **Medial**

The most prominent portion of the medial wall of the middle ear cavity is the promontory. The projection is raised by underlying basal turn of cochlea. It has number of grooves containing tympanic plexus of nerves.

36. Ans. (a) **Nasopharynx**

- ET opens on lateral wall of nasopharynx.
- Bounded by ridge-Torus Tubarius

37. Ans. (a) **Cochlea**

Ref: Dhingra's ENT, 5th ed. pg. 12

- Upon taking the section of cochlea, we see 3 compartments and 3 membranes:
 - **Scala vestibuli:** Contains perilymph
 - **Scala media:** Contains endolymph
 - **Scala tympani:** Contains perilymph

- **Three membranes are:**
 - **Reissner's membrane:** Separates scala vestibule from scala media.
 - **Basilar membrane:** Separates scala tympani from scala media. Also supports organ of corti.
 - **Stria vascularis:** On the wall of scala media. Converts perilymph into endolymph.

38. Ans. (a) **Utricle**

Ref: P.L. Dhingra's ENT, 6th ed. pg. 16

- Sensory organ of utricle and saccule: Macula

Structure of Macula

- Made of 2 parts:
 - A **sensory neuroepithelium** made of type 1 and type 2 hair cells
 - An **otolith membrane**. This membrane is made up of a gelatinous mass and on top, there is crystal of calcium carbonate called **otoconia or otolith.**

Extra Mile

- Sensory organ of linear motion/acceleration: Macula (In utricle and saccule)
- Sensory organ of angular motion/acceleration: Crista ampularis (in Semicircular canal, ampulated portion)

39. Ans. (c) Long process of incus

Ref: PubMed

40. Ans. (c) Posterior wall

Ref: Dhingra's ENT, 6th ed. pg. 4-5

- Chorda tympani is a branch of facial nerve which is located on posterior wall of middle ear.
- Middle wall is box shaped cavity having 6 walls.
- Corda tympani is a branch of facial nerve which is located on posterior wall of middle ear. It has sensory and secretomotor branches and supplies:
 - Anterior 2/3rd of tongue
 - Sublingual gland
 - Submandibular gland

Extra Mile

TABLE: Middle ear walls and their contents

Wall	Made of significance
• Superior wall/roof	Made of tegmen tympani, a very thin plate of bone. Separates middle ear from middle cranial fossa
• Inferior wall/floor	Aka Jugular wall. It is formed by tympanic plate of temporal bone. Below the floor lies inferior jugular vein
• Lateral wall	Aka outer wall. Formed by tympanic membrane
• Anterior wall	Aka carotid wall. Separates middle ear from Internal carotid artery.

Contd...

Wall	Made of significance
	Contents of anterior wall: Opening of eustachean tube 2 Drains on lateral wall of nasopharynx Canal of tensor tympani- Gives origin to tensor tympani muscle
• Medial wall	Aka labyrinth wall . Separates middle ear from inner ear. Contents: <ul style="list-style-type: none"> • Promontory: Due to basal coil of cochlea • Oval window: Covered by foot plate of stapes • Round window: Covered by secondary tympanic membrane • Processus cochleariformis: Hook like structure, anterior to oval window. Tensor tympani muscle takes a turn here before inserting to neck of malleus • Fistula ante-fenestrum: MC site for otosclerosis • Fallopian canal/Facial canal: Facial nerve runs here in horizontal direction.
• Posterior wall	Aka mastoid wall . Separates middle ear from mastoid cavity. Contents: <ul style="list-style-type: none"> • Pyramid: Bony protrusion. Origin of stapedius muscle from tip of pyramid • Aditus ad-antrum: Doorway to antrum of mastoid. Located on postero-superior wall. • Facial nerve in facial canal in vertical direction. Gives rise to chorda tympani • Facial recess-Landmark for intact canal wall surgery

41. Ans. (c) Carotid wall

Ref: Dhingra's ENT, 6th ed. pg. 5

Anterior wall is also known as carotid wall. Separates middle ear from Internal carotid artery. Contents of anterior wall:

- **Opening of eustachean tube:** Drains on lateral wall of nasopharynx
- **Canal of tensor tympani:** Gives origin to tensor tympani muscle.

42. Ans. (d) Aditus ad antrum

Ref: Dhingra's ENT, 6th ed. pg. 5-6

- Aditus ad antrum is located on posterior wall. It is a doorway to antrum of mastoid.
- Antrum is largest mastoid air cell.

43. Ans. (c) Middle cranial fossa

Ref: Dhingra's ENT, 6th ed. pg. 5

FMGE Solutions Screening Examination

982

- Roof of middle ear is formed by tegmen tympani, a very thin plate of bone.
- It separates middle ear from middle cranial fossa.

44. Ans. (d) **Medial**

Ref: Dhingra's ENT, 6th ed. pg. 5

- MC site for otosclerosis: **Fistula ante-fenestrum**
- **Location of fissula ante-fenestram:** Medial wall of middle ear

45. Ans. (b) **Malleus**

Ref: Dhingra's ENT, 5th ed. pg. 12

There are two important muscles of middle ear:

Muscle	Origin	Insertion	Nerve supply
Tensor tympani	Canal of tensor tympani (anterior wall)	Neck of malleus	Mandibular branch of CN- V
Stapedius	Tip of pyramid (posterior wall)	Neck of stapes	CN- VII

46. Ans. (c) **7**

Ref: Dhingra's ENT, 5th ed. pg. 6

- Fallopian canal is also known as facial canal present on the walls of middle ear.
- **Direction:**
 - Entry from media wall. Facial nerve runs in horizontal direction
 - Exits on posterior wall. Facial nerve here runs in vertical direction.
 - Exits via stylomastoid foramen.

47. Ans. (b) **1 cm**

Ref: Dhingra's ENT, 6th ed. pg. 9-10

- The opening to the internal acoustic meatus is located inside the cranial cavity, near the center of the posterior surface of the petrous part of the temporal bone.
- The size varies considerably; its margins are smooth and rounded. **The canal is short (about 1 cm)** and runs laterally into the bone.
- Length of external acoustic canal: **24 mm.**
- **Length of middle ear canal:**
 - Epitympanum- 6 mm
 - Mesotympanum- 2 mm
 - Hypotympanum- 4 mm
- **Shortest** distance between tympanic membrane to promontory: 2 mm.

Middle ear cavity section

48. Ans. (a) **2 mm**

Ref: Dhingra's ENT, 6th ed. pg. 9-10

- **Length of middle ear canal:**
 - Epitympanum- 6 mm
 - Mesotympanum- 2 mm
 - Hypotympanum- 4 mm
- **Shortest** distance between tympanic membrane to promontory: 2 mm.

49. Ans. (b) **Facial nerve and superior vestibular cochlear nerve**

Ref: Dhingra's ENT, 6th ed. pg. 90-91

- Bill's bar divides the superior compartment of the internal acoustic meatus into an anterior and posterior compartment.
- **Anterior to Bill's bar, are the facial nerve (in the anterior superior quadrant) and nervus intermedius, and posterior to it is the superior division of the vestibular nerve (in the posterosuperior quadrant).**

50. Ans. (b) **Hearing**Ref: Dhingra's ENT, 5th ed. pg. 11

- The main function of cochlea is hearing via the hair cells present on basilar membrane
- **Sensory organ of hearing:** Organ of Corti
- **Otolith organ:** Utricle and Saccule

51. Ans. (b) **Olfactory system**Ref: Dhingra's ENT, 5th ed. pg. 22

- **Requirements for balancing:**
 - Vision
 - Vestibule and cochlea
 - Proprioception
 - Cerebellum

52. Ans. (c) **Semicircular canal**Ref: Dhingra's ENT, 5th ed. pg. 20

- Sensory organ of angular motion is crista ampularis which is located in semicircular canal.
- Structure of crista ampularis is a crest like mound of connective tissue on which lie the sensory epithelial cells. These sensory hair cells project into the cupula.
- **Cupula is a gelatinous mass** of polysaccharides and contains canals into which project the cilia of sensory cells.

53. Ans. (c) **Cochlea**Ref: Dhingra's ENT, 5th ed. pg. 12

- Upon taking the section of cochlea, we see 3 compartments and 3 membranes:
 - Scala vestibuli: Contains perilymph
 - Scala media: Contains endolymph
 - Scala tympani: Contains perilymph
- **3 membranes are:**
 - **Reissner's membrane:** Separates scala vestibule from scala media.

- **Basilar membrane:** Separates scala tympani from scala media. Also supports organ of corti.
- **Stria vascularis:** On the wall of scala media. Converts perilymph into endolymph.

**TESTS OF AUDITORY SYSTEM**54. Ans. (d) **Can cause Vertigo**Ref: Diseases of ENT by Dhingra 6th ed. P 53-54

- **External ear syringing** is done to clean/remove wax from external auditory canal.
- **Indications:**
 - Removal of wax
 - Dried fungal debris
 - Epithelial debris
 - Blunt foreign bodies
- **Direction of flow:** Postero-superior wall
- **Water** that is used is normal room temperature water (pre-boiled and cooled to room temperature)
- If too cold or too warm water used → It can stimulate labyrinth as in caloric testing and can cause vertigo.

REQUIREMENTS AND PROCEDURE OF SYRINGING

Requirements: Aural syringe 50 or 100 cc capacity, a kidney tray and warm saline at body temperature (Not to produce caloric reaction and vertigo)

Procedure: Patient sits before the operator with the ear to be syringed facing him. The nozzle of the syringe is detached and the syringe is filled with water/saline. The nozzle is then tightly reapplied and air pushed out of the syringe in vertical position. Light is thrown on to the patient's ear by means of head mirror/light. The kidney tray is held below the ear. The pinna of the patient is pulled **upwards, backwards and outwards** with one hand of the operator to straighten out the meatus and by means of the syringe, the jet of the fluid is ordinarily directed towards the postero-superior wall of the meatus. The force used should be moderate and canal washed of wax. The meatus should be inspected after each

FMGE Solutions Screening Examination

984

syringing to see the TM so that operator does not go on syringing unnecessarily. After syringing, the meatus should be dried with cotton wool on carrier.

Contraindications: Generalized & Localized otitis externa, Perforation of ear drum, Acute otitis media, Scarred ear drum, Recent or old fracture of base of skull, Patient suffering from heart disease for fear of vagal reflex.

55. Ans. (c) Noise induced hearing loss

Ref: Diseases of ENT by Dhingra 6th ed. P 34-35

- Most common cause of acquired hearing loss: presbycusis > Noise induced hearing loss
- NIHL is usually bilateral and symmetrical
- Noise induced hearing loss (NIHL) is caused by acoustic trauma which is characterized by specific pattern of audiogram finding.
- NIHL can damage hair cells, starting in the basal turn of cochlea. Outer hair cells are affected first followed by inner hair cells.
- NIHL usually affect a person's hearing sensitivity in the higher frequencies like 3000 Hz, 4000 Hz or 6000 Hz.
- Upon audiogram a notch is seen especially at 4000 Hz.
- Tinnitus is the first symptom without any hearing impairment.

Extra Mile

- **Carhart Notch:** A sudden dip/notch at 2000 Hz. Seen in otosclerosis
- **Acoustic trauma:** Sudden, permanent, SNHL due to single exposure to an intense sound (130–140 dB) for < 0.2 sec.

56. Ans. (b) 90 dB in 8 hrs/days for 5 days per week

Ref: Dhingra's ENT 6th ed. P 35

Book states: "a noise of 90 dB, 8 hours a day for 5 days per week is the maximum safe limit as recommended by the ministry of labour, GOI."

TABLE: Permissible exposure in cases of continuous noise or a number of short-term exposure (Ministry of Labor, GOI): Factory Act 1948

Noise level (dBA)	Permitted daily exposure (hour)
• 90	8
• 92	6
• 95	4
• 97	3
• 102	1 ½
• 105	1
• 110	½
• 115	¼

Note: 5 dB rule of time intensity states that "any rise of 5 dB noise level will reduce the permitted noise exposure time to half".

57. Ans. (b) As

Ref: Dhingra's ENT, 6th ed. pg. 25

Types of tympanogram graphs and their interpretation:

- A: Normal
- As: Otosclerosis (reduced compliance at ambient pressure)

- Ad: Disruption of ossicular chain (increased compliance at ambience pressure)
- B: Glue ear/Fluid in middle ear (**Flat or dome shaped**)
- C: Eustachian tube obstruction (Maximum compliance at pressure more than -200 mm H₂O; Negative pressure in middle ear)—**negative tympanogram**

58. Ans. (b) ABR

Ref: Dhingra's ENT, 6th ed. pg. 27

ABR is auditory brainstem response. It is used for:

- Screening infants hearing
- To determine threshold of hearing in infant and in uncooperative patient.

- To diagnose brainstem pathology. E.g. multiple sclerosis.
- For intraoperative monitoring of CN.
- In acoustic neuroma surgery
- OAE is also used for screening of hearing in neonates.

59. Ans. (b) Cochlea

Ref: Dhingra's ENT, 6th ed. pg. 27

Otoacoustic emission test will determine cochlear, hair cell function. It is used for—

- Screening neonates exposed to aminoglycoside antibiotics.
- Differentiating sensory and neural components of sensori-hearing loss.
- Test for feign (maligned) hearing loss.
- To differentiate cochlear vs retrocochlear hearing loss

Note: Sedation does not interfere with OAE test.

60. Ans. (d) Acoustic neuroma

Ref: Dhingra's ENT 6th ed. pg. 450

- **Tone decay** also known as auditory fatigue, is a change in auditory threshold when a continuous tone is presented to the ear.
- It is seen in **acoustic neuroma** and other retrocochlear lesion.

61. Ans. (a) Otosclerosis

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 22-23

- Gelle's test is a Tuning fork test which can be performed using tuning fork of different frequencies such as: 128, 256, 512, 1024, 2048, 4096 Hz.
- MC used/ideal for routine clinical practice is of **512 Hz**.
- **Tests done with tuning fork:**
 - Rinne's test
 - Weber's test
 - Absolute bone conduction (ABC) test
 - Bing test
 - Gelle's test
 - Lewis test

POINTS TO KNOW ABOUT GELLE'S TEST

- Gelle's test is a bone conduction test and examines effect of increased air pressure in ear canal (*using siegel's speculum*) on hearing.
- This test is performed by placing a vibrating tuning fork on mastoid, while changes in air pressure in the ear canal are brought about by siegel's speculum.
- In normal individuals, increased air pressure in ear canal, pushes tympanic membrane inwards which raises intralabyrinthine pressure → immobility of basilar membrane → decreased hearing (**POSITIVE TEST**).
- In patients with fixed ossicular chain (otosclerosis) or disconnected ossicular chain, there is no change in hearing (**NEGATIVE TEST**).
- **Note:** Earlier it was a popular test for otosclerosis. Now it is superseded by tympanometry.

62. Ans. (b) CSOM

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 22

TABLE: Tests done with help of tuning fork and their interpretation

- Rinne's is a tuning fork test, which is done to test the air conduction and bone conduction.
- It is done by placing the tuning fork on mastoid (Bone conduction) followed by bringing it in front of ear canal (air conduction).
- In normal individual and in SNHL sound is still heard when tuning fork is brought in front of ear canal (**AC > BC** → **Positive Rinne**)
- In patients with conductive hearing loss, sound transmitted via bone conduction (mastoid) is more as compared to air conduction (**BC > AC** → **Negative Rinne**).
- All the given conditions in options causes sensorinual hearing loss, except the CSOM, which causes conductive hearing loss.

63. Ans. (c) Left ear, air conduction

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 30

Symbols and Lines used in Audiogram

- Broken line for bone conduction (Mn: B-B)
- Continuous line for air conduction
- Red line for right ear (Mn: R-R)
- Blue line for left ear

TABLE: Symbols used in Audiogram charting

Test modality	Right ear	Left ear
AC unmasked	○	×
AC masked	△	□
BC unmasked	<	>
BC masked	[]

64. Ans. (b) 512 Hz

Ref: Dhingra's ENT, 5th ed. pg. 26

- Tuning fork test can be performed using tuning fork of different frequencies such as: 128, 256, 512, 1024, 2048, 4096 Hz.
- MC used/ideal for routine clinical practice is of 512 Hz.
- Tuning fork of lower frequencies produce sense of bone vibration while those of higher frequencies have a shorter decay time and are thus not routinely preferred.
- Tuning fork of
- **Tests done with tuning fork:**
 - Rinne's test
 - Weber's test
 - Absolute bone conduction (ABC) test
 - Bing test
 - Gelle's test
 - Lewis test

65. Ans. (c) **512 Hz**

Ref: Dhingra's ENT, 6th ed. pg. 22, 5th ed. pg. 26

66. Ans. (d) **Pure tone audiometry**

Tests done with help of tuning fork and their interpretation:

Test	Normal	CHL	SNHL
RINNE	AC > BC	BC > AC	AC > BC
WEBER	NO Lateralization	Lateralization deaf side	Lateralization normal side
ABC	Equal	Equal	Reduced
Schwabach's	Equal	Increased	Reduced

67. Ans. (c) **Cochlea**

Ref: Dhingra's ENT 5th ed. / 32

- Otoacoustic emission (OAE) are low intensity sounds **produced by outer hair cells of a normal cochlea.**
- These sounds produced by outer hair cells travels in a reverse direction: Outer hair cells 2 basilar membrane 2 perilymph 2 oval window 2 ossicles 2 tympanic membrane 2 ear canal.
- When outer hair cells are damaged, OAE are absent. Hence it helps to know the function of cochlea.

68. Ans. (a) **ABR**

Ref: Dhingra's ENT, 5th ed. pg. 31-32

- **ABR** is considered as best test for screening of hearing in neonates
- **ABR** is auditory brainstem response. Can be used as screening procedure and threshold of hearing in infants. Mainly used to diagnose retrocochlear pathology. Ex: Acoustic Neuroma.
- **Tympanometry** is considered as IOC for otosclerosis.
- **Electrocochleography:** Used to find out threshold of hearing in young infants and children. It is also the most sensitive test for Meniere's disease.

69. Ans. (a) **Vestibular function**

Ref: Dhingra's ENT, 5th ed. pg. 48

- Caloric test is used to assess vestibular function. The basis of this test is to induce nystagmus by thermal stimulation of the vestibular system.
- Done by taking water of 2 temperatures, cold (30°C) and hot (44°C).
- **Position of the test:** Supine then lift head at 30° forward or patient sitting with bending backwards 60°.
- **This position is used in order to make lateral/horizontal SCC in vertical position.**

- Cold water elicits nystagmus in opposite eye and warm water elicit nystagmus in same eye (Mn: COWS).
- **Interpretation:**
 - **Normal:** Time taken from start of irrigation to end point of Nystagmus is taken and it is **80 seconds —120 seconds.**
 - **Canal paresis:** Duration of Nystagmus shortened i.e. <80 sec.
- Indicates depressed function of ipsilateral Labyrinth, vestibular nerve and vestibular nuclei.
- **It is seen in:**
 - Meniere's disease
 - Acoustic neuroma
 - Vestibular neuritis
 - Vestibular nerve section
 - Postural vertigo

70. Ans. (b) **Lateral semicircular canal**

Ref: Dhingra's ENT, 6th ed. pg. 43

71. Ans. (a) **Fistula test**

Ref: Dhingra's ENT, 6th ed. pg. 41

FISTULA TEST

- The aim of this test is to induce nystagmus by increasing pressure in labyrinth which is performed by applying pressure at tragus.
- **If there is fistula between middle ear and inner ear, this increased pressure leads to stimulation of labyrinth which results in nystagmus and vertigo.**
- In normal population the test is negative because the pressure changes in the external auditory canal cannot be transmitted to the labyrinth.
- **Fistula test is positive in the following cases:**
 - When there is erosion of lateral/horizontal semicircular canal as in cholesteatoma
 - After fenestration operation- **type V tympanoplasty** (a surgically created window in the horizontal canal)
 - Post stapedectomy fistula (Abnormal opening in the oval window post-stapedectomy)
 - After rupture of round window membrane
 - **A positive fistula also implies that the labyrinth is still functioning.**
- **It is absent when labyrinth is dead.**
- A false negative fistula test is also seen when cholesteatoma covers the site of fistula and doesn't allow pressure changes to be transmitted to the labyrinth.
- A false positive fistula test is seen in case of menier's disease aka endolymphatic hydrops.

Extra Mile

- **Impedance audiometry** is done in order to determine the status of the tympanic membrane and middle ear via tympanometry.
 - The other purpose of this test is to evaluate acoustic reflex pathways, which include cranial nerves VII and VIII and the auditory brainstem.
- **Galvanic vestibular stimulation** is the process of sending specific electric messages to a nerve in the ear that maintains balance.

DISEASES OF EAR, TREATMENT AND REHABILITATION

72. Ans. (d) Myringotomy + Gromet insertion

Ref: Diseases of ENT by Dhingra 6th ed. P 65

- Main cause of otitis media is Eustachian tube obstruction/dysfunction. Can occur due to chronic rhinitis, chronic sinusitis
 - In child: MC due to adenoid hypertrophy
 - Adult: Raise suspicion of nasopharyngeal carcinoma
- **Upon examination:**
 - Severely retracted tympanic membrane
 - Dull/pale tympanic membrane
 - Presence of fluid level with air bubbles
- **Initial management:**
 - Nasal decongestant
 - Anti-allergic measures
 - Antibiotics (in cases of URTI)
 - Valsalva maneuver/Politzerisation- for middle ear aeration
- Mainstay of treatment of glue ear is **myringotomy with grommet insertion** with or without adenoidectomy.
- Indications of surgery in glue ear:
 - Chronic effusion >3 months
 - CHL 40 dB
 - Suspicion of malignancy
- **Preferred site:** Postero-inferior quadrant of tympanic membrane

Extra Mile

- If aspirate is thick/glue like → two incisions are made: Antero-superior and antero-inferior quadrant known as “Beer can principle”

73. Ans. (a) Kanamycin

Ref: Goodman & Gillman 13th ed. P 1044-45

- All aminoglycosides have the potential to produce reversible and irreversible vestibular, cochlear, and renal toxicity and neuromuscular blockade.

- Aminoglycoside-induced ototoxicity may result in irreversible, bilateral, high-frequency hearing loss or vestibular hypofunction.
- A high-pitched tinnitus often is **the first symptom** of cochlear toxicity.
- Drugs like amikacin, neomycin and kanamycin are specifically cochleotoxic > vestibulotoxic.
- Gentamicin, streptomycin is vestibular > cochleotoxic
- Tobramycin: Cochlear = Vestibular toxicity

74. Ans. (a) Idiopathic Bell's palsy

Ref: Dhingra's ENT 6th ed. P 95

- Facial nerve palsy can be central or peripheral.
- Peripheral lesion can involve nerve in its intracranial, intratemporal or extratemporal part. Peripheral lesions are more common and 2/3rd of them are idiopathic variety.
- **MCC:** 60–75% of the facial paralysis is due to **bell's palsy**. It is defined as idiopathic, peripheral facial paralysis or paresis of acute onset.
 - **Causes:** Viral infection (HSV, HZV or EBV), vascular ischemia, hereditary (~10% of patients have positive family history), autoimmune disorder.

75. Ans. (b) Otosclerosis

Ref: Dhingra's ENT 6th ed. P 87

- Otosclerosis is a sclerotic bone disease having two stages:
 - **Otospongiotic stage** also known as active stage
 - **Otosclerotic stage** also known as passive stage
- It is most commonly seen in females, in the age group of 20–30 years and the condition worsens during pregnancy.
- **Clinical features/Symptoms:**
 - Progressive conductive hearing loss
 - Tinnitus
 - Vertigo
 - **Paracusis willis:** Patient hears better in noisy environment (as a normal person raises voice in noisy environment)
- **Signs**
 - **Schwartz sign:** Reddish hue/flamingo pink coloration seen on the promontory through tympanic membrane.
 - Pure tone audiometry shows loss of air conduction more for lower frequencies. At 2000 Hz, there is sudden dip/notch formation known as **Carhart Notch**
- **IOC: Tympanometry** (finding will be “As”)
- **Treatment:** Stapedectomy/Stapedotomy with a placement of prosthesis is treatment of choice.

76. Ans. (c) Costen syndrome

Ref: Dhingra's ENT 6th ed. P 447

- **Costen syndrome:**

FMGE Solutions Screening Examination

988

- It is an abnormality of temporomandibular joint, and is characterized by otalgia, feeling of blocked ear, tinnitus and often vertigo as well.
- Pain in Costen syndrome also radiates to frontal, parietal and occipital region.
- Gradenigo's syndrome:** It is a severe form of petrositis (complication of otitis media) and involves CN V and VI. It consists of:
 - Ear discharge
 - Diplopia (due to CN VI involvement)
 - Retro-orbital pain (due to CN V involvement)

77. Ans. (b) Ramsay hunt syndrome

Ref: Dhingra's ENT, 6th ed. pg. 55, 96

- Herpes zoster oticus** is a condition which is characterized by the appearance of vesicles on tympanic membrane, deep meatus, retroauricular sulcus and concha.
- If herpes zoster oticus involves facial nerve, this condition is called **Ramsay Hunt syndrome**. Patient may present in symptoms of facial nerve paralysis along with facial anesthesia, giddiness and hearing impairment due to involvement of 5th and 8th cranial nerve.
- Treatment:** Acyclovir + Steroids

Extra Mile

- Bell's palsy** is usually idiopathic. However it can be infective or hereditary in origin as well. It is always diagnosis of exclusion.
- Myringitis bullosa** is a painful condition characterized by formation of haemorrhagic blebs on the tympanic membrane and deep meatus. Involvement of facial nerve is very less likely.
- Melkersson syndrome** is an idiopathic condition present with triad of recurrent facial nerve paralysis, lip swelling and fissured tongue.

78. Ans. (c) Chronic myringitis

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 55

- Myringitis granulosa**
 - It is a non-specific granulation on the outer/lateral surface of tympanic membrane.
 - It may be associated with external ear infection, impacted wax or long-standing foreign body.

79. Ans. (c) Serous otitis media

Ref: Dhingra, 5th ed. pg. 71-72

- Serous otitis media is also known as Glue ear.
- It is an insidious condition characterized by accumulation of non-purulent effusion in the middle ear cleft.
- One of common causes of serous otitis media (Glue ear) in children is blockage of Eustachian tube secondary to adenoid hyperplasia.

- Therefore, the treatment aims at removal of adenoid (adenoidectomy) and drainage of middle ear by grommet/Ventilation tube.
 - Grommet** is a small tube inserted in tympanic membrane to drain the middle ear.
- Serous otitis media in adults should arouse suspicion of nasopharyngeal carcinoma and hence the treatment aims at removal of carcinoma.
- Adenoiditis is an acute condition and requires treatment conservatively.

80. Ans. (b) Softening followed by syringing

Ref: PL Dhingra's ENT, 6th ed. pg. 53

Dhingra states: "If the wax is too hard and impacted to be removed by syringing or instruments, it should be softened by drops of 5% sodium bicarbonate in equal parts of glycerine and water instilled 2-3 times a day for a few days."

Note:

- Hydrogen peroxide, liquid paraffin or olive oil may also achieve same result.
- Commercial drops like 2% paradichlorobenzene (ceruminolytic agent) can also be used to soften the wax.

Extra Mile

- If a fly or any crawling insect enters the ear canal, no attempt should be made to catch them alive. First they should be killed by instilling oil, spirit or chloroform, then suctioned out.

81. Ans. (a) Autograft

Ref: PubMed

- Autograft:** Transplantation of tissue to the same person, from whom the tissue is harvested.
- Isograft:** Transplantation of organ or a tissue from a donor to a genetically identical recipient like the twins
- Allograft:** Transplant of an organ or tissue between two genetically non-identical members of same species
- Xenograft:** Transplant of organ or tissues from one species to another.

Extra Mile

- Tympanoplasty is repairing of tympanic membrane in cases of ruptured tympanic membrane either due to infection or trauma.
- Temporalis fascia is used for tympanoplasty. It has **very low basal metabolic rate**, hence very high rate of survival.

82. Ans. (a) 20-20,000 Hz

Ref: Dhingra's ENT, 6th ed. pg. 14-15

- Normal hearing capacity is from 20 Hz to 20,000 Hz.
- Function of hearing is by cochlea, which has 2 ends broadly. Apex and Base. Apex is for low frequency sound (20 Hz) and Base is for high frequency sound (20,000 Hz).

83. Ans. (b) 41–60 dB

Ref: Dhingra's ENT, 6th ed. pg. 38

WHO classification for hearing loss:

0–25 dB	Normal hearing
26–40 dB	Mild hearing loss
41–60 dB	Moderate hearing loss
61–80 dB	Severe hearing loss
>80 dB	Profound hearing loss

84. Ans. (c) 5–6 kHz

Ref: Noise-Induced Hearing Loss: Scientific Advances; edited by Colleen G. Le Prell, Donald Henderson, Richard R. Fay, Arthur Poppe

- When the ear is exposed to excessive sound levels or loud sounds over time, the overstimulation of the hair cells on basilar membrane leads to heavy production of reactive oxygen species, leading to oxidative cell death.
- Damage ranges from exhaustion of the “hair” (hearing) cells in the ear to loss of those cells.
- NIHL usually occurs initially at high frequencies (3, 4, or 6 kHz), and then spreads to the low frequencies (0.5, 1, or 2 kHz)."

85. Ans. (b) Virus

Ref: Dhingra, 5th ed. pg. 62

- **Myringitis bullosa**
 - It is a painful condition characterized by formation of haemorrhagic belbs on the tympanic membrane and deep meatus.
 - It is most commonly caused by virus-Adenovirus
 - However it can also be caused by mycoplasma Pneumonia
- **Another similar disease entity is:**
 - **Myringitis granulosa**
 - ◆ It is non-specific granulations on the outer surface of tympanic membrane.
 - ◆ It may be associated with external ear infection, impacted wax or long-standing foreign body.

86. Ans. (a) Virus

Ref: Dhingra, 5th ed. pg. 62

Please refer to above explanation

87. Ans. (a) Streptococcus pneumoniae

Ref: Dhingra's ENT, 6th ed. pg. 62

- Acute otitis media is most commonly caused by Streptococcus Pneumonia. However it can also be caused by H. influenzae and Moraxella catarrhalis.

Extra Mile

Common Infections and their most Common Causative Agents:

Infection	MC organism
Perichondritis	Pseudomonas
Malignant otitis externa	Pseudomonas
Localized otitis externa	Staphylococcus aureus
Acute suppurative otitis media	Strep pneumoniae
Chronic otitis Media	Pseudomonas

88. Ans. (c) Air

Ref: Dhingra's ENT, 5th ed. pg. 69-70

Otitis media is acute inflammation of middle ear by pyogenic organism secondary to:

- Eustachian tube blockage (MCC)
- Tympanic membrane perforation

Stages of Otitis Media Development

- **Stage of tubal occlusion:** Edema and hyperemia of nasopharyngeal end of eustachian tube blocks the tube leading to absorption of air and negative intratympanic pressure and retraction of TM with handle of malleus.
- **Stage of pre-suppurative:** Prolonged suppuration leads to growth of pyogenic organism causing appearance of inflammatory exudates, characterized by **cart-wheel appearance of TM**
- **Stage of suppuration:** Marked formation of pus in middle ear and to some extent in mastoid air cells, characterized by red and bulging tympanic membranes with loss of landmarks. X-rays shows clouding of air cells.
- **Stage of resolution:** Rupture of TM with release of pus and subsidence of symptoms, characterized by a small perforation in antero-inferior quadrant of pars-tensa.
- **Stage of complication:** If resolution doesn't take place, disease spreads, causing mastoiditis, facial paralysis, petrositis, meningitis etc.

89. Ans. (b) Stage 2

Ref: Dhingra's ENT, 6th ed. pg. 67-69

PARS FLACCIDA RETRACTION

- This classification described by Toss is fairly simple to apply, the only difficulty being the difficulty in making a distinction between stages 3 and 4. Hence for practical purposes these two stages are grouped together.
- Pars flaccida retractions have a vital role to play in the pathophysiology of cholesteatoma. Tos et al classified pars flaccida retraction in to four stages:

FMGE Solutions Screening Examination

990

- **Stage I:** Pars flaccida is dimpled and is more retracted than normal. It is not adherent to the malleus.

- **Stage II:** In this stage the retraction pocket is adherent to the handle of malleus. The full extent of the retraction pocket can be clearly seen.

- **Stage III:** In this stage part of the retraction pocket may be hidden. There may also be associated erosion of the outer attic wall (scutum).

- **Stage IV:** In this stage there is definite erosion of the outer attic wall. The extent of the retraction pocket cannot be clearly seen as most of it is hidden from the view.

90. Ans. (d) **Lateral sinus thrombophlebitis**

Ref: Dhingra's ENT, 5th ed. pg. 94 and 84-86

- Lateral sinus thrombophlebitis is an inflammation of inner wall of lateral venous sinus with formation of thrombus.
- It occurs as a complication of acute coalescent mastoiditis, masked mastoiditis or chronic suppurative otitis media.

Intra cranial	Extra cranial
• Meningitis- MC	• Ossicular damage
• Lateral sinus thrombophlebitis	• Mastoiditis (MC)
• Sub dural abscess	• Gardenigo's syndrome
Intra cranial	Extra cranial
• Extra dural abscess	• Labyrinthine fistula/ Labyrinthitis
• Otitis hydrocephalus	• Petrositis
• Cerebral abscess (2nd MC)	• Facial nerve palsy
• Mn: Men Like S-Ex On Call	• Mn: <u>OMG</u> <u>L</u> ady <u>L</u> ove <u>P</u> eters <u>F</u> ace

91. Ans. (a) **Brain abscess**

Ref: Dhingra's ENT, 5th ed. pg. 84-86, 94

- MC Intracranial complication of CSOM Meningitis > Cerebral Abscess

Please refer to above explanation

92. Ans. (c) **Mastoiditis**

Ref: Dhingra's ENT 5th ed./ 84-86, 94

- Overall, MC complication of csom → Mastoiditis
- MC extracranial complication → Mastoiditis.

93. Ans. (a) **Conductive hearing loss**

Ref: Dhingra's ENT, 5th ed. pg. 83

Clinical features of Tubercular otitis media:

- **Painless foul smelling ear discharge:** Very characteristic finding.
- **Perforation:** Multiple perforations usually 2-3 on pars tensa is classical sign of disease.
- **Hearing loss:** There is a severe hearing loss, out of proportion to symptoms. **Mostly conductive**, it may be SNHL if labyrinth is involved.
- Facial paralysis
- In the presence of secondary pyogenic infection, tubercular otitis media may be indistinguishable from chronic suppurative otitis media. Culture of ear discharge for tubercle bacilli, histopathological examination of granulations and other evidence of tuberculosis in the body help to confirm the diagnosis.

Treatment

- **Systemic antitubercular therapy** as being carried for primary focus.
- **Local treatment** in the form of aural toilet and control of secondary pyogenic infection. Mastoid surgery is indicated for complications. Healing is delayed in tuberculous cases. Wound break-down and fistula formation are common.

94. Ans. (b) **Multiple perforation of pars tensa**

Ref: Dhingra's ENT, 5th ed. pg. 83

Please refer to above explanation

95. Ans. (a) **Long process of incus**

Ref: Dhingra's ENT, 5th ed. pg. 78 & 81

■ OSSICULAR NECROSIS IN OTITIS MEDIA

Dhingra States

- In case of tubo-tympanic CSOM "ossicular chain is usually intact and mobile but may show some degree of necrosis, **particularly of the long process of incus**"
- In case of atticoantral type CSOM "ossicular necrosis is common in atticoantral type of CSOM. **Destruction may be limited to the long process of incus** or may also involve stapes superstructure, handle of malleus or the entire ossicular chain"

96. Ans. (b) **CN V, VI**

Ref: Dhingra's ENT, 6th ed. pg. 447

- Petrositis is inflammation of petrous bone.
- Gardenigo's syndrome results due to severe petrositis, which is a complication of CSOM (Chronic Suppurative Otitis Media).
- Two cranial nerves are involved in case of Gardenigo's syndrome: CN V and CN VI.
- **It is characterized by 3 D's:**
 - Discharge
 - Diplopia
 - Deep pain/retro-orbital pain
- Remember, there is NO Deafness in case of Gardenigo's syndrome.

97. Ans. (a) **Deafness**

Ref: Dhingra's ENT, 6th ed. pg. 447

98. Ans. (b) **Bacteria**

Ref: Dhingra's ENT, 5th ed. pg. 57-58

- Malignant otitis externa is caused by pseudomonas infection in elderly, diabetics & patients on the immune-compromised drugs.
- Early manifestation resembles diffuse otitis externa. Patients have severe pain and appearance of granulation in meatus.

Infectious Etiology of Ear Canal

Bacterial	Fungal	Viral
<ul style="list-style-type: none"> • Localized otitis externa • Diffuse otitis externa • Malignant otitis externa 	<ul style="list-style-type: none"> • Otomycosis 	<ul style="list-style-type: none"> • Herpes zoster oticus • Otitis externa hemorrhagica

99. Ans. (a) **7th**

Ref: Dhingra's ENT, 6th ed. pg. 52-53

- Malignant otitis externa is an inflammatory condition caused by pseudomonas infection usually in elderly diabetic & those on immune-compromised drugs.
- Facial nerve paralysis is common.

100. Ans. (a) **Herpes zoster virus**

Ref: P.L. Dhingra, 5th ed. pg. 107

- In some cases of herpes zoster oticus, there is facial paralysis along with vesicular rash in the external auditory canal and pinna. This condition is called Ramsay Hunt Syndrome.
- **Treatment:** Acyclovir + Steroids

101. Ans. (c) **Geniculate ganglion**

Ref: Dhingra's ENT, 5th ed. pg. 102, 109

Course of Facial Nerve

- Motor fibres take origin from the nucleus of VIIth nerve. It leaves the brainstem at pontomedullary junction, travels through posterior cranial fossa and enters the internal acoustic meatus.
- Origin of facial nerve in inner ear is from geniculate ganglion. If there is a lesion at geniculate ganglion it can cause slow progressive facial palsy

Branches of Facial Nerve

- **Greater superficial petrosal nerve:** Arises from geniculate ganglion and carries secretomotor fibres to lacrimal gland and glands of nasal mucosa
- Nerve to stapedius
- Chorda tympani: Sensory to anterior 2/3rd of tongue and secretomotor fibres to sublingual and submandibular gland.
- Communicating branch

- Posterior auricular nerve
- Muscular branch: To stylohyoid and posterior belly of digastric
- Peripheral branches.

102. Ans. (a) **Otosclerosis**

Ref: Dhingra, 5th Ed. pg. 461, 98-99

- **Schwartz sign** is a pink reflex, seen through intact tympanic membrane, in the area of oval window. It indicates active otosclerosis usually during pregnancy.
- Otosclerosis is an abnormal bone growth in the middle ear that causes conductive hearing loss.

Symptoms

- Hearing loss (CHL)
- **Paracusis willi:** An otosclerotic patient hears better in noisy surrounding.
- Tinnitus
- Vertigo
- Speech

Signs

- **Schwartz's sign:** A reddish hue seen on the promontory through the tympanic membrane. This is indicative of active focus with increased vascularity.
- Pure tone audiometry shows loss of air conduction, more for lower frequencies
- **Carhart's notch:** there is a sudden dip at 2000 Hz in bone conduction curve.

Extra Mile

- Don't get confused between schwartz sign and Schwartz surgery.
- Schwartz surgery is a simple mastoidectomy or cortical mastoidectomy in case of mastoiditis.

103. Ans. (c) **2000 Hz**

- **Carhart Notch** is an audiogram finding and is an important feature in patients with Otosclerosis.
- There is a sudden dip (notch) at 2000 Hz in bone conduction curve.
- Carhart's notch disappears after stapedectomy.

104. Ans. (b) **Tinnitus**

Ref: Dhingra, 5th ed. pg. 120-121

- **GLOMUS TUMOR** is the most common benign neoplasm of middle ear and is so-named because of its origin from the glomus bodies.
- The tumor is often seen in the middle age (40–50 years)
- Females are affected five times more than males.
- **There are two types of glomus tumor:**
 - **Glomus jugulare** arise from the dome of jugular bulb. Invade the hypotympanum and jugular foramen.

- ♦ They may compress jugular vein or invade its lumen
- **Glomus tympanicum** arise from the promontory of the middle ear and cause aural symptoms and sometimes with facial paralysis.

Clinical Features

- **Earliest symptoms are tinnitus** and hearing loss.
 - Tinnitus is pulsatile and of swishing character.
 - Hearing loss is conductive and slowly progressive.
- Otoscopy shows a red reflex through intact tympanic membrane.
- **“Rising sun”** appearance is seen when tumor arises from the floor of middle ear.
- In addition to hearing loss and tinnitus, there is history of profuse bleeding from the ear either spontaneously or on attempts to clean it
- Dizzines or vertigo and facial paralysis may appear
- Ear ache is less common
- Otorrhea may occur due to secondary infection and the condition may simulate chronic suppurative otitis media with polyp.
- IXth to XIIth cranial nerves may be paralyzed
- There is dysphagia and hoarseness with unilateral paralysis of the soft palate, pharynx and vocal cord with weakness of the trapezius and sternomastoid muscles.
- **Rule of 10's** Remember that 10% of the tumors are familial, 10% multicentric and up to 10% functional, i.e. they secrete catecholamines.

105. Ans. (c) **Meniere's disease**

Ref: Dhingra's ENT, 6th ed. pg. 448

Meniere's disease aka Endolymphatic Hydrops is a condition which is characterized by triad of:

- Episodic Vertigo
- Sensorineural Hearing loss
- Tinnitus

Meniere's disease has some special features:

- **Hennebert's sign:** False positive fistula sign
- **Tulio's phenomenon:** Vertigo in noisy environment
- Diplacusis

106. Ans. (c) **Diplacusis**

Ref: PL Dhingra, 5th ed. pg. 112

WHY DIPLACUSIS IN MENIERE'S DISEASE?

- In the abnormal ear, neurons respond to a broader range of stimulus frequencies. But due to CNS preconditioning, the brain interprets any activity in a particular neuron as resulting from a stimulus of its normal characteristic frequency. Thus a single stimulus simultaneously processed by the normal and abnormal cochlea will

be perceived as two different stimuli by the CNS, thus leading to diplacusis.

107. Ans. (b) Posterior semicircular canal

Ref: Dhingra's ENT, 6th ed. pg. 45-46

- BPPV is Benign Paroxysmal Positional Vertigo
- It occurs **due to an otolith in posterior semicircular canal**, which can result either due to head trauma, infection or drugs.
- This condition can be diagnosed by typical history and Dix- Hallpike Manoeuvre.
- This condition can be treated by Epley's Maneuver, where repositioning of otolith is done from posterior semicircular canal to Utricle.

108. Ans. (b) Carcinoma of tongue

Ref: Dhingra, 5th ed. pg. 240

- Referred pain in the ear is most likely due to carcinoma of tongue.
- Due to common nerve supply of the tongue (lingual nerve) and ear (auriculo temporal) from the mandibular division of the trigeminal nerve, a referred pain of tongue CA presents with ipsilateral ear pain.

CARCINOMA OF TONGUE

- Carcinoma involving anterior 2/3rd of tongue is commonly seen in men in the age group of 50-70 years.
- It may also develop on a pre-existing leukoplakia, long standing dental ulcer or syphilitic glossitis
- Most common type of tongue CA: Squamous cell type
- **Site: Most common site is middle of the lateral border** or the ventral aspect of the tongue

Clinical Presentation

- A submucous nodule with induration of the surrounding tissue.
- An exophytic lesion like a papilloma
- A non-healing ulcer with rolled edges, grayish white shaggy base and induration.

Symptomatology

- Early lesions are painless and remain asymptomatic for a long time
- Pain in the tongue locally at the site of ulcer
- **Pain in the ipsilateral ear:** Due to common nerve supply of the tongue (lingual nerve) and ear (auriculo temporal) from the mandibular division of the trigeminal nerve
- A lump in the mouth
- Enlarged lymph node mass in the neck
- Dysphagia, difficulty to protrude the tongue, slurred speech and bleeding from the mouth are late features.

109. Ans. (c) Sensorineural deafness

Ref: Dhingra's ENT, 6th ed. pg. 446-47

- Trotter's triad is seen in case of nasopharyngeal carcinoma. **It is also called Sinus of Morgagni Syndrome. Trotter's triad includes:**
 - Ipsilateral soft palate palsy (Due to CNX)
 - Conductive hearing loss (Due to ET obstruction)
 - Trigeminal neuralgia (Due to CN V).

110. Ans. (c) Sensorineural hearing loss

Ref: Dhingra's ENT, 5th ed. pg. 124

ACOUSTIC NEUROMA

- Acoustic neuroma is also known as vestibular schwannoma, neurilemmoma or eighth nerve tumor.
- It arises from superior division of vestibular nerve.
- The tumor arises from the Schwann cells of the vestibular, but rarely from the cochlear division of 8th nerve within the internal auditory canal.

Clinical Features

- **Age and sex:** Mostly seen in age group of 40-60 years. Both sexes are equally affected.
- **Cochleovestibular symptoms**
 - They are the earliest symptoms.
 - Most commonly manifests by Progressive unilateral sensorineural hearing loss, often accompanied by tinnitus.
 - Vestibular symptoms are imbalance or unsteadiness.
- **Cranial nerve involvement**
 - **Cranial nerve 5th is the earliest nerve to be involved** (after 8th) causing loss of corneal reflex
 - **MC clinical finding of acoustic neuroma**-loss of corneal reflex
 - CN 7th involvement: although rare, it causes numbness or paraesthesia of face
 - **Hitzelberger sign:** Hypoaesthesia around posterior auricular area (due to CN 7th involvement)
 - In CN 8th Sensory fibres are affected early.
 - **9th and 10th nerves:** There is dysphagia and hoarseness due to palatal, pharyngeal and laryngeal paralysis.
- **Brainstem involvement**
 - There is ataxia, weakness and numbness of the arms and legs with exaggerated tendon reflexes.
- **Cerebellar involvement**
 - Revealed by finger-nose test, knee-heel test, dysdiadochokinesia, ataxic gait, inability to walk along a straight line with tendency to fall to the affected side.
- **Raised intracranial tension**
 - This is also a late feature.
 - There is headache, nausea, vomiting, diplopia and papilloedema with blurring of vision.

111. Ans. (d) **Crowding of lower tooth**

Ref: Dhingra's ENT, 6th ed. pg. 243-44

- **Enlargement of adenoid tonsils due to infection can lead to adenoid hypertrophy.**

Clinical Features of Adenoid Hypertrophy

- Signs and symptoms of adenoid hypertrophy doesn't depend on the absolute size of the adenoid mass but are relative to the available space in the nasopharynx.
- This hypertrophy may cause nasal, aural or general symptoms.

A. Nasal Symptoms

- **Commonest symptom of adenoid hypertrophy: Nasal obstruction.**
- **Nasal discharge:** It is partly due to choanal obstruction, as the normal nasal secretions cannot drain into nasopharynx and partly due to associated chronic rhinitis. The child often has a wet bubbly nose.
- **Sinusitis:** Adenoid hypertrophy can lead to persistent nasal discharge and infection which can cause Chronic maxillary sinusitis. Reverse is also true that a primary maxillary sinusitis may lead to infected and enlarged adenoids.
- **Epistaxis:** When adenoids are acutely inflamed, epistaxis can occur with nose blowing.
- **Voice change:** Decreased nasality in voice (*Rhinolalia Clausa*).

B. Aural Symptoms

- **Tubal obstruction.** Adenoid mass blocks the eustachian tube leading to retracted tympanic membrane which causes conductive hearing loss.
- Persistence can cause Chronic suppurative otitis media which may fail to resolve due to presence of infected adenoids.
- **Serous otitis media:** The waxing and waning size of adenoids causes intermittent eustachian tube obstruction with fluctuating hearing loss.

C. General Symptoms

- **Adenoid facies:** Mouth breathing and Chronic nasal obstruction can lead to characteristic facial appearance called **adenoid facies**.
 - *In adenoid facies, the child has an elongated face with dull expression, open mouth, prominent crowded upper teeth, and hitched up upper-lip, pinched-in nose appearance due to disuse atrophy of alae nasi.*
- **Highly arched hard palate** as the moulding action of the tongue on palate is lost. *This high arched hard palate can cause deviated nasal septum.*

- **Pulmonary hypertension:** Long-standing nasal obstruction due to adenoid hypertrophy can cause pulmonary hypertension and cor-pulmonale.

112. Ans. (d) **Cleft palate**

Ref: Dhingra, 5th ed. pg. 442

- **Adenoids**, also known as **pharyngeal tonsil**, or **nasopharyngeal tonsil**, are located at the back of the throat, above the tonsils, and are small lumps of tissue.
- They form part of the immune system of babies and young children.
- In case of their hyperplasia, there are several difficulties faced by patients like rhinousinusitis, mouth breathing, snoring etc.
- Adenoidectomy is surgical removal of adenoids to overcome those problems.

Indications and Contraindications of Adenoidectomy

Indications	Contraindications
<ul style="list-style-type: none"> • Adenoid hypertrophy causing snoring • Mouth breathing sleep apnea syndrome or speech abnormalities, i.e. (rhinolalia clausa) • Recurrent rhinosinusitis • Chronic secretory otitis media associated with adenoid hyperplasia • Recurrent ear discharge in benign CSOM associated with adenoiditis/adenoid hyperplasia • Dental malocclusion 	<ul style="list-style-type: none"> • Cleft palate or submucous palate • Removal of adenoids causes velopharyngeal insufficiency in such cases • Haemorrhagic diathesis • Acute infection of upper respiratory tract. • Bleeding disorders • Allergic rhinitis • Polio epidemic

113. Ans. (b) **Allergic rhinitis**

Ref: Dhingra's ENT, 6th ed. pg. 431-432

114. Ans. (b) **Serous otitis media in children**

Ref: Dhingra, 5th ed pg. 71-72

- Serous otitis media is also known as Glue ear.
- It is an insidious condition characterized by accumulation of non-purulent effusion in the middle ear cleft.
- One of common causes of serous otitis media (Glue ear) in children is blockage of Eustachian tube secondary to adenoid hyperplasia.
- Therefore, the treatment aims at removal of adenoid (adenoidectomy) and drainage of middle ear by grommet.
 - Grommet is a small tube inserted in tympanic membrane to drain the middle ear.

- Serous otitis media in adults should arouse suspicion of nasopharyngeal carcinoma and hence the treatment aims at removal of carcinoma
- Adenoiditis is an acute condition and requires treatment conservatively.

115. Ans. (b) **Adenoidectomy**

Ref: Dhingra's ENT, 6th ed. pg. 431-32

Please refer to the previous question for explanation.

116. Ans. (b) **Temporalis fascia**

Ref: Dhingra's ENT, 6th ed. pg. 29-30, 400

- Tympanoplasty is repairing of tympanic membrane in cases of ruptured tympanic membrane either due to infection or trauma.
- Temporalis fascia is used for tympanoplasty. It has very low basal metabolic rate, hence very high rate of survival of graft.

117. Ans. (a) **Round window**

Ref: Dhingra's ENT, 5th ed. pg. 138

- Cochlear implant is an electronic device that can provide useful hearing and improved communication abilities for a person with profound sensorineural hearing loss.
- **Cochlear implant consists of 2 components:**
 - **External component:** Include external speech processor and a transmitter. Speech processor may be body worn or behind the ear type.
 - **Internal component:** It is surgically implanted and comprises the receiver/stimulator package with an electrode array. Electrode array is **passed via round window** and is **inserted into the cochlea (scala tympani) deeper in skull.**

NOSE AND PARANASAL SINUSES

118. Ans. (c) **Neck swelling**

Ref: Diseases of ENT by Dhingra 6th ed. P 250-251

Nasopharyngeal cancer

- Commonly seen in Chinese, elderly population (30 – 50/100,000 population)
- **MC site:** Fossa of Rosenmuller
- The tumor from fossa of Rosenmuller can grow in any direction.
 - Anterior: Can block Eustachian tube → CHL
 - Inferior: Can cause difficulty in deglutition
 - Superior: Can involve several cranial nerve if skull base is involved

- ♦ All cranial nerves can be affected (First CN involved: CN-VI)
- ♦ Frequently involved CN are V, VI, IX and X
- ♦ Involvement of nerve supplying ocular muscles are also seen

• **Symptoms:**

- Neck mass: Due to cervical lymphadenopathy- most common clinical picture that patient present with
- Trotter's triad: CHL, soft palate palsy, deep facial pain
- Diplopia, nasal dysfunction, headache, etc.

• **WHO classification-on basis of histopathology**

Type I (25%)	Squamous cell carcinoma
Type II (12%)	Non-keratinising carcinoma <ul style="list-style-type: none"> • Without lymphoid stroma • With lymphoid stroma
Type III (63%)	Undifferentiated carcinoma <ul style="list-style-type: none"> • Without lymphoid stroma • With lymphoid stroma

• **Treatment:**

- Radiotherapy is definitive treatment (it is most radiosensitive tumor of head and neck).

119. Ans. (c) **CSF Rhinorrhea**

Ref: Dhingra's ENT 6th ed. P 305

- It is a case of CSF rhinorrhea due to cribriform plate fracture.
- Cribriform plate, which is a thin plate of bone, forms the roof of nose. In patients with trauma, there is clear watery nasal discharge with or without blood tinged.
- **Causes of CSF rhinorrhea:**
 - Trauma: Most common cause
 - Surgical: During FESS, transphenoidal surgery
 - Neoplasm invading the skull base
 - Infection and mucocele of sinuses eroding bone and dura
 - Congenital: Meningocele, meningoencephalocele and glioma with skull base defect
- **Symptoms:**
 - Clear watery nasal discharge which cannot be sniffed back
 - Reservoir sign: When rising in morning CSF collected in sinuses on bending head.
 - Handkerchief sign: Handkerchief stiffens if it is due to nasal discharge due to its mucus content.
- **Investigation:**
 - Beta 2 transferrin: Most sensitive and specific.
 - HRCT: IOC
 - MRI: To locate site of leak and if any associated CNS pathology.
- **Treatment:**
 - Conservative treatment along with prophylactic antibiotics.

- Surgical repair if there is no relief from conservative management.

120. Ans. (c) Ammonia irritates trigeminal nerve

Ref: Physical Medicine and Rehabilitation, 4th ed. P 12

- The patient here is presenting with history of trauma, which can cause damage to olfactory nerve → leading to anosmia.
 - MC cranial nerve damaged in head trauma: Olfactory nerve
- Remember, for olfaction system two separate nerves are responsible:
 - CN I: Responsible for perception associated with quality of odour
 - CN V: Produces sensation of irritation or pungency
- Odour sensation from olfactory nerve usually do not produce physiological response. But sensation from trigeminal nerve can produce response such as runny nose, red eyes, sneezing when an irritant like ammonia/vinegar is detected.

121. Ans. (a) CSF rhinorrhea

Ref: Dhingra's ENT 6th ed. P 305

- It is a case of CSF rhinorrhea due to cribriform plate fracture.
- Cribriform plate, which is a thin plate of bone, forms the roof of nose. In patients with trauma, there is clear watery nasal discharge with or without blood tinged.
- **Symptom:**
 - Watery nasal discharge which cannot be sniffed back.
- **Investigation:**
 - **Beta 2 transferrin:** Most sensitive and specific.
 - **HRCT:** IOC.
 - **MRI:** To locate site of leak and if any associated CNS pathology.
- **Treatment:**
 - Conservative treatment along with prophylactic antibiotics
 - Surgical repair if there is no relief from conservative management.

122. Ans. (b) Atrophic rhinitis

Ref: Dhingra's ENT 6th ed. P 154

- Atrophic rhinitis is the chronic inflammation of nose characterized by atrophy of nasal mucosa and turbinate bone. This makes the nasal cavity roomy and filled with foul smelling nasal crust.
- **Pathology:** Ciliated columnar epithelium is lost and is replaced with stratified squamous type of epithelium.
- **Treatment:**
 - Alkaline nasal douching using Na⁺ bicarbonate, Na⁺ bitorate and NaCl.

- Followed by local application of 25% glycerin → it inhibits the growth of proteolytic organisms.
- Antibiotics (streptomycin 1 g/day × 10 days)
- Surgery:
 - ◆ **Young's operation:** Complete closure of both nostrils by nasal flaps.
 - ◆ **Modified Young's operation:** Keep the nostrils partially open ~3 mm. Its efficacy is similar to Young's operation.
 - ◆ **Lautenslager operation:** Medicalization of lateral wall of nose
 - ◆ **Wittmack's operation:** It is the transposition of the parotid duct into the maxillary sinus for moistening the nasal cavity.
 - ◆ Submucosal Teflon paste injection.

123. Ans. (b) Anterior ethmoidal artery

Ref: Dhingra's ENT 6th ed. P 177

- Kiesselbach's plexus is the arterial plexus present at the anteroinferior part of septum just above the vestibule and the area is also known as Little's area.
- **Arteries of the plexus are:**
 - Sphenopalatine artery (branch of maxillary artery → Br. of external carotid artery)
 - Greater palatine artery (branch of maxillary artery → Br. of external carotid artery)
 - Superior labial artery (branch of facial artery → Br. of External carotid artery)
 - Anterior ethmoidal artery (branch of ophthalmic artery → Br. of internal carotid artery)

124. Ans. (c) Aspirin sensitivity, asthma, nasal polyp

Ref: Dhingra's ENT, 6th ed. pg. 240

- **Samter's triad** consists of nasal polyp, bronchial asthma and aspirin sensitivity.

125. Ans. (b) Nasal drop withdrawal

Ref: Dhingra's ENT, 6th ed. pg. 170

- Topical nasal decongestants can sometimes cause rebound phenomenon if used for long time, the condition is known as **rhinitis medicamentosa**.
- **It is treated by:**
 - **Withdrawal of nasal drops**
 - Short course of systemic steroid therapy
 - Surgical reduction of turbinates in some cases if hypertrophied.

126. Ans. (a) Squamous cell CA

Ref: Dhingra's ENT, 6th ed. pg. 205-206

- Paranasal sinus CA most commonly affects males of age above 50 years.
- **Most common paranasal sinus CA is squamous cell CA.** Rest are adenocarcinoma, adenoid cystic CA, melanomas and various other sarcomas.
- Most common sinus associated with CA: **Maxillary sinus.**
- Most common sinus CA among workers of furniture/wood industry: **Adenocarcinoma**

127. Ans. (d) Supreme meatus

Ref: Dhingra's ENT, 6th ed. pg. 187-88

- On the lateral wall of the nose are three turbinates and four meatuses.
- **The inferior turbinate is the longest turbinate**
- The supreme meatus is also called sphenoethmoidal recess

Ostia Opening in Meatuses

Meatus	Ostia
• Supreme meatus/ Sphenoethmoidal recess	Sphenoid sinus ostia
• Superior meatus	Posterior ethmoidal sinus ostia
• Middle meatus	Has three ostias <ul style="list-style-type: none"> • Maxillary sinus • Frontal sinus • Anterior ethmoidal sinus
• Inferior meatus	Has no Ostia. It has Nasolacrimal duct opening

Remember: Direction of nasolacrimal duct is **downwards, backwards and outward**.

128. Ans. (a) Inferior meatus

Ref: Dhingra's ENT, 6th ed. pg. 187-88

- Lateral wall of the nose **contains inferior meatus** which has no ostia, **instead it has naso-lacrimal duct**. The nasolacrimal duct (sometimes called the tear duct) carries tears from the lacrimal sac into nasal cavity.
- Inferior nasal meatus is partially covered by a mucosal fold called **valve of Hasner** or *plica lacrimalis*).

129. Ans. (d) Inferior meatus of the nose

Ref: Dhingra's ENT, 6th ed. pg. 187-88

Refer to above explanation

130. Ans. (a) Middle meatus

Ref: Dhingra's ENT, 6th ed. pg. 173-75

- **ANTROCHOANAL POLYP** most commonly seen in children. They are unilateral, usually arises from the mucosa of maxillary antrum near its accessory ostium, comes out of it & grows in the concha & nasal cavity.
- Maxillary sinus opens into the middle meatus.

131. Ans. (a) Sphenoid sinus

Ref: Dhingra's ENT, 6th ed. pg. 138

- Spheno ethmoidal recess is situated above the superior turbinate. Sphenoid sinus opens into it.
- Sphenoid sinus. It has an anterior part & posterior part.
 - **Anterior part:** Roof related to the olfactory tract, optic chiasma, frontal lobe while the lateral wall is related to optic nerve, internal carotid artery & maxillary nerve.
 - **Posterior part:** Roof is related to the pituitary gland in the sella turcica while each lateral wall is related to cavernous sinus, internal carotid artery and CN 3rd and all division of 5th nerve.

132. Ans. (d) None

Ref: Dhingra's ENT, 6th ed. pg. 138-40

FMGE Solutions Screening Examination

998

- Please read the question carefully! The question is about the sinus opening.
- In inferior meatus there is no opening of any sinuses. It has opening for nasolacrimal duct.

133. Ans. (d) Posterior ethmoidal artery

Ref: Dhingra's ENT, 6th ed. pg. 147, Dhingra 4th ed. pg. 140

- Kiesselbach's area, aka Kiesselbach's plexus and Little's area, is an area on the nasal septum located on the antero-inferior part of the septum.
- In this area four arteries anastomose to form a vascular plexus called Kiesselbach's plexus.
- **The arteries are**
 1. Sphenopalatine artery (from the maxillary artery):
Main artery of plexus
 2. Greater palatine artery (from the maxillary artery)
 3. Anterior ethmoidal artery (from the ophthalmic artery)
 4. Septal branch of the superior labial artery (from the facial artery)

Extra Mile

- Only artery of Kiesselbach's plexus which is a branch of internal carotid artery: Anterior ethmoidal artery. The other three are branches of external carotid artery.
- Most common site of epistaxis: Kiesselbach's area/Little's area
- **Artery of epistaxis: Sphenopalatine artery**
- **Posterior epistaxis is from:** Woodruff's plexus (very difficult to control)
- **Woodruff's Plexus:** Situated in the posterior part of meatus. Formed when sphenopalatine artery anastomosis with postpharyngeal artery.

134. Ans. (c) Anterior ethmoidal artery

Ref: Dhingra's ENT, 6th ed. pg. 147-48

- Anterior and posterior Ethmoid artery is a branch of ophthalmic artery, which is derived from internal carotid artery.
- It is only anterior ethmoidal artery (of internal carotid) which contributes to little's area.
- **Branches from external carotid artery (indirectly) contributing to little's area:** Sphenopalatine artery, Greater palatine artery and superior labial artery.

135. Ans. (d) Hereditary hemorrhagic telangiectasia

Ref: Dhingra's ENT, 6th ed. pg. 176-77

ETIOLOGY OF EPISTAXIS

- One of the most common local causes is trauma, due to nose picking or fractures.
- Some of the other local causes include nasal sprays, inflammatory reactions, anatomical deformities (i.e. septal deviation, septal spurs), foreign bodies, intranasal

tumors, chemical irritants, and nasal prongs for oxygen. Systemic causes include hypertension, vascular disorders, blood dyscrasias, hematologic malignancies, allergies, malnutrition, alcohol, drugs, and infection.

- Hereditary Hemorrhagic Telangiectasia is a rare cause causing bleeding. This is also known as **Osler-Weber-Rendu disease** and an **autosomal dominant** disease.

Extra Mile

- MCC of epistaxis overall: Trauma
- MCC of epistaxis in adult: Trauma
- MCC of epistaxis in elderly: Hypertension
- MCC of epistaxis in child: Digital trauma from nose picking.

136. Ans. (a) Olfactory epithelium

Ref: Dhingra's ENT, 6th ed. pg. 204

- **Esthesioneuroblastoma** usually arise from the olfactory epithelium. It's a rare tumor of any age group.
- **Presentation of tumor:** cherry red, polypoidal spots mass in upper third of nasal cavity. It is a vascular tumor that bleeds profusely on biopsy.

137. Ans. (c) Sphenoid sinus

Ref: Dhingra, 5th ed. pg. 203

TABLE: Development and growth of paranasal sinuses

Sinuses	Status at birth	Growth	First radiologic evidence
Maxillary	Present at birth	Rapid growth from birth to 3 years and from 7-12 years. Adult size-15 yrs	4-5 months after birth
Ethmoid	Present at birth	Reach Adult size by 12 years	1 years
Frontal	Not present	Invades frontal bone at the age of 4 years. Size increases until teens	6 years
Sphenoid	Not present	Reaches sella turcica by the age of 7 years. Reaches full size between 15 years to adult age	4 years

138. Ans. (c) Frontal sinus

Ref: Dhingra, 5th ed. pg. 203

- Please refer to above table
- The first sinus that starts to develop in human embryo is maxillary sinus. It starts to develop around 10 weeks of intra-uterine life.
- **The last sinus to develop in human embryo is frontal sinus. This sinus is absent at the time of birth & starts to develop postnatally.**

- Frontal sinus can be visualized radiologically at 6 yrs of age.

139. Ans. (c) 6 years

Ref: Dhingra, 5th ed. pg. 203

140. Ans. (c) 15 years

Ref: Dhingra, 5th ed. pg. 203

141. Ans. (d) 12 years

Ref: Dhingra, 5th ed. pg. 203

142. Ans. (b) Maxillary sinus

Ref: Dhingra, 5th ed. pg. 203-204

- Maxillary sinus is largest sinus with volume of around 15 cc.

143. Ans. (b) Maxillary sinusitis

Ref: Dhingra's ENT, 6th ed. pg. 411-12

- **Most common sinus involved in sinusitis: Maxillary sinus** (aka Antrum of Highmore)
- Treatment of acute cases is by antibiotics and symptomatic.
- Chronic cases and recurrent cases are treated by surgery. Usually performed surgeries are:
 - Antral wash
 - **Caldwell-Luc operation**
 - FESS (Functional Endoscopic Sinus Surgery)- Most preferred currently. Best surgical option

Caldwell Luc operation Indications:	Technique
<ul style="list-style-type: none"> • In case of chronic maxillary sinusitis • Dental cyst or Oro-antral fistula • Fracture of maxilla or blow out fracture of orbit • Antrochoanal polyp 	<ul style="list-style-type: none"> • Horizontal Incision below gingivolabial sulcus • Elevation of flap à Opening of Antrum à Removal of diseased antral mucosa/polyp • Making of naso-antral window • Packing the antrum à Closure of wound

144. Ans. (a) Atrophic rhinitis

Ref: Dhingra, 5th ed. pg. 170

■ ATROPHIC RHINITIS (OZAENA)

- **Etiology** (Remember Mnemonic HERNIA)
 - Hereditary factors
 - Endocrinal disturbance: Disease usually starts at puberty, involves females more than males.
 - Racial factors: White and yellow races are more susceptible than equatorial African natives.

- Nutritional deficiency. Disease may be due to deficiency of vitamin A, D or iron
- Infective.
 - ◆ **Kelbsiella ozaenae: Most common cause**
 - ◆ Diphtheroids, P. vulgaris, Esch. coli, staphylococci and Streptococci

Clinical Features

- Foul smell from the nose
- **Merciful anosmia**
- **Nasal obstruction:** Due to large crusts filing the nose
- Epistaxis: May occur when the crusts are removed

Treatment

Medical: Nasal irrigation and removal of crusts by Alkaline Douche- **Best Treatment**

- **Alkaline nasal douche** is prepared from (in ratio of 1:1:2):
 - Sodium bicarbonate
 - Sodium baborate
 - Sodium chloride

Surgical

- **Young's operation:** Both the nostrils are closed completely just within the nasal vestibule by raising flaps. They are opened after 6 months.
- **Modified young operation:** To avoid the discomfort of bilateral nasal obstruction, modified Young's operation aims to partially close the nostrils.

145. Ans. (d) Crusting

Ref: Dhingra, 5th ed. pg. 170

Please refer to above explanation

146. Ans. (b) Lymphadenopathy

Ref: Dhingra's ENT, 6th ed. pg. 446-47

■ NASOPHARYNGEAL CARCINOMA

- Nasopharyngeal carcinoma is caused by **Ebstein Barr virus (EBV)**.
- It is seen most commonly in Chinese population or South East Asian peoples.
- Most common site of nasopharyngeal carcinoma: **Fossa of Rosenmuller**.
 - This is a pyramidal shaped fossa on the lateral wall of nasopharynx.
- The most common type of nasopharyngeal carcinoma is undifferentiated carcinoma of nasopharyngeal type.

Clinical Presentation

- The most common presentation is cervical lymphadenopathy.

- **Other important presentations are**
 - Nasal obstruction
 - Nasal bleeding
 - Unilateral glue ear in adult leading to conductive hearing loss.
 - Cranial nerve palsies. *All the nerves from 3rd to 12th may be involved.*
- **Trotter's triad** seen in case of nasopharyngeal carcinoma. It is also called Sinus of Morgagni Syndrome.
 - Ipsilateral soft palate palsy
 - Conductive hearing loss
 - Trigeminal neuralgia.

147. Ans. (b) Rhinoscleroma

Ref: Dhingra's ENT, 5th ed. pg. 172

RHINOSCLEROMA

- Caused by gram negative coccobacillus- *Klebsiella Rhinoscleromatis*.
- **It passess through 3 stages:** Catarrhal, Granulomatous and Cicatricial.
- It causes woody infiltration of upper lip, so it is also known as Woody Nose.
- Upon biopsy characteristic cells seen are: Miculicz's cell and Russel Bodies.
- Tx: Streptomycin (1 g/day) and tetracycline (2 g/day) are given together for 4-6 weeks.

RHINOPHYMA

- It is due to hypertrophy of sebaceous glands of nasal tip.
- Associated with Acne Rosacea.
- Nose becomes big and ugly, hence also known as Potato Nose.

RHINOLITH

- It is old, calcified foreign body in nose.
- Present with foul smelling, one sided yellowish nasal discharge.

RHINOSPORIDIOSIS

- Caused by Rhinosporidiosis Seeberi
- *Present as strawberry/mulberry polyp in the nose.*
- It has very higher tendency to bleed. Hence also known as Bleeding Polyp.

148. Ans. (a) Hypertrophy of sebaceous gland

Ref: PL Dhingra, 5th ed. pg. 159, 461

RHINOPHYMA/POTATO NOSE/RUM NOSE/COPPER'S NOSE/TOPPER'S NOSE/BRANDY NOSE

- Benign tumor due to **hypertrophy of sebaceous glands of tip of nose.**
- Seen in cases of long-standing **acne rosacea.**
- Precipitated by: Spicy food, Heat, Alcohol
- **Treatment: Laser (CO₂)** Excision with skin grafting and **Avoidance of alcohol.**

149. Ans. (d) Protozoa

Ref: Dhingra's ENT, 6th ed. pg. 158-59

- Currently rhinosporidiosis is considered as a protozoal infection caused by **RHINOSPORIDIOSIS SEEBERI**. It is most commonly seen in the coastal parts of the world, most commonly in India, Pakistan and Sri Lanka. In india most commonly reported from the coastal part Tamil Nadu.
- It most commonly infects nose and nasopharynx. Other sites: Lip, Palate, conjunctiva, brochi, skin, vulva, vagina.
- It presents as polypoid mass which bleeds easily on touch, hence also known as Bleeding polyp.
- According to very recent papers, it is classified as **aquatic protist**

Treatment

- **Medical:** Dapsone
- **Surgical:** Complete excision of mass with diathermy knife and cauterization of base

150. Ans. (b) Rhinoscleroma

Ref: Dhingra's ENT, 6th ed. pg. 156-57, 5th ed. pg. 172

RHINOSCLEROMA

- It is a chronic granulomatous disease caused by gram negative coccobacillus-***Klebsiella Rhinoscleromatis***.
- **It has 3 stages:**
 - **Catarrhal or atrophic stage:** characterized by foul smelling purulent nasal discharge and crusting (*causing obstruction*). *This stage resembles atrophic rhinitis.*
 - **Granulomatous stage:** In this stage there are painless and non-ulcerative granulomatous nodules in nasal mucosa. *There is also subdermal infiltration of lower part of external nose and upper lip giving a 'woody' feel.*
 - **Cicatricial stage:** The last stage which causes adverse conditions like stenosis of nares, distortion of upper lip, adhesions in the nose, nasopharynx and

oropharynx. There may be subglottic stenosis with respiratory distress.

- Rhinoscleroma causes woody infiltration of nose, so it is also known as **Woody Nose**.
- Characteristic cells upon biopsy are: *Miculicz's cell and Russel Bodies*.
- **Treatment:** Streptomycin (1g/day) and tetracycline (2g/day) are given together for 4-6 weeks.

151. Ans. (c) **Granulomatous stage**

Ref: Dhingra's ENT, 6th ed. pg. 156-57, 5th ed. pg. 172

152. Ans. (b) **Bacteria**

Ref: Dhingra's ENT, 6th ed. pg. 156-57

Please refer to above explanation for more details.

153. Ans. (c) **Nasal bone**

Ref: Dhingra's ENT, 6th ed. pg. 147-148

- **Facial trauma**, also called **maxillofacial trauma**, is any physical trauma to the face.
- Commonly injured facial bones include the nasal bone, maxilla, and the mandible. The mandible may be fractured at its symphysis, body, angle, ramus, and condyle.
- **Nasal fracture is the most common facial fracture, and the third most common fracture of the skeleton overall.**
- Facial fractures occur for a variety of reasons related to sports participation: Contact between players (eg, a head, fist, elbow); contact with equipment (eg, balls, pucks, handle bars); or contact with the environment, obstacles, or a playing surface (e.g., wrestling mat, gymnastic equipment, goalposts, trees).
- Facial fractures may be associated with head and cervical spine injuries and it requires a significant amount of force.

154. Ans. (b) **Vertical fracture**

Ref: Dhingra's ENT, 6th ed. pg. 147-48

- There are two main types of fracture of septum namely: Chevallet and Jarjavay fracture

TABLE: Fracture of nasal septum

Fracture	Injury type	Impact of force
Chevallet fracture	Vertically	From below
Jarjavay fracture	Horizontally	From front

FIGURE: Fracture showing (A) Jarjavay type (B) Chevallet type

155. Ans. (c) **Front**

Ref: Dhingra's ENT, 6th ed. pg. 147-48

156. Ans. (a) **Neck of condyle**

Ref: Dhingra's ENT, 6th ed. pg. 185

- Neck of condyle is the most common site of fracture of mandible followed by angle of mandible.

THROAT/PHARYNX

157. Ans. (a) **Quinsy**

Ref: Diseases of ENT by Dhingra 6th ed. P 265

- **Quinsy** is peritonsillar abscess where crypta magna gets infected and sealed off leading to intratonsillar abscess which then burst through tonsillar capsule leading to collection of pus in peritonsillar tissues → Peritonsillar abscess.
- **MC organism:** *Streptococcus pyogenes*, *Staph aureus*
- **Symptoms:** Severe throat pain, odynophagia (refusal to eat), halitosis, hot potato voice, ipsilateral earache
- **Upon examination:** Congested tonsil with edematous pillar, contralateral deviation of uvula

FMGE Solutions Screening Examination

1002

• Treatment:

- IV antibiotics and fluid
- Surgical drainage by incision

▶ Extra Mile

- **Infection in pretracheal space** can lead to is dangerous and can compress major vessels, lower airways and upper digestive tract. Infection in this space is secondary to thyroiditis or perforation of anterior cervical esophagus.
- **Retropharyngeal abscess** patient can present with dysphagia, difficulty in breathing, stridor, croupy cough and torticollis (neck become stiff). Upon examination- bulge in the posterior pharyngeal wall usually seen on one side of midline.

▶ Extra Mile

	Croup	Epiglottitis	Bacterial tracheitis	Retro-pharyngeal abscess
Peak age	1-2 years	2-7 years	1-6 years	1-5 years
Onset	Gradual (days)	Sudden (hours)	Gradual (days) with progressive worsening	Gradual (days) with progressive worsening
Prodromal URTI	Yes	Minimal, short	Yes	Yes
Fever	Low grade	High grade	Variable severity	High grade
Cough	Barking	Minimal, muffled	Barking, croup-like	Minimal
Stridor	Harsh	Soft, may become inaudible	Harsh	Variable (20-71% cases)
Discriminating features	Well child; worsens at night	Drooling; leans forward in 'tripod' posture	Painful swallow; poor response to croup treatment	Painful swallow; neck stiffness or torticollis

URTI = Upper Respiratory Tract Infection

158. Ans. (a) Palatoglossus

- The hypoglossal nerve (CN- XII) runs inferior to the tongue and innervates tongue muscles.
- All the intrinsic and extrinsic muscles of tongue (genioglossus, styloglossus, hyoglossus) is supplied by CN-XII except palatoglossus.
- Palatoglossus is supplied by CN- X

▶ Extra Mile

Sensory supply of tongue

- **Anterior 2/3rd:**
 - General sensation: Lingual nerve
 - Special sensation: Chorda tympani (branch of CN- VII)
- **Posterior 1/3rd:**
 - General and special sensation: Glossopharyngeal nerve
- **Base of tongue:**
 - General and special sensation: Internal laryngeal nerve

159. Ans. (a) Lateral sinus thrombophlebitis

Ref: Diseases of ENT by Dhingra 6th ed. P 84-85

- Lateral sinus thrombophlebitis is an intracranial complication of CSOM.
- The patient usually present with intermittent high grade fever termed as hectic picket fence fever associated with rigor, chills, headache.

Other clinical features:

- Anemia
- Thrombocytopenia
- Papilledema
- **Griesinger sign:** Edema over posterior part of mastoid, due to thrombosis of mastoid emissary veins.
- **Tobey- Ayer test:** If internal jugular vein compressed on healthy side, there is rise in CSF pressure.
- **Crowe- Beck test:** Pressure applied on the jugular vein of healthy side produces engorgement of retinal veins and supraorbital veins (because of thrombosed opposite side).

160. Ans. (d) Aphthous ulcer

Ref: Diseases of ENT by Dhingra 6th ed. P218

- **Aphthous ulcer** can be due to autoimmune process, nutritional deficiency of Vitamin B12, folic acid and iron, infection, stress or food allergy.
- **Site:** mucosa of inner surface of lips and buccal mucosa, tongue, floor of mouth, soft palate
- **Spares** mucosa of hard palate and gingiva.
- **Occur in 2 forms:**
 - Minor form: 2-10 mm; multiple in number with central necrotic area and a red halo; heals without any scar in 2 weeks.
 - Major form: 2-4 cm; heals with a scar

• **Treatment:**

- Topical application of steroids
- Cauterization with 10% silver nitrate
- In severe cases: 250 mg of tetracycline dissolved in 50 ml water → given as mouth rinse then to be swallowed (4 times/day)
- Lignocaine viscous: For local pain

Extra Mile

- Erosive form of **lichen planus** can be a premalignant lesion. There is painful erosion of buccal mucosa, gingiva or lateral tongue surrounded by a keratotic periphery.
 - Malignant potential: 0.4 to 3.7%
- **Chronic hypertrophic candidiasis** aka candidial leukoplakia.
 - **MC site:** anterior buccal mucosa just behind angle of mouth
 - It appears as white patch that cannot be wiped off
- **Oral submucal fibrosis** mostly associated with betel-nut chewing. Alcohol further increases the risk by 2 fold.
 - It is a premalignant condition. Malignant transformation is seen in 3 – 7.6% of cases
 - Leukoplakia and squamous cell CA is associated with submucous fibrosis, possible due to common etiological factors involved

TABLE: Some premalignant lesion and conditions

Premalignant lesions	Premalignant conditions
<ul style="list-style-type: none"> • Erythroplakia (aggressive) • Leukoplakia • Candidiasis • Carcinoma in situ • Leukokeratosis nicotina palatinae 	<ul style="list-style-type: none"> • Oral submucous fibrosis • Oral lichen planus • Actinic keratosis • Syphilis • Discoid lupus erythematosus • Sideropenic dysphagia

161. Ans. (a) Chemoradiation

Ref: Dhingra's ENT 6th ed. P 252

- Nasopharyngeal carcinoma is the most common malignant carcinoma (CA) of nasopharyngeal area and is most commonly seen in Chinese population.

TREATMENT OF NASOPHARYNGEAL CA:

- **Stage I and II:** Radiotherapy is the treatment of choice.
- **Stage III and IV:** Radiotherapy + chemotherapy.
- **Book states:** "Stage III and IV CA can be cured by radiotherapy alone, but cure rate is doubled when chemotherapy is combined with radiotherapy".
- Cisplatin or cisplatin + 5FU is used for chemotherapy.

MUST KNOW QUESTIONS ABOUT NASOPHARYNGEAL CA:

- **Most common site for nasopharyngeal CA:** Fossa of Rosenmüller
- Most common type of nasopharyngeal carcinoma is Type III (63%).

- **Trotter's triad** is associated with nasopharyngeal CA includes: Conductive hearing loss, soft palate palsy and deep facial pain.
- First cranial nerve (CN) to be affected is: CN VI (Abducens nerve).
- Nasopharyngeal CA can involve multiple cranial nerves like II, III, IV, V, VI, IX, X, XI, XII.
- Involvement of CN IX, X, XI causes *jugular foramen syndrome*.

162. Ans. (a) Aspiration

Ref: Dhingra's ENT 6th ed. P 326

- External branch of superior laryngeal nerve supplies cricothyroid and is mainly responsible for pitch of the voice.
- If it is injured, it causes bowing and inferior placement of vocal cord with consequent loss of pitch.

163. Ans. (a) Cricothyroid

Ref: Dhingra's ENT 6th ed. P 284, 298

- All the muscles of larynx are supplied by either recurrent laryngeal nerve or superior laryngeal nerve.
- External branch of **superior laryngeal nerve supplies cricothyroid muscle** and is mainly responsible for pitch of the voice. Rest all the muscles are supplied by recurrent laryngeal nerve (RLN).
- Right RLN arises from the vagus at the level of subclavian artery, hooks around it and then ascends between the trachea and esophagus.
- Left recurrent laryngeal nerve arises from vagus and hooks around arch of aorta, loose around it and then ascends into the neck in tracheoesophageal groove.
- The left RLN has much longer course and is more prone to injury and paralysis as compared to right side.

164. Ans. (c) Glottis level

Ref: Dhingra's ENT 6th ed. P 295

- Laryngeal web is due to incomplete recanalization of larynx.
- Most common site of this web is between the vocal cords (at the glottis level) and has a concave posterior margin.
- **Clinical features:**
 - Airway obstruction
 - Weak cry
 - Aphonia (dating from birth)
- **Treatment:**
 - **If thin webs:** Cut with a knife or CO₂ laser
 - **Thick web:** Excision via laryngofissure and placement of a silicon keel and subsequent dilatation.

FIGURE: Laryngeal web

165. Ans. (a) Quincy

Ref: Dhingra's ENT 6th ed. P 265

QUINCY

- It is collection of pus in the peritonsillar space, which lies between the tonsillar capsule and superior constrictor muscle.
- It usually follows acute tonsillitis, though it may arise de novo as well.
- **MCC:** *Streptococcus pyogenes*, *Staphylococcus aureus*.
- **Symptoms:**
 - Acute onset high grade fever
 - Severe throat pain, usually unilateral
 - Marked odynophagia; patients are even unable to swallow their own saliva
 - **Muffled voice**, often called **hot potato voice**
 - Foul breath due to sepsis in oral cavity
 - Trismus and ipsilateral earache.
- **Signs:**
 - Swollen/enlarged tonsil
 - Swollen uvula and pushed to opposite side
 - Soft palate and anterior pillar bulging
 - Cervical lymphadenopathy.
- **Treatment:**
 - IV fluids + antibiotics + analgesics + oral hygiene
 - Surgery:
 - ◆ Incision and drainage
 - ◆ Interval tonsillectomy (I/D → then tonsillectomy after 4–6 weeks).

Extra Mile

- **Parapharyngeal and acute retropharyngeal abscess** is usually seen in children below 3 years. Symptoms can be dysphagia, stridor, bulge in posterior pharyngeal wall.

166. Ans. (c) HPV

Ref: Dhingra's ENT 6th ed. P 305

- Juvenile papillomatosis also known as respiratory papillomatosis is the most common benign neoplasm of larynx in the children.
- It is most commonly caused by **HPV type 6 and 11**.
- Affected children acquire this infection at birth itself from the mothers who had vaginal HPV virus infection.
- Papilloma's mostly affects supraglottic and glottic region of larynx but can also involve subglottis, trachea and bronchi.
- **Symptoms:** Hoarseness, aphonia, respiratory difficulty, stridor.
- **Treatment:** CO₂ laser surgery.

167. Ans. (c) Carcinoma of pyriform sinus

Ref: Dhingra's ENT, 6th ed. pg. 273

Pyriform Sinus Carcinoma

- It is the most common hypopharyngeal cancer
- Mostly affect males above 40 years of age. The growth is asymptomatic for long time due to large size of the pyriform sinus.
- It can spread locally or via lymphatic spread.
- Most common and first lymph node involved: Cervical lymph node.

Clinical feature:

- Patient usually describes it as "something sticking in throat and pricking sensation" while swallowing. It is also the **earliest symptom**.
- **First sign:** Mass of lymph nodes high up in the neck
- Referred otalgia, pain on swallowing and increasing dysphagia are other symptoms which may follow.

IOC: Endoscopic biopsy

Treatment:

- If no nodal involvement: Radiotherapy
- If nodal involvement: Surgery

Extra Mile

Postcricoid carcinoma arises from postcricoid region and most commonly affects females in early 20's–30's. Its most common presenting symptom is progressive dysphagia.

168. Ans. (a) Palatopharyngeus

Ref: Dhingra's ENT, 6th ed. pg. 240

- **Passavant ridge** is a mucosal ridge raised by fibres of palatopharyngeus.
- It encircles the posterior and lateral walls of nasopharyngeal isthmus

- **Advantage of ridge:** Soft palate while contraction makes a firm contact with this ridge to cut off Nasopharynx from the oropharynx during speech or deglutition.

169. Ans. (b) Laryngomalacia

Ref: Dhingra's ENT, 6th ed. pg. 295

TABLE: Different shape of glottis and conditions

Finding	Condition
Key hole shaped glottis	Phonasthenia
Omega shaped glottis	Laryngomalacia
Thumb sign	Acute epiglottitis
Steeple sign	Croup/ Laryngotracheobronchitis
Turban shaped glottis	Laryngeal TB

170. Ans. (c) Analgesic with antibiotic and drainage

Ref: Dhingra's ENT, 6th ed. pg. 264-65

Treatment of Peritonsillar Abscess (Quinsy)

- IV fluids to cover dehydration
- Antibiotics to cover both aerobic and anerobic organisms
- Analgesics to relieve pain
- Oral hygiene
- Incision and drainage of abscess
- Interval tonsillectomy: Tonsils are removed 4–6 weeks following attack of quinsy.

171. Ans. (c) Burn of head and neck

Ref: Dhingra's ENT, 6th ed. pg. 316

- Burn of face and neck can lead to airway edema and will require a planned tracheostomy. Elective tracheostomy can be therapeutic to relieve respiratory obstruction, remove tracheobronchial secretions. Prophylactic tracheostomy is done to guard against anticipated respiratory obstruction or aspiration of blood.
- **Elective tracheostomy** also known as routine tracheostomy is a planned, unhurried procedure. It is done when all surgical facilities are available, endotracheal tube can be put and local or general anesthesia can be given.

172. Ans. (a) Carcinoma larynx

Ref: Dhingra's ENT, 6th ed. pg. 316

- Tracheostomy can be divided into: High, Mid or Low
 - **High tracheostomy** is done above the level of thyroid isthmus. It violates the 1st ring of trachea. Only indication for high tracheostomy is CA larynx, because in such cases total larynx would ultimately be removed and in a lower down area, a fresh tracheostome is made.
 - **Mid tracheostomy** is the preferred one. Done through 2nd or 3rd ring by dividing or retracting isthmus upwards.
- **Low tracheostomy** is done below the level of isthmus. Diptheria is a common indication.

173. Ans. (d) Speech therapy plus PPI

Ref: Dhingra's ENT, 6th ed. pg. 303

- The given condition is a case of singer's nodule also known as screamer's nodule.
- It is medically treated with **speech/voice therapy** and PPI should be added to relieve GERD, which might be an aggravating factor for the patient.
- For large nodules or long standing nodules, surgery (Microscopic laryngeal surgery) may be required.

174. Ans. (a) Lower part of thyroid cartilage

Ref: Dhingra's ENT, 6th ed. pg. 285

- Infants larynx is small and conical. The diameter of cricoid cartilage is smaller than size of glottis, making **subglottis the narrowest part**.
- Cricoid cartilage is located at the lower part of thyroid cartilage, hence it is the best answer of choice given these options.

TABLE: Difference between pediatric and adult larynx

	Infant	Adult
Anatomical level of glottis	C2-C3	C3-C6
Shape	Conical	Tubular
Narrowest at	Subglottis	Glottis
Functional difference	Can swallow and breath at same time (due to high positioning)	Can not swallow and breath at the same time
Cartilage	Softer	Soft

175. Ans. (d) Bilateral mobile lymph nodes >6 cm

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 308

FMGE Solutions Screening Examination

TABLE: Tumor staging

1006

Tumor	Node	Metastasis
T1 - One focal area involved	N0 - No LN involved	M0 : no mets
T2 - 2-3 area involved	N1 - <3 cm, single, 1/L	M1 : + Mets
T3 - Pre-epiglottic, Para-Glottic, Paralysis of VC, Posterior cricoid space	N2a : 3–6 cm single, 1/L N2b : 3–6 cm multiple, 1/L N₂C : 3–6, multiple, B/L	Mx : Can not be assessed
T4 - Trachea, Tongue base muscle Thyroid muscle	N₃ : >6 cm	

176. Ans. (c) **Posterior cricoarytenoid**

Ref: P.L. Dhingra, 6th ed. pg. 283-84

Movement	Muscles	Nerve supply
Abduction of vocal cords	Posterior cricoarytenoids only	Recurrent laryngeal nerve
Adduction of the vocal cords	<ul style="list-style-type: none"> Lateral cricoarytenoids Interarytenoids Thyroarytenoids (external part) 	Recurrent laryngeal nerve
Tensor of vocal cords	<ul style="list-style-type: none"> Cricothyroid Vocalis (internal part, part of Thyroarytenoid) 	Superior laryngeal nerve
Relaxor of vocal cord	Thyroarytenoid	Recurrent laryngeal nerve
Elevation of larynx	Thyrohyoid, mylohyoid	
Depression of larynx	Sternothyroid, sternohyoid	

177. Ans. (b) **Laryngeal TB**

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 293

- Laryngeal TB is always secondary. It is primary most commonly from lungs.
- Most commonly involved part: Posterior wall
- First part to get affected in case of laryngeal TB: **Interarytenoid fold**
- Important Features:**
 - Turban epiglottitis**—due to pseudo edema
 - Mouse nibbled appearance:** Due to ulceration of vocal cord
- Cobble stone appearance**

178. Ans. (c) **Peri-tonsillar abscess**

Ref: Dhingra's ENT, 5th ed. pg. 279

- Hot potato voice is muffled and thick speech.
- MCC of hot potato voice is **Quincy (peritonsillar abscess)**, which is an extremely painful condition.
- However it can also be seen in conditions like CA tonsil and streptococcus pharyngitis.

179. Ans. (c) **Subglottis**

Ref: Diseases of ENT, by Dhingra, 6th ed. pg. 285

TABLE: Difference between infant and adult larynx

Features	Infant/Child	Adult
Anatomical level	C2–C3	C3–C6
Shape	Conical	Tubular
Narrowest at	Subglottis	Glottis
Important feature	Can swallow and breath at the same time	Can not swallow and breath at the same time
Cartilage	Softer	Soft

Extra Mile

TABLE: Difference between male and female larynx

Features	Male	Female
Length	44 mm	36 mm
AP diameter	43 mm	41 mm
Transverse diameter	36 mm	26 mm

180. Ans. (c) **Young males**

Ref: Dhingra's ENT, 5th ed. pg. 261

"Nasopharyngeal angiofibroma is seen almost exclusively in **ADOLESCENT males in the age group of 10-20 years.**"

ABOUT NASOPHARYNGEAL ANGIOFIBROMA

- It is a vascular tumor with lots of fibrous tissue without muscular coat. Hence it causes severe bleeding because of inability to contract.
- Most common benign tumour** of nasopharynx.
- Arises from the posterior part of nasal cavity close to superior margin of **sphenopalatine foramen**.
- Frog face deformity**—if tumor Extends to orbit and causes proptosis
- Antral/Holman-Millar sign**—Anterior bowing of posterior wall of maxillary sinus is pathognomonic.
- Investigation of choice is **C.E.C.T. scan**
- Treatment of choice is **surgical excision**.

181. Ans. (b) **Angiofibroma**

Ref: Dhingra's ENT, 5th ed. pg. 261

182. Ans. (a) **Tonsils**

Ref: Dhingra's ENT, 6th ed. pg. 257-58

- Crypts are inward folding of the mucosa which are found in tonsils and they increase the surface area.
- Crypts are also seen in small intestine.

183. Ans. (b) **Oral cavity of patient for intubation**

- Mallampati score, also known as Mallampati classification is used to assess the oral cavity of patient to predict the ease of intubation.
- It is assessed by looking at the anatomy of the oral cavity; specifically, it is based on the visibility of the base of soft palate, uvula, fauces, and pillars.
- A high Mallampati score (class 3 or 4) is associated with more difficult intubation as well as a higher incidence of sleep apnea.

MODIFIED MALLAMPATI SCORING

- Class I: Soft palate, uvula, fauces, pillars visible.
- Class II: Soft palate, uvula, fauces visible.
- Class III: Soft palate, base of uvula visible.
- Class IV: Only hard palate visible

184. Ans. (a) **Cricothyroid**

Ref: P.L. Dhingra, 5th ed. pg. 317; BD Chaurasia Vol: 3 pg. 242, 244

- All intrinsic muscles of the larynx are supplied by the recurrent laryngeal nerve except cricothyroid which is supplied by external branch of superior laryngeal nerve.
- Recurrent laryngeal nerve supplies posterior cricoarytenoid, lateral cricoarytenoid, transverse and oblique arytenoids, aryepiglotticus, thyroarytenoid, thyroepiglotticus muscle.

185. Ans. (a) **Posterior cricoarytenoid**

Ref: P.L. Dhingra, 5th ed. pg. 317

Please refer to above explanation

186. Ans. (a) **Cricothyroid**

Ref: P.L. Dhingra, 5th ed. pg. 317

Please refer to above explanation

187. Ans. (b) **Parotid gland**

Ref: Dhingra's ENT, 5th ed. pg. 248

WARTHINS TUMOR

- Warthins tumor is also known as Adenolymphoma
- It is a benign, mixed type tumor of salivary gland.
- It occurs exclusively in parotid gland.
- It is the 2nd most common benign tumor of parotid gland.
- Most common benign & overall tumor of parotid gland is pleomorphic adenoma

Extra Mile

- Most common salivary gland tumors occurs in Parotid Gland (85% benign): **Pleomorphic adenoma**.
- Overall, **mucoepidermoid carcinoma** is the most common malignant tumor of the parotid gland or any salivary gland. It can be divided into low-grade and high-grade tumors.
- Second most common tumor of parotid gland is **Warthin's tumor**
- Most common malignant tumor of parotid gland is **mucoepidermoid carcinoma**
- Parotid tumor which spreads by perineural invasion is Adenoid cystic carcinoma.

188. Ans. (b) **Stylopharyngeus muscle**

- Cranial nerve IX (glossopharyngeal nerve) is a mixed nerve that carries afferent sensory and efferent motor information.

Functions

- **Branchial motor:** Supplies the stylopharyngeus muscle
- **Visceral motor:** provides parasympathetic innervation to the parotid gland
- **Visceral sensory:** Carries visceral sensory information from the carotid sinus and carotid body.
- **General sensory:** Provides general sensory information from the skin of the external ear internal surface of the tympanic membrane, upper pharynx and the posterior one-third of the tongue.
- **Special sensory:** Provides taste sensation from the posterior one-third of the tongue including circumvallate papillae.

189. Ans. (b) **Laryngomalacia**

Ref: Dhingra's ENT, 6th ed. pg. 295

LARYNGOMALACIA

- The most common congenital disease of larynx is Laryngomalacia.
- Laryngeal cartilages are extremely soft and flabby in a child with laryngomalacia.
- **Most common clinical presentation of laryngomalacia: Stridor**
- The stridor is mainly inspiratory and increases during supine position but decreases during prone position.
- Laryngomalacia may involve all the cartilages but epiglottis and aryepiglottic folds are mainly involved.
- **IOC:** Direct laryngoscopy.
- The finding is Omega shaped epiglottis (long and tubular epiglottis with curled up tip).

Extra Mile

TABLE: Different shape of glottis and conditions

Glottis shape	Condition
• Key hole shaped	Phonasthenia
• Omega shaped	Laryngomalacia
• Thumb sign	Acute epiglottitis
• Steeple sign	Croup/Laryngotracheobronchitis
• Turban shaped	Laryngeal TB

190. Ans. (b) **Acute epiglottitis**

Ref: Dhingra's ENT, 6th ed. pg. 289, 4th ed. pg. 267

	Acute epiglottitis	Acute laryngo-tracheo-bronchitis (or croup)
Causative organism	• Strep. pneumoniae > Haemophilus influenza type B	Para influenza virus type I and II
Age	2–7 years	3 months to 3 years
Pathology	Supraglottic larynx	Subglottic area
Prodromal symptoms	Absent	Present
Onset	Sudden	Slow
Fever	High	Low grade or no fever
Patient's look	Toxic	Non-toxic
Cough	Usually absent	Present, (Barking seal-like)
Stridor	Present and may be marked	Present
Odynophagia	Present, with drooling of secretions	Usually absent
Radiology	Thumb sign on lateral view	Steeple sign on AP view of neck
Treatment	Humidified oxygen, third generation cephalosporin or amoxicillin	Humidified O ₂ tent, steroids

Note: According to recent papers Strep. pneumoniae is MCC of acute epiglottitis

191. Ans. (b) **Sternocleidomastoid muscle**

Ref. PL Dhingra, 5th pg. 87

- **Mastoid tip is in relation to two muscles:**
 - Sternocleidomastoid muscle
 - Digastric muscle (posterior belly)
- If there is abscess from:
 - **SCM muscle:** Bezold's abscess
 - **Digastric area:** Citelli's abscess.

Extra Mile

Different MASTOID Abscess

Abscess	Location
Wild's abscess	Subperiosteal mastoid abscess
Bezold's abscess	Deep to Sternomastoid muscle
Luc's abscess	Under periosteum of the roof of bony canal
Citelli's abscess	Digastric triangle (along posterior belly of digastric muscle)

192. Ans. (b) **Sternocleidomastoid muscle**

Ref: Dhingra's ENT, 6th ed. pg. 78

Please refer to above explanation

193. Ans. (c) Malignant change

Ref: Dhingra's ENT, 5th ed. pg. 272-273

- Acute tonsillitis often affects school-going children, but it can also affect adults.

Cause:

- MCC:** Group A Beta Hemolytic streptococcus
- Acute infections of tonsil may involve these components and are thus classified as:
 - Acute catarrhal or superficial tonsillitis:** generalized pharyngitis and is mostly seen in viral infections.
 - Acute follicular tonsillitis:** Infection spreads into the crypts which become filled with purulent material.
 - Acute parenchymatous tonsillitis:** Uniformly enlarged and red tonsil.
 - Acute membranous tonsillitis:** It is a stage ahead of acute follicular tonsillitis. In this, exudation from the crypts coalesces to form a membrane on the surface of tonsil.

Symptoms

- Sore throat, Difficulty in swallowing, Fever, Earache, odynophagia, dysphagia
- Constitutional symptoms**
 - Headache, general body aches, malaise and constipation.

Treatment

- Patient is put to bed and encouraged to take plenty of fluids.
- Analgesics
- Antimicrobial therapy (DOC: Penicillin)

Complications

- Chronic tonsillitis with recurrent acute attacks. This due to incomplete resolution of acute infection.
- Peritonsillar abscess.*
- Parapharyngeal abscess.*
- Cervical abscess due to suppuration of jugulodigastric lymph nodes.
- Acute otitis media.*
- Rheumatic fever.
- Acute glomerulonephritis.
- Subacute bacterial endocarditis.*

Note: Malignancy is never a complication of tonsillitis.

194. Ans. (c) Sublingual dermoid cyst

Ref: Dhingra's ENT, 5th ed. pg. 398

- Sublingual dermoid cyst present as midline submental swelling. This cyst is not attached to foramen cecum and hence does not move upon tongue protrusion or upon deglutition.
- The thyroglossal cyst classically moves upwards with swallowing and notably with tongue protrusion, as

it is attached to foramen cecum. It merely indicates attachment to the hyoid bone.

195. Ans. (a) Glottic CA

Ref: Dhingra's ENT, 5th ed. pg. 327

- Most common laryngeal malignancies are squamous cell CA (90-95%).
- It can be any of these three sites:

Supraglottis	2 nd MC site. Nodal metastasis occur early. MC to middle jugular nodes Symptom: Throat pain, Dysphagia, referred pain to ear > Hoarseness
Glottis	MC site. Local spread present. <i>Nodal metastasis is always absent as glottis has no (or very few) lymphatics.</i> Symptoms: Hoarseness > Stridor > laryngeal obstruction
Subglottis	3 rd MC site. Lymph nodes involved are: Prelaryngeal, Pretracheal, Paratracheal and Lower jugular nodes. Symptoms: Stridor > Hoarseness

196. Ans. (b) Epiglottitis CA

Ref: Dhingra's ENT, 5th ed. pg. 329

- Treatment of laryngeal CA depends upon site of lesion, extent of lesion, presence or absence of nodal metastasis.
- It consists of:**
 - Radiotherapy
 - Surgery (conservative laryngeal surgery, total laryngectomy)
 - Combined therapy
- Radiotherapy:** Reserved for early lesions which neither impair cord mobility nor invade the cartilage or cervical nodes.
- Superficial exophytic lesions, especially of the tip of epiglottis, and aryepiglottic folds give 70-90% cure rate.**
- RT doesn't give good results in lesions with fixed cords, subglottic extension, cartilage invasion and nodal metastasis.
- Note:** Early stages of all these cancers, gives good prognosis with radiotherapy. But once cord mobility is impaired, surgery is the next best choice.

197. Ans. (b) Carcinoma thyroid

Ref: Dhingra's ENT, 5th ed. pg. 279

- Hot potato voice is muffled and thick speech.
- MCC of hot potato voice is Quincy (peritonsillar abscess), which is an extremely painful condition.
- However it can also be seen in conditions like CA tonsil and streptococcus pharyngitis.

198. Ans. (c) **Ranula**

Ref: Dhingra's ENT, 5th ed. pg. 237-38, 400

- **Ranula** is a cystic **transilluminant** swelling seen in the floor of mouth on one side of frenulum. It arises due to obstruction of sublingual salivary gland duct.
 - **Treatment:** complete surgical excision if small, or marsupialization if large.
- **Thymic cyst** can be cystic or solid. Present as a neck mass anterior and deep to middle third of SCM muscle.
- **Branchial cyst** is non-transilluminant, round, fluctuant, non-tender mass present in upper part of neck anterior to SCM muscle.
- **Thyroglossal duct cyst** is cystic midline swelling in the course of thyroid duct.

199. Ans. (a) **Puberphonia**

Ref: Dhingra's ENT, 6th ed. pg. 314-15

- **Androphonia:** Female patient with male like voice. Cause can be psychological or organic
- **Puberphonia:** Male patient with female like voice. Cause can be psychological or organic
- **Rhinolalia aperta:** Hypernasality in voice. Cause can be: cleft palate, Post adenoidectomy, oronasal fistula etc.

- **Rhinolalia clausa:** Hyponasality in voice. Caused due to any pathology causing nasal obstruction.

200. Ans. (d) **IV**

There are 4 types of thyroplasty done, depending on the pathology

- **Type I:** Medialization (Done for Abducted Vocal Cord)
- **Type II:** Lateralization (Done for Adducted Vocal Cord)
- **Type III:** Relaxation, shortening (*in order to lower down the pitch*)
- **Type IV:** Tensioning, Lengthening (*in order to increase the pitch*)

201. Ans. (a) **Type I**

- Type I thyroplasty is medialization. It is done in patient with lateralized vocal cord to prevent complications like aspiration.

202. Ans. (a) **Hemorrhage**

Ref: Dhingra's ENT, 6th ed. pg. 319

- Most common complication of tracheostomy: Hemorrhage > Tracheal stenosis
- MC damaged structure while tracheostomy: Isthmus of thyroid

ANSWERS TO BOARD REVIEW QUESTIONS

203. Ans. (c) **Aberrant right subclavian artery**

Ref: Sr's Manual of Surgery by Sriram Bhat pg. 720

204. Ans. (a) **Hypotympanum**

Ref: Dhingra, 4th ed. pg. 107

221. Ans. (a) **Glossopharyngeal nerve**

222. Ans. (b) **Nasal decongestants**

223. Ans. (d) **Infective condition**

224. Ans. (a) **Glomus tumor**

225. Ans. (b) **Tensor tympani**

226. Ans. (a) **Protozoal infection**

227. Ans. (a) **Greater petrosal nerve**

228. Ans. (d) **>90 mm Hg**

229. Ans. (c) **20-30 years**

230. Ans. (a) **Pulsatile tinnitus**

231. Ans. (c) **7th nerve**

232. Ans. (c) **Ulcerative lesion of the tonsil**

233. Ans. (c) **Mucormycosis**

234. Ans. (a) **Syphilis**

235. Ans. (a) **Otosclerosis**

236. Ans. (b) **Posterior cricoarytenoid**

237. Ans. (a) **Junction of the ant: 1/3 and posterior 2/3**

238. Ans. (a) **Maxillary sinusitis**

239. Ans. (a) **Laryngotracheobronchitis**

240. Ans. (a) **Bezold abscess**

241. Ans. (d) **Pseudomonas**

242. Ans. (b) **Ethmoidal polyp**

243. Ans. (b) **Beta-hemolytic streptococcus**

244. Ans. (a) **Angiofibroma**

245. Ans. (a) **Dental extraction**

246. Ans. (b) **Meningitis**

247. Ans. (a) **Rhinoscleroma**

248. Ans. (a) **24 hours**

249. Ans. (b) **Facial nerve and superior vestibular nerve**

250. Ans. (a) **Conductive hearing loss**

251. Ans. (a) **Middle meatus**

252. Ans. (a) **Atrophic rhinitis**

253. Ans. (b) **45°**

Ref: Dhingra's, 5th ed. p-158, Sss-Otorhinolaryngology and Head & Neck Surgery by George 2010 ed. pg. 139

283. Ans. (b) **Posterior cricoarytenoid**

- Posterior cricoarytenoid muscle is the only abductor of vocal cord, leading to air passage to lungs. Therefore it is said that this muscle is having life saving action.
- Other intrinsic laryngeal muscles like lateral cricoarytenoid, cricothyroid, interarytenoid having adduction action, which is helpful in voice production.

284. Ans. (d) **Lateral sinus thrombophlebitis**

- Lateral sinus thrombophlebitis is an intracranial complication of CSOM.
- The patient usually present with intermittent high grade fever termed as hectic picket fence fever associated with rigor, chills and headache.
- Other clinical features:
 - Anemia

- Papilledema
- **Griesinger sign:** Edema over posterior part of mastoid, due to thrombosis of mastoid emissary veins.
- **Tobey- Ayer test:** If internal jugular vein compressed on healthy side, there is rise in CSF pressure.
- **Crowe- Beck test:** pressure applied on the jugular vein of healthy side produces engorgement of retinal veins and supraorbital veins (because of thrombosed opposite side).

285. Ans. (a) Anterior laryngeal wall

Ref: Kendig's Disorders of the Respiratory Tract in Children E-Book, P 305

- Laryngeal web is a rare congenital anomaly, which result from failure of recanalization of laryngotracheal tube during 3rd month of gestation.
- Most common site of these webs are anterior commissure.
- **Cohen's classification** subdivides laryngeal web into four types:

- **Type I:** Anterior web, involving 35% of glottis or less
- **Type II:** Anterior web involving 35-50% of glottis
- **Type III:** Anterior web involving 50 – 70% of glottis
- **Type IV:** Anterior web involving 75 – 90% of glottis
- Most common presentation: **Hoarseness**

286. Ans. (b) Aspergillus Niger

- Most common organism causing fungal infection of ear (Otomycosis) is: Aspergillus Niger.
- Common organism causing otomycosis: Aspergillus Niger > Aspergillus fumigatus > Candida

287. Ans. (d) Presbycusis

- Overall, most common cause of SNHL: Presbycusis
- Hallmark of presbycusis is bilateral, high frequency SNHL.
- Noise induced hearing loss is the second most common cause of SNHL among adults
- Most common infectious cause of congenital SNHL: CMV infection

ANSWERS TO IMAGE-BASED QUESTIONS

288. Ans. (a) Quinsy

- The image shows a deviated uvula indicating a Peritonsillar abscess and clinical history of hot potato voice confirms the diagnosis of quinsy

289. Ans. (c) Semicircular canal

290. Ans. (c) Serous otitis media

- During otoscopy, fluid level with air bubble is very suggestive of Glue ear/serous otitis media.

291. Ans. (a) Acute otitis media

- Upon otoscopy, red congested tympanic membrane with fluid level is suggestive of acute suppurative otitis media.
- The shown image shows cart wheel appearance which is due to dilatation of vessels of tympanic membrane due to inflammation.

292. Ans. (a) Rhinoscleroma

- Woody nose is seen in granulomatous stage of rhinoscleroma.

293. Ans. (b) Vocal cord polyp

- The shown image is vocal cord polyp.
- Site: Junction of anterior 1/3rd and posterior 2/3rd

- Most common site is junction of anterior 1/3rd and posterior 2/3rd

294. Ans. (b) Weber fergusson incision

- The shown incision line is weber fergusson incision.
- It is done for maxillectomy in maxillary sinus carcinoma.

295. Ans. (b) Angiofibroma

- The shown case and radiological image is diagnostic of Juvenile nasopharyngeal carcinoma.
- The shown HPE image shows endothelial lining which is also a finding of angiofibroma.

296. Ans. (d) Checking the mobility of tympanic membrane

The shown image is of **siegel speculum** which is used for checking the mobility of tympanic membrane.

297. Ans. (c) Lateral sinus thrombophlebitis

- The shown sign is known as **Griesinger sign**, which is mastoid emissary vein thrombosis seen in case of lateral sinus thrombophlebitis.

298. Ans. (c) Ranula

- The shown image is ranula. It is retention cyst of sublingual gland.

Orthopedics

MOST RECENT QUESTIONS 2019

1. A 6-year-old child is suspected with supracondylar fracture of right hand, complaining of pain and swelling. X-ray of right elbow was not significant. What is the next best step in this case?
 - a. Compare with X-ray of left hand
 - b. Closed reduction and slab
 - c. Closed reduction with K wire fixation
 - d. Casting
2. A patient presented with following serum parameters: Normal serum ALP, normal PTH level and increased Ca^{++} and PO_4 . Most likely cause:
 - a. Vitamin D increase
 - b. Hyperparathyroidism
 - c. Osteoporosis
 - d. Osteomalacia
3. Three point bony relationship has diagnostic value in:
 - a. Elbow fracture
 - b. Monteggia fracture
 - c. Galeazzi fracture
 - d. Colles' fracture
4. Management of olecranon fracture as seen in the image:

- a. Above elbow plaster slab
- b. Below elbow plaster slab
- c. Close reduction with Tension band wiring
- d. Open reduction with Tension band wiring

GENERAL ORTHOPEDICS AND FRACTURES

5. A lady presented in emergency with history of trauma to neck region. Identify the shown fracture in image:

(Recent Pattern Question 2018-19)

- a. Atlanto-axial dislocation
 - b. Jefferson fracture
 - c. Hangman fracture
 - d. Clay-shoveler fracture
6. Jefferson fracture is: *(Recent Pattern Question 2017)*
 - a. C2 fracture
 - b. C1 fracture
 - c. Fracture of talus
 - d. Atlanto-axial dislocation
 7. Hangman fracture is: *(Recent Pattern Question 2017)*
 - a. C1 ring fracture
 - b. C2 odontoid process fracture
 - c. C2 pars interarticularis fracture
 - d. C7 fracture
 8. A male patient presents after trauma with popliteal vessel injury and fracture of 0.5 cm × 0.5 cm. What is the Anderson Gustillo classification? *(Recent Pattern Question 2017)*
 - a. 1
 - b. 2
 - c. 3A
 - d. 3C
 9. What is the treatment of Anderson Gustillo classification grade 3B? *(Recent Pattern Question 2017)*
 - a. Intramedullary nailing
 - b. Intramedullary wiring
 - c. Close reduction
 - d. K wire

10. Connection of Haversian canal are by
(Recent Pattern Question 2016)
- Canaliculi
 - Volkman canal
 - Osteon
 - Central canal
11. Stress fracture occurs most commonly in:
- Metatarsals
 - Metacarpals
 - Calcaneum
 - Talus
12. Runners fracture occurs in which bone
- Fibula
 - Metatarsals
 - Tibia
 - Calcaneum
13. Fracture and dislocation of lateral clavicle. Best treatment is:
- Figure of 8 splint
 - Open reduction
 - Normal sling
 - Surgical repair
14. Avascular necrosis can be a possible sequelae of fracture of all of the following bones, EXCEPT:
- Femur neck
 - Scaphoid
 - Talus
 - Calcaneum
15. Mason's classification is used for:
- Clavicle fracture
 - Colle's fracture
 - Radial head fracture
 - Monteggia fracture
16. Which of the following fracture most likely leads to malunion:
- Clavicle fracture
 - Femur neck fracture
 - Scaphoid fracture
 - Ulna fracture

UPPER LIMB

17. A Tennis player presents with a history of spontaneous shoulder dislocation, labrum injury. Now he states that he can himself correct the dislocation. This condition most likely is: (Recent Pattern Question 2018-19)
- Recurrent anterior shoulder dislocation
 - Recurrent posterior shoulder dislocation
 - Reverse hill sach's lesion
 - Inferior shoulder dislocation
18. Herberden's arthropathy affects: (Recent Pattern Question 2018)
- Lumbar spine
 - Sacroiliac joint
 - Distal interphalangeal joint
 - Knee joint
19. Muscle in 2nd compartment of wrist: (Recent Pattern Question 2018)
- Extensor pollicis brevis
 - Extensor carpi radialis brevis and longus
 - Abductor pollicis longus
 - Extensor pollicis longus
20. A patient received an electric shock and fell down. He cannot do external rotation of shoulder and cannot move arm. What is the diagnosis? (Recent Pattern Question 2018)
- Anterior dislocation
 - Posterior dislocation
 - Clavicle fracture
 - Luxation erecta
21. Terrible triad of elbow is: (Recent Pattern Question 2017)
- Humerus fracture with medial epicondyle fracture
 - Shaft fracture with dislocation and ulnar fracture
 - Elbow dislocation with shaft fracture
 - Elbow dislocation with radial head and coronoid fracture
22. What is true about supracondylar fracture? (Recent Pattern Question 2017)
- Mostly seen in elderly population
 - Females are mostly affected
 - Most common type is extension type
 - Can cause non union
23. Nerve involved in shaft of humerus fracture (Recent Pattern Question 2016)
- Median
 - Anterior interosseus
 - Posterior interosseus
 - Radial
24. Nerve involved in carpal tunnel syndrome (Recent Pattern Question 2016)
- Ulnar nerve
 - Radial nerve
 - Median nerve
 - Medial nerve
25. Which of the following is static stabilizer of shoulder joint:
- Supraspinatus
 - Infraspinatus
 - Negative pressure in glenoid cavity
 - Subscapularis
26. Supraspinatus injury leads to which of the following:
- Frozen shoulder
 - Winging of scapula
 - Cannot abduct
 - Cannot adduct
27. In Anterior dislocation of shoulder which nerve is commonly affected:
- Axillary nerve
 - Radial nerve
 - Ulnar nerve
 - Median nerve
28. In a man lifting up suitcase, posterior dislocation of glenohumeral joint is prevented by:
- Deltoid
 - Latissimus dorsi
 - Coracobrachialis
 - Short head of biceps
29. Which of the following test of shoulder dislocation is verified by just looking at the axillary fat folds:
- Dugas test
 - Callway test
 - Hamilton ruler test
 - Bryants's test
30. Hill Sach's lesion is seen in:
- Hip joint dislocation
 - Elbow dislocation
 - Shoulder Dislocation
 - Jaw dislocation
31. Colle's fracture which of the following tendons likely to rupture:
- Flexor pollicis longus
 - Flexor pollicis brevis
 - Extensor pollicis longus
 - Extensor pollicis brevis

32. Kienbock disease is avascular necrosis of:
- Scaphoid
 - Trapezoid
 - Trapezium
 - Lunate
33. Monteggia fracture is:
- Fracture of distal radius with dislocation of head of ulna
 - Fracture of the proximal third of the ulna with dislocation of the head of the radius.
 - Fracture of distal third of ulna with dislocation of head of radius
 - Fracture of proximal one third of radius with dislocation of head of radius
34. Injury in radial groove of humerus will lead to:
- Wrist drop
 - Chauffeur's fracture
 - Skier's thumb
 - Mallet finger
35. Content of anatomical snuff box
- Radial artery
 - Ulnar artery
 - Median nerve
 - Superficial artery
36. Which of the following does not indicate ulnar nerve injury:
- Clawing of medial 2 digits
 - Froment sign is present
 - Abductor Pollicis longus palsy
 - Loss of sensory supply of medial little finger and medial half of ring finger
37. First sign of volkman's ischemia is:
- Pulselessness
 - Pallor
 - Paralysis
 - Pain
38. A pregnant woman aged 30 years, after trauma feeling tingling pain and numbness at the tips of thumb, index finger and middle finger, on examination doctor presses between the wrist joint for 30 seconds and the patient develops more pain at the tips of the middle, index finger and thumb. What is the diagnosis
- Carpal tunnel syndrome
 - Cubital tunnel syndrome
 - Tarsal tunnel syndrome
 - Pronator syndrome
39. Finkelstein test is done for:
- Compound palmar ganglia
 - Carpal tunnel syndrome
 - De-quervain tenosynovitis
 - Tennis elbow
40. Dupuytren's contracture is associated with all EXCEPT:
- Usually not painful
 - Involves the ring and little finger
 - Table top test is negative
 - Clostridial collagenase for resolution
41. Gun stock deformity is seen in:
- Supracondylar fracture of humerus
 - Lateral condyle fracture
 - Radial head fracture
 - Ulnar head fracture

42. A 20-year-old male presents with anterior shoulder dislocation. This injury is usually caused as a combination of which of the following?
- Abduction and external rotation
 - Abduction and internal rotation
 - Adduction and external rotation
 - Adduction and internal rotation
43. A 24-year-old sustained the fracture shown in the X-ray below. The nerve most likely to be injured is:

- Ulnar nerve
 - Median nerve
 - Radial nerve
 - Musculocutaneous nerve
44. Eponym for fracture shown in below X-ray is:

- Monteggia fracture
- Colles fracture
- Galezzei fracture
- Smith fracture

LOWER LIMB

45. The triad of triple arthrodesis includes all EXCEPT:
- (Recent Pattern Question 2018)
- Calcaneocuboid joint
 - Talonavicular joint
 - Tibiotalar joint
 - Subtalar joint
46. Lauge-Hansen classification belongs to:
- (Recent Pattern Question 2018)
- Femur fracture
 - Elbow fracture
 - Ankle fracture
 - Shoulder fracture

47. Triple deformity is seen in all of the following conditions EXCEPT: (Recent Pattern Question 2017)

- a. Knee TB
- b. Reactive arthritis
- c. Iliotibial contracture
- d. Poliomyelitis

48. Triple deformity of knee includes all EXCEPT:

- a. Knee flexion
- b. Posterior subluxation of femur
- c. Lateral rotation of tibia
- d. Posterior subluxation of tibia

49. A patient with fracture of femur shaft develops petechiae, respiratory distress and decreased sPO_2 , 5 days after injury. Possible diagnosis is

(Recent Pattern Question 2016)

- a. Hypostatic pneumonia
- b. Haemolytic anemia
- c. Crush syndrome
- d. Fat embolism

50. Anterior cruciate ligaments prevent:

- a. Anterior dislocation of ulna
- b. Posterior dislocation of ulna
- c. Anterior dislocation of tibia
- d. Posterior dislocation of tibia

51. Which nerve is injured in fracture of fibula:

- a. Posterior tibial nerve
- b. Anterior tibial nerve
- c. Common peroneal nerve
- d. Deep peroneal nerve

52. Bumper fracture is?

- a. Fracture of fibula
- b. Fracture of distal tibia
- c. Fracture of medial tibial plateau
- d. Fracture of lateral tibial plateau

53. Main extensor of knee:

- a. Gastrocnemius
- b. Quadriceps femoris
- c. Hamstrings
- d. Peroneal muscles

54. Q angle is increased in

- a. Patellar subluxation
- b. Genu varum
- c. Femoral ante-flexion
- d. Medial positioning tibial tuberosity

55. Gallow's traction is used for fracture of:

- a. Neck of femur
- b. Shaft of femur
- c. Shaft of tibia
- d. Tibial plafond

56. The ligaments connecting the menisci to the tibia are known as:

- a. Coronary
- b. Arcuate
- c. Transverse
- d. Oblique

57. In patient with femoral head fracture associated with femur neck fracture. What is the grading according to pipkin classification:

- a. Grade I
- b. Grade II
- c. Grade III
- d. Grade IV

58. Spot diagnosis:

- a. Malignant fracture
- b. Straddle fracture
- c. Pubic rami with penile fracture
- d. Sacroiliac joint dislocation only

PELVIS AND HIP

59. A 79-year-old lady presents with history of fall. There is right sided intertrochanteric fracture of hip evidenced by the given X-ray. Best management for this patient is:

(Recent Pattern Question 2018-19)

- a. Bipolar Hemiarthroplasty
- b. Intramedullary nail
- c. Hip-Spica
- d. Internal fixation

60. A 30-year-old male fell from a tree. Thereafter he complains of pain and is unable to move his legs (image given). Next management (Recent Pattern Question 2016)

- a. Open reduction
- b. Urgent Closed reduction
- c. Traction
- d. Observation

61. Patient came into emergency department with flexion, adduction and internal rotation of hip. Diagnosis?
- Anterior dislocation of hip
 - Posterior dislocation of hip
 - Femur neck fracture
 - Femur head fracture
62. Posterior dislocation of hip results in:
- Abduction, internal rotation, extension
 - Adduction, internal rotation, extension
 - Adduction, internal rotation, flexion
 - Abduction, external rotation, flexion
63. 82-year-old female with necrotic head of femur and bilateral osteoarthritis. What is the next step of management:
- Uncemented total hip replacement
 - Cemented total hip replacement
 - Hemi-arthroplasty
 - Observation
64. In anterior dislocation of hip, attitude of limb is:
- Flexion, abduction, internal rotation
 - Flexion, abduction, external rotation
 - Flexion, adduction, internal rotation
 - Flexion, adduction, external rotation
65. What is the position of leg in tubercular arthritis in synovitis stage:
- Flexion, adduction, Internal rotation
 - Flexion, abduction, Internal rotation
 - Flexion, abduction, External rotation
 - Extension, abduction internal rotation

INFECTION & TUBERCULOSIS OF BONE AND JOINTS

66. The spina ventosa is seen in:
(Recent Pattern Question 2018)
- Carpals
 - Phalanges
 - Dorsal spine
 - Shoulder joint
67. Most common type of lesion in Pott's spine:
(Recent Pattern Question 2018)
- Central
 - Anterior
 - Paradiscal
 - Appendiceal
68. A 4-year-old child presented with limping and fever and has the given X-ray. Most likely diagnosis:
(Recent Pattern Question 2017)
- Osteomyelitis
 - Osteosarcoma
 - Enchondroma
 - Aneurysmal bone cyst

69. Most common organism causing osteomyelitis:
- Staph Aureus
 - Strep pneumonia
 - H. Influenza
 - E. coli
70. Most common site for osteomyelitis:
- Epiphysis
 - Metaphysis
 - Diaphysis
 - Sub-chondral growth plate
71. Earliest X-ray finding in osteomyelitis:
- Involucrum
 - Sequestrum
 - Cloacae
 - Periosteal reaction
72. Felon means infection of:
- Epinychium
 - Terminal pulp space
 - Deep palmar abscess
 - Subcuticular space
73. Spina ventosa is:
- Tubercular dactylitis
 - TB of spine
 - TB of vertebral pedicles
 - Extra-axial
74. Triple deformity of knee includes all EXCEPT:
- Posterior subluxation of tibia
 - Medial rotation of tibia
 - Lateral rotation of tibia
 - Flexion
75. Triple deformity in tubercular arthritis of the knee is:
- Flexion, posterior subluxation and external rotation
 - Flexion, posterior subluxation and internal rotation
 - Extension, anterior subluxation and external rotation
 - Extension, anterior subluxation and internal rotation
76. Most common area involved in tubercular spine is:
- Paradiscal area
 - Central type
 - Anterior involvement
 - Appendicle involvement
77. True about bony ankylosis:
- Painful condition
 - Tubercular arthritis is most common cause
 - Septic arthritis leads to bony ankylosis
 - Spine tuberculosis is the leading cause
78. The most common sequelae of tuberculous spondylitis is:
- Fibrous ankylosis
 - Bony Ankylosis
 - Pathological dislocation
 - Chronic osteomyelitis
79. Kanavel sign includes all EXCEPT:
- Tenderness
 - Flexion
 - Pain upon passive flexion
 - Uniform swelling

BONE ONCOLOGY AND JOINT DISORDERS

80. Most common site of Adamantinoma:

(Recent Pattern Question 2018-19)

- a. Radius
- b. Humerus
- c. Tibia
- d. Femur

81. Sunray appearance in osteosarcoma is due to:

(Recent Pattern Question 2018)

- a. Bone destruction
- b. Periosteal reaction
- c. Vascular calcification
- d. Bone hypertrophy

82. A child with pain in lower limb presented with this X-ray. Which is the probable diagnosis?

(Recent Pattern Question 2017)

- a. Osteosarcoma
- b. Osteoid osteoma
- c. Ewing's sarcoma
- d. Osteofibrous dysplasia

83. Which of the following is an epiphyseal tumor?

(Recent Pattern Question 2017)

- a. Osteoid osteoma
- b. Adamantinoma
- c. Osteosarcoma
- d. Chondroblastoma

84. An intramedullary tumor occurring in the lower metaphysis of the tibia in a 15-year-old male is most likely to be:

- a. Ewing's sarcoma
- b. Giant cell tumor
- c. Chondrosarcoma
- d. Osteosarcoma

85. Sun burst appearance usually seen in:

- a. Osteosarcoma
- b. Osteopetrosis
- c. Osteomyelitis
- d. Osteoradionecrosis

86. Aspirin is useful in which type of bone tumor:

- a. Osteonecrosis
- b. Osteopetrosis
- c. Osteoid osteoma
- d. Ewing sarcoma

87. Most common presenting age of Ewing's sarcoma is:

- a. First decade
- b. Second decade
- c. Third decade
- d. Fourth decade

88. X-ray wrist showing soap bubble appearance in epiphyseal region. Diagnosis:

- a. Giant cell tumor
- b. Osteosarcoma
- c. Osteochondroma
- d. Osteoid osteoma

JOINT DISORDERS

89. Which is the most common joint involved in thalassemia?

(Recent Pattern Question 2017)

- a. Hip
- b. Knee
- c. Shoulder
- d. Ankle

90. Which of the following condition present as arthritis with conjunctivitis?

(Recent Pattern Question 2017)

- a. Reiter's syndrome
- b. Kaplan syndrome
- c. Pneumoconiosis
- d. Aspergillosis

91. Joint not involved in Rheumatoid Arthritis:

- a. DIP
- b. PIP
- c. MC
- d. Wrist

92. Which of the following is seen in Boutonniere's deformity:

- a. Extension of PIP and DIP
- b. Flexion of PIP and DIP
- c. Flexion contracture of PIP and extension of DIP
- d. Flexion of DIP and extension of PIP

93. All are seen in Rheumatoid arthritis EXCEPT:

- a. Boutonniere's deformity
- b. Heberden nodes
- c. Involvement of PIP
- d. Swan neck deformity

94. A 35-year-old female presented with MCP and PIP pain. Diagnosis:

- a. Rheumatoid arthritis
- b. Rheumatic fever
- c. Gouty arthritis
- d. Psoriatic arthritis

95. Diagnosis of the picture given:

- a. Osteoarthritis
- b. Gouty arthritis
- c. Rheumatoid arthritis
- d. Pseudogout

96. Drug of choice for acute gouty arthritis:

- a. Indomethacine b. Allopurinol
- c. Colchicine d. Aspirin

97. Correct meaning of Poncet disease:

- a. TB with Rheumatoid arthritis
- b. TB of short bones
- c. TB with polyarthritis
- d. TB of shoulder

VERTEBRA & NEUROMUSCULAR DISEASE

98. Cubital tunnel syndrome involves which nerve?

- a. Radial nerve *(Recent Pattern Question 2017)*
- b. Ulnar nerve
- c. Anterior interosseous nerve
- d. Median nerve

99. In the lumbar spine, 90% of the disc herniations occur at which of the following level:

- a. L1-L2 b. L2-L3
- c. L3-L4 d. L4-L5

100. Injury to cervical nerve C5, C6 causes:

- a. Erb's paralysis b. Klumpke paralysis
- c. Horner syndrome d. Central cord syndrome

101. Sciatic nerve damage most commonly due to:

- a. Degenerative b. Iatrogenic
- c. Traumatic d. Vascular

102. Condition in which there is anterior or posterior displacement of a vertebra in relation to the vertebrae below:

- a. Spondylosis b. Spondylitis
- c. Spondylolisthesis d. Spondylolysis

103. Motor march is seen in:

- a. Neurapraxia b. Axonotmesis
- c. Neurotmesis d. None of these

104. Card test/book test is done for which nerve injury:

- a. Radial nerve b. Ulnar nerve
- c. Median nerve d. Tibial nerve

105. Froment's sign is a feature of:

- a. Radial nerve palsy b. Ulnar nerve palsy
- c. Median nerve palsy d. Tibial nerve palsy

106. Ulnar nerve paralysis causes:

- a. Ape thumb deformity b. Wrist drop
- c. Claw finger deformity d. Meralgia perasthetica

107. Cockup splint is used in paralysis of:

- a. Ulnar nerve b. Radial nerve
- c. Median nerve d. Sciatic nerve

108. Neuropraxia is a condition characterized by:

- a. Division of nerve sheath b. Division of axons
- c. Division of nerve fibres d. Physiological block

109. Little finger of the hand corresponds to:

- a. C6 dermatome b. C7 dermatome
- c. C8 dermatome d. T1 dermatome

110. Pain due to postamputation neuroma is best treated by:

- a. Infrared therapy b. Interference therapy
- c. Ultrasound therapy d. Stump bandaging

111. The picture given below shows a hand following a nerve injury. Identify the nerve:

- a. Median nerve b. Ulnar nerve
- c. Radial nerve d. Musculocutaneous nerve

PEDIATRIC ORTHOPEDICS

112. A 5-year-old child presents with limping and limb shortening. Based on the following finding seen on X-ray, this is most likely a case of:

(Recent Pattern Question 2018-19)

- a. DDH b. Hip dislocation
- c. Perthes disease d. Stage I TB hip joint

113. True about Blount disease:

(Recent Pattern Question 2018-19)

- a. Dysplasia of proximal epiphysis
- b. Metaplasia of distal epiphysis
- c. Dysplasia of diaphysis
- d. Metaplasia of diaphysis

114. Most common joint dislocation in pediatric population:

(Recent Pattern Question 2017)

- a. Wrist b. Sternoclavicular
- c. Elbow d. Hip

115. Trethovan sign is used for diagnosis of:

(Recent Pattern Question 2017)

- a. Talar fracture
- b. Congenital hip dysplasia
- c. Clavicle fracture
- d. Slipped capital femoral epiphysis

116. Investigation for screening congenital dislocation of hip in an infant is:

- a. X-ray
- b. USG
- c. CT scan
- d. MRI

117. Barlow test is used for testing:

- a. Talar fracture
- b. Slipped capital femoral epiphysis
- c. Congenital dislocation of hip
- d. Rickets

118. Which ligament is involved in Pes-planus:

- a. Spring ligament
- b. Deep transverse ligament
- c. Long & short plantar ligament
- d. Deltoid ligament

119. Clutton's joint is seen in:

- a. Early congenital syphilis
- b. Late congenital syphilis
- c. Tertiary syphilis
- d. All of the above

120. Vertical talus is associated with:

- a. Congenital flat foot
- b. Ankle dislocation
- c. Talus fracture
- d. Pes cavus

METABOLIC BONE DISORDERS

121. Marble Schonberg disease is:

(Recent Pattern Question 2018-19)

- a. Osteomalacia
- b. Osteosclerosis
- c. Osteopetrosis
- d. Osteoporosis

122. A patient presented finger deformity and pain in knee and fingers. In which of the following condition there is involvement of DIP, PIP, CMC (carpometacarpal joint) and sparing of wrist: (Recent Pattern Question 2018-19)

- a. Psoriatic arthritis
- b. Rheumatoid Arthritis
- c. Pseudogout
- d. Osteoarthritis

123. Which of the following is the management for postmenopausal women with osteoporosis:

(Recent Pattern Question 2018)

- a. Raloxifene
- b. Tamoxifen
- c. Bisphosphonates
- d. Calcitonin

124. X-ray Wrist and hand of a child is given below. There is prominent cupping and widening of growth plate. What is the diagnosis: (Recent Pattern Question 2017)

- a. Fluorosis
- b. Plumbism
- c. Vitamin C deficiency
- d. Vitamin D deficiency

125. A case of young patient presents to you with knee pain, irritability and gum bleeding. Upon X-ray of leg, cortex is significantly thin with a white line at the metaphysis. What could be possible cause:

- a. Fluorosis
- b. Rickets
- c. Scurvy
- d. Caffey's disease

126. A 1-year-old breast fed child with excessive crying and gum bleeding and the below shown X-ray is a feature of:

- a. Rickets
- b. Scurvy
- c. Kwashiorkor
- d. Marasmus

127. A 7-year-old boy presented with double medial malleolus. X-Ray was performed. What is the treatment?

- a. Vitamin B
- b. Vitamin C
- c. Vitamin D
- d. Vitamin E

128. A child from a small village of Bihar has long bone pain, is weak and lethargic and on examination he has bow legs. The X-ray reports shows increase in bone density, osteophytes and dismorphic joint space. Possible diagnosis:

- a. Fluorosis
- b. Rickets
- c. Scurvy
- d. Caffey's disease

- 129. Osteopetrosis results due to defective**
 a. Osteoblasts b. Osteoclasts
 c. Bone collagen
 d. Phosphate deposition in trabecular bone
- 130. "Bone within bone" appearance is classically seen in**
 a. Osteomalacia b. Osteopetrosis
 c. Renal osteodystrophy d. Vitamin C deficiency
- 131. Stoss therapy is used for:**
 a. Scurvy b. Vit D deficiency Rickets
 c. Vit D Resistant rickets d. Paget's disease
- 132. All of the following are true about osteomalacia EXCEPT:**
 a. Vitamin D deficiency b. Proximal myopathy
 c. Raised serum calcium
 d. Bone biopsy shows increased demineralized bone matrix
- 133. Looser's zones are seen in:**
 a. Osteoporosis b. Osteomalacia
 c. Osteosarcoma d. TB spine
- 134. Multiple fractures in a child without healing are seen in which condition:**
 a. Battered baby syndrome b. Hypoparathyroidism
 c. Resistant rickets d. Osteogenesis Imperfecta
- 135. Gower's sign is seen in:**
 a. Gullian barre syndrome
 b. Duchenne muscular dystrophy
 c. Congenital myopathy
 d. All of the above

- 136. Short 4th and 5th metacarpal is seen in:**
 a. Pseudohypoparathyroidism
 b. Hyperparathyroidism
 c. Hyperthyroidism d. Hypothyroidism
- 137. Sub-periosteal bone absorption is best seen in**
 a. Radius b. Metacarpals
 c. Phalanges d. Ulna
- 138. Most common cause of bone disease especially in women in India:**
 a. Steroid-induced osteoporosis
 b. Nutritional deficiency
 c. Paget's disease d. Sarcoidosis
- 139. The following X-ray is diagnostic of which of the following condition:**

- a. Rheumatoid arthritis b. Ankylosing spondylitis
 c. Hyperparathyroidism d. Pagets disease

BOARD REVIEW QUESTIONS

- 140. Most common cause of Sciatic nerve damage?**
 a. Iatrogenic b. Traumatic
 c. Vascular d. Degenerative
- 141. All are seen in Rheumatoid arthritis EXCEPT?**
 a. Heberden nodules b. Involvement of PIP
 c. Swan neck deformity d. Boutonniere deformity
- 142. Which ligament is involved in Pesplanus?**
 a. Spring ligament
 b. Deep transverse ligament
 c. Long & short plantar ligament
 d. Deltoid ligament
- 143. Clutton's joint is seen in?**
 a. Early congenital syphilis b. Late congenital syphilis
 c. Tertiary syphilis d. All of the above
- 144. Runners fracture occurs in which bone?**
 a. Fibula b. Femur
 c. Tibia d. All of the above
- 145. Most common presenting age of Ewings sarcoma is?**
 a. First decade b. Second decade
 c. Third decade d. Fourth decade
- 146. True about osteosarcoma:**
 a. Very radio sensitive tumor
 b. Sunburst appearance exclusively found here
 c. Most commonly seen in diaphyseal area
 d. Tissue biopsy is investigation of choice
- 147. Brodie's abscess, false statement:**
 a. Can be seen in Chronic osteomyelitis
 b. Can be seen in Subacute osteomyelitis
 c. Can be seen in Acute osteomyelitis
 d. Organism is staph aureus
- 148. Bony ankylosis is noticed in case of**
 a. TB arthritis b. Pyogenic arthritis
 c. Rheumatoid arthritis d. None
- 149. Kanavel's sign is seen in:**
 a. Tenosynovitis b. Trigger finger
 c. Dupuytren's contracture d. Carpal tunnel syndrome
- 150. Triple deformity of knee includes all EXCEPT:**
 a. Posterior subluxation of tibia
 b. Medial rotation of tibia
 c. Lateral rotation of tibia
 d. Flexion

- 151. MC malignant bone tumor is:**
 a. Osteosarcoma b. Osteoclastoma
 c. Secondaries d. Multiple myeloma
- 152. Most common bone tumor in hand:**
 a. Exostosis b. Giant cell tumor
 c. Enchondroma d. Synovial sarcoma
- 153. Hill Sach's lesion is seen in:**
 a. Hip joint dislocation b. Elbow dislocation
 c. Shoulder dislocation d. Jaw dislocation
- 154. What is uncommon in Colle's fracture:**
 a. Non-union b. Mal-union
 c. Rupture of EPL tendon d. Dinner fork deformity
- 155. Fallen leaf sign is seen in?**
 a. Aneurysmal bone cyst b. Simple bone cyst
 c. Osteosarcoma d. Osteoclastoma
- 156. Most common site of tuberculosis of spine is?**
 a. Thoracolumbar b. Sacral
 c. Cervical d. Lumbosacral
- 157. Nerve involved in foot drop is?**
 a. Deep peroneal b. Common peroneal
 c. Anterior tibial d. Posterior tibial
- 158. Fairbank's Triangle is seen in?**
 a. Tibia vara b. Genu valgum
 c. Hip fracture d. Coxa vara
- 159. Terry Thomas sign is seen in?**
 a. Keinbock's disease b. Carpal instability
 c. Calcaneal disorders d. Hip trauma
- 160. Classical sign of scaphoid fracture is?**
 a. Pain with limited range of motion
 b. Pain in snuffbox
 c. Scaphoid ring sign
 d. Swelling of wrist
- 161. Most common part of spine affected by Rheumatoid arthritis is?**
 a. Lumbar spine b. Thoracic spine
 c. Cervical spine d. Sacrum
- 162. Fracture of distal tibial epiphysis with anterolateral displacement is called as?**
 a. Pott's fracture b. Cotton's fracture
 c. Triplane fracture d. Tillaux fracture
- 163. Postitive trendelenburg's sign is seen in paralysis of?**
 a. Gluteus maximus b. Gluteus medius
 c. Calf muscles d. Hamstrings
- 164. Most common primary malignancy of bone is?**
 a. Multiple myeloma b. Osteoid osteoma
 c. Osteosarcoma d. PNET
- 165. Axillary nerve damage is caused by damage to?**
 a. Shaft of humerus b. Surgical neck humerus
 c. Medial epicondyle d. Lateral epicondyle
- 166. Osgood schlatters disease involves?**
 a. Tibial tuberosity
 b. Femoral condyle
 c. Lateral malleolus
 d. Medial malleolus
- 167. Jones operation is done for?**
 a. CTEV b. Hallux valgus correction
 c. Cavus deformity of foot d. Claw hallux
- 168. C6-C7 cervical spine fracture is seen in?**
 a. Chance fracture b. Clay shoveller's fracture
 c. Hangman's fracture d. Jefferson fracture
- 169. Bone cement setting time is?**
 a. 30 seconds b. 1-2 min
 c. 8-10 min d. >30 min
- 170. A 65-year-old male has been diagnosed with osteoarthritis, feature or deformity seen is?**
 a. Swan neck deformity b. Boutonniere deformity
 c. Heberden's nodes d. Opera glass deformity
- 171. Most common deformity seen in osteoarthritis is?**
 a. Genu valgum b. Genu varum
 c. Genu recurvatum d. Triple knee deformity
- 172. Hawkin sign denotes?**
 a. Retained vascularity b. Non union
 c. Decrease vascularity d. Avascular necrosis
- 173. Phalen test is done for?**
 a. De quervain's tenosynovitis
 b. Carpal tunnel syndrome
 c. Rotator cuff injury
 d. Tennis elbow
- 174. Finkelstein test is used for diagnosis of?**
 a. Thoracic outlet syndrome
 b. Carpal tunnel syndrome
 c. Tarsal tunnel syndrome
 d. De quervain tenosynovitis
- 175. Keller's operation is done for?**
 a. Hallax valgus b. Hallux varus
 c. Genu varus d. CTEV
- 176. Charlie chaplin gait is seen in?**
 a. Congenital coxavara b. Tibial torsion
 c. Genu valgus d. CDH
- 177. Joint spared in osteoarthritis:** (2018)
 a. DIP b. PIP
 c. Knee d. Ankle
- 178. Most common joint involved in OA:** (2018)
 a. Knee b. Elbow
 c. Shoulder d. Hip
- 179. Keinbock disease involves:** (2018)
 a. Capitate b. Lunate
 c. Talus d. Trapezoid

IMAGE-BASED QUESTIONS

1024

180. Diagnosis is:

- a. Unicameral bone cyst
- b. Aneurysmal bone cyst
- c. Giant cell tumor
- d. Osteosarcoma

183. 18-year-old Male has history of trauma. X-ray is shown below. The diagnosis is?

- a. Supra-Condylar Fracture
- b. Colle's Fracture
- c. Galeazzi fracture
- d. Monteggia fracture

181. Diagnosis is:

- a. Unicameral bone cyst
- b. Aneurysmal bone cyst
- c. Giant Cell tumor
- d. Osteosarcoma

184. Identify the periosteal reaction:

- a. Onion peel appearance
- b. Codman's Triangle
- c. Sun Burst appearance
- d. Onion ring appearance

182. Spot diagnosis for foot deformity?

- a. CTEV
- b. Congenital vertical talus
- c. Rocker bottom foot
- d. Pes Cavus

185. The image shows presence of?

- a. Swan neck deformity
- b. Boutonniere Deformity
- c. Mallet finger
- d. Dupuytren's Contracture

186. The image shows ?

- a. Gallow's Traction
- b. 90-90 traction
- c. Russel traction
- d. Agnes hunt traction

1025

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) Compare with X-ray of left hand

Ref: J. Maheshwari 6th ed. P 97-98

- Supracondylar fracture (SCF) is one of the most serious fracture in childhood.
- Mechanism:** Fall on outstretched hand → as the hand strikes the ground → elbow forced into hyperextension → fracture of humerus above condyles → Known as supracondylar fracture.
- Types of SCF:**
 - Extension type (MC type):** Distal fragment is tilted backwards (extended) in relation to proximal fragment
 - Flexion type:** Distal fragment is tilted forwards (flexed) in relation to proximal fragment.

• Diagnosis:

- Child brought to hospital with history of fall, followed by pain, swelling, deformity and inability to move the affected elbow.

- Radiological investigation:** Commonly diagnosed because of wide displacement. A comparison with an X-ray of opposite shoulder might be helpful in suspected cases (*this is done in some difficult to diagnose cases of minimally displaced fracture due to presence of ossification centres around the elbow*)

• Treatment:

- Undisplaced fracture:** Require immobilisation in an above-elbow plaster slab, with elbow in 90 degree flexion.
- Displaced fracture:** Closed reduction and percutaneous K wire fixation
- Open, displaced fracture:** Open reduction and K wire fixation.

2. Ans. (a) Vitamin D increase

Ref: J. Maheshwari 6th ed. P 308, 313

TABLE: Actions of PTH, Vit D, and FGF23 on Gut, Bone, and Kidney

	PTH	Vitamin D	FGF23
Intestine	↑Ca and P absorption (by ↑1,25 [OH] ₂ D production)	↑Ca and phosphate absorption by 1,25 (OH) ₂ D	↓Ca and P absorption by ↓1,25 (OH) ₂ production
Kidney	↓Ca excretion, ↑P excretion	↓Ca and P excretion by 25(OH)D and 1,25(OH) ₂ D ¹	↑P excretion
Bone	↑Ca and P resorption high doses. Low doses may increase bone formation	↑Ca and P resorption by 1,25(OH) ₂ D; ↑bone formation by 1,25(OH) ₂ D and 24,25(OH) ₂ D	↓mineralization due to hypophosphatemia
Net effect on serum levels	↑Serum Ca, ↓Serum P	↑Serum Ca and P	↓Serum P

Note:

- In hyperparathyroidism serum ALP, Ca⁺ is high and PO₄ is low.
- In osteoporosis all serum parameters are normal.
- Osteomalacia is due to dietary deficiency of Vitamin D causing decreased Serum Ca⁺ and PO₄.

3. Ans. (a) Elbow fracture

Ref: J. Maheshwari 6th ed. P 107

- Three point bony relation is made with medial malleolus, lateral malleolus and olecranon process
- This three point relationship comes in a horizontal line if elbow is extended.
- In olecranon fracture this three point bony relation is disrupted
- In supracondylar fracture, three point bony relation is maintained

Flexion

- Medial epicondyle
- Lateral epicondyle
- Olecranon

Extension

4. Ans. (d) Open reduction with Tension band wiring

Ref: J. Maheshwari 6th ed. P 105-106

- Olecranon fracture is commonly seen in adults due to direct injury after a fall onto the point of elbow.
- It can be of three types:

Fracture type	Treatment
Type I: Crack without displacement of fragments	Immobilize the elbow with an above elbow plaster slab in 30 degree of flexion
Type II: Clean break with separation of fragments	Open reduction and internal fixation using the technique of tension-band wiring. It is NOT possible to keep the fragments together in the plaster alone because of constant pull exerted by triceps
Type III: Comminuted fracture	If not separated: Treated in a plaster slab If fragments are separated: Tension band wiring or excision of fragments may be required.

GENERAL ORTHOPEDICS AND FRACTURES

5. Ans. (a) Atlanto-axial dislocation

Ref: Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 3

- The shown image is a case of atlanto-axial dislocation
- Atlantoaxial dislocation commonly present with fracture, as compared to pure dislocation of C1 (Atlas) and C2 (Axis)
- Pure dislocation commonly associated with neurological deficit
- MC dislocation in atlanto-axial dislocation: Anterior
- **Treatment:**
 - Skull traction followed by immobilisation using Minerva jacket.

Extra Mile

- **Hangman fracture:** Fracture through pedicle and lamina of C2 vertebra, with subluxation of C2 over C3. This type of fracture seen in hanging.
- **Jefferson fracture:** Fracture of C1 vertebra
- **Clay-shoveler fracture:** Avulsion fracture of spinous process of one or more of the lower cervical or upper thoracic vertebra. Name is given as it is caused by muscular action in shovelling by labourers.

6. Ans. (b) C1 fracture

Ref: Apley's System of Orthopaedics, 9th ed. pg. 813

- **Jefferson's fracture:** Sudden severe load on the top of the head may cause a 'bursting' force which fractures the ring of the atlas.
- There is no encroachment on the neural canal and, usually, **no neurological damage**.

7. Ans. (c) C2 pars interarticularis fracture

Ref: Apley's System of Orthopaedics, 9th ed. pg. 814

- In the true judicial 'hangman's fracture' there are bilateral fractures of the pars interarticularis of C2 and the C2/3 disc is torn.
- The mechanism is extension with distraction.

8. Ans. (d) 3C

Ref: Apley's System of Orthopaedics, 9th ed. pg. 706

- If there is arterial injury that needs to be repaired, regardless of the amount of other soft tissue damage, it is considered as grade IIIC.

Grade	Characteristics of fracture
I	Open fracture with a wound < 1 cm
II	Open fracture with a wound > 1 cm without extensive soft-tissue damage
III	Open fracture with extensive soft-tissue damage
IIIa	3 with adequate soft-tissue coverage
IIIb	3 with soft tissue loss and periosteal stripping and bone exposure
IIIc	3 with arterial injury needing repair

9. Ans. (a) Intramedullary nailing

Ref: Anderson JT, Gustilo RB. Orthopedics clinics of North America, 1980; 11:569

- For open fractures like 3B intramedullary nails are preferred over K wires.
- With the evolution of available nails like antibiotic impregnated nails, intramedullary nailing is now performed even in 3B fractures.
- Although there was initial phobia for the use of intramedullary nails, their usage has become widespread not only in grade 1 and 2 but even in grade 3 injuries.

10. Ans. (b) Volkmann canal

Ref: Wheater's Functional Histology: A Text and Colour Atlas pg. 192

- Basic structural unit of lamellar bone is osteon. These osteons consist of concentric bone layers called lamella.
- Lamella surrounds a long passageway/central canal, known as **Haversian canal** aka longitudinal canal (a neurovascular canal).

- These haversian canals are joined by a transverse canal known as **Volkman canal** (see image). The neurovascular bundles connects the endosteum from periosteum via this volkman canal.

11. Ans. (a) Metatarsals

Ref: Essential Orthopedics Maheshwari, 5th ed. pg. 167

- Stress fractures often develop from overuse, such as from high-impact sports like distance running or basketball.
- Most stress fractures occur in the weight-bearing bones of the foot and lower leg. Studies show that athletes participating in tennis, track and field, gymnastics, dance, and basketball are at high risk for stress fractures.
- It most commonly occurs in metatarsals.
- It is seen due to imbalance between load and resistance on the bone.
- **2 Types of stress fracture:**
 - **FATIGUE #:** Increased load, Normal resistance of bone
 - **INSUFFICIENCY #:** Normal load, Decreased resistance of bone
- **Examples of stress fracture:**
 - **Lower extremity:** March # - 2nd MT > 3rd MT
 - **Upper extremity:** Olecranon #
 - **Note:** MC site of stress # → lower 3rd tibia > 2nd MT

12. Ans. (a) Fibula

Ref: Apley's Orthopedics, 9th edn. pg. 724

The most common site of runner's fracture is distal shaft of fibula.

13. Ans. (d) Surgical repair

Ref: Maheshwari, 5th ed. pg. 88; Disorders of shoulder: Diagnosis and management, volume 1/ 961

- Since best treatment for lateral third fracture and dislocation of clavicle is asked, the best choice here will surgical repair.

References State

- "Distal third of fracture of clavicle accounts for 15% of all clavicle fracture. Non-displaced fractures of the distal clavicle are splinted and treated symptomatically with ice, analgesics and sling."
- Dislocated fractures of the distal third requires surgical intervention because of the rupture of coracoclavicular ligament.
- If displaced fracture is treated conservatively, it may cause non-union

Extra Mile

- CLASSIFICATION used for clavicular fracture → Craig's, Campbell Allman, Robinson's

14. Ans. (d) Calcaneum:

Ref: Maheshwari 5th ed. pg. 50, 2nd pg. 41; Adams 9th/62

Common sites of avascular necrosis	Causes
Head of femur	<ul style="list-style-type: none"> • Fracture neck femur • Posterior dislocation of hip
Proximal pole of scaphoid	Fracture through waist of scaphoid
Body of Talus	Fracture through neck of talus
Lunate	Dislocation

15. Ans. (c) Radial head fracture

Fracture classification

Classification	Used for
• Mason's	• Head of radius fracture
• Campbell	• Clavicle fracture
• Neer	• Proximal humerus
• Bado	• Monteggia fracture
• Melon's	• Colle's fracture
• Garden's/Pauwels	• Neck of femur
• Pipkin	• Head of femur
• Judet	• Acetabulum #
• Tiles	• Pelvic fracture

16. Ans. (a) Clavicle fracture

- Malunion and non-union is always a worrisome complication associated with fractures.
- **Malunion** is when the fracture heals in a deformed position or with limb shortening. It can be due to improper or inadequate reduction. **It can be seen in following fractures:**
 - ♦ Intertrochantric fracture
 - ♦ Humerus supracondylar fracture

- ◆ *Clavicle fracture*
- ◆ *Colle's fracture*
- **Nonunion** is when the bone doesn't heal properly leaving the limb with pain and disability. It can be due to poor blood supply, infection.
- Femur neck #, Scaphoid #

UPPER LIMB

17. Ans. (a) Recurrent anterior shoulder dislocation

Ref: *Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 89-90*

- **Most common joint dislocation in body:** Shoulder dislocation
- **MC type of shoulder dislocation:** Anterior
- **Shoulder instability:** Head of the humerus is NOT stable in the glenoid. It can present with:
 - **Loose shoulder/minor shoulder instability:** Patient present with pain in shoulder upon using it. Pain occurs as a result of stretching of capsule, as the head moves out, without actual dislocation
 - **Frank dislocation:** Patient presents with abnormal movement of the head of humerus → partial movement → gets spontaneously reduced or dislocated
- **Mechanism of injury:**
 - **MC:** Fall on outstretched hand with the shoulder abducted and externally rotated.
 - Direct force (as seen in tennis player) pushing humerus head from glenoid cavity.
- **Classification of anterior shoulder dislocation:**
 - **Preglenoid:** Head of humerus lies in front of glenoid
 - **Subcoracoid:** MC type; head lies below the coracoid process
 - **Subclavicular:** Head lies below the clavicle

Extra Mile

- **Posterior shoulder dislocation** is associated with epileptiform convulsion or as a consequence of electric shock.
- **Luxatio Erecta** - inferior dislocation. Rare type of shoulder dislocation. Head comes to lie in the subglenoid position.
- **Hill-Sachs lesion**, also **Hill-Sachs fracture**, is a cortical depression in the **posterolateral** head of the humerus bone. It is seen in anterior shoulder dislocation.
- **Reverse Hill Sach's lesion** is due to posterior shoulder dislocation. Micro avulsion is seen on **antero-medial** aspect of humeral head.
- **Bankart lesion** is avulsion of anterior glenoid labrum.

18. Ans. (c) Distal interphalangeal joint

Ref: *Colour Atlas of Clinical Pharmacology by N Bellamy, pg. 60*

- **Heberden's arthropathy/node** is a form of joint pathology seen in osteoarthritis and involves distal interphalangeal joint.
- Another similar pathological involvement of proximal interphalangeal joint in osteoarthritis is known as **Bouchard's nodes**.

Extra Mile

TABLE: Joint involvement in several conditions

	Osteoarthritis	Rheumatoid arthritis	Psoriatic arthritis
Joint involved	PIP DIP and 1st carpometacarpal joint (1st CMC) Knee	<ul style="list-style-type: none"> • PIP • MCP • Wrist 	<ul style="list-style-type: none"> • DIP • PIP and any other joints
Joint spared	MCP and wrist	DIP	Any

19. Ans. (b) Extensor carpi radialis brevis and longus

Ref: *Hand and Wrist edited by James R. Doyle. P 94*

- Second compartment of the wrist contains two muscles namely: **Extensor carpi radialis longus** and **extensor carpi radialis brevis**.
- On the other hand 1st dorsal compartment of hand contains muscles like **abductor pollicis longus** and **extensor pollicis brevis**.

Extensor compartment of the wrist

Anatomy - Compartments

20. Ans. (b) Posterior dislocation

Ref. The Shoulder volume 1, Charles A Rockwood, P 151

- Electrical injury is a rare cause of posterior shoulder dislocation. Injury mechanism in electrical injury is similar to epileptic seizures, where the shoulder is forced to internal rotation, flexion and adduction.
- Posterior dislocation is seen in 2–4% patients.
- It is usually seen after electric shock, epileptic seizure, extreme trauma known as triple E syndrome.

21. Ans. (d) Elbow dislocation with radial head and coronoid fracture

Ref: Mastering Orthopedic techniques: Intra-articular Fractures by Rajesh Malhotra, pg. 149

Terrible triad of elbow includes/aka terrible triad of Hotchkiss

- Elbow dislocation
- Radial head fracture
- Coronoid fracture
 - It is called terrible because after this fracture, the joint becomes extremely unstable and fracture segments are usually quite small and hence difficult to repair.
 - In this type of injury there is recurrent instability of elbow joint.
 - This injury almost always requires surgical intervention. Non-operative treatment of this injury results in severe joint stiffness and a non-functional elbow range of motion.

22. Ans. (c) Most common type is extension type

Ref: Rockwood and Wilkins' Fractures in Children, Volume 3, pg. 489

- Supracondylar fracture is mostly seen among child age group due to fall on outstretched hand.
- Males are more commonly affected than females

- Well known complications of supracondylar fracture are:
 - Anterior interosseous nerve damage
 - Malunion of union → can cause **gun stock deformity**.
- There are two types of supracondylar fracture, based on location of its distal fragment:
 - **Extension type (MC type 75–80%)**: Distal fragment displaced in posterior aspect
 - **Flexion type**: Distal fragment displaced in volar aspect.

23. Ans. (d) Radial

TABLE: Shoulders pathology and nerve involved:

Fracture	Nerve involved
• Anterior shoulder dislocation	Axillary Nerve
• Surgical neck humerus #	Axillary Nerve
• Humerus shaft #	Radial Nerve
• Supracondylar #	Anterior Interosseous Nerve > Median Nerve
• Cubitus valgus	Tardy ulnar nerve palsy
• Medial condyle humerus #	Ulnar Nerve

24. Ans. (c) Median nerve

TABLE: Entrapment syndromes

Entrapment syndrome	Nerve involved
Carpal tunnel syndrome aka Pronator syndrome	<ul style="list-style-type: none"> • Median nerve (at wrist) • Median nerve (proximally compressed beneath – ligament of struthers, bicipital aponeurosis or origins of pronator teres or flexor digitorum superficialis)
Cubital tunnel syndrome/ Guyon's canal syndrome	<ul style="list-style-type: none"> • Ulnar nerve (between two heads of flexor carpi ulnaris or arcade of struthers) • Ulnar nerve (at wrist)
Tarsal tunnel syndrome	Posterior tibial nerve (behind & below medial malleolus)
Thoracic outlet syndrome	Lower trunk of brachial plexus, (C8 & T1) & subclavian vessels (between clavicle & first rib)
Meralgia parasthetica	Lateral cutaneous nerve of thigh
Morton's metatarsalgia	Interdigital nerve compression (usually of 3 rd , 4 th toe)

25. Ans. (c) Negative pressure in glenoid cavity

Ref: Maheshwari, 5th ed. pg. 87

- Shoulder joint is the most mobile joint of the body. Being the most mobile, it is also stable at its position. This can be due to following factors.

**TABLE:** Static stabilizer vs dynamic stabilizer of shoulder joint

Static stabilizer	Dynamic stabilizer (SITS)
<ul style="list-style-type: none"> Glenoid labrum Glenohum ligament Negative pressure in glenoid cavity 	<ul style="list-style-type: none"> Supraspinatus Infraspinatus Teres minor Subscapularis

Extra Mile

- SITS** muscle is also known as rotator cuff muscle.
- SIT** (Supraspinatus, Infraspinatus, Teres minor) inserts on greater trochanter (**Mn: SIT on GT**)
- Subscapularis** inserts on lesser trochanter.
- Tendon passes in intertubercular groove-Long head of biceps brachii

26. Ans. (c) Cannot abduct

Ref: *Apley's System of Orthopaedics & Fractures*, 8th ed. pg. 281-82

In case of supraspinatus injury, abduction is restricted.

Function of Rotator Cuff Muscle

- Supraspinatus:** Assists deltoid in *abduction* of arm by fixing head of humerus against the glenoid cavity.
- Infraspinatus & Teres minor:** *Laterally (externally) rotates arm* & stabilizes the shoulder joint.
- Subscapularis:** Internal rotation

27. Ans. (a) Axillary nerve

Ref: *Maheshwari*, 5th ed. pg. 91

- The shoulder is the most frequently dislocated joint. It moves almost without restriction but pays the price of stability. The shoulder's integrity is maintained by the gleno-humeral joint capsule, the cartilaginous glenoid labrum (which extends the shallow glenoid fossa), and muscles of the rotator cuff.
- Anterior dislocations occur in as many as 98% of cases. Anterior displacement of the humeral head is the most common dislocation seen by emergency physicians.**
- An inferior shoulder dislocation is the least common form of shoulder dislocation. The condition is also called luxatio erecta because the arm appears to be permanently held upward or behind the head, in fixed abduction. It is caused by a hyper-abduction of the arm that forces the humeral head against the acromion.

28. Ans. (c) Coracobrachialis

Ref: *Maheshwari*, 5th ed. pg. 88

- Glenohumeral joint is *the most important joint of shoulder complex*.
- It is a *synovial ball and socket* articulation between the head of the humerus and glenoid cavity of scapula.

- Movements at this joint includes *flexion, extension, abduction, adduction, medial rotation, lateral rotation and circumduction*.
- Posterior dislocation of glenohumeral (shoulder) joint would be prevented by the muscle which originate posteriorly and inserted anteriorly.
 - For example: Coracobrachialis muscle** originate from **Coracoid process of scapula** and inserted at Medial aspect of shaft of humerus.
- The net vector of pull of this muscle would be anteriorly, opposing the posterior dislocation of shoulder joint.

Origin & Insertions of Muscles Around Shoulder Joint:

Muscle	Origin	Insertion
Deltoid	Ant. Fibres- Lateral 1/3rd of anterior border of clavicle Middle Fibres- Lateral border of acromion Posterior Fibres-Lower lip of crest of spine	Deltoid Tuberosity of humerus
Coracobrachialis	Coracoid process of scapula	Medial aspect of shaft of humerus
Latissimus dorsi	Posterior 1/3rd of iliac crest, lumbar fascia, spine of lower 6 thoracic vertebrae, lower 4 ribs inferior angle of scapula	Floor of bicipital groove
Biceps	Long head: Supra glenoid tubercle of scapula Short head: Coracoids process of scapula	Tuberosity of radius
The classical clinical feature of posterior dislocation of shoulder is- arm is held in medial rotation and is locked in that position , and an examiner can not externally rotate it.		

29. Ans. (d) Bryant's test

Ref: *Practical Orthopedics*, 2th ed. pg. 479

Tests for Shoulder Dislocation can be Memorized by Simple Mnemonic: B.D.C.H.

- Bryants test:** Look at the axillary fat fold on the dislocated side. It is displaced inferiorly if compared to normal side.
- Dugas test:** Instruct the patient to put the hand on opposite shoulder, then bring the elbow close to chest. Inability to perform it, means positive test.
- Callaways test:** Check for the circumference of dislocated shoulder and compare it with normal side. Circumference on dislocated side will be more than that of normal side.
- Hamilton ruler test:** If a ruler is placed on upper arm, its two ends can easily touch the acromion and lateral condyle in a straight line. In normal person it will not be possible due to humeral head prominence.

30. Ans. (c) **Shoulder Dislocation**

Ref: Maheshwari, 5th ed. pg. 90

- A **Hill-Sachs lesion**, also **Hill-Sachs fracture**, is a cortical depression in the **postero-lateral** head of the humerus bone.
- It is seen in anterior shoulder dislocation due to forceful impaction of the humeral head against the antero-inferior glenoid rim.

Extra Mile

- **Reverse Hill Sach's lesion** is due to posterior shoulder dislocation. Micro avulsion is seen on **antero-medial** aspect of humeral head.
- **Bankart lesion** is avulsion of anterior glenoid labrum.

31. Ans. (c) **Extensor pollicis longus**

Ref: Apley's, 9th ed. pg. 772-74

- Colle's fracture is a fracture of distal radius at corticocancellous junction with dorsal displacement of distal segment.
- **Mechanism of injury:** Fall on outstretched hand with wrist in hyperextension.

Complication of Colle's

- **Joint stiffness-most common**
- Malunion- 2nd most common
- Sudeck's osteodystrophy
- **Rupture of extensor pollicis longus tendon:** Less common complication, usually seen after 4th week of injury.

32. Ans. (d) **Lunate**

Ref: Maheshwari, 5th ed. pg. 318

- It is breakdown of the lunate bone, a carpal bone in the wrist that articulates with the radius in the forearm.
- **Specifically, Kienbock's disease is another name for avascular necrosis with fragmentation and collapse of the lunate.**

- This has classically been attributed to arterial disruption, but may also occur after events that produce venous congestion with elevated inter-osseous pressure.

33. Ans. (b) **Fracture of the proximal third of the ulna with dislocation of the head of the radius.**

Ref: Maheshwari, 5th ed. pg. 110

- **Monteggia fracture:** Fracture of the proximal third of the ulna with dislocation of proximal radio-ulnar joint.
- **Posterior interosseous nerve** is damaged in case of Monteggia fracture dislocation.
- **Cause of Monteggia fracture:** Fall on an outstretched hand with the forearm in excessive pronation (hyper-pronation injury).

Extra Mile

- **Galeazzi Fracture:** Fracture of the distal third of radius and dislocation of the distal radio-ulnar joint.
- Isolated ulnar shaft fractures are most commonly seen in defence against blunt trauma (e.g. nightstick injury). Such an isolated ulnar shaft fracture is not a Monteggia fracture. It is called a '**nightstick fracture**'.

34. Ans. (a) **Wrist drop**

Ref: Maheshwari, 5th ed. pg. 117

- **Wrist drop:** Due to injury to radial nerve
- **Skier's thumb:** Sprain or rupture of ULNAR collateral ligament. It is due to forceful radial and palmar hyperabduction of thumb, because of snow skiing accidents.
- **Chauffeur's fracture:** Fracture of radial styloid process
- **Mallet finger:** It is flexion deformity of the **distal inter-phalangeal joint**, due to avulsion of extensor tendon of distal phalanx.

35. Ans. (c) Radial artery

Contents of Anatomical Snuff Box

- **Radial artery:** Only content which runs in groove (*all others are either floor or roof*)
- Tendon of abductor pollicis longus
- Tendon of extensor pollicis brevis
- Scaphoid bone-Floor

Extra Mile

- Superficial cutaneous branch of radial nerve
- Partial tear of supraspinatus: Painful arc syndrome.
- **Winging of scapula:** Long thoracic nerve palsy
- **Frozen shoulder:** Also known as *Adhesive Capsulitis*. In frozen shoulder, all range of motion is restricted. Associated with DM, hyperthyroidism, Dupuytren's disease, cardiac disease etc.

36. Ans. (c) Abductor Pollicis longus palsy

Ref: Maheshwari, 5th ed. pg. 65,67

- The abductor pollicis longus muscle is innervated by the posterior interosseous nerve, which is a continuation of the deep branch of the radial nerve after it passes through the supinator muscle.
- **Froment's sign** tests for palsy of the **ulnar nerve**, specifically, the action of **adductor pollicis**. To perform the test, a patient is asked to hold an object, usually a flat object such as a piece of paper, between their thumb and index finger (pinch grip). The examiner then attempts to pull the object out of the subject's hands. A normal individual will be able to maintain a hold on the object without difficulty.
- However, with ulnar nerve palsy, the patient will experience difficulty maintaining a hold and will compensate by flexing the FPL (Flexor Pollicis Longus) of the thumb to maintain grip pressure causing a pinching effect.
- Injury of the ulnar nerve at different levels causes varying motor and sensory deficits.

37. Ans. (d) Pain

Ref: Maheshwari, 5th ed. pg. 102

Clinical Features of Volkman's Ischemic Contracture (VIC)

- Pain out of proportion to physical examination findings.
 - **Pain on passive stretching: 1st sign**
 - Pressure increased
 - Pallor/may also be pink
 - Pulselessness
 - Paresthesia
 - Paralysis
- (Pulselessness is a late sign and is unreliable for diagnosis of compartment syndrome)

Extra Mile

- Nerve involved in VIC: Anterior Interosseous Nerve > Median nerve

38. Ans. (a) Carpal tunnel syndrome

Ref: Maheshwari, 5th ed. pg. 303

Entrapment syndrome	Nerve involved
Carpal tunnel syndrome aka Pronator syndrome	Median nerve (at wrist) Median nerve (proximally compressed beneath—ligament of struthers, bicipital aponeurosis or origins of pronator teres or flexor digitorum superficialis)
Cubital tunnel syndrome/ Guyon's canal syndrome	Ulnar nerve (between two heads of flexor carpi ulnaris or arcade of struthers) Ulnar nerve (at wrist)
Tarsal tunnel syndrome	Posterior tibial nerve (behind & below medial malleolus)
Thoracic outlet syndrome	Lower trunk of brachial plexus, (C8 & T1) & subclavian vessels (between clavicle & first rib)
Meralgia parasthetica	Lateral cutaneous nerve of thigh
Morton's metatarsalgia	Interdigital nerve compression (usually of 3 rd , 4 th toe)

39. Ans. (c) De-quervain tenosynovitis

Ref: Maheshwari, 5th ed. pg. 303

- Finkelstein's test is one way to determine if there is tenosynovitis in the abductor pollicis longus and extensor pollicis brevis tendons of the wrist. These two tendons belong to the first dorsal compartment.
 - **Finkelstein's test** is used to diagnose De-Quervain's tenosynovitis in people who have wrist pain.
 - To perform the test, the examining physician grasps the thumb and the hand is ulnar deviated sharply. If sharp pain occurs along the distal radius it is indicative of tenosynovitis.

40. Ans. (c) Table top test is negative

Ref: Maheshwari, 5th ed. pg. 302

- Dupuytren's contracture is a condition in which the fascia or tissue lining underneath the skin on the palm and fingers becomes thickened and scarred. As a result, the tissue lining shortens and may cause puckering of the skin or limit the ability to straighten the finger joints.
- It is usually an unpainful condition and is usually seen in northeastern European population.

- **Cause:** Idiopathic
- **Most commonly affects** Ring finger > little finger. Thumb is rarely involved
- **Most common joint involved:** Metacarpophalangeal joint > PIP joint
- Table top test involves placing palm on the table, which in presence of contracture would turn out to be impossible. **Table top test is positive in case of Duputren's contracture.**
- No definite treatment but Clostridial collagenase injections have shown excellent results and are becoming the preferred method of treatment for this condition.

Extra Mile

- **Dupuytren disease** is another disease entity. It doesn't only affect the palms of the hands but it can also involve the back of their finger joints giving a nodule like appearance called "Garrod pads", "knuckle pads", or "dorsal Dupuytren nodules"
- Dupuytren disease can cause lumps in the arch of the feet (**Ledderhose disease**). In severe cases, it can also involve wrist joint.

41. Ans. (a) Supracondylar fracture of humerus

Ref: Maheshwari, 5th ed. pg. 102; Essential Orthopedics by J. Maheshwari, pg. 98

- Most common complication of supracondylar fracture is malunion, which further can lead to cubitus varus deformity. This is because of the reason that fracture unites with the distal fragment tilted medially and in internal rotation.
- This cubitus varus is usually termed as gun stock deformity.
- Most common nerve damaged in supracondylar fracture: **Anterior Interosseous Nerve.**

Extra Mile

A pressure >30 mm Hg → can cause compartment syndrome

42. Ans. (a) Abduction and external rotation

Ref: Maheshwari's 'Essential Orthopaedics'; 3rd ed. p-74

- A fall on the outstretched hand with the shoulder abducted and externally rotated is the common mechanism of injury of anterior shoulder dislocation.
- Occasionally, it may result from a direct force pushing the humerus head out of the glenoid cavity.
- A posterior dislocation may result from a direct blow on the front of the shoulder, driving the head backwards.
- More often, however, the posterior dislocation is a consequence of an electric shock or an epileptiform convulsion.

Pathology (in recurrent cases)

- Bankart's lesion is stripping off (or an avulsion of) fibrocartilage labrum from anterior glenoid and neck of scapula.
- Hill Sachs lesion is compression fracture of postero lateral humeral head due to impression (friction) of glenoid rim which occur during repeated dislocation.

Tests for Anterior Shoulder Dislocation

- **Dugas' test:** Inability to touch the opposite shoulder.
- **Hamilton ruler test:**
 - Because of the flattening of the shoulder, it is possible to place a ruler on the lateral side of the arm.
 - This touches the acromion and the lateral condyle of the humerus simultaneously.
- **Callway's test:** The vertical circumference of the axilla is increased compared to the normal side.

Management:

- Commonly used reduction techniques are Stimson's gravity method, Hippocratic method and Kocher's method.
- Force direction in other dislocations of shoulder
- Posterior dislocation—Indirect force producing marked internal rotation and adduction.
- So the arm is flexed and internally rotated.

Extra Mile

Positions of leg in hip dislocation

Dislocation of hip	Position of limb
Anterior	Flexion, Abduction, External Rotation
Posterior	Flexion, Adduction, Internal Rotation
Fracture neck of femur	Flexion, Adduction, External Rotation

43. Ans. (c) Radial nerve

Holstein Lewis Fracture

- The radiograph shows a fracture shaft of humerus.
- The nerve most likely to get damaged is radial nerve, as this nerve is very close to the shaft of humerus
- **Holstein Lewis fracture:** Entrapment of radial nerve between fragments in the oblique fracture of distal third of humerus.
- Radial nerve, which is fixed to proximal fragment by lateral intermuscular septum, is trapped between fragments when closed reduction is attempted.

44. Ans. (a) Monteggia fracture

- The radiograph shows a fracture of proximal part of ulna and dislocation of head of radius (disruption of upper radioulnar joint).
- This is called Monteggia fracture dislocation.
- Treatment of Monteggia Fracture

Acute fractures:

- **In children:** Closed reduction and Plaster cast
- **In adults:** ORIF with plate. Radial head reduces spontaneously.
- Old, malunited fractures: ORIF with plate for ulna fracture and radial head excision.

LOWER LIMB

45. Ans. (c) Tibiotalar joint

Ref: Atlas Foot and Ankle Surgery, 2nd ed. P 272

- **Triple arthrodesis** is a surgical procedure done in order to relieve pain in the rear part of the foot, improve stability of the foot, and in some cases correct deformity of the foot, by fusing of the three main joints of the hindfoot:
 - The subtalar joint
 - Calcaneocuboid joint and
 - Talonavicular joint.

Triple Arthrodesis
(Three fusions)

Joint to be fused
marked in purple

- It is commonly carried out on patients with joint degeneration resulting from arthritis or a severe flat foot deformity.

46. Ans. (c) Ankle fracture

Ref: Rockwood and Green's Fractures in Adults, Volume 1
by Charles A Rockwood, P 1980

- Lauge-Hansen classification is a system of categorizing ankle fractures based on the foot position and the force applied.

Extra Mile

Some fracture classification nomenclature

- **Femur fracture:** Winquist classification
- **Femur neck fracture:** Pauwel and Garden classification
- **Elbow fracture:** Mayo classification
- **Lateral condyle fracture:** Milch classification
- **Proximal humerus fracture:** Neer classification

47. Ans. (b) Reactive arthritis

Ref: Textbook of Orthopedics by Kotwal, pg. 98

- Triple deformity of knee can result due to spasm and contracture of biceps femoris and tensor fascia lata. It consists of:
 - Flexion at knee
 - Postero-lateral subluxation at tibia
 - Lateral rotation and abduction of the leg
- It is seen in following conditions (remembered as TRIP):
 - TB knee
 - Rheumatoid arthritis
 - Iliotibial contracture
 - Polio

48. Ans. (b) **Posterior subluxation of femur**

- Triple deformity of knee is seen in TB knee. It includes:
 - Knee flexion
 - Posterior subluxation tibia
 - Lateral rotation
- Triple deformity seen in: (TRIP)
 - TB knee
 - RA
 - Iliotibial contracture
 - Polio

49. Ans. (d) **Fat embolism**

- A **fat embolism** is often caused by physical trauma such as **fracture of long bone**, soft tissue trauma and burns.

Clinical Feature

- Tachycardia, tachypnea, increased temperature, **hypoxemia (decreased sPO_2)**, hypercapnea, thrombocytopenia.
- **Pathognomonic sign: Petechial rash** on the upper anterior portion of the body, including the chest, neck, upper arm, axilla, shoulder, oral mucosa and conjunctivae.

TABLE: Factors favoring fat embolism

Traumatic	Nontraumatic
<ul style="list-style-type: none"> • Fracture of long bones eg. Femur • Reaming • Mobility of fracture 	<ul style="list-style-type: none"> • Diabetes • Fatty liver • Pancreatitis • Sickle cell anemia • Decompression sickness • Extensive burns • Inflammation of bone & soft tissue • Oil or fat introduced to body

Extra Mile

- **Crush injury** is compression of extremities or other parts of the body that causes muscle swelling and/or neurological disturbances in the affected areas of the body, while **crush syndrome** is localized crush injury with systemic manifestations. It is characterized by major shock and renal failure after a crushing injury to skeletal muscle.
- **Hypostatic pneumonia** is usually seen in elderly and debilitating patients. It results from infection developing in the dependent portions of the lungs due to decreased ventilation of those areas, with resulting failure to drain bronchial secretions.

50. Ans. (c) **Anterior Dislocation of tibia**

Ref: Maheshwari, 5th ed. pg. 148-149

- The anterior cruciate ligament (ACL) stretches from the lateral condyle of femur to the anterior intercondylar area.

- **The ACL is critically important because it prevents the tibia from being pushed too far anterior relative to the femur.** It is often torn during twisting or bending of the knee.

- **ACL is considered as the major stabilizer of the knee. Therefore, ACL Tears are the most common knee injuries.**
- If there is ACL tear, reconstruction is most commonly done by autograft, meaning the tissue used for the repair is from the patient's body.
- **The two most common sources for tissue are the patellar tendon and hamstrings tendon**
- **The posterior cruciate ligament (PCL)** stretches from medial condyle of femur to the posterior intercondylar area.
- This ligament prevents posterior displacement of the tibia relative to the femur.

51. Ans. (c) **Common peroneal nerve**

Ref: Maheshwari, 5th ed. pg. 158

- Smaller terminal branch of sciatic nerve, the common peroneal nerve arises in the lower third of thigh. It runs downward through the popliteal fossa (lateral side) closely following the medial border of biceps femoris muscle. It leaves the fossa by crossing superficially the lateral head of the gastrocnemius muscle. It then passes behind the head of the fibula, winds laterally around the neck of the bone, pierces the peroneus longus muscle, and divides into two terminal branches superficial and deep peroneal nerve.
- **The common peroneal nerve is extremely vulnerable to injury by direct trauma and fractures of fibula as it winds around the neck of fibula.**
- Injury to common peroneal nerve causes **foot drop**.

52. Ans. (d) Fracture of lateral tibial plateau

Ref: BRS: Gross Anatomy, 7th ed. pg. 83

- **Bumper fracture** is a fracture of the **lateral tibial plateau** caused by a forced valgus applied to the knee usually by the impact bumper of a moving car on the lateral side of the knee while the foot is planted on the ground.
- This causes the lateral part of the distal femur and the lateral tibial plateau to come into contact, compressing the tibial plateau and causing the tibia to fracture.

53. Ans. (b) Quadriceps femoris

Ref: Maheshwari, 5th ed. pg. 145

- Quadriceps is a large muscle group that includes the four prevailing muscles on the front of the thigh. It is the great extensor muscle of the knee. It is subdivided into four separate portions or 'heads', which have received distinctive names:
 - **Rectus femoris** occupies the middle of the thigh, covering most of the other three quadriceps muscles.

It originates on the ilium. It is named from its straight course.

- The other three lie deep to rectus femoris and originate from the body of the femur, which they cover from the trochanters to the condyles:
 - ◆ **Vastus lateralis** is on the *lateral side* of the femur (i.e. on the outer side of the thigh).
 - ◆ **Vastus medialis** is on the *medial side* of the femur (i.e. on the inner part thigh).
 - ◆ **Vastus intermedius** lies between vastus lateralis and vastus medialis on the *front* of the femur (i.e. on the top or front of the thigh), but deep to the rectus femoris. Typically, it cannot be seen without dissection of the rectus femoris.
- **Quadriceps femoris is the main and only extensor of knee.**
 - It produces locking action as a result of medial rotation of the femur during the last stage of extension.
 - To reverse this lock popliteus muscle comes into action and does so by the lateral rotation of femur
- **Remember: Lock is: Quadriceps femoris muscle and, Key is popliteus muscle.**

54. Ans. (a) Patellar subluxation

Ref: Practical Orthopedics, 2th ed. pg. 511

Q angle is the angle formed by a line drawn from the ASIS to central patella and a second line drawn from central patella to tibial tubercle.

- An increased Q-angle is a risk factor for patellar subluxation
- Normally Q angle is 14 degree for males and 17 degree for females

- **Q angle is increased in:**
 - Genu valgum
 - Increased femoral anteversion
 - External tibial torsion
 - Laterally positioned tibial tuberosity
 - Tight lateral retinaculum

55. Ans. (b) Shaft of femur

Ref: Apley's 'System of Orthopaedics and Fractures'; 9/e, p-861

Gallow's Traction

- This is used in infants and children with femoral shaft fractures.
- **Indications of Gallow's traction**
 - Child must weigh less than 12 kg
 - Femoral fractures
 - Skin must be intact
- Both the fractured and the well femur are placed in skin traction and the infant is suspended by these from a special frame.
- Vascular compromise is the biggest danger.
- Check the circulation twice daily.
- The buttocks should be just off the bed.

Bryant's or Gallow's Traction

- Do not use for children older than 18 months, best for infant under 1 year.
- Weight limit of child: 16–18 kg.
- Lie child supine with the hips flexed 90°, the legs being pulled directly upwards.
- Apply only enough weight or elevate the infant just enough to allow you to slip your hand under the nappy.
- Gallows traction has been associated with vascular problems, including severe compartment syndrome.
- This is due to the elevated position of the legs, straightness of the knees and tightness of bandages.
- Avoid complications, apply the traction carefully, use adhesive skin traction, allow some knee flexion and don't bandage too tight.

56. Ans. (a) Coronary

Ref Apley's 'System of Orthopaedics and Fractures'; 9/e, p-583

Ligaments Related to Menisci

Coronary Ligaments:

- These ligaments attach the periphery of both the menisci to the periphery of tibial condyles.
- The coronary ligaments of the knee (also known as **meniscotibial ligaments**) are portions of the joint capsule which connect the inferior edges of the fibrocartilaginous menisci to the periphery of the tibial plateaus.
- The coronary ligaments function to connect parts of the outside, inferior edges of the medial and lateral menisci to the joint capsule of the knee.

Meniscomfemoral Ligaments:

- These ligaments attach the posterior part of lateral meniscus to the femur.
- These are of two types:
 - ♦ Anterior meniscomfemoral ligament (Ligament of Humphrey): Runs anterior to PCL.
 - ♦ Posterior meniscomfemoral ligament (Ligament of Wrisberg): Runs posterior to PCL.

Transverse Ligament:

It attaches the anterior edges of medial and lateral meniscus to each other.

• **Option 'B': Arcuate**

Arcuate ligament is the ligament between the posterolateral femoral condyle to the fibular head.

It covers the popliteus tendon.

• **Option 'D': Oblique**

Oblique popliteal ligament is the ligament from semimembranous to lateral femoral condyle and it is derived from semimembranous.

57. Ans. (c) Grade III

Pipkin classification for femur head fracture (#)

- I-femoral head # caudal to fovea
- II-femoral head # cephalad to fovea
- III-femoral head # associated with femoral neck #
- IV-any of the above with acetabular #

58. Ans. (a) Malgaigne fracture

- **Straddle #**- B/L Pubic rami
- **Malgaigne#** I/L Pubis with ilium near sacroiliac joint. The image shows malgaigne's fracture
- Classification for pelvic bone fracture → Tiles classification

PELVIS AND HIP

59. Ans. (d) Internal fixation

Ref: *Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 138*

- In elderly population the intertrochanteric fracture is usually sustained by a sideway fall or a blow over the greater trochanter.
- In young population it occurs due to violent trauma usually due to road traffic accident.
- In the fracture the distal fragment rides up so that the femoral neck-shaft angle is reduced (coxa-vara). In most cases the fracture is comminuted and displaced.

TREATMENT:

- Most of these fractures unite by themselves if femoral neck-shaft angle is maintained. Done by conservative means like traction (require bed rest of 3-4 months).
 - **MC used traction:** Russei's traction
- In elderly population internal fixation is preferred.
 - Prolong bed rest in elderly can cause further complications like pneumonia, bed sores etc.

Extra Mile

- **Hemiarthroplasty:** Used for femoral neck fracture
- **Hip spica:** used for femoral shaft fracture (age >2 to 16 years)
- **Gallows traction:** Used for femoral shaft fracture (birth to 2 years)

TABLE: Differences between fracture neck of the femur and intertrochanteric fracture

	Fracture neck femur	Intertrochanteric fracture
Age	After 50 years	After 60 years
Sex	F > M	M > F
Injury	Trivial	Significant
Ability to walk	May walk in impacted fracture	Not possible
Pain	Mild	Severe
Swelling	Nil	Severe
Ecchymosis	Nil	Present
Tenderness	In Scarpa's triangle	On the greater trochanter
Ext. rotation deformity	Less than 45°	More than 45°
Shortening	Less than 1 inch	More than 1 inch
Treatment	Int. fixation always	Can be managed in traction
Complications	Non-union	Malunion

60. Ans. (b) Urgent Closed reduction

- The shown image is case of posterior hip dislocation
- Posterior hip dislocation is usually reduced under general anesthesia as soon as possible (within the 7 day of injury).
- Most commonly this reduction is done by **closed reduction**.
- **Indication of surgical reduction:**
 - In case of failed closed reduction.
 - If associated with acetabular fracture, making hip unstable
 - Intra-articular loose fragment
- **Complications of posterior hip dislocation:**
 - Avascular necrosis of femoral head
 - Sciatic nerve injury
 - Osteoarthritis
 - Femoral head damage

61. Ans. (b) Posterior dislocation of hip

Ref: *Maheshwari, 5th ed. pg. 130*

POSTERIOR DISLOCATION OF HIP

- It is most common type of hip dislocation in adults and children.
- Usually this occurs in a road accident when someone seated in car is thrown forwards, striking the knee against the dashboard (*dashboard injury*)
- It is the position (direction) of hip at the time of injury that decides the pattern of injury.

Pattern of injury	Position of Hip at the time of injury
Pure posterior dislocation	Flexion, adduction, internal rotation
Posterior fracture dislocation	Less flexion, less adduction (neutral or slight abduction), internal rotation
Anterior dislocation	Hyper abduction + Extension

Classification Schemes for Posterior Hip Dislocations

Thompson & Epstein	
Type I	Dislocations without or with minor fracture
Type II	Dislocation with a single large fracture of posterior acetabular rim
Type III	Dislocation with comminution of posterior acetabular rim
Type IV	Dislocation with fracture of acetabular floor
Type V	Dislocation with fracture of femoral head

Stewart and Miford

Type I	Dislocation without fracture
Type II	Dislocation with posterior rim fracture (one or more fragments), but the hip is stable after reduction
Type III	Dislocation with fracture of rim producing gross instability
Type IV	Dislocation with fracture head or neck of femur

Type V Thompson & Epstein is Subdivided by Pipkin into Four Types (Pipkin Classification)

- I. Femoral head fracture caudal to fovea centralis
- II. Femoral head fracture cephalad to the fovea
- III. Femoral head fracture associated with femoral neck fracture
- IV. Type I, II, or III associated acetabular fracture

Note: Thomson & Epstein, and Stewart & Milford are posterior dislocation injuries of hip and Pipkin's fracture is fracture of femoral head (& / or neck) in posterior dislocation injuries.

62. Ans. (c) Adduction, internal rotation, flexion

Ref: Maheshwari, 5th ed. pg. 130

- Posterior dislocations comprise approximately 80-90% of hip dislocations caused by Motor Vehicle Crash.
- In posterior hip dislocations, the femoral head goes posteriorly causing the femur to get adducted and internally rotated.
- Posterior dislocation:** The hip is Flexed, ADducted and Internally Rotated (Mn: FADIR)
- Anterior dislocation:** The hip is minimally Flexed, markedly ABducted, and Externally Rotated (Mn: FABER).

63. Ans. (b) Cemented total hip replacement

Ref: Maheshwari, 5th ed. pg. 138

TOTAL HIP REPLACEMENT

- Total Hip replacement may be preferable in patients with acetabular damage (osteoarthritis, rheumatoid arthritis, AVN), metastatic disease or Paget's disease.
- Originally the primary indication for THR was the alleviation of incapacitating pain in patients older than 65 years of age who could not be relieved, sufficiently by non surgical means & for whom the only surgical alternative was resection of hip joint (Girdle stone resection arthroplasty). Secondary importance is improved function of hip.
- Therefore it is mostly used for hip arthritis (rheumatoid, ankylosing, osteoarthritis), avascular necrosis of femoral head, non-union of femoral head and, or neck.

64. Ans. (b) Flexion, abduction, external rotation

Ref: Maheshwari, 5th ed. pg. 130

65. Ans. (c) Flexion abduction External rotation

Ref: Maheshwari, 5th ed. pg. 196

- The tuberculosis of hip mainly progresses through three stages.
 - Stage of Synovitis (FABER - AL)**
 - Stage of Arthritis (FADIR - AS)**
 - Stage of Erosion (FADIR - TS)**
- The mnemonics indicate the orientation and appearance of the lower limb during those stages of TB
 - FABER - AL:** stands for Flexion, ABduction, External Rotation and Apparent Lengthening.
 - FADIR - AS:** stands for flexion, adduction, internal rotation and apparent shortening.
 - FADIR - TS:** stands for flexion, adduction, internal rotation and true shortening.

Staging	Clinical findings	Radiologic features
Ist stage of synovitis	Flexion, abduction, external rotation, apparent lengthening	Haziness, rarefaction
IInd stage of early arthritis	Flexion, adduction, internal rotation, apparent shortening	Rarefaction, osteopenia, bony lesion in femoral head, acetabulum or both. No reduction in joint space
IIIRD stage of arthritis	Flexion, adduction, internal rotation, shorting	All of the above and destruction of articular surface, reduction in joint space
IVth stage of advanced arthritis	Flexion, adduction, internal rotation with gross shortening	Complete destruction, no joint space, wandering acetabulum

Source: Babhulkar and Pande, Clin Ortho Rel Res 2002

INFECTION & TUBERCULOSIS OF BONE AND JOINTS

66. Ans. (b) Phalanges

Ref: Textbook of Orthopedics by John Ebnezar, Rakesh John P 554

- Spina ventosa is a rare skeletal tuberculosis of short tubular bones like phalanges, metacarpals, metatarsals.
- This condition is uncommon after the age of 5 years. It is also known as tuberculosis dactylitis.
- In this condition hand is more frequently involved than foot.

- Due to abundant blood flow through the large nutrient artery, almost in the middle of the bone, the first inoculum of infection, lodged in the center of marrow cavity, leads to spindle shaped expansion of bone called *spina ventosa*.

Extra Mile

- **Caries sicca:** TB shoulder
- **Poncet disease-** TB associated with polyarthritis
- **Pott's disease**

67. Ans. (c) Paradiscal

Ref: Tuberculosis of the Skeletal system, SM Tuli, P 223

- There are 4 patterns of vertebral involvement in Pott's spine:
 - I. Paradiscal (due to arterial spread)
 - II. Central (due to venous spread)
 - III. Anterior (due to subperiosteal spread)
 - IV. Appendiceal and articular type (occur in isolation involving pedicles, laminae, transverse process and spinous process or in conjunction with typical paradiscal variant).

- Paradiscal is the most common type of lesion in Pott's spine.
- It spreads through arterial supply, causing reduced disc space and loss of vertebral margins.

68. Ans. (a) Osteomyelitis

Ref: Apley's System of Orthopaedics, 9th ed. pg. 36

- The given image is a case of Brodie's abscess showing sclerotic margin which can be manifested sometimes in subacute osteomyelitis.

Extra Mile

- Most common bone involved in acute osteomyelitis: Lower end of femur
- Most common bone involved in subacute and chronic osteomyelitis: Upper end of tibia
- Most common organism for osteomyelitis: *Staphylococcus aureus*

69. Ans. (a) Staph Aureus

Ref: Maheshwari, 5th ed. pg. 168

Note that responsible pathogens may be isolated in only 35-40% of infections. Bacterial causes of acute hematogenous and direct osteomyelitis include the following:

- Most common organism causing acute osteomyelitis: *Staph. Aureus*
- MCC of osteomyelitis in **sickle cell anemia patient:** **SALMONELLA**
- MCC of osteomyelitis in **IV drug abuser:** **PSEUDOMONAS**
- MC organism causing osteomyelitis in **open foot injury:** **PSEUDOMONAS**
- MC organism causing osteomyelitis in **HIV patient:** **Staph. Aureus**
- MC organism causing osteomyelitis in case of **animal bite:** **Pasteurella Multiocida**
- MC organism causing osteomyelitis in case of **human bite:** **Eikenella Corrodens**

70. Ans. (b) Metaphysis

Ref: Maheshwari, 5th ed. pg. 168

- Hematogenous osteomyelitis is an infection caused by bacterial seeding from the blood.
- Acute hematogenous osteomyelitis is characterized by an acute infection of the bone caused by the seeding of the bacteria within the bone from a remote source. This condition primarily occurs in children.
- The most common site is the rapidly growing and highly vascular metaphysis of growing bones. The apparent slowing or sludging of blood flow as the vessels make sharp angles at the distal metaphysis predisposes the vessels to thrombosis and the bone itself to localized necrosis and bacterial seeding.

Extra Mile

- MC site of OM in child: Lower end of femur
- MC site of OM in adults: Thoraco-Lumbar vertebra (Thoracic > Lumbar)
- MC site of OM in infants: Hip

71. Ans. (d) **Periosteal reaction**

Ref: Maheshwari, 8th ed. pg. 169; Harrison's, 18th ed. Ch 126

- **Earliest X-ray change:** Loss of soft tissue plane which is seen after 24 hours. In case of osteomyelitis X-Ray is normal during first 24 hours.
- 2nd X-ray change seen is periosteal reaction, which is usually seen 7–10 days after infection.
- **Periosteal reaction can be of 3 types:**
 - **No reaction:** seen in case of TB
 - **Narrow zone of activity:** Benign condition (Ex: in infection like osteomyelitis)
 - **Wide zone of activity:** Malignant condition (Ex: Codman's triangle in osteosarcoma)

72. Ans. (b) **Terminal pulp space**

Ref: Maheshwari, 5th ed. pg. 206

- Felons/Whitlow are closed-space infections of the fingertip pulp. Infection occurring within these compartments can lead to abscess formation, edema, and rapid development of increased pressure in a closed space. This increased pressure may compromise blood flow and lead to necrosis of the skin and pulp.
- **Clinical feature:** Felons are characterized by marked throbbing pain, tension, and edema of the fingertip pulp.
- **Causes:** Staphylococcus aureus, is the most common cause.
- **Management:** The felon should be incised in the area of maximum tenderness. The incision should not cross the distal interphalangeal (DIP) joint to prevent formation of a flexion contracture at the DIP flexion crease. Probing is not carried out proximally to avoid extension of infection into the flexor tendon sheath.
- **Complication of felon:** Osteomyelitis > Tenosynovitis

73. Ans (a) **Tubercular dactylitis**

Ref: Maheshwari, 5th ed. pg. 203

- **Spina ventosa** ("wind-filled sail") refers to the end-stage radiographic appearance of tuberculous dactylitis. Cystic expansion of the short tubular bones with bone destruction.
- Tuberculous dactylitis is the painless tuberculous involvement of the fingers and toes and is more common in children. It begins with fusiform soft-tissue swelling with or without periostitis.

Extra Mile

- **MC site bone TB:** Spine > Hip > Knee
- MC site in spine is *Thoracolumbar (paradiscal)*
- Earliest symptom: BACK PAIN
- **Triad of TB joint:** Decreased joint space + articular damage + Juxta-articular osteoporosis
- **Spina ventosa-** TB of short bones
- **Caries sicca:** TB shoulder
- **Poncet disease:** TB associated with polyarthritis

74. Ans. (b) **Medial rotation of tibia**

Ref: Practical Orthopedics, 2th ed. pg. 173

- Tuberculosis of the knee is classical cause of triple deformity. It includes:
 - Flexion
 - Lateral (external) rotation of tibia
 - Posterior subluxation of tibia
- Better treatment results are seen with ATT and arthrodesis
- This condition can also be seen in Rheumatoid arthritis.

75. Ans. (a) **Flexion, posterior subluxation and external rotation**

Ref: Practical Orthopedics, 2th ed. pg. 173

76. Ans. (a) **Paradiscal Area**

Ref: Maheshwari, 8th ed. pg. 185

- **Most common site of skeletal tuberculosis:** TB Spine (50% of cases)
- **Most common site in spine:** Thoraco Lumbar vertebra followed by cervical vertebra (Thoracic vertebra > Lumbar)
- The spinal TB is always secondary to a primary lesion (ex: in lungs) and occurs due to hematogenous spread.
- **IOC for TB spine:** MRI

Clinically there are four types of Pott's Spine

- **Paradiscal lesion (most common)** begins in the metaphysis, erodes the cartilage and destroys the disc, resulting in narrowing of the disc space.
- **Central type** begins in the midsection of the body which further gets softened under gravity and muscle action, leading to compression, collapse and bony deformation.
- **Anterior lesions** lead to cortical bone destruction beneath the anterior longitudinal ligament. Spread of the infection is in the subperiosteal and sub ligamentous planes resulting in the loss of periosteal blood supply to the body with resultant collapse.
- **In appendicle type**, the infection settles in the pedicles, the laminae, the articular processes or the spinous processes and causes initial ballooning of the structure followed by destruction.

77. Ans. (c) **Septic arthritis leads to bony ankylosis**Ref: Maheshwari, 5th ed. pg. 182**TABLE: Bony Ankylosis vs Fibrous Ankylosis**

Bony	Fibrous
<ul style="list-style-type: none"> Painless MCC: Septic arthritis > TB spine 	<ul style="list-style-type: none"> Painful MCC: Tubercular arthritis of hip and knee

78. Ans. (b) **Bony ankylosis**Ref: Maheshwari, 5th ed. pg. 189

- Tuberculous spondylitis is most commonly localized in the thoracic portion of the spine.
- The infection coming from primary site (ie: lungs) then spreads from two adjacent vertebrae into the adjoining intervertebral disc space. If only one vertebra is affected, the disc is normal, but if two are involved, the disc, which is avascular, cannot receive nutrients and collapses. The disc tissue dies and is broken down by caseation, leading to vertebral narrowing and eventually to vertebral collapse (Bony ankylosis) and spinal damage.
- From the choices given in the question, the most logical answer is bony ankylosis.
- Actual late complications of Tubercular spondylitis is: Vertebral collapse resulting in kyphosis, Spinal cord compression, sinus formation, paraplegia.
- Most common cause of bony ankylosis: Septic arthritis > TB spine**

79. Ans. (c) **Pain upon passive flexion**

Kanavel sign is seen in tenosynovitis... infl of tendon sheath of flexor aspect of hand. It includes 4 components:

- Tenderness
- Uniform swelling
- Flexed finger
- Pain upon passive extension

BONE ONCOLOGY AND JOINT DISORDERS80. Ans. (c) **Tibia**

Ref: Campbell Orthopaedics, 12th ed. P 922; Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 237

- Adamantinoma is an uncommon tumor (<1%) of long bones containing epithelial—like islands of cells
- MC site of adamantinoma:** Tibia (85%) > Mandible
 - In mandible, it is termed as ameloblastoma
 - Can involve ipsilateral fibula
- MC age group:** 10–35 years
- MC symptom:** Pain
- On X-ray:** Honey comb like appearance/Sharply demarcated radiolucent lesions
- Treatment:** Wide surgical resection

TABLE: Most common sites of primary bone tumors

Tumor	Site
Chondroblastoma	Epiphyseal (most common tumor in this region before puberty)
Osteoclastoma	Epiphyseal (most common tumor in this region after puberty)
Chondrosarcoma, osteochondroma, bone cyst, enchondroma, osteosarcoma, osteoclastoma	Metaphyseal
Ewing's tumor, lymphoma, multiple myeloma, adamantinoma, osteoid osteoma	Diaphyseal

TABLE: Most common sites of individual bone tumors

Tumor	Site
Solitary bone cyst	Upper end of humerus
Aneurysmal bone cyst	Lower limb metaphysis
Osteochondroma	Distal femur
Osteoid osteoma	Femur
Osteoblastoma	Vertebrae
Osteoma	Skull, facial bones
Enchondroma	Short bones of hand
Chordoma	Sacrum
Adamantinoma	Tibial
Ameloblastoma	Mandible
Osteoclastoma	Lower end femur
Fibrous dysplasia	Polyostotic—craniofacial Monostotic—upper femur
Multiple myeloma	Lumbar vertebrae
Osteosarcoma	Lower end femur
Ewing's sarcoma	Femur
Chondrosarcoma	Pelvis
Secondary tumors	Dorsal vertebrae

81. Ans. (b) **Periosteal reaction**

Ref: Fundamentals of Orthopedics, by Mukul Mohindra, Jitesh Kumar Jain P 500

- Sunray appearance in osteosarcoma is due to periosteal reaction, causing calcification along Sharpey's fiber.

IMPORTANT X-RAY SIGNS

- Fibrous dysplasia:** Ground glass appearance, Rind sign (sclerotic margin around tumor), Shephard crook deformity (collapse of medial part of femoral neck so that proximal femur becomes hook shaped, seen in Paget's disease and Osteogenesis imperfecta also)
- Simple bone cyst:** Fallen leaf sign (can be seen in ABC but less often).

- **Hemangioma:** Corduroy appearance (Jail house sign), Polka dot pattern.
- **Osteoid osteoma:** Nidus <1.5 cm and osteoblastoma >1.5 cm.
- **Giant cell tumor:** Soap bubble appearance.
- **Osteosarcoma:** Codman's triangle, Sunray appearance (due to calcification along Sharpey's fibers).
- **Chondrosarcoma:** Popcorn like calcification.
- **Ewing's sarcoma:** Onion peel appearance (intense periosteal reaction in layers), Codman's triangle.
- **Eosinophilic granuloma:** Punched out lytic lesions in skull with double contours.
- **Multiple myeloma:** Punched out lesions without a reactive/sclerotic surrounding zone.

82. Ans. (d) Osteofibrous dysplasia

- In the given image, the lesion is in tibial shaft. Given these choices, osteofibrous dysplasia is the single best answer.
- **Apley's states:** "tumors in the tibial shaft is fairly rare. A condition that particularly affects the tibial shaft is osteofibrous dysplasia, a tumor that almost always occurs on the tibia, predominantly in shaft area"
- **Note:** This condition is a very close differential diagnosis of malignant adamantinoma

83. Ans. (d) Chondroblastoma

Ref: Apley's System of Orthopaedics, 9th ed. pg. 198

CHONDROBLASTOMA

- This benign tumor of immature cartilage cells is one of the few lesions to appear primarily in the epiphysis, usually of the proximal humerus, femur or tibia.
- The presenting symptom is a constant ache in the joint; the tender spot is actually in the adjacent bone.
- X-ray shows a rounded, well-demarcated radiolucent area in the epiphysis with no hint of central calcification.

84. Ans. (d) Osteosarcoma

Ref: Maheshwari, 5th ed. pg. 239

Osteosarcoma is a malignant bone tumor, which most commonly originates from metaphyseal region and is common in second decade.

TABLE: Tumors according to their origin site in long bone

Epiphysis (Mn: ECG)	Metaphysis (Mn: ME-BOO)	Diaphysis (DEMO-A)
<ul style="list-style-type: none"> • Chondroblastoma- before physeal closure • Giant cell tumor-after physeal closure 	<ul style="list-style-type: none"> • Enchondroma (short bones) • Bone cyst (MC in upper humerus) <ul style="list-style-type: none"> ▪ UBC, ABC ▪ Osteochondroma (EXOSTOSIS) ▪ Osteosarcoma 	<ul style="list-style-type: none"> • Ewing's sarcoma • Multiple myeloma • Osteoid osteoma • Adamantioma

UBC = Unicameral bone cyst
ABC = Aneurysmal bone cyst

85. Ans. (a) Osteosarcoma

Ref: Maheshwari, 5th ed. pg. 239

- Osteosarcoma is an aggressive malignant neoplasm arising from primitive transformed cells of mesenchymal origin (and thus a sarcoma) that exhibit osteoblastic differentiation and produce malignant osteoid.
- **Sun Ray Appearance** It is the most common radiological finding of primary bone cancer.
- If the lesion grows rapidly but steadily, the periosteum will not have enough time to lay down thin shell of bone, and in such cases, the tiny fibers that connect the periosteum to the bone (Sharpey's fibers) become stretched out perpendicular to the bone.
- **When these fibers ossify, they produce a pattern sometimes called "sunburst" periosteal reaction.**

86. Ans. (c) Osteoid osteoma

Ref: Maheshwari, 5th ed. pg. 235

- Osteoid osteoma is a benign bone tumor characterized by pain which is relieved by non-steroidal anti-inflammatory drugs (NSAIDs), such as aspirin.
- To clarify the mechanism of the pain, five osteoid osteomas were studied immune-histochemically using polyclonal antibodies against prostaglandin E2 (PGE2), S-100 protein and protein gene product.

87. Ans. (b) Second decade

Ref: Maheshwari, 5th ed. pg. 243

"Ewing's sarcoma is generally a lesion of children and adolescents, occurring most commonly (80% to 94%) in the first 2 decades, with a peak incidence in the second decade"

EWING'S SARCOMA

- Highly malignant, undifferentiated peripheral primitive neuro ectodermal tumor (PNET)
- Most common site is diaphysis of femur
- Common in 10–20 year old male
- Histopathology shows round cells containing glycogen and reticulin; PAS positive and diastase digestible
- 80–95% tumors possess translocation; t(11, 22)
- X-ray reveals laminated periosteal new bone formation also known as "Onion peel appearance"

TABLE Bone tumors and their Incidence age wise

Tumor	Seen at age
Unicameral bone cyst	1 st decade
Aneurysmal bone cyst	2 nd decade
Giant cell tumor	2 nd to 4 th decade

88. Ans. (a) **Giant cell tumor**

Ref: Maheshwari 5th ed. pg. 237; Orthopedic Pathology by Vincent J Vigorita pg. 294

- GCT is an epiphyseal tumor
- GCT usually involves subarticular region distal radius and distal femur, the proximal tibia being most common site.
- If there is a soap bubble appearance in diaphyseal region, it is adamantoma.

Extra Mile

- **Sun burst appearance:** Osteosarcoma
- **Nidu/Seed in cortex:** Osteoid osteoma
- **Onion skin appearance:** Ewing's sarcoma
- **Exostosis (cartilage cap):** Osteochondroma

JOINT DISORDERS

89. Ans. (b) **Knee**

- Most common joint involved in thalassemia is Knee joint.
- Most common orthopaedic symptom in thalassemia is leg pain.

Extra Mile

- Most common joint involved in haemophilia: Knee > Elbow > Ankle > Shoulder > Hip

90. Ans. (a) **Reiter's syndrome**

Ref: Apley's System of Orthopaedics, 9th ed. pg. 70

REITER'S SYNDROME

- It is a clinical **triad** of **urethritis, arthritis and conjunctivitis** occurring some weeks after either dysentery of genitourinary infection. It is now recognized that this is one of the classic forms of reactive arthritis, i.e. an aseptic inflammatory arthritis associated with non-specific infection

Cause

- First-degree relatives and a close association with HLA-B27 point to a genetic predisposition.
- Gut pathogens include *Shigella flexneri*, *Salmonella*, *Campylobacter* species and *Yersinia enterocolitica*. Lymphogranuloma venereum and *Chlamydia trachomatis* have been implicated as sexually transmitted infections.

Clinical Features

- The acute phase of the disease is marked by an asymmetrical inflammatory arthritis of the lower limb joints—usually as well. The joint may be acutely painful, hot and swollen with a tense effusion, suggesting gout or infection.

- The chronic phase is more characteristic of a spondyloarthropathy.

91. Ans. (a) **DIP**

Ref: Maheshwari, 5th ed. pg. 287

- Rheumatoid arthritis characteristically causes swelling of small joints in the hand like the PIP, MCP and the wrist joint bilaterally.
- Isolated DIP joint involvement is seen in psoriatic arthropathy.
- DIP joint involvement is also seen with osteoarthritis but the involvement is with pain at the base of thumb. Knee joint is the commonest large joint involved in these patients.

92. Ans. (c) **Flexion contracture of PIP and extension of DIP**

Ref: Maheshwari, 5th ed. pg. 288

- **Boutonniere deformity** is a deformed position of the fingers or toes, in which the joint nearest the knuckle (PIP) is permanently bent toward the palm while the farthest joint (DIP) is bent back away (**PIP flexion with DIP hyperextension**).
- It is commonly caused by injury or by an inflammatory condition like rheumatoid arthritis.

Extra Mile

- **'Z-deformity'** i.e. radial deviation of the wrist with ulnar deviation of the digits, often with palmar subluxation of proximal phalanges.
- **'Swan – neck deformity'** i.e. hyperextension of PIP joints with compensatory flexion of the distal interphalangeal joints.
- **Wind – sweep** deformities of toes i.e. valgus deformities of toes in one foot and varus in other, (*as wind sweeps all the structure in one direction*).

93. Ans. (b) **Heberdens nodes**

Ref: Harrison, 18th ed./ch. 332

- **"Heberden's nodes are hard or bony swellings that develop in the distal interphalangeal joints (DIP) in a case of osteoarthritis"**

**Clinical Features of Rheumatoid Arthritis**

- The presenting symptoms of RA typically result from inflammation of the joints, tendons, and bursae.
- Early morning joint stiffness lasting more than 1 hour and easing with physical activity.
- The earliest involved joints are typically the small joints of the hands and feet. The initial pattern of joint involvement may be monoarticular, oligoarticular (<4 joints), or polyarticular (>5 joints), usually in a symmetric distribution.
- **Wrists, metacarpophalangeal (MCP) and proximal interphalangeal (PIP) joints stand out as the most frequently involved joints.**
- **Frequent hallmark of RA:** Flexor tendon tenosynovitis.

Deformities

- Ulnar deviation of the hand.
- **Swan-neck deformity:** Hyperextension of the PIP joint with flexion of the DIP
- **Boutonniere deformity:** Flexion of the PIP joint with hyperextension of the DIP joint
- **Z deformity:** Radial deviation of wrist with ulnar deviation of digits, often with palmar subluxation proximal phalanges.
- Inflammation about the ulnar styloid and tenosynovitis of the extensor carpi ulnaris may cause subluxation of the distal ulna, resulting in a “piano-key movement” of the ulnar styloid
- **Metatarsophalangeal joint (MTP)** involvement is a feature of early disease in the feet
- **Atlantoaxial involvement of the cervical spine** can cause compressive myelopathy and neurologic dysfunction
- **Most frequent extraarticular manifestations:** Subcutaneous nodules, secondary Sjogren's syndrome, pulmonary nodules, and anemia.

94. Ans. (a) Rheumatoid ArthritisRef: Harrison's, 18th ed. Ch. 321**Clinical Features of RA**

- Incidence of RA increases between 25 and 55 years of age.
- **Gender:** Female > Male
- Early morning joint stiffness lasting more than 1 hour and easing with physical activity.
- The earliest involved joints are typically the small joints of the hands and feet.
- The wrists, metacarpophalangeal (MCP), and proximal interphalangeal (PIP) joints stand out as the most frequently involved joints. Distal interphalangeal (DIP) joint involvement may occur in RA, but it usually is a manifestation of coexistent osteoarthritis.

95. Ans. (b) Gouty arthritisRef: Harrison's, 18th ed. Ch 332, 333**TABLE: Pathology and Common Joint Involved**

Pathology	Common joint involved
Gout	1 st MTP; GREAT TOE
OA	DIP, PIP- sparing MCP, wrist, elbow, ankle (DIP > KNEE)
RA	Involving PIP, MCP joint
Psoriasis	DIP
Pseudogout	Knee

96. Ans. (a) IndomethacinRef: Harrison's, 18th ed. Ch 333

- **MC site of gout:** Meta-tarsophalangeal joint of great toe.
- In gout there is deposition of uric acid in the joint.
- **Intake of Alcohol, Diuretics and aspirin are precipitating factors of gout.**

Treatment:

- NSAIDs given in full anti-inflammatory doses are effective in ~ 90% of patients.
- The most effective drugs are NSAIDs (*except aspirin*) with a short half-life and include **indomethacin 25–50 mg TID**; naproxen, ibuprofen and diclofenac.
- **Colchicine** given orally is a traditional and effective treatment if used early in an attack. It causes GI disturbance thereby reducing the compliance.
- Ultimate control of gout requires correction of the basic underlying defect: The hyperuricemia. Uricosuric drugs like **Allopurinol and Febuxostat** both are xanthine oxidase inhibitors. *These drugs are never preferred during acute attacks and whenever given, they should always be covered by NSAIDs.*
- **DOC for chronic gout: Allopurinol.**

97. Ans. (c) TB with polyarthritis

- Spina ventosa-TB of short bones
- Caries sicca-TB shoulder
- Poncet disease-TB with polyarthritis
- Pott's-TB spine

VERTEBRA & NEUROMUSCULAR DISEASE**98. Ans. (b) Ulnar nerve**Ref: Apley's System of Orthopaedics, 9th ed. pg. 290

- The ulnar nerve is easily felt behind the medial epicondyle of the humerus (the 'funny bone'). It can be trapped or compressed within the cubital tunnel (by bone abnormalities, ganglia or hypertrophied synovium).

- Sometimes it is stretched by a cubitus valgus deformity or simply by holding the elbow flexed for long.

Extra Mile

TABLE: Neuropathy and Nerve involved

• Carpal tunnel syndrome	Median nerve
• Cubital tunnel syndrome	Ulnar nerve
• Guyon canal syndrome	Ulnar nerve
• Meralgia paresthetica	Lateral cutaneous nerve of thigh
• Cheralgia paresthetica	Superficial radial nerve

99. Ans. (d) L4-L5

Ref: Maheshwari, 5th ed. pg. 253

- **Most common site of spinal disc herniation: Lumbar region (95% in L4-L5 or L5-S1).**
- **The second most common site is the cervical region (C5-C6, C6-C7).**
- Thoracic region accounts for only **0.15% to 4.0%** of cases.
- Herniations usually occur posterolaterally, where the annulus fibrosis is relatively thin and is not reinforced by the posterior or anterior longitudinal ligament.
- In the cervical spinal cord, a symptomatic posterolateral herniation between two vertebrae will impinge on the nerve which exits the spinal canal between those two vertebrae on that side. For example, a right posterolateral herniation of the disc between vertebrae C5 and C6 will impinge on the right C6 spinal nerve.

100. Ans. (a) Erb's paralysis

Ref: Apley's Orthopedics, 9th ed. pg. 279-80

Erb's paralysis	- Erb's palsy or Erb-Duchenne palsy is a paralysis of the arm caused by injury to the upper group of the arm's main nerves, specifically the severing of the upper trunk C5-C6 nerves. Position of hand in Erb's paralysis: Adducted, Internally rotated, and pronated
Klumpke's paralysis	Klumpke's Palsy involves the eighth cervical vertebra and the first thoracic vertebra (C8 and T1). Position of hand: Elbow flexed, arm supinated There may be unilateral horner syndrome
Horner syndrome	Seen with Pancoast tumor and presents with Ptosis, Miosis, enophthalmos, anhydrosis, loss of ciliospinal reflex.
Central cord syndrome	Seen most often after a hyperextension injury in an individual with long-standing cervical spondylosis. It presents with features of cortico-spinal pathway.

101. Ans. (b) Iatrogenic

Ref: Maheshwari, 5th ed. pg. 264

- The most common pathological mechanisms for sciatic nerve injury are compression, traction or direct injury by mechanical disruption as is seen in intragluteal muscle injection, or called as Sciatic neuritis.
- **Division of the main sciatic nerve is rare except in gunshot wounds or operative (iatrogenic) accidents.**
- The sciatic nerve is the nerve most commonly injured during total hip replacement.
- Sciatic nerve is the most common nerve injured by intramuscular injections, especially in children.

102. Ans. (c) Spondylolisthesis

Ref: Maheshwari, 5th ed. pg. 283-284

Spondylosis	Degenerative osteoarthritis of the joints between the center of the spinal vertebrae and/or neural foramina
Spondylitis	Spondylitis is an inflammation of the vertebra. It is a form of spondylopathy. In many cases spondylitis involves one or more vertebral joints as well, which itself is called spondylarthritis
Spondylolisthesis	<i>Spondylolisthesis is the anterior or posterior displacement of a vertebra or the vertebral column in relation to the vertebrae below</i>
Spondylolysis	Defect of a vertebra. More specifically it is defined as a defect in the pars interarticularis of the vertebral arch

103. Ans. (b) Axonotmesis

Ref: Maheshwari, 5th ed. pg. 63

104. Ans. (b) Ulnar nerve

Ref: Clinical assessment & examination in Orthopedics pg. 67

Tests for ulnar nerve	
• Card test	Palmar interossei are Adductors (PAD) tested by asking the patient to hold a card between the extended fingers and assess resistance against pulling
• Egawa test	Dorsal interossei are Abductors (DAB) supplied by the ulnar nerve. It is tested by asking the patient to place the palm on table and move the middle finger both ways, i.e. towards index finger and ring finger. In Dorsal interossei palsy patient will be unable to abduct the middle finger
• Book test/ Froment's sign	To test adductor pollicis ask the patient to grasp a book or card between extended thumb and index finger. An ulnar nerve palsy patient tries to grasp the book by flexing the inter-phalangeal joint of thumb.

- OSCHNER CLASP TEST and PEN TEST is used to check for MEDIAN NERVE PALSY.

105. Ans. (b) **Ulnar nerve palsy**

Ref: Maheshwari, 5th ed. pg. 64

Please refer to above explanation

106. Ans. (c) **Claw finger deformity**

Ref: Maheshwari, 5th ed. pg. 64

- In ulnar nerve palsy especially in long standing cases, the hand assumes the characteristic “**claw**” deformity. It is also known as partial claw hand deformity.
- Complete claw hand deformity is due to palsy of ulnar and median nerve both.

Condition	Features
Median Nerve Palsy Labourer Nerve Palsy	<ul style="list-style-type: none"> • Pointing index • Pen test • Ape thumb deformity • Carpal tunnel syndrome
Ulnar Nerve Palsy Musician nerve palsy	<ul style="list-style-type: none"> • Book test (froment sign) • Card test • Egawa's test • Claw finger deformity
Radial Nerve Palsy	<ul style="list-style-type: none"> • Wrist drop • Thumb drop • Finger drop • Meralgia paraesthetica
Lateral cutaneous nerve of thigh (entrapped)	
Erb's palsy	Policeman tip deformity (Porter's tip deformity)

107. Ans. (b) **Radial nerve**

Ref: Maheshwari, 5th ed. pg. 25 Table 4.1

Cockup splint is used in cases of radial nerve injury.

TABLE: Different splint and their Uses

Splint	Used In
Knuckle bender splint	Ulnar nerve
Aeroplane splint	Brachial plexus injury
Dennis brown splint	CTEV
Bohler Brown splint	Fracture femur (anywhere from neck to supracondylar region)
Turn buckle splint	VIC (Volkmann ischemic contracture)

108. Ans. (d) **Physiological block**

Ref: Apley's, 8th ed. pg. 231

TABLE: Patterns of nerve injury

Neuropraxia	Axonotmesis	Neurotmesis
<ul style="list-style-type: none"> • Reversible physiological nerve conduction block • It is seen in crutch palsy, tourniquet palsy, and saturday night palsy 	<ul style="list-style-type: none"> • There is loss of conduction because of axonal interruption but the nerve is in continuity and the neural tubes are intact • Seen in closed fractures and dislocations 	<ul style="list-style-type: none"> • There is complete division of nerve with complete loss of conduction (i.e. epineurium, perineurium, endoneurium, & axon all have lost their continuity) • Seen in open wounds

109. Ans. (c) **C8 dermatome**

Ref: Apley's system of Orthopaedics & Fractures, 9/e, pp-229, 272

Clinically Important Dermatomes

Upper Extremity

- C6- Thumb
- C7 - Middle finger
- C8 - Little finger
- T1 - Inner forearm
- T2 - Upper inner arm

Lower Extremity

- L3-Knee
- L4 - Medial malleolus
- L5 - Dorsum of foot
- L5 - Toes 1-3
- S1 - Toes 4 and 5; lateral malleolus

Others

- C2 and C3 - Posterior head and neck
- T4 - Nipple
- T10 - Umbilicus

110. Ans. (c) Ultrasound therapy

Ref: De Lisa's 'Physical Medicine and Rehabilitation: Principles and Practice'; 5/e, Vol II, p-1304

Treatment of Post-amputation Neuroma and Scar Pain

- Repeated injection of a local anaesthetic has proven to be an extremely useful technique.
- This should be followed by appropriate **physical therapy to the scar, usually ultrasound** followed by stretching or deep massage of the scar.
- This type of treatment has provided permanent or prolonged pain relief for longer than 6 months in many patients.
- When the local anaesthetics, with or without steroids, do not provide prolonged relief, other methods should be considered.
- Cryoanalgesia using a cryoprobe and freezing the neuroma for 1 minute at 20°C has been used with good success.
- The advantage of a cryoprobe lies in the fact that it is a physical method of blocking the nerve without further neuroma or neuritis.
- Neurolytic agents such as phenol or alcohol have been used to relieve neuroma and scar pain.
- However, incomplete block with these agents can result in neuritis, producing severe pain.
- These neurolytic techniques should be used only after repeated injections of local anaesthetics produce consistent pain relief proportional to the duration or action of the local anaesthetic agent.
- Although surgical revision of the scar is often considered, it is not very successful when the scar cannot be stretched out and there is significant nerve entrapment.

111. Ans. (b) Ulnar nerve

Ulnar Claw Hand

- The deformity in the picture is Partial Claw Hand, i.e. Hyperextension of MCP joints and Hyperflexion of interphalangeal joints of ring and little fingers.

- Clawing of fingers is caused by Lumbrical muscle paralysis. It is also called as Intrinsic Minus Deformity or **Duchenne's sign**.
- Lumbricals of little finger and ring finger are supplied by Ulnar nerve.
- Lumbricals of Index finger and Middle finger are supplied by Median nerve.
- The ulnar nerve palsy causes partial claw hand involving little and ring fingers; **Ulnar nerve and Median Nerve combined injury causes Total claw hand involving all four fingers**
- Knuckle bender splint is used to correct the claw hand deformity.

PEDIATRIC ORTHOPEDICS

112. Ans. (c) Perthes disease

Ref: Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 318

PERTHES DISEASE

- Also known as Coxa plana or Pseudocoxalgia
- It is an osteochondritis of the epiphysis of the femoral head
- The femoral head here becomes avascular → Avascular necrosis of femoral head
- **MC age group:** 5–10 years
- **The disease progress through 3 stages:**
 - Stage of synovitis
 - Stage of trabecular necrosis
 - Stage of healing
- **Clinical picture:**
 - Pain in hip, radiating to knee
 - Limping or hip stiffness
- **Upon examination:**
 - Limb shortening
 - Limitation of abduction and internal rotation
- **X-ray:**
 - Sclerosis of femoral head epiphysis (*as seen in image of this patient*)
 - Hip joint space is increased
- **Treatment:**
 - Head containment (by plaster, splint or surgical)—Head is kept inside the acetabulum while revascularisation takes place

OTHER OPTIONS

- There is no history of trauma, so hip dislocation is unlikely
- DDH usually seen in infant, and the clinical presentation also doesn't correlate with DDH
- In Stage 1 hip there is apparent limb lengthening

113. Ans. (a) **Dysplasia of proximal epiphysis**

Ref: *Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 320*

BLOUNT'S DISEASE

- Disease caused by abnormality of proximal posteromedial tibial epiphysis
- Classically seen in African-American obese male child (first 3 years) and in west Indies
- Presents as pathologic tibia vara (bowed legs)

TABLE: Some other developmental abnormalities of orthopaedic interest

• Olliers disease (multiple enchondromas)	• Not familial
• Dyschondroplasia	• Masses of cartilage in the metaphysis remain unossified
Melorheostosis	• Defective ossification
Osteopathia striata	• Candle bone disease
Osteopoikilosis	• Striped bones disease
Morquio disease	• Spotted bones disease
	• Familial (autosomal recessive) disease
	• Gives rise to dwarfism affecting both, limbs and trunk
	• Mental development normal
	• Corneal opacity sometimes present
	• X-ray – typical 'tonguing' of lumbar vertebrae
	• Keratan sulphate in urine
Hunter's disease	• Familial x-linked disease
	• Defect is the excretion of large amount of Keratan sulphate in urine
	• Dwarf with dorso lumbar kyphosis, knock knees, flat feet
	• Mental deficiency may occur
	• No corneal opacity
Hurler's disease (Gargoylism)	• Familial (autosomal recessive) disease
	• Give rise to dwarfism of both, limbs and trunk
	• Defect is an error in development of fibroblasts
	• There is excretion of dermatan sulfate and heparan sulfate in urine
	• Typical facial appearance
	• Mental development abnormal
	• Corneal opacity present
	• X-ray typical 'beak' in 2 nd lumbar vertebra
Engelmann's disease	• Familial (autosomal recessive) disease
	• Symmetrical, fusiform enlargement and sclerosis of shafts of the long bones in children. Femur affected commonly.
	• Epiphysis is spared

Contd...

Caffey's disease (infantile cortical hyperostosis)	<ul style="list-style-type: none"> • Nonfamilial disease • Starts early in life (before the 5th month) • There is a formation of sub-periosteal bone on the shafts of long bones, and on the mandible • Self-limiting course, resolves by 3 years of age • Tibia more common than ulna in familial form
Albright's syndrome	<ul style="list-style-type: none"> • Polyostotic fibrous dysplasia and precocious puberty
Arthrogryposis multiplex congenita (AMC)	<ul style="list-style-type: none"> • Defective development of muscles • Stiff, deformed joints • Multiple joint dislocations with 'shapeless extremities' • May present as clubfoot
Myositis ossificans progressiva	<ul style="list-style-type: none"> • Ectopic ossification, often beginning in trunk • Short big toe
Multiple epiphyseal dysplasia	<ul style="list-style-type: none"> • Least rare type • Affects all the epiphyses, resulting in stunted growth, deformities (varum, valgum etc.) • Epiphysis looks ill defined, irregular on X-rays
Spondylo-epiphyseal dysplasia	<ul style="list-style-type: none"> • Spine is also involved in addition to limb epiphyses
Metaphyseal dysplasia (Pyle's disease)	<ul style="list-style-type: none"> • Autosomal recessive • A modelling defect results in 'Erlenmeyer flask' deformity of the distal femur and proximal tibia
Blount's disease	<ul style="list-style-type: none"> • The growth of the medial-half of the proximal tibial epiphysis is retarded, resulting in severe tibia vara deformity in childhood, common in West Indies
Cleidocranial dysostosis	<ul style="list-style-type: none"> • Faulty development of membranous bones • Clavicles are absent • Skull sutures remain open • Coxa vara • Wide foramen magnum
Nail patella syndrome	<ul style="list-style-type: none"> • Familial disorder • Hypoplastic nails and absence of patella
Marfans syndrome (Arachnodactyly)	<ul style="list-style-type: none"> • Spider fingers • Associated atrial regurgitation • Ocular lens dislocation
Apert syndrome	<ul style="list-style-type: none"> • Tower shaped head

114. Ans. (c) **Elbow**

- Most common joint dislocation in pediatric population: **Elbow joint**
- Most common joint dislocation in adult population: **Humerus Joint**

115. Ans. (d) Slipped capital femoral epiphysis

- The usual presentation of SCFE is an overweight child who has poorly localized groin, thigh or knee pain.
- Usual age of presentation is 11–14 years. M>F
- Upon examination leg is shortened and externally rotated.
- Upon radiological investigation:
 - **Trethovan's sign:** A line drawn along the superior border of the femoral neck on the AP view should pass through the femoral head. In SCFE, the line passes superior to the head rather than through the head.

116. Ans. (b) USG

Ref: Maheshwari, 5th ed. pg. 222

TABLE: Investigations of congenital dislocation of Hip

USG	<ul style="list-style-type: none"> • Post natal diagnosis within the first year is best made by an ultrasound • Allows assessment even in first two months when plain radiographs can be normal • Considered as screening test of choice in case of CDH
X-Ray	Plain films may be normal in first 2–3 months, however subtle changes begin to appear at 6 weeks <ul style="list-style-type: none"> • Reliable depiction of DDH made after 4–6 months • Most useful in period between 2–8 months • Classical findings: (putti's triad) <ol style="list-style-type: none"> 1. Absent or small proximal femoral capital epiphyses 2. Lateral displacement of femur 3. Shallow acetabulum with an increased inclination of acetabular roof > 30 degrees • Disruption of shenton's line • Head lies in outer and upper quadrant
CT	Used for pre-surgical planning
MRI	Considered as IOC/Best investigation for diagnosis of CDH

117. Ans. (c) Congenital dislocation of hip

- Physical examination used for testing congenital dislocation of hip (CDH)- done together
 - ◆ **Barlow test:** Hip is dislocated by Adduction
 - ◆ **Ortolani test:** relocation done by Abduction

118. Ans. (a) Spring ligament

Ref: Maheshwari, 5th ed. pg. 210

- “Pesplanus or a flat foot is a disorder of laxity of medial longitudinal arch which is maintained by the spring ligament and plantar aponeurosis”
- The term pesplanus denotes an excessively flat foot. There is no precise degree of flatness that defines pesplanus, but it may be either physiological or pathological.
- In physiological pesplanus, the feet are flexible and rarely problematic. In marked contrast, pathological pesplanus is often associated with stiffness and pain.
- The windlass (or 'Jack's great toe') test involves passively dorsiflexing the hallux at the metatarsophalangeal joint. This tightens the plantar aponeurosis and, in flexible pesplanus, results in accentuation of the medial longitudinal arch.
- In pathological pesplanus, no accentuation of the arch is seen. This test can also be carried out by asking the individual to stand on tiptoe and viewing the hind foot from behind. In flexible flat feet, the calcaneus swings into a varus position; in pathological pesplanus it does not.

119. Ans. (b) Late congenital syphilis

Ref: Maheshwari, 5th ed. pg. 178

- **The clinical manifestations of congenital syphilis include:**
 - **Early manifestations:** Infection appear within the first 2 years of life (often at 2–10 weeks of age)
 - **Late manifestations,** are noninfectious and appear after 2 years
- *Late congenital syphilis (untreated after 2 years of age) is subclinical in 60% of cases; the clinical spectrum in the remainder of cases may include interstitial keratitis (which*

occurs at 5–25 years of age), eighth-nerve deafness, and recurrent arthropathy. Bilateral knee effusions are known as **clutton's joints**.

- **Triad of congenital syphilis:**
 - Keratitis
 - Heart defect (MC: PDA)
 - Deafness (SNHL)

120. Ans. (a) Congenital flat foot

Ref: Maheshwari, 5th ed. pg. 326

- Congenital vertical talus (CVT) is an uncommon disorder of the foot, manifested as a rigid rocker-bottom flatfoot. Its characteristic radiographic feature is a dorsal dislocation of the navicular on the talus. If left untreated, CVT results in a painful and rigid flatfoot with weak push-off power. CVT has been referred to in the literature by several synonyms, including congenital convex pes valgus.
- **Presentation:**
- Presents as a rigid flatfoot with a **rocker-bottom appearance** of the foot.
- The forefoot is abducted and dorsiflexed.
- **Treatment:** Serial casting should be the initial treatment, although prior to the Dobbs article, it was usually thought to be unsuccessful. A single-stage surgical correction is another option and can be accomplished via either the **Cincinnati approach** or the dorsal approach.

METABOLIC BONE DISORDERS

121. Ans. (c) Osteopetrosis

Ref: Essential Orthopaedics, Maheshwari & Mhaskar, 6th ed. P 317

OSTEOPETROSIS

- Also known as Marble bone disease or Albers-Schonberg disease
- It is characterized by dense but brittle bones also known as marble bones which occur due to reduced bone resorption and diffuse symmetrical skeletal sclerosis due to impaired formation or function of osteoclast.
- **X-ray appearances**
 - Bone within Bone appearance
 - Erlenmeyer flask deformity of long bone disease ends (flask shaped metaphysis)
 - Rugger jersey spine
 - Increased bone density

It can occur in two forms:

Autosomal dominant	Congenital Autosomal recessive
• Less severe	More severe form
• Has tendency to fracture	In child it is associated with severe anemia, jaw osteomyelitis and cranial nerve palsies
• Better survival	Poor survival

122. Ans. (d) Osteoarthritis

Ref: Harrison's 19th ed. P 2226

- Osteoarthritis (OA) is the most common type of arthritis.
- Commonly affected joints include the cervical and lumbosacral spine, hip, knee, and first metatarsal phalangeal joint (MTP).
- In the hands, the distal and proximal interphalangeal joints and the base of the thumb are often affected.
- Joints Spared: Wrist, elbow, and ankle
- Deformity can be due to bouchard nodes (PIP) and heberden nodes (DIP)

TABLE: Joint involvement in several conditions

	Osteoarthritis	Rheumatoid arthritis	Psoriatic arthritis
Joint involved	PIP DIP and 1 st carpometacarpal joint (1 st CMC)	• PIP • MCP • Wrist	• DIP • PIP and any other joints
Joint spared	MCP and wrist	DIP	Any

123. Ans. (c) Bisphosphonates

Ref. Postmenopausal Osteoporosis, Hormones & Other therapies by Andrea R Genazzari, P 289-90

- Bisphosphonates act by inhibiting osteoclast mediated bone resorption. Currently the 3rd generation bisphosphonate is commonly used.
- Zoledronate is the most potent and is also considered as *drug of choice for treatment and prophylaxis of osteoporosis*.
- It is also used for treatment of hypercalcemia associated with malignancy and for treatment of Paget's disease.
- Bisphosphonates have poor oral absorption. Therefore given empty stomach, around 30 minutes before meal with a glass of water. They are known to cause esophagitis, so patients are asked to remain upright after drug intake.

TABLE: Classification of bisphosphonates

1st generation	2nd generation	3rd generation
• Etidronate • Clodronate • Medronate	• Alendronate • Pamidronate	• Zoledronate (2–5 mg/year) • Risedronate (150 mg/month)

124. Ans. (d) Vitamin D deficiency

Ref: Apley's System of Orthopaedics, 9th ed. pg. 135-36

- The given image and the information on cupping and widening points towards rickets.
- Rickets and osteomalacia are different expressions of the same disease: inadequate mineralization of bone.
- The inadequacy may be due to defects anywhere along the metabolic pathway for vitamin D: Nutritional lack, underexposure to sunlight, intestinal malabsorption, decreased 25-hydroxylation (liver disease, anticonvulsants) and reduced 1 α -hydroxylation (renal disease).

Clinical Features of Rickets

- The infant with rickets may present with **tetany** or convulsions. Later the parents may notice that there is a **failure to thrive**, listlessness and **muscular flaccidity**. Early bone changes are deformity of the skull (**craniotabes**) and thickening of the knees, ankles and wrists from physal overgrowth. Enlargement of the costochondral junctions ('**rickety rosary**') and lateral indentation of the chest (**Harrison's sulcus**) may also appear.
- Distal tibial bowing has been attributed to sitting or lying **cross-legged**.
- In active rickets there is thickening and **widening of the growth plate, cupping of the metaphysis** and, sometimes, bowing of the diaphysis. The metaphysis may remain abnormally wide even after healing has occurred.

125. Ans. (c) Scurvy

Ref: Maheshwari, 5th ed. pg. 315

Scurvy causes failure of collagen synthesis and osteoid formation. It clinically presents with:

- Irritability
- Gum bleeding
- Pseudoparalysis (due to subperiosteal haemorrhage)
- Anemia and beading of costochondral junction.

Radiological features are: Frenkel's line (dense line between metaphysic and physis/epiphysis), ring sign, *thin cortex*, scurvy line (band of rarefaction on the diaphyseal side) and metaphyseal osteopenia, cleft and fractures.

Pathology: Deficiency causes failure of collagen synthesis or primitive collagen formation, throughout the body, including in blood vessels, predisposing to haemorrhage.

Extra Mile

Rickets

- **Metaphysis:** indistinct, frayed, splaying, and cupping of margin. Patchy sclerosis in case of intermittent dietary deficiency
- Widened epiphysis with hazed cortical margin
- Generalized reduction in bone density
- Looser's zone (less common)
- Severe cases show Genu valgum, bow legs, thoracic kyphosis, pigeon chest, *ricketic rosary*, skull bossing, cox vera.

Scurvy

- **Metaphysis:** Frankel's white line, Trummerfeld, lucent zone, Pelkan spur due to fracture.
- Wimberger's sign (small epiphysis surrounded by sclerotic rim)
- Subperiosteal hemorrhage with periosteal elevation
- Ground glass appearance of bone with pencil thin cortex.

126. Ans. (b) Scurvy

Please refer to above explanation

127. Ans. (c) Vitamin D

Ref: Maheshwari, 5th ed. pg. 311

- Double malleoli is sign of rickets which is seen due to deficiency of vitamin D.

Please refer to above explanation

128. Ans. (a) Fluorosis

Ref: Maheshwari, 5th ed. pg. 314

- Hint in the question is child from a village of Bihar with Genu varum/bow legged, long bone pain and X-Rays showing increased bone density, this characteristically focuses towards Fluorosis.

GENU VALGUM (KNOCK KNEE)

- It is *abnormal approximation of knees* with abnormally *divergent ankles*. It can be estimated by measuring the distance between the medial malleoli, when the knees are touching with the patella facing forwards; it is usually <5 cm. Valgus alignment of lower extremities is normal in child between 2-8 years of age (Known as *physiological valgus* & is maximum between 2-4 years). The commonest cause of genu valgum (knock knee) is *idiopathic* > rickets.

FMGE Solutions Screening Examination

1054

GENU VARUM (BOW LEGS)

- Knee are abnormally divergent and ankles approximated. B/L bow legs can be estimated by measuring the distance between the medial malleoli when heels are touching; it should be <6 cm. Normal children show maximum varus at 6 months to 1 year of age. The causes of genu varum are similar to genu valgum except that the defective growth is on the medial side.

FLUOROSIS

- Fluorine in very low concentration- 1 part per million (ppm) or less is used to reduce the incidence of dental caries. At slightly higher levels (2–4 ppm) it may produce mottling of teeth.
- In some parts of India and Africa, where fluorine concentration in the drinking water may be above 10 ppm- chronic fluorine intoxication (fluorosis) is endemic and results in skeletal anomalies.
- Characteristic pathological feature** is subperiosteal new bone accretion and osteosclerosis (increased bone density), most marked in vertebrae, ribs, pelvis, forearm and leg bones, together with hyperostosis at the bony attachments of ligaments, tendons and fascia.
- Despite the apparent thickening and density of skeleton, tensile strength is reduced and the bones fracture more easily.
- First clinical manifestation is usually a stress fracture, **back pain, bone pain, joint stiffness** and neurological defects (due to hyperostosis encroaching vertebral canal).
- Characteristic X-ray features** are osteosclerosis, osteophytosis and ossification of ligamentous and fascial attachments. It can be radiologically mistaken for other osteosclerotic conditions as Paget's disease, osteopetrosis, renal osteodystrophy, idiopathic skeletal hyperostosis etc.
- Note:** Fluorine stimulates osteoblastic activity; fluoroapatite crystals are laid down in bone and these are usually resistant to osteoclastic resorption. This leads to calcium retention impaired mineralization and secondary hyperparathyroidism.

Extra Mile

- Infantile cortical hyperostosis (Caffey's Disease)** is a self limiting disorder characterized by soft tissue swelling, rapid subperiosteal new bone formation, cortical thickening of underlying bones, fever and irritability. Classically, the onset of disease occurs before 5th month of life with resolution by 3 years of age.
- In sporadic cases, mandible is the most common site of involvement presenting as jaw tumor or swelling i.e. is firm, tender without heat or redness.

129. Ans. (b) Osteoclasts

Ref: Robbin's Pathology, 8th pg. 1212

“**Osteopetrosis** also known as **marble bone disease** and **Alber's Schon-berg disease** is characterized by reduced bone resorption and diffuse symmetrical skeletal sclerosis due to impaired formation or function of **osteoclasts**.”

Disease	Cause
Osteogenesis imperfecta	Deficiency in synthesis of type 1 collagen
Osteopetrosis	Osteoclasts dysfunction
Osteoporosis	Loss of bone mass
Paget disease (Osteitis Deformans)	Both osteoclast and osteoblast dysfunction
Rickets and osteomalacia	Vitamin D deficiency
Scurvy	Vitamin C deficiency

130. Ans. (b) Osteopetrosis

Ref: Sutton, 7th pg. 1339, 1355, 1365

Disease	Radiological feature
Osteoporosis	<ul style="list-style-type: none"> Cod fish vertebrae Pencil-in-vertebrae (loss of density of vertebral body with radiodense end plates)
Osteomalacia	<ul style="list-style-type: none"> Looser's zone/Pseudo fracture is the Hallmark feature (B/L radiolucent band of uncalcified osteoid due to pressure of pulsating artery) Cod Fish (marked biconcave) vertebrae Pencil-in vertebrae
Osteopetrosis/ Marble Bone disease/Alber's Schowenberg disease	<ul style="list-style-type: none"> Bone within Bone appearance Erlenmeyer flask deformity of long bone disease ends (flask shaped metaphysis) Rugger jersey spine Increased density of bones

131. Ans. (b) Vit D deficiency Rickets

Ref: Maheshwari 5th ed. pg. 317, 311; <http://www.indianpediatrics.net/july 2013/july-669-675.htm>

- Different methods of treating vitamin D deficiency have been advocated, ranging from small doses for a few months to a single mega dose (*high dose*), an approach referred to as **stoss therapy**.
- Vitamin D deficiency rickets occurs secondary to vitamin D deficiency which can take place secondary to many factors:

Decreased vitamin D synthesis	Due to chronic liver disease
Decreased nutritional intake of vitamin	In strict vegetarian diet
Age and physiology related	Elderly, obese and institutionalized patients
Decreased maternal vitamin D stores	Exclusive breast feeding
Malabsorption	Celiac disease, pancreatic insufficiency (cystic fibrosis), biliary obstruction (biliary atresia)
Increased degradation of 25 (OH) D ₃	Due to intake of drugs such as rifampicin, isoniazid, anticonvulsants, glucocorticoids

Recommended Treatment Regimen

- **Common recommendations include** vitamin D 1000-5000 units/day for several weeks or single IM injection of 6 lakh units (Stoss therapy) or 50,000 U of vitamin D₂ weekly for 8 weeks.
- Another advantage of Stoss therapy is that vitamin D is efficiently stored in adipose tissue and muscle and is continuously converted into active form.
- Stoss therapy regimens with large oral or parenteral dose of vitamin D₃ has been shown to cause increased and sustained higher levels of 25 (OH) D₃ levels, especially the regimen with **6 lakh IU**.

Note: Vitamin D stimulates renal and GI absorption of calcium.

PAGET'S DISEASE

- It is characterized by *excessive disorganized bone turnover*, that encompasses *excessive osteoclastic activity initially followed by disorganized excessive new bone formation*.
- **Treatment of choice for paget's disease: Calcitonin.**

132. Ans. (c) Raised serum calcium

Ref: Maheswari's, 5th pg. 310, 311

"In **osteomalacia** the **serum calcium level is low**, the phosphates are low, and alkaline phosphatase is high."

PATHOPHYSIOLOGY OF OSTEOMALACIA

Lack of sunlight exposure, nutritional deficiency of **vitamin D**, malabsorption syndrome, partial gastrectomy

Failure of absorption of **calcium and phosphorous**
(Decreased serum calcium and phosphorous)

Decreased turnover of calcium and phosphorus in bone matrix

↓
Demineralization of bone and bony substance replaced by soft osteoid tissue

Bone pains, muscular weakness (myopathy), spontaneous fractures

Note: *Osteoid matrix is secreted at normal rate but the mineralization is decreased (i.e. decrease in mineral apposition rate). This leads to increased osteoid maturation time.*

Radiological Features

- **Looser's Zone (pseudo fracture)**- Are radiolucent zones at sites of stress.
- **Triradiate pelvis** in female.

133. Ans (b) Osteomalacia

Ref: Maheswari, 5th ed. pg. 312

- **Cortical infarctions** are wide transverse lucencies traversing bone usually at right angles to the involved cortex and are **associated most frequently with osteomalacia** and rickets. They are pseudo-fractures and considered a type of insufficiency fracture.
- Typically, the fractures have sclerotic irregular margins, and are often symmetrical.

Causes of Looser's Zone

- Osteomalacia
- Renal osteodystrophy
- Fibrous dysplasia
- Hyperthyroidism
- Paget's disease of bone
- X linked hypophosphataemia
- Osteogenesis Imperfecta

134. Ans. (d) Osteogenesis Imperfecta

Ref: Maheswari, 5th ed. pg. 316

- In case of Osteogenesis Imperfecta patients are born with defective connective tissue, or without the ability to make it.
- This condition usually arises because of a **deficiency of type I collagen**.
- Deficiency of type I collagen arises from an amino acid substitution of glycine to bulkier amino acids in the collagen triple helix structure.
- The replaced larger amino acid side-chains create steric hindrance that creates a bulge in the collagen complex, which in turn influences both the molecular nano-mechanics and the interaction between molecules, which are both compromised.

**Radiological Findings in Limbs in Osteogenesis Imperfecta**

- Thin and under tabulated gracile bones which are normal in length or shortened
- **Thickened or deformed bones (due to multiple fractures)**
- **Banana fracture:** pathological fractures tend to be oriented transversely within long bones
- Shaft fractures and metaphyseal abnormalities with florid or exuberant callus formation that can mimic an osteosarcoma.

Extra Mile

- Battered baby syndrome in this question is ruled out since fractures are seen in it in various stages of healing.
- Hypo-parathyroidism can present with short stature and features of rickets like delayed dentition.

135. Ans. (b) Duchenne muscular dystrophy

Ref: Harrison, 19th ed. pg. 462e-5

- **Gowers' sign is classically seen in Duchenne muscular dystrophy** but also presents itself in centro nuclear myopathy, myotonic dystrophy and various other conditions associated with proximal muscle weakness.
- This causes the patient to get up in a peculiar fashion taking support of his body or a nearby object.

136. Ans. (a) Pseudohypoparathyroidism

Ref: Harrison 19th ed. pg. 2485

Differential Diagnosis of Short 4th and 5th Metacarpal

- Post traumatic
- Ischemic diseases like sickle cell anemia
- Pseudohypoparathyroidism

- Pseudo-pseudo hypoparathyroidism
- Turner's syndrome

137. Ans. (c) Phalanges

Ref Sutton 7th ed. pg. 1339,1362

Hallmark or characteristic feature of hyperparathyroidism is- subperiosteal erosion of bone, particularly aspect of middle pharynx of middle and index finger.

Extra Mile

- Other sites of subperiosteal resorption include the phalangeal tufts; medial aspect of the proximal ends of the tibia, humerus and femur; superior and inferior margins of the ribs; and lamina dura.

138. Ans. (b) Nutritional deficiency (most probably)

- **Nutritional bone disease** is defined as a **syndrome of bone disease and deformities** in which the bone is affected as a tissue, primarily as a consequence to deficiencies of vitamin D and calcium; or imbalances of the nutrients which are critically important for the growth and development of the bone; its mineralization and maintenance of calcium homeostasis and the structural integrity and health of the skeleton.
- Vitamin D deficiency is widespread in both genders in India.

139. Ans. (b) Ankylosing spondylitis

Radiological features of Ankylosing Spondylitis

- Sacroiliitis is a pre-requisite for diagnosis. The SI joints may show erosion, sclerosis at early stage and ankylosis in late stages.
- Spine: Squaring of vertebral bodies
- Syndesmophyte formation
- Bamboo spine' appearance

ANSWERS TO BOARD REVIEW QUESTIONS**140. Ans. (a) Iatrogenic**

Ref: Apley's Concise system of Orthopaedics and Fractures 3rd p 118

141. Ans. (a) Heberden nodules

Ref: Harrison's 18th ed. ch. : 321

142. Ans. (a) Spring ligament

Ref: Gray's Anatomy 40th ed. ch. : 84, 39th ed p 1512, Keith L Moore 4th ed p 400

143. Ans. (b) Late congenital syphilis

Ref: Harrison's 18th ed. ch. : 169

144. Ans. (a) Fibula

Ref: Rockwood 7th ed. ch. : 19

145. Ans. (b) Second decade

Ref: Apley's system of orthopaedics 8th edn p 190, Turek's orthopaedics 6th ed p 307

146. Ans. (d) **Tissue biopsy is investigation of choice**

- Sunburst appearance can also be found in other bone malignancy

147. Ans. (c) **Can be seen in Acute osteomyelitis**

- MCC of brodie's = Subacute OM >> chronic OM.

148. Ans. (b) **Pyogenic arthritis**

149. Ans. (a) **Tenosynovitis**

150. Ans. (b) **Medial rotation of tibia**

151. Ans. (c) **Secondaries**

152. Ans. (c) **Enchondroma**

153. Ans. (c) **Shoulder dislocation**

154. Ans. (a) **Non-union**

155. Ans. (b) **Simple bone cyst**

Ref: Essentials in Bone and Soft-Tissue Pathology-By Jasvir S. Khurana, Edward F. McCarthy Paul J. Zhang p-70

156. Ans. (a) **Thoracolumbar**

Ref: Apley 387-389, Schwartz's Principles of Surgery 9th ed ch-29 M Tuli 3rd ed p-192

157. Ans. (b) **Common peroneal**

Ref: Gray's Anatomy 39th ed Grant's Atlas of Anatomy, 12th ed p-428

158. Ans. (d) **Coxa vara**

Ref: Textbook of orthopaedics and Trauma by GS Kulkarni p -3635

159. Ans. (b) **Carpal instability**

Ref: Essential Orthopaedics p-307

160. Ans. (b) **Pain in snuffbox**

Ref: Rockwood and Green's Fractures in Adults by Robert W. Bucholz p 791

161. Ans. (c) **Cervical spine**

Ref: Orthopedic surgery essentials-Spine by Christopher M. Bono, Steven R. Garfin p-188

162. Ans. (d) **Tillaux fracture**

Ref: Rockwood and wilkins' fractures in children p 991

163. Ans. (b) **Gluteus medius**

Ref: Keith L. Moore 4/e, p 348/354

164. Ans. (a) **Multiple myeloma**

Ref: Apley's 8/e, p 191

165. Ans. (b) **Surgical neck humerus**

Ref: Grant's atlas of anatomy, 12/e, p 524

166. Ans. (a) **Tibial tuberosity**

Ref: Apley's system of Orthopaedics and fractures edited by Louis Solomon, Dividwarwick, Selvadurainayagam 9/e, p 575-576, 887

167. Ans. (d) **Claw hallux**

Ref: Textbook of Orthopaedics and trauma G. S. Kulkarni 2/e, p 575, Essential orthopaedicsmaheshwari 4/e, p 341

168. Ans. (b) **Clay shoveller's fracture**

Ref: Essential Orthopaedics by J. Maheshwar 4/e, p 265

169. Ans. (c) **8-10 min**

Ref: Essential orthopaedics by J. Maheshwari 4/e, p 338

170. Ans. (c) **Heberden's nodes**

171. Ans. (b) **Genu varum**

Ref: Apley's orthopaedics 9/e, p 572

172. Ans. (a) **Retained vascularity**

Ref: Rockwood and wilkins' Fractures in children p 1020, Lovell and winter's pediatric orthopaedics vol-1, 6/e,p 1512

173. Ans. (b) **Carpal tunnel syndrome**

Ref:Appendix-135 for "Tests used in orthopedics"

174. Ans. (d) **De quervain tenosynovitis**

Ref: Appendix-135 for "Tests used in orthopedics"

175. Ans. (a) **Hallux valgus**

Ref: Essential orthopaedics J. Maheshwari 4/e, p 341, Srb's Manual of surgery by bhat 4/e, p 173

176. Ans. (b) **Tibial torsion**

Ref: *Segen's Medical dictionary*

177. Ans. (d) **Ankle**

Ref: *Skeletal radiology: Bare bones, P 225*

- In hand osteoarthritis primarily affects PIP, DIP and basal joint of thumb (1st carpometacarpal joint).
- Isolated involvement of basal joint of thumb is diagnostic of primary osteoarthritis (Specific joint involved).
- Other joints involved are: 1st metatarsophalangeal joint, hips and knees, cervical and lumbar spine.
 - Lumbar spine is the most frequent spinal location for osteoarthritis
- **Joints which are spared in osteoarthritis:**
 - Metacarpophalangeal joint (MCP)
 - Wrist
 - Elbow
 - Shoulder
 - Ankle

178. Ans. (a) **Knee**

- Among the given options knee is the more commonly affected joint in osteoarthritis.
- Knee joint is also the most common lower limb joint affected in osteoarthritis.

179. Ans. (b) **Lunate**

Ref: *Textbook of Orthopedics by Kotwal; P 124-125*

- Keinbock disease is avascular necrosis of lunate bone.

Other avascular necrosis of bones are:

- **Kohler disease:** AVN of Navicular
- **Freiberg disease:** 2nd MT head
- **Islene disease:** 5th MT base
- **Perthes disease:** Avascular necrosis of Head of Femur
- **Scheuermann's disease:** vertebral epiphysis avascular necrosis

ANSWERS TO IMAGE-BASED QUESTIONS

180. Ans. (c) **Giant cell tumor**

The image shows X-ray of wrist joint with presence of Soap Bubble appearance.
Soap bubble appear once is seen in Adamantinoma (MC site of Adamantinoma: Tibia > mandible)

"Soap Bubble appearance as a term" is to be remembered also for:

- Hydronephrosis
- Osteoclastoma (Giant cell tumor)
- Meconium ileus

181. Ans. (b) **Aneurysmal bone cyst**

- The image shows X-ray of the knee joint with presence of multiple lytic lesions suggestive of aneurysmal bone cyst.
- Unicameral bone Cyst is more common in upper humerus.

182. Ans. (c) **Rocker bottom foot**

The image shows convexity at the sole of the foot sole. In CTEV the bilateral feet and toes point inwards facing each other.

183. Ans. (d) **Monteggia fracture**

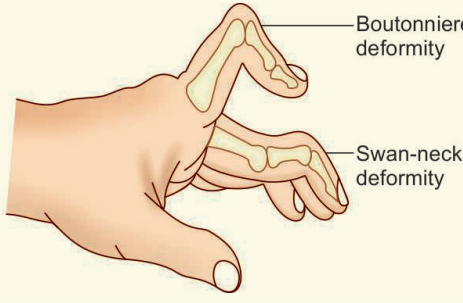

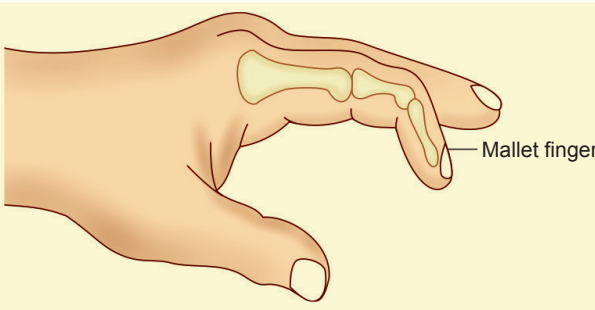

- The image shows X-ray of the Elbow joint with fracture of upper ulna diagnostic of Monteggia Fracture.
- Galeazzi fracture is an isolated fracture of the junction of the distal third and middle third of the radius with associated subluxation or dislocation of the distal radio-ulnar joint

184. Ans. (c) **Sunburst appearance**

- The image shows a sun burst appearance lesion which grows rapidly but steadily, and the periosteum will not have enough time to lay down thin shell of bone.
- Therefore in such cases, the tiny fibers that connect the periosteum to the bone (Sharpey's fibers) become stretched out perpendicular to the bone. When these fibers ossify, they produce a pattern sometimes called "sunburst" periosteal reaction.
- It is usually seen in osteosarcoma, but can also be seen in other bone malignancies.

185. Ans. (c) **Mallet finger**

Swan neck deformity & Boutonniere Deformity	
Mallet finger	
Duputyren's Contracture	

186. Ans. (a) **Gallow's Traction**

Gallow's traction	Fracture shaft of femur in children <2 years
90–90 traction	Fracture shaft femur in children
Russel traction	Conventional skin traction
Agnes hunt traction	Hip deformity

Ophthalmology

MOST RECENT QUESTIONS 2019

1. **Most common cause of blindness in India:**
 - a. Cataract
 - b. Refractive error
 - c. Trachoma
 - d. Glaucoma
2. **In a patient of head injury, who presents with headache and increased intracranial pressure, the effect on pupil is:**
 - a. Ipsilateral mydriasis
 - b. Contralateral mydriasis
 - c. Ipsilateral miosis
 - d. Contralateral miosis
3. **All of the following conditions cause miosis EXCEPT:**
 - a. Bright light
 - b. Horner syndrome
 - c. Oculomotor paralysis
 - d. Iridocyclitis
4. **Evisceration is removal of which layer of eye ball?**
 - a. Middle and inner
 - b. Outer and middle
 - c. Outer and inner
 - d. All the layers of eyeball
5. **The following image shows:**

- a. Bacterial keratitis
 - b. Fungal keratitis
 - c. Viral keratitis
 - d. Syphilitic keratitis
6. **Drug contraindicated in keratitis**
 - a. Tear drops
 - b. Steroids
 - c. Cycloplegics
 - d. Timolol
7. **Which of the following is seen retinitis pigmentosa?**
 - a. Arteriolar attenuation
 - b. Neovascularization
 - c. Retinal artery thrombosis
 - d. Papilledema
8. **Not used for color vision testing:**
 - a. Holmgren wool test
 - b. Ishihara chart
 - c. FM 100 Hue test
 - d. Ames test

9. **Superior quadrantic hemianopia is caused by:**

- a. Craniopharyngioma
- b. Meningioma
- c. Pituitary adenoma
- d. Temporal lobe lesion

10. **Which of the following lesions occurs at optic chiasma?**

- a. Bitemporal hemianopia
- b. Unilateral blindness
- c. Pie in floor
- d. Bilateral homonymous macular defect

11. **In which of the following condition there is ipsilateral 3rd nerve palsy with contralateral hemiplegia and facial palsy of upper motor neuron?**

- a. Weber syndrome
- b. Terson syndrome
- c. Millard-Gubler syndrome
- d. Foville's syndrome

12. **Phacomorphic glaucoma occurs due to:**

- a. Intumescent cataract
- b. Morgagnian cataract
- c. Nuclear cataract
- d. Cortical cataract

13. **First sign of sympathetic Ophthalmitis is:**

- a. Circumcorneal congestion
- b. Hypopyon
- c. Retrolental flare
- d. Iris nodule

ANATOMY, PHYSIOLOGY AND EXAMINATION OF EYE

14. **Corneal endothelium is derived from?**

(Recent Pattern Question 2018-19)

- a. Neuroectoderm
- b. Neural crest
- c. Mesoderm
- d. Surface ectoderm

15. **True about retinoscopy:**

(Recent Pattern Question 2018-19)

- a. In Hypermetropia the red glow moves in opposite direction
- b. In high myopia, the red glow moves in same direction
- c. In emmetropia the red glow moves in opposite direction
- d. Done from 1 meter distance from patient

16. A child presents with night blindness, delayed dark adaptation. Which investigation to be done further to confirm the diagnosis? (Recent Pattern Question 2018-19)

- a. Dark adaptometry b. ERG
- c. EOG d. Retinoscopy

17. Newborn is hypermetropic by?

(Recent Pattern Question 2018)

- a. +2 to +3 D b. +1 to +2 D
- c. +3 to +4 D d. +2 to +4 D

18. Structure with highest refractive index:

(Recent Pattern Question 2018)

- a. Cornea b. Lens
- c. Aqueous humor d. Vitreous humor

19. Which is True about PHPV?

(Recent Pattern Question 2018)

- a. Visual prognosis is good
- b. Generally unilateral
- c. Associated with microphthalmia
- d. Associated with exophthalmos

20. Maximum visual field is seen in?

(Recent Pattern Question 2016)

- a. Temporal b. Nasal
- c. Inferior d. Superior

21. Normal intraocular pressure ____ mm Hg?

(Recent Pattern Question 2016)

- a. 5–10 b. 10–20
- c. 20–25 d. 25–30

22. Axial length of orbit:

- a. 2.5 mm b. 2.5 cm
- c. 2 mm d. 2 cm

23. The junction between the retina and ciliary body is called:

- a. Pars plana b. Pars plicata
- c. Ora serrata d. Equator

24. All of the following ocular muscles are supplied by CN III EXCEPT:

- a. Superior rectus b. Superior oblique
- c. Inferior rectus d. Medial rectus

25. All of the following statement are true about oculomotor nerve EXCEPT:

- a. Supplies extrinsic ocular muscles
- b. Its nucleus is located in lower midbrain
- c. Its nucleus is located in upper midbrain
- d. Palsy may lead to ptosis

26. All are glands of eyelids EXCEPT:

- a. Glands of zeis
- b. Lacrimal gland
- c. Meibomian gland
- d. Glands of moll

27. Person is not able look down. Which extra ocular muscle is affected:

- a. Superior oblique b. Inferior oblique
- c. Superior rectus d. Lateral rectus

28. The secondary actions of superior rectos muscle are:

- a. Adduction and intorsion b. Abduction and intorsion
- c. Adduction and extorsion d. Abduction and extorsion

29. Person is not able look down. Which extra ocular muscle is affected:

- a. Inferior oblique b. Inferior rectus
- c. Superior rectus d. Lateral rectus

30. In lateral rectus palsy of the right side, the face of the patient is turned to which of the following sides?

- a. Upwards b. Downwards
- c. Towards the right side d. Towards the left side

31. Synergistic muscle of right inferior oblique:

- a. Right superior oblique b. Left superior rectus
- c. Left inferior rectus d. Right superior rectus

32. The oculomotor and trochlear nerve passes through:

- a. The superior orbital fissure
- b. The inferior orbital fissure
- c. The optic canal
- d. None of the above

33. Maddox rod test is used for:

- a. Strabismus b. Refractive error
- c. Retinal hemorrhage d. Color blindness

34. By pinhole visual acuity is neutralized till:

- a. 1 D b. 2 D
- c. 3 D d. 4 D

35. Which component of the eye has maximum refractive index:

- a. Anterior surface of the lens
- b. Posterior surface of the lens
- c. Centre of the lens
- d. Cornea

36. Power of cornea is?

- a. 41 D b. 40 D
- c. 45 D d. 47 D

37. Shallow anterior chamber is seen in?

- a. Myopia b. Phacomorphic glaucoma
- c. Phacolytic glaucoma d. Aphakia

38. Accommodation is maximum in:

- a. Children b. Young male
- c. Elderly d. None

39. Surface ectoderm forms:

- a. Lens of eye b. Retina
- c. Iris d. Corneal stroma

40. Lens develops from.

- a. Neuroectoderm b. Surface ectoderm
- c. Mesoderm d. Neural crest

41. Outer epithelium of cornea is derived from?

- a. Mesoderm b. Endoderm
- c. Surface ectoderm d. Neural ectoderm

42. Which of the following has maximum field of vision:

- a. Superior b. Inferior
- c. Temporal d. Nasal

43. Neuroretinal rim is broadest in which area:

- a. Temporal area b. Inferior
- c. Superior d. Supero temporal

44. Which of the following is better diagnosed with distant direct ophthalmoscopy:

- a. Retinal hemorrhage
- b. Subluxation of lens
- c. Ciliary body injury
- d. Opacity in the refractive media

45. Macular edema is seen with:

- a. Indirect ophthalmoscopy
- b. Direct ophthalmoscopy
- c. Slit lamp + 90 D
- d. Distant direct ophthalmoscopy

46. Hirschberg test measures?

- a. Strabismus b. Glaucoma
- c. Cataract d. Refractive error

47. Muscle first affected in thyroid ophthalmopathy is:

- a. Medial rectus b. Lateral rectus
- c. Inferior rectus d. Superior rectus

48. True about Color blindness:

- a. Males are more prone
- b. Males and females equally affected
- c. Autosomal dominant
- d. Males are carrier

CORNEA, CONJUNCTIVA AND SCLERA

49. True about pterygium: (Recent Pattern Question 2018-19)

- a. Inflammation of cornea
- b. Fatty deposition over sclera
- c. Conjunctiva invasion making a flap over cornea
- d. Dead epithelial debris accumulation

50. Cause of acute hemorrhagic conjunctivitis:

(Recent Pattern Question 2018)

- a. Coronavirus b. Adenovirus
- c. Enterovirus d. Herpes virus

51. Klebsiella pneumoniae causes:

(Recent Pattern Question 2018)

- a. Styte b. Keratitis
- c. Chalazion d. Entropion

52. True about dendritic ulcer:

(Recent Pattern Question 2018)

- a. Corneal sensation decreased
- b. Increased corneal thickness
- c. Descemetocoele
- d. Hypopyon

53. Which is therapeutic indication of keratoplasty?

(Recent Pattern Question 2018)

- a. Optic nerve atrophy b. Keratoconus
- c. Myopia d. Hypermetropia

54. Swimming pool conjunctivitis is caused due to?

(Recent Pattern Question 2017)

- a. Streptococcus b. Staph aureus
- c. Chlamydia d. Hemophilus

55. To prevent disease transmission from a conjunctivitis patient, which is the most effective way:

(Recent Pattern Question 2017)

- a. Rinse eye b. Wearing black sunglasses
- c. Antibiotics d. Clean hand

56. Stocker line is seen in? (Recent Pattern Question 2017)

- a. Pingecula b. Pterygium
- c. Keratitis bacterial d. Keratitis viral

57. Most common cause of bacterial corneal ulcer:

(Recent Pattern Question 2017)

- a. Pseudomonas b. Acanthamoeba
- c. Pneumococcus d. Staphylococcus

58. Salmon patch is seen in? (Recent Pattern Question 2017)

- a. Mooren's ulcer b. Viral keratitis
- c. Interstitial keratitis d. Allergic keratitis

59. Munson sign is seen in? (Recent Pattern Question 2017)

- a. Corneal degeneration b. Keratoconus
- c. Mooren ulcer d. Pinguecula

60. Angular conjunctivitis is most commonly caused by:

(Recent Pattern Question 2017)

- a. Moraxella b. H. influenzae
- c. Strep. Pneumoniae d. Staph. Aureus

61. In case of Neurotropic keratitis which nerve is involved:

(Recent Pattern Question 2016)

- a. Trigeminal nerve b. Oculomotor
- c. Facial d. Trochlear

62. Colored halos in conjunctivitis are due to excess:

(Recent Pattern Question 2016)

- a. Lacrimation b. Edema
- c. Flakes of mucus d. Dryness

63. Angular conjunctivitis is caused by:

(Recent Pattern Question 2016)

- a. Moraxella b. Streptococcus
- c. Gonococcus d. Corynebacterium

64. Fleischer ring is seen in: (Recent Pattern Question 2016)

- a. Wilson's disease b. Keratoconus
- c. Fungal infection d. Protozoal keratitis

65. True about bowman's membrane:

- a. True elastic membrane
- b. Most regenerative layer
- c. Prevents infection more than descemet's membrane
- d. Cellular layer

66. Keratometer is used to assess:

- a. Thickness of cornea b. Refractive power
- c. Astigmatism d. Curvature of cornea

67. Thickness of cornea is best detected by:

- a. Keratometry b. Pachymetry
- c. Placido disc d. Tonometry

- 68. All are seen in Keratoconus EXCEPT:**
- Progressive vision loss due to increasing myopia and irregular astigmatism
 - Keyser Fleischer Ring
 - Scissoring reflex in retinoscopy
 - Munson sign Positive
- 69. Recurrent corneal erosion are seen in:**
- Corneal dystrophy
 - Keratoconus
 - Keratoglobus
 - Corneal degeneration
- 70. Recurrent corneal erosion are seen in:**
- Corneal degeneration
 - Keratitis
 - Corneal dystrophy
 - Keratoconus
- 71. Which of the following drug has corneal staining property:**
- Thioridazine
 - Isoniazid
 - Quinines
 - Acetazolamide
- 72. In case of xerophthalmia secondary to Vitamin A deficiency, what does X2 indicate according to WHO:**
- Conjunctival xerosis
 - Bitot's spot
 - Corneal xerosis
 - Corneal ulcer
- 73. Which of the following does not occur due to vitamin A intoxication:**
- Xerophthalmia
 - Pseudotumor cerebri
 - Dry skin
 - Vomiting
- 74. First sign of papilledema:**
- Hyperemia of disc margin
 - Abolition of cups
 - Blurring of disc
 - Soft exudates
- 75. Treatment of mooren's ulcer is?**
- Topical steroids
 - Corneal graft
 - Immunosuppressives
 - All of the above
- 76. Kayser fleischer ring affects:**
- Conjunctiva
 - Epithelium layer
 - Bowman's layer
 - Descemets membrane
- 77. Giant dendritic ulceration on cornea is seen in case of:**
- Fungal infection
 - Chlamydial infection
 - HSV infection
 - Pneumococcal infection
- 78. Which one of the following drugs is contraindicated in treatment of dendritic corneal ulcer:**
- Atropine
 - Cefazolin
 - Acyclovir
 - Dexamethasone
- 79. Herpes Simplex Virus infection with disc shaped ulceration is seen in:**
- Epithelial keratitis
 - Stromal keratitis
 - Syphilitic keratitis
 - Interstitial keratitis
- 80. Nummular keratitis is seen in:**
- Bacterial keratitis
 - Herpes zoster keratitis
 - Acanthamoeba keratitis
 - Fungal keratitis
- 81. Interstitial keratitis is seen in:**
- Trachoma
 - Bacterial conjunctivitis
 - Fungal conjunctivitis
 - Syphilis
- 82. Which of the following is used in Acanthamoebic keratitis treatment:**
- Topical corticosteroids
 - Propamidine isothionate
 - Acetazolamide
 - Artificial tear
- 83. Acanthamoebic keratitis is associated with which of the following:**
- Lacrimal gland inflammation
 - Inturning of eyelids
 - Wearing of soft contact lenses
 - Dry eye
- 84. Giant Papillary Conjunctivitis is caused by:**
- Contact Lens wear
 - Ocular Prosthesis
 - Protruding corneal sutures
 - All of the above
- 85. Giant papillary conjunctivitis can be secondary to:**
- Trachoma
 - Contact lens
 - Phlyctenular conjunctivitis
 - Vernal kerato conjunctivitis
- 86. Which of the following is seen in chronic contact lens wearer:**
- Inclusion conjunctivitis
 - Giant papillary conjunctivitis
 - Vernal keratoconjunctivitis
 - Follicular conjunctivitis
- 87. Complication in a patient with Long term use of contact lens is most commonly caused by?**
- Aspergillus
 - Acanthameoba
 - Pneumococcus
 - Pseudomonas
- 88. In which of the following corneal ulcers signs are more than symptoms:**
- Fungal corneal ulcer
 - Bacterial corneal ulcer
 - Viral corneal ulcer
 - Herpetic corneal ulcer
- 89. Satellite lesion on cornea are seen in:**
- Viral ulcer
 - Bacterial ulcer
 - Fungal ulcer
 - Herpetic ulcer
- 90. Treatment of choice of trachoma:**
- Azithromycin
 - Tetracycline
 - Erythromycin
 - Penicillin
- 91. Location of Arlt's line:**
- Sclera
 - Lens
 - Lower palpebral conjunctiva
 - Upper palpebral conjunctiva

- 92. Herbert pits are seen in trachoma at:**
 a. Limbus b. Lid margin
 c. Palpebral conjunctiva d. Bulbar conjunctiva
- 93. Swimming pool conjunctivitis is caused by:**
 a. Pneumococcus b. Adeno virus
 c. Pox virus d. Staph Aureus
- 94. Cobble stoning of conjunctiva is seen in:**
 a. Vernal keratoconjunctivitis
 b. Simple allergic conjunctivitis
 c. Giant papillary conjunctivitis
 d. Acute hemorrhagic conjunctivitis
- 95. Spring catarrh is treated with which of the following drugs:**
 a. Olopatadine drops
 b. Normal saline eye drops
 c. Ciprofloxacin
 d. Carboxymethylcellulose (CMC) eye drops
- 96. Chlamydia trachomatis A-C will cause which of the following?**
 a. Ophthalmia Neonatorum
 b. Vernal Kerato conjunctivitis
 c. Paratrachoma
 d. Trachoma
- 97. Ropy discharge is seen in:**
 a. Conjunctival conjunctivitis
 b. Bacterial conjunctivitis
 c. Fungal conjunctivitis
 d. Venereal conjunctivitis
- 98. Fat like nodules on bilateral nasal side of conjunctiva is seen in?**
 a. Pterygium b. Pinguecula
 c. Chalazion d. Hordeolum
- 99. Intercalary staphyloma:**
 a. Sloughing corneal ulcer b. Degenerative high myopia
 c. Bulge in limbal area lined by root of iris
 d. Penetrating injuries
- 100. Ciliary staphyloma is a complication of:**
 a. Episcleritis b. Degenerative myopia
 c. Perforated corneal ulcer d. Scleritis
- 101. Posterior staphyloma is seen in:**
 a. High hypermetropia
 b. Astigmatism
 c. Emmetropia
 d. Degenerative myopia
- 102. Scleritis is commonly seen with:**
 a. Reiter's syndrome b. Rheumatoid arthritis
 c. Ankylosing spondylitis d. Wegner's syndrome
- 103. Keratoconjunctivitis sicca is due to:**
 a. Mucin deficiency b. Lipid deficiency
 c. Aqueous deficiency d. Impaired eyelid function

RETINA AND UVEAL TRACT

- 104. Sarcoidosis is associated with:**
(Recent Pattern Question 2018-19)
 a. Cataract b. Ectopia lentis
 c. Anterior uveitis d. Keratitis
- 105. Cattle track appearance is seen in:**
(Recent Pattern Question 2018)
 a. Central retinal vein occlusion
 b. Central retinal artery occlusion
 c. Central serous retinopathy
 d. Diabetic retinopathy
- 106. What is the size of optic disc?**
(Recent Pattern Question 2018)
 a. 0.5 mm b. 1.5 mm
 c. 2 mm d. 2.5 mm
- 107. In uveitis, site of keratic precipitate is:**
(Recent Pattern Question 2018)
 a. Corneal stroma b. Corneal endothelium
 c. Lens anterior part d. Lens posterior part
- 108. How many years does it take to develop retinopathy in case of uncontrolled diabetes mellitus type I?**
(Recent Pattern Question 2018)
 a. 1-5 b. 6-10
 c. 11-15 d. 16-20
- 109. Which of the following is used for immediate management of acute uveitis?** *(Recent Pattern Question 2017)*
 a. Cycloplegics b. Steroids
 c. Antimicrobials d. Eye patching
- 110. Granular keratic precipitates are seen in:**
(Recent Pattern Question 2017)
 a. Nongranulomatous uveitis
 b. Granulomatous uveitis
 c. Syphilitic uveitis
 d. Infective uveitis
- 111. Mutton fat KP is seen in:** *(Recent Pattern Question 2017)*
 a. Granulomatous uveitis
 b. Non-granulomatous uveitis
 c. Traumatic uveitis
 d. Acute anterior uveitis
- 112. Which of the following condition presents with Uveitis with arthritis:** *(Recent Pattern Question 2017)*
 a. Kaplan syndrome b. Pneumoconiosis
 c. Reiter syndrome d. Aspergillosis
- 113. Retinopathy of prematurity is due to?**
(Recent Pattern Question 2017)
 a. Hypoxia b. Hyperoxia
 c. Hypercapnea d. Apnea
- 114. Koeppe nodules are seen in**
(Recent Pattern Question 2016)
 a. Iris stroma b. Periphery of pupil
 c. Papilla d. Cornea

- 115. Retinal detachment occurs between which layers of retina?**
- Sensory and nuclear layer
 - Inner nuclear layer and outer nuclear layer
 - Sensory and pigmentary layer
 - Outer plexiform and inner plexiform layer
- 116. Which of the following is true about inverse Retinitis pigmentosa?**
- X linked
 - Bony spicule in fovea
 - Bony spicule in para fovea
 - Progressive Choroid degeneration
- 117. All of the following are features of retinitis pigmentosa EXCEPT:**
- Bony spicule pigmentation in retina
 - Waxy pallor of disc
 - Central scotoma
 - Ring scotoma
- 118. A diabetic patient taking Insulin for the past 10 years complains of gradual painless loss of vision. Most likely cause of his condition is:**
- Total rhegmatogenous retinal detachment.
 - Cataract
 - Tractional retinal detachment not involving the macula
 - Vitreous haemorrhage.
- 119. Early stage non proliferative diabetic retinopathy is present as:**
- Microaneurysms
 - Dot and Blot hemorrhages
 - Hard exudates
 - Soft exudates
- 120. Classical sign of neovascular glaucoma is:**
- Retinal neovascularization
 - Disc neovascularization
 - Ciliary body neovascularization
 - Iris neovascularization
- 121. All are anti-VEGF EXCEPT:**
- Pegaptanib
 - 5FU
 - Bevacizumab
 - Ranibizumab
- 122. Sudden painless loss of vision is due to:**
- Iridocyclitis
 - Chorioretinitis
 - Vitreous hemorrhage
 - Diabetic retinopathy
- 123. In a diabetic patient sudden severe painless loss of vision is due to?**
- Vitreous Haemorrhage
 - Tractional Retinal Detachment
 - Diabetic retinopathy
 - Neovascularization
- 124. The most common cause of vitreous hemorrhage in a young normal male is:**
- Diabetes
 - Anemia
 - Hypertensive retinopathy
 - Trauma
- 125. A hypertensive pregnant patient presented to you with sudden painless loss of vision what could be the possible cause?**
- Tractional retinal detachment
 - Exudative retinal detachment
 - Vitreous hemorrhage
 - Rhegmatogenous retinal detachment
- 126. Malignant melanoma of the choroid will produce:**
- Exudative retinal detachment
 - Traction retinal detachment
 - Retinal dialysis
 - Rhegmatogenous retinal detachment
- 127. All of the following are predisposing factors for rhegmatogenous retinal detachment EXCEPT:**
- Myopia
 - Diabetic retinopathy
 - Trauma
 - Aphakia
- 128. Cherry red spot NOT seen in?**
- Trauma
 - Tay Sach's
 - CRAO
 - CRVO
- 129. The only condition amongst the following associated with cystoid macular edema is?**
- Overuse of ocular analgesics
 - Glaucoma
 - Central retinal vein occlusion
 - Topical steroid therapy
- 130. Candle Wax retinopathy seen in?**
- Sarcoidosis
 - Amyloid
 - Diabetic retinopathy
 - Hypertensive retinopathy
- 131. Snow banking is typically seen in:**
- Pars planitis
 - Endophthalmitis
 - Coat's disease
 - Eale's disease
- 132. Duration of cycloplegic by atropine in an adult:**
- 6 hours
 - 2–3 days
 - 7–10 days
 - 1–2 days
- 133. Drug contraindicated in uveitis is:**
- Pilocarpine
 - Acetazolamide
 - Atropine
 - Steroids
- 134. All of the following drugs are used for acute iridocyclitis EXCEPT:**
- Atropine eye ointment
 - Steroid eye drops
 - Pilocarpine eye drops
 - Timolol eye drops
- 135. Most common complication of acute anterior uveitis:**
- Secondary glaucoma
 - Cataract
 - Retinal detachment
 - Macular oedema

EYELID AND LACRIMAL APPARATUS

- 136. In Dacryocystorhinostomy (DCR), lacrimal gland opens into:** *(Recent Pattern Question 2018-19)*
- Inferior meatus
 - Middle meatus
 - Supreme meatus
 - Superior meatus

137. Site of internal hordeolum:

(Recent Pattern Question 2018)

- a. Zeiss gland
- b. Meibomian gland
- c. Moll gland
- d. Conjunctiva

138. Adhesion of margin of two eyelids:

- a. Symblepharon
- b. Lagophthalmos
- c. Ankyloblepharon
- d. Blepharophimosis

139. Treatment of choice for the chronic dacryocystitis?

- a. Syringing
- b. Dacryocystectomy
- c. Conjunctivo-dacryocystorhinostomy
- d. Dacryocystorhinostomy

140. In case of Ptosis which cranial nerve will be completely paralyzed?

- a. 3rd CN palsy
- b. 4th CN palsy
- c. 5th CN palsy
- d. 6th CN palsy

LENS/CATARACT

141. For Laser iridotomy which laser is used?

(Recent Pattern Question 2018-19)

- a. Double argon laser
- b. ND:YAG laser
- c. Excimer laser
- d. CO₂ laser

142. Rosette cataract is seen after:

(Recent Pattern Question 2018-19)

- a. Blunt trauma to eye
- b. Penetrating injury to eye
- c. Copper foreign body in eye
- d. Infection

143. Ectopia lentis is seen in:

(Recent Pattern Question 2018-19)

- a. Homocystinuria
- b. Refsum's disease
- c. Wilson's disease
- d. Sarcoidosis

144. Laser used in after cataract surgery:

(Recent Pattern Question 2017)

- a. Nd:YAG
- b. Argon
- c. CO₂
- d. Excimer

145. Rosette cataract is caused due to:

(Recent Pattern Question 2017)

- a. Blunt trauma
- b. Diabetes
- c. Myotonic dystrophy
- d. Wilson's disease

146. Second sight is a feature of *(Recent Pattern Question 2016)*

- a. Congenital cataract
- b. Cortical cataract
- c. Nuclear cataract
- d. Posterior subcapsular cataract

147. A 65-year-old patient presented with gradual painless reduction in vision 1 year after vitrectomy. Possible cause

- a. Secondary glaucoma *(Recent Pattern Question 2016)*
- b. Anterior uveitis
- c. Lens protein leakage
- d. Posterior-subcapsular cataract due to long term use of steroids

148. Most common cause of blindness in world is:

- a. Cataract
- b. Refractive errors
- c. Trachoma
- d. Glaucoma

149. Which laser is used for Posterior capsular cataract:

- a. Krypton
- b. ND-YAG
- c. Argon
- d. Diode laser

150. Ideal site for intraocular lens implantation:

- a. Behind the lens capsule
- b. Anterior to the pupil
- c. Behind the cornea
- d. In the lens capsule

151. All of the following are Clinical features of complicated cataract EXCEPT:

- a. Polychromatic lustre
- b. Axial spread of opacity
- c. Opacity along sutures
- d. Posterior subcapsular opacity

152. Complicated cataract caused by all EXCEPT:

- a. Subluxation of lens
- b. Retinal detachment
- c. Vitreous movement
- d. Anterior Uveitis

153. Rosette cataract is seen in?

- a. Trauma
- b. Diabetes
- c. Galactosemia
- d. Wilson's disease

154. Vossius ring is seen at:

- a. Iris
- b. Cornea
- c. Anterior capsule of the lens
- d. Posterior capsule of the lens

155. The type of immature cataract which causes severe loss of vision is:

- a. Posterior subcapsular cataract
- b. Capsular cataract
- c. Cortical cataract
- d. Nuclear sclerosis

156. Rainbow cataract is due to:

- a. Phenylketonuria
- b. Galactosemia
- c. Diabetes mellitus
- d. Secondary cataract

157. All of the following systemic diseases may be associated with cataract EXCEPT:

- a. Phenylketonuria
- b. Galactosemia
- c. Diabetes mellitus
- d. Wilson's disease

158. Anterior lenticonus is found in:

- a. Lowe's syndrome
- b. William's syndrome
- c. Down's syndrome
- d. Alport's syndrome

159. In Marfan's syndrome which of the following will be seen in eyes:

- a. Inferonasal subluxation of lens
- b. Superotemporal subluxation of lens
- c. Corneal edema
- d. Increased IOP

160. Location of lens in Marfan's syndrome is:

- a. Inferior and nasally
- b. Superior and temporally
- c. Forward subluxated
- d. Upward displacement

161. Jack in a box is seen in:
 a. Pseudophakia b. Aphakia
 c. Squint d. Cataract
162. Side effect of oral steroid:
 a. Glaucoma
 b. Cataract
 c. Basement membrane thickening
 d. Blepharoconjunctivitis
163. Iridodonesis is seen with?
 a. Iridocyclitis b. Subluxation of lens
 c. Mature cataract d. Intumescent cataract

GLAUCOMA

164. Which of the following is the carbonic anhydrase inhibitor used in glaucoma?

(Recent Pattern Question 2018)

- a. Timolol b. Mannitol
 c. Latanoprost d. Dorzolamide
165. Vertically fixed mid-dilated pupil seen in:
 a. Cataract b. Open angle glaucoma
 c. Angle closure glaucoma d. Uveitis
166. In case of Angle closure glaucoma, what is the shape of pupil:
 a. Vertically dilated b. Horizontally dilated
 c. Fully constricted d. Irregular constricted fixed
167. A 50-year-old female, presented with redness, painful, sudden loss of vision. She also claims about seeing colored haloes. Diagnosis:
 a. Angular conjunctivitis
 b. Retinal detachment
 c. Acute congestive glaucoma
 d. Keratitis
168. Primary open angle glaucoma is best treated by:
 a. Peripheral Iridectomy b. Latanoprost
 c. Trabeculoplasty d. Laser Iridotomy
169. Clinically earliest visual field defect in primary open angle glaucoma:
 a. Seidel scotoma b. Arcuate scotoma
 c. Paracentral scotoma d. Nasal spur
170. MOA of acetazolamide used in glaucoma:
 a. Increase aqueous production
 b. Increase uveo-scleral outflow
 c. Increase trabecular outflow
 d. Decrease aqueous production
171. The first line of treatment of advanced open angle glaucoma is:
 a. Epinephrine b. Latanoprost
 c. Pilocarpine d. Acetazolamide
172. Safest anti-glaucoma drug in children:
 a. Acetazolamide b. Latanoprost
 c. Timolol d. Dorzolamide
173. Which of the following drug is contraindicated in a glaucoma patient suffering from bronchial asthma:
 a. Timolol maleate b. Latanoprost
 c. Betaxolol d. Brimonidine
174. A patient of 18 year, presents with swollen, watery eyes. Examination confirms glaucoma. Which of the following is the best step that provides earliest relief:
 a. Gonioscopy b. Medical management
 c. Surgical management d. Ophthalmoscopy
175. Treatment for the given case (bilateral big blue eyes in image due to increased IOP)

- a. Goniotomy b. Trabeculotomy
 c. Trabeculectomy d. Laser iridotomy

176. Treatment of angle closure glaucoma.

- a. Peripheral Iridectomy b. Trabeculectomy
 c. Trabeculoplasty d. Laser Iridotomy

177. Laser iridotomy is useful in:

- a. Angle closure glaucoma b. Neovascular glaucoma
 c. Open angle glaucoma d. Secondary glaucoma

178. In acute congestive glaucoma, best prophylaxis for the other eye is:

- a. Laser Iridotomy
 b. Topical steroids
 c. Trabeculectomy
 d. Surgical peripheral Iridectomy

179. Treatment of choice for the other eye in open angle glaucoma is:

- a. Peripheral iridectomy b. Laser trabeculoplasty
 c. Laser iridotomy d. Trabeculectomy

180. Colored haloes least seen in:

- a. Cataract b. Open angle glaucoma
 c. Angle closure glaucoma d. Purulent conjunctivitis

181. A man present with frequent change of presbyopic lens. Diagnosis:

- a. Open angle glaucoma b. Angle closure glaucoma
 c. Cataract d. Astigmatism

182. Krukenberg spindles are seen at?

- a. Cornea anterior surface b. Cornea posterior surface
 c. Lens posterior surface d. Lens anterior surface

REFRACTIVE ERROR

183. A newborn is hypermetropic by:

(Recent Pattern Question 2018-19)

- a. +2.5 D b. 5 D
 c. 10 D d. 1 D

184. Obstacle in manifest squint-concomitant type is:

(Recent Pattern Question 2018-19)

- a. Motor obstacle
- b. Sensory obstacle
- c. Central obstacle
- d. All of the above

185. Crowding phenomenon is seen in:

(Recent Pattern Question 2018)

- a. Hypermetropia
- b. Amblyopia
- c. Strabismus
- d. Retinitis pigmentosa

186. What is the best treatment of Amblyopia?

(Recent Pattern Question 2018)

- a. Occlusion
- b. Atropine penalization
- c. Correction of refractive error
- d. Surgery

187. Which is true statement for a patient with paralytic squint?

(Recent Pattern Question 2017)

- a. Head tilt opposite to rectus muscle paralysis
- b. Head tilt towards the rectus muscle paralysis
- c. Amblyopia
- d. Decreased visual acuity

188. Least common cause of blindness:

(Recent Pattern Question 2016)

- a. Cataract
- b. Corneal opacity
- c. Refractive error
- d. Glaucoma

189. Convex lenses are used for:

(Recent Pattern Question 2016)

- a. Myopia
- b. Hypermetropia
- c. Astigmatism
- d. Myopic astigmatism

190. In convergent squint what is the angle of deviation?

(Recent Pattern Question 2016)

- a. 10°
- b. 15°
- c. 20°
- d. 30°

191. In case of Myopia, the following is seen:

- a. Large optic disc
- b. Small optic disc
- c. Normal eye
- d. None of above

192. Excessive accommodation causes:

- a. Pseudomyopia
- b. Pseudohypermetropia
- c. Astigmatism
- d. Presbyopia

193. Treatment of anisometropia:

- a. Glasses
- b. Contact lens
- c. Trabeculectomy
- d. Trabeculoplasty

194. Lens used in Astigmatism:

- a. Convex lens
- b. Cylindrical
- c. Concave lens
- d. Contact lens

195. Worth 4 dot test is done for:

- a. Color deficiency
- b. Strabismus
- c. Binocular vision
- d. Squint

196. Different refractive power between two eyes is known as?

- a. Combined astigmatism
- b. Aniseikonia
- c. Anisometropia
- d. Ametropia

197. Cylindrical lens is used for:

- a. Presbyopia
- b. High myopia
- c. Hypermetropia
- d. Astigmatism

OCULAR INJURY AND MALIGNANCY

198. A patient with a history of fall on symmetrical surface, presents with enophthalmos, diplopia on upward gaze and loss of sensitivity over cheek. True statement about this is:

(Recent Pattern Question 2018-19)

- i. Strongly suspecting orbital floor fracture
- ii. It is a blow-out fracture
- iii. Zygomatic bone is most likely injured
- iv. Frontal bone fracture
- a. Only i and ii are correct
- b. II, III and IV are correct
- c. I, II, and III are correct
- d. All are correct

199. Blow out fracture can be due to:

- a. Tennis ball injury
- b. Chisel and hammer injury
- c. Sudden fall
- d. Punch at the chin from below

200. Most common malignant orbital tumour in children:

(Recent Pattern Question 2017)

- a. Rhabdomyosarcoma
- b. Retinoblastoma
- c. Lipoma
- d. Neuroblastoma

201. Tear drop sign is seen in fracture of?

(Recent Pattern Question 2017)

- a. Orbital roof
- b. Orbital floor
- c. Orbital lateral wall
- d. Orbital medial wall

202. Which gene is associated with Knudson two hit hypothesis?

(Recent Pattern Question 2017)

- a. RB gene
- b. PTEN
- c. P16
- d. P53

203. A patient presents with ocular trauma and blood in anterior chamber. Which is the best treatment?

(Recent Pattern Question 2017)

- a. Eye patch
- b. Hospital admission
- c. Steroid
- d. Conservative

204. Corneal curvature is measured by:

(Recent Pattern Question 2017)

- a. Perimetry
- b. Gonioscopy
- c. Pachymetry
- d. Keratometry

205. Which of the following is an etiology of axial proptosis?

(Recent Pattern Question 2017)

- a. Lacrimal gland tumour
- b. Optic nerve glioma
- c. Orbital floor fracture
- d. Forehead tumour

- 206. Most common primary intraocular tumor in children?**
 a. Retinoblastoma (Recent Pattern Question 2016)
 b. Malignant melanoma of choroid
 c. Malignant melanoma of ciliary body
 d. Rhabdomyosarcoma
- 207. Unilateral oculomotor nerve paralysis leads to?**
 (Recent Pattern Question 2016)
 a. Loss of accommodation
 b. Argyll Robertson pupil
 c. Eyeball turned up and out
 d. Diplopia
- 208. Ciliary muscle damage leads to:**
 (Recent Pattern Question 2016)
 a. Angle closure glaucoma
 b. Loss of accommodation
 c. ARP
 d. Diplopia
- 209. Tolosa Hunt syndrome involves:**
 (Recent Pattern Question 2016)
 a. Orbital floor
 b. Orbital apex
 c. Orbital roof
 d. Orbital space
- 210. Which one is seen after penetrating injury in ciliary body?**
 a. Iridocyclitis
 b. Sympathetic ophthalmitis
 c. Endophthalmitis
 d. Corneal ulceration
- 211. Sympathetic ophthalmitis usually results due to:**
 a. Glaucoma
 b. Trachoma
 c. Penetrating injury to Ciliary body
 d. Uveitis
- 212. Most common foreign body to cause penetrating injury to ciliary body:**
 a. Ball
 b. Hammer and chisel
 c. Gun bullet
 d. Vegetative material
- 213. Most common cause of subconjunctival hemorrhage:**
 a. Hypertension
 b. Trauma
 c. Pertussis
 d. Diabetes
- 214. Pupillary reaction to light is still normal in lesion/injury to:**
 a. Optic nerve
 b. Optic disc
 c. Optic tract
 d. Optic chiasm
- 215. Blow out fracture of orbit is characterized by all EXCEPT:**
 a. Orbital floor and medial wall involvement are common
 b. Tear drop sign on X-ray
 c. Diplopia
 d. Exophthalmos

- 216. Lisch Nodules on Iris is a feature of:**
 a. Amyloidosis
 b. Neurofibromatosis
 c. Tuberous Sclerosis
 d. None of these
- 217. Most common malignant eyelid tumor:**
 a. Squamous cell carcinoma
 b. Basal carcinoma
 c. Sebaceous carcinoma
 d. Malignant melanoma
- 218. Most common epithelial tumor of lacrimal gland:**
 a. Choroid melanoma
 b. Pleomorphic adenoma
 c. Basal cell CA
 d. Rhabdomyosarcoma
- 219. Commonest site of distant metastasis of retinoblastoma is:**
 a. Liver
 b. Brain
 c. Lungs
 d. Long bones
- 220. A child with retinoblastoma will have this:**
 a. Esotropia
 b. Exotropia
 c. Hypotropia
 d. Heterotropia

NEURO-OPHTHALMOLOGY

- 221. Bilateral temporal hemianopia is due to:**
 (Recent Pattern Question 2016)
 a. Bilateral optic nerve damage
 b. Pituitary adenoma
 c. Unilateral optic tract damage
 d. Bilateral optic tract damage
- 222. Colour blindness in ethambutol toxicity:**
 a. Red blue
 b. Red green
 c. Blue
 d. Red green blue
- 223. What will be the treatment of ptosis due to Horner syndrome:**
 a. Unilateral sling operation
 b. Bilateral sling operation
 c. Cut levator palpebrae superioris 15 mm
 d. Fasanella servat operation
- 224. Which of the following muscle is affected in increased cranial pressure:**
 a. Inferior oblique
 b. Lateral rectus
 c. Middle rectus
 d. Superior oblique
- 225. Lesion in occipital lobe will cause?**
 a. Binasal hemianopia
 b. Bitemporal hemianopia
 c. Homonymous superior quadrantonopia
 d. Homonymous hemianopia with macular sparing
- 226. Lesion of optic tract causes?**
 a. Binasal hemianopia
 b. Bitemporal hemianopia
 c. Homonymous superior quadrantonopia
 d. Homonymous hemianopia
- 227. Right homonymous hemianopia is caused by lesion of:**
 a. Right optic nerve
 b. Right optic radiation
 c. Left optic tract
 d. Right geniculate body

- 228. The characteristic field defect seen in pituitary tumors is**
- Homonymous hemianopia
 - Complete vision loss
 - Binasal hemianopia
 - Bitemporal hemianopia
- 229. Isolated third nerve palsy with pupillary sparing is seen in which of the following conditions:**
- Aneurysmal rupture
 - Trauma
 - Diabetes
 - Raised ICT
- 230. Which amongst the following is associated with Altitudinal visual field defect:**
- Optic neuritis
 - AION (Anterior Ischemic Optic Neuropathy)
 - Intracranial tumor
 - Papillitis
- 231. All are true about Adie's pupil EXCEPT:**
- Seen due to inflammation of ciliary ganglion secondary to post viral illness
 - Pupil is super sensitive to pilocarpine
 - Bilateral constricted and irregular pupil
 - Adie's pupil shows no response to light

BOARD REVIEW QUESTIONS

- 232. Volume of eye ball is?**
- 30 ml
 - 6.5 ml
 - 20 ml
 - 10 ml
- 233. Oral dose of Vitamin A given to child with Xerophthalmia is?**
- 10,000 IU per dose
 - 100,000 IU per dose
 - 20,000 IU per dose
 - 200,000 IU per dose
- 234. Hirschberg test is used for?**
- Ptosis
 - Keratitis
 - Corneal curvature
 - Strabismus
- 235. Papilloedema is seen in?**
- Optic neuritis
 - Optic nerve glioma
 - CRVO
 - CRAO
- 236. Vitamin B12 deficiency causes?**
- Scotoma
 - Hemianopia
 - Myopia
 - Quadrantanopia
- 237. Most common cause of optic atrophy in children is:**
- Retinopathy of prematurity
 - Optic nerve glioma
 - Dwarfism
 - Hydrocephalus
- 238. Hemorrhagic conjunctivitis is caused by?**
- Enterovirus 70
 - Coxsackie virus
 - Enterovirus 72
 - Calicivirus
- 239. Most common cause of vitreous hemorrhage in adults?**
- Hypertension
 - Eale's disease
 - Diabetes
 - HIV
- 240. Schwalbe's line is?**
- The posterior limit of Descemet's membrane of cornea
 - The posterior limit of Bowman's membrane of cornea
 - The anterior limit of Descemet's membrane of cornea
 - The posterior limit of Bowman's membrane of cornea
- 241. Optic nerve is which order neuron in visual pathway?**
- First
 - Third
 - Second
 - Fourth
- 242. What is the definition of blindness according to WHO?**
- 1/60
 - 3/60
 - 6/60
 - 6/18
- 243. Candle wax droppings on fundus examination are seen in:**
- Sarcoidosis
 - Undulant fever
 - Anterior uveitis
 - Juvenile rheumatoid arthritis
- 244. Earliest manifestation of sympathetic ophthalmitis in uninjured eye?**
- Esotropia
 - Loss of accommodation
 - Epiphora
 - Circum-corneal congestion
- 245. Aqueous humour is produced by:**
- Pars plana
 - Pars plicata
 - Pars intermedialis
 - Iris
- 246. Vitamin present in aqueous humour is?**
- Vitamin A
 - Vitamin B
 - Vitamin C
 - Vitamin D
- 247. Swinging flashlight test is done for?**
- Optic neuritis
 - Papilledema
 - Papillitis
 - Perception of light
- 248. Most common type of cataract?**
- Nuclear
 - Cortical
 - Posterior subscapular
 - Anterior subscapular
- 249. Most common cause of angle closure glaucoma?**
- Hyperopia
 - Myopia
 - Pupillary block
 - Space occupying tumour
- 250. Latanoprost acts by?**
- Increase uveo-scleral outflow
 - Decrease aqueous production
 - Decrease aqueous resistance
 - Decrease aqueous consistency
- 251. Placido disc is used for measuring?**
- Corneal thickness
 - Corneal surface
 - Corneal staining
 - Corneal curvature

- 252. Most common type of hypermetropia is:**
 a. Simple b. Pathological
 c. Functional d. Physiological
- 253. Marcus gunn sign seen in:**
 a. Optic neuritis
 b. Hypertensive retinopathy
 c. Anterior ischemic optic neuropathy
 d. Tobacco amblyopia
- 254. Metamorphopsia is seen in:**
 a. Scleritis b. Optic nerve inflammation
 c. Iridocyclitis d. Choroiditis
- 255. All are true about rods and cones EXCEPT?**
 a. Cones for photopic vision
 b. Form sense at fovea
 c. Purkinje shift is all colours seen as grey in bright light
 d. Rhodopsin is the visual pigment
- 256. Preferred treatment of Ophthalmia neonatorum?**
 a. Crede's method b. Ceftriaxone
 c. Azithromycin d. Neomycin
- 257. Night blindness can occur due to all EXCEPT?**
 a. Retinitis pigmentosa b. Post LASIK
 c. Central cataract d. Vitamin A deficiency
- 258. Not a feature of alport syndrome?**
 a. Sensorineural Hearing loss
 b. Posterior lenticonus
 c. Hematuria
 d. COL4 gene defect
- 259. What is true about Eale's disease?**
 a. Painful loss of vision
 b. Young females commonly affected
 c. Seen after reactivation with Syphilis
 d. ATT with Steroids given
- 260. Fundus showing splashed tomato appearance is seen in:**
 a. CRVO b. CRAO
 c. Cystoid macular edema d. Hypertensive retinopathy
- 261. All are true about ROP EXCEPT?**
 a. Prematurity
 b. Direct ophthalmoscopic screening done at 32 weeks post conceptional age
 c. Earliest sign is dilatation of veins
 d. Seen with $\text{FiO}_2 > 50\%$
- 262. Best test for Best disease?**
 a. EOG b. ENG
 c. EMG d. ECG
- 263. Treatment of tractional retinal detachment?**
 a. Par plana vitrectomy
 b. Scleral buckling
 c. Pan-retinal photocoagulation
 d. All of the above
- 264. Blue sclera is seen in?**
 a. Buphthalmos b. Osteogenesis imperfecta
 c. Ehler danlos syndrome d. All of the above
- 265. Laser iridotomy is useful in:**
 a. Angle closure glaucoma b. Neovascular glaucoma
 c. Open angle glaucoma d. Secondary glaucoma
- 266. Shaffer sign is seen in:**
 a. Retinitis pigmentosa b. Retinal detachment
 c. Vitreous haemorrhage d. Scotoma
- 267. Secondary malignancy in retinoblastoma:**
 a. Chondroma b. Osteosarcoma
 c. AML d. Malignant melanoma
- 268. Rollable intraocular lens is made of?**
 a. PMMA b. Acrylate
 c. Hyaluronic acid d. Hydrogel
- 269. Salt and pepper fundus is seen in:**
 a. Congenital rubella b. Congenital syphilis
 c. Leber amaurosis d. Congenital herpes
- 270. Most serious complication of cataract surgery:**
 a. Hyphema b. Malignant glaucoma
 c. Vitreous loss d. Cystoid macular edema
- 271. Roth spots are seen in:**
 a. Infective endocarditis
 b. Libman sacks endocarditis
 c. Hypertension retinopathy
 d. NBTE
- 272. Sudden increase in sugar in diabetics leads to:**
 a. Myopia b. Presbyopia
 c. Hypermetropia d. Anisometropia
- 273. Child attains 6/6 vision of the age of:**
 a. 3 years b. 6 years
 c. 7 years d. 14 years
- 274. Tear production in child begins at:**
 a. 4 weeks b. 4 months
 c. 6 months d. 9 months
- 275. Retinal astrocytoma is seen in:**
 a. Tuberous sclerosis b. Retinitis pigmentosa
 c. Choroid melanoma d. All of the above
- 276. All are used for distant vision EXCEPT?**
 a. Landolt C chart b. Snellen chart
 c. E chart d. Jaeger chart
- 277. Bevacizumab is used in:**
 a. Central serous retinopathy
 b. Phlyctenular conjunctivitis
 c. Diabetic retinopathy
 d. CRVO
- 278. Which of these is not a feature of Horner syndrome in children:**
 a. Ptosis b. Heterochromia iridis
 c. Exophthalmos d. Anhidrosis
- 279. All are useful in treatment of keratomalacia EXCEPT?**
 a. Injection vitamin A
 b. Vitamin C drops
 c. Amniotic membrane transplant
 d. Eye patching

280. Dua's layer is present between:

- a. Between deep stroma and descemet membrane
- b. Deep stroma and bowman membrane
- c. Bowman and descemet membrane
- d. Superficial stroma and bowman membrane

281. Optic tract lesion leads to:

- a. Homonymous hemianopia
- b. Homonymous hemianopia with macular sparing
- c. Pie in the sky
- d. Pie in floor

282. Organism leading to angular conjunctivitis:

- a. Corynebacterium diphtheria
- b. Moraxella axenfeld
- c. Mobiluncus
- d. Staph aureus

283. Acute hemorrhagic conjunctivitis is caused by:

- a. Enterovirus 70
- b. HSV1
- c. Chlamydia
- d. Moraxella

284. All are true about trachoma EXCEPT?

- a. Spread via houseflies
- b. Sago grain follicles
- c. Pannus
- d. White ropy discharge

285. Horner tranta spots are seen at:

- a. Limbus
- b. Palpebral conjunctiva
- c. Bulbar conjunctiva
- d. Puncta

286. Most common cause of corneal ulcer:

- a. Staphylococcus aureus
- b. Coagulase negative staphylococcus
- c. Pneumococcus
- d. H. influenza

287. Most common cause of viral corneal ulcer:

- a. Herpes zoster
- b. Herpes simplex
- c. Adenovirus
- d. Enterovirus

288. Fleischer ring is seen in:

- a. Wilson disease
- b. Keratoconus
- c. Menke disease
- d. Hemosiderosis

289. Corneal ulceration can be seen due to damage to which nerve:

- a. Fifth
- b. Sixth
- c. Seventh
- d. Ninth

290. Tubular vision is seen in:

- a. Retinitis pigmentosa
- b. Bread crumb cataract
- c. Balint syndrome
- d. Central serous retinopathy

291. Champagne cork appearance of optic disc is seen in:

- a. Papilledema
- b. Papillitis
- c. Optic atrophy
- d. Optic neuritis

292. Unilateral papilledema with contralateral optic atrophy is a feature of:

- a. Foster Kennedy syndrome
- b. ICSOL
- c. Retinitis pigmentosa
- d. CRVO

293. Correct action of superior rectus:

- a. Elevation and intortion
- b. Depression and intortion
- c. Elevation and extortion
- d. Depression and extortion

294. Maddox rod is used for:

- a. Latent squint in near vision
- b. Latent squint in distant vision
- c. Manifest squint in distant vision
- d. Manifest squint in near vision

295. Sty is:

- a. Inflammation of gland of zeis
- b. Inflammation of meibomian glands
- c. Inflammation of tarsal cyst
- d. Inflammation of tenon capsule

296. Loss of eye lashes is known as:

- a. Tylosis
- b. Madarosis
- c. Entropion
- d. Trichiasis

297. Madarosis is seen in:

- a. Leprosy
- b. Angular conjunctivitis
- c. Style
- d. Sarcoidosis

298. Kerato conjunctivitis sicca is seen in:

- a. Sjogren syndrome
- b. Sarcoidosis
- c. Mikulicz syndrome
- d. HIV

299. Cobble stone appearance of conjunctiva is seen in:

- a. Trachoma
- b. Vernal conjunctivitis
- c. Ophthalmia neonatorum
- d. Bacterial conjunctivitis

300. Which component of eye has highest refractive index:

- a. Cornea
- b. Lens cortex
- c. Vitreous humour
- d. Aqueous humour

301. Amaurotic cat eye reflex is seen in:

- a. Cridu chat syndrome
- b. Retinoblastoma
- c. Trachoma
- d. Retinitis pigmentosa

302. X3A in WHO staging of vitamin A deficiency is:

- a. Keratomalacia
- b. Corneal ulcer
- c. Conjunctival xerosis
- d. Xerophthalmia

303. Most common cause of visual loss in an AIDS patient is:

- a. Ocular Kaposi sarcoma
- b. CMV retinitis
- c. HIV retinitis
- d. Toxoplasma

304. Scleritis is most commonly associated with?

- a. Ankylosing spondylitis
- b. Rheumatoid arthritis
- c. Giant cell arteritis
- d. Ehler danlos syndrome

305. Altitudinal field defects are seen in:

- a. Anterior ischemic optic neuritis
- b. Papilledema
- c. Papillitis
- d. Rieter syndrome

306. Intraocular calcification is seen with:

- a. Retinoblastoma
- b. Retrolental fibroplasia
- c. Persistent hyperplastic vitreous
- d. Chloroma

- 307. Investigation of choice for retinal detachment is:**
- Indirect ophthalmoscopy
 - Direct ophthalmoscopy
 - Retinoscopy
 - Slit lamp
- 308. Foster fuch spots are seen in:**
- Ophthalmia neonatorum
 - Sympathetic ophthalmitis
 - Myopia
 - Presbyopia
- 309. Mutton fat keratic precipitates are seen in:**
- Granuloma uveitis
 - Non granulomatous uveitis
 - Choroiditis
 - Posterior staphyloma
- 310. Hudson stahl line is seen in limbus due to:**
- Iron deposition
 - Melanin deposition
 - Copper deposition
 - Heavy metal deposition
- 311. All are features of hypercholesterolemia EXCEPT:**
- Lipemia retinalis
 - Tendon xanthoma
 - Arcus senilis
 - Hollenhurst fundus plaques
- 312. Size of optic disc is?**
- 0.5 mm
 - 1.5 mm
 - 5.5 mm
 - 10.5 mm
- 313. Most common etiology of Phlyctenular conjunctivitis is?**
- Bacterial
 - Fungal
 - Protozoal
 - Tuberculous
- 314. Krukenberg's spindles are seen in?**
- Pigmentary glaucoma
 - Sympathetic ophthalmitis
 - Chalazion
 - Retinitis pigmentosa
- 315. Macular edema is seen in?**
- Diabetes mellitus
 - Age related macular degeneration
 - Papilloedema
 - CRAO
- 316. Photoretinitis is caused by?**
- Solar eclipse
 - Welder's flash
 - Arc lamp
 - Lightening
- 317. Shafer's sign is seen in?**
- Retinal detachment
 - Vitreous break
 - Glaucoma
 - Iritis
- 318. Where does squamous cell carcinoma of conjunctiva originate from?**
- Limbus
 - Fornix
 - Nasal conjunctiva
 - Temporal conjunctiva
- 319. Cupuliform cataract arises from?**
- Posterior capsule
 - Anterior capsule
 - Posterior cortex
 - Anterior cortex
- 320. Most common intraocular malignancy in adults is?**
- Melanoma of choroid
 - Melanoma of uvea
 - Retinoblastoma
 - Rhabdomyosarcoma
- 321. Which of the following do not penetrate cornea?**
- Gonococci
 - Neisseria meningitis
 - Pseudomonas
 - Corynebacterium diphtheria
- 322. Angle kappa is formed between which axis?**
- Anatomical and visual axis
 - Anatomical and horizontal axis
 - Between two visual axes
 - Visual axis and vertical axis
- 323. How is posterior chamber examined in mature cataract?**
- Laser interferometry
 - Optical coherence tomography
 - B scan
 - A scan
- 324. Diagnosis of CMV retinitis is primarily by?**
- Fundoscopy
 - Retinal biopsy
 - CMV DNA
 - ELISA
- 325. Snow banking is seen in:**
- Anterior uveitis
 - Posterior uveitis
 - Intermediate uveitis
 - None of these
- 326. Which is not a differential diagnosis of blue sclera?**
- Homocystinuria
 - Ehlers-Danlos syndrome
 - Neurofibromatosis
 - Marfan's syndrome

- 327. Physiological blue sclera is seen in?**
- Elderly
 - Pregnancy
 - Premature newborn
 - None of these
- 328. Most common ocular feature in rheumatoid arthritis is?**
- Uveitis
 - Ectopia lentis
 - Keratoconjunctivitis sicca
 - Episcleritis
- 329. Pseudoproptosis is seen in?**
- High myopia
 - Thyrotoxicosis
 - Orbital proptosis
 - Deep orbital tumour
- 330. Most common complication of corneal transplant is?**
- Lenticonus
 - Melting of cornea
 - Neovascularisation
 - Post transplant astigmatism
- 331. Rhodopsin gene is seen in which chromosome?**
- Chromosome 3
 - Chromosome 7
 - Chromosome 10
 - X Chromosome
- 332. Corneal ulcer leads to?**
- Anterior staphyloma
 - Posterior staphyloma
 - Lenticonus
 - Keratoconus
- 333. Which of the following is the most common cause of anterior uveitis?**
- Idiopathic
 - HLA-B27
 - Sarcoidosis
 - Tuberculosis
- 334. Chronic use of systemic steroids most commonly leads to which ocular complication?**
- Cataract
 - Glaucoma
 - Uveitis
 - Conjunctival and lid papillomata
- 335. Muscles responsible for accommodation are innervated by nerves passing through?**
- Devilotschaw nucleus
 - Edinger-westphal nucleus
 - Nucleus coeruleus
 - Dorsal nucleus
- 336. Normal flora of the eye constitutes?**
- E. coli
 - B. proteus
 - C. gonococci
 - Diphtheroids
- 337. Transparency of cornea is mainly due to which layer?**
- Endothelium
 - Descemet's membrane
 - Bowman's membrane
 - None of these
- 338. Most common cause of retinal detachment is?**
- Myopia
 - Hypermetropia
 - Tractional
 - Exudates
- 339. Muddy appearance of iris is seen in?**
- Glaucoma
 - Iridocyclitis
 - Persistent papillary membrane
 - Iris cyst
- 340. Glaukomflecken is a feature of?**
- Acute angle-closure glaucoma
 - Pigmentary glaucoma
 - Primary open angle glaucoma
 - Congenital glaucoma
- 341. Most common muscle involved in Graves ophthalmopathy is?**
- Medial rectus
 - Lateral rectus
 - Inferior rectus
 - Superior rectus
- 342. Posterior capsular cataract is treated by which laser?**
- Argon laser
 - CO₂ laser
 - Excimer
 - Nd:YAG
- 343. Tarsal muscles are supplied by?**
- Ophthalmic nerve
 - Nasociliary nerve
 - Sympathetic nerves
 - Oculomotor nerve
- 344. Lens is derived from?**
- Endoderm
 - Surface ectoderm
 - Lambert Eaton syndrome
 - Hyperthyroidism
- 345. Optic cup develops into?**
- Lens
 - Retina
 - Cornea
 - Sclera
- 346. Corneal endothelial counting is done by?**
- Tachymetry
 - Pachymetry
 - Specular microscope
 - Perimetry
- 347. Normal corneal endothelial count is?**
- 500/mm²
 - 2500/mm²
 - 4500/mm²
 - 6500/mm²
- 348. According to WHO best definition of blindness is:**
- <3/60
 - <6/60
 - <6/6
 - <3/6

IMAGE-BASED QUESTIONS

349. Which eye abnormality is shown?

- a. Pinguecula
- b. Pterygium
- c. Keratomalacia
- d. Entropion

351. What is the following fundus finding shown below?

- a. Retinitis Pigmentosa
- b. Age related macular degeneration
- c. Papilledema
- d. Papillitis

350. The image shows?

- a. Hypopyon
- b. Hyphaema
- c. Stye
- d. Chalazion

352. The fundus finding shows presence of?

- a. Splashed tomato appearance
- b. Dot blot haemorrhages
- c. Cottage cheese and tomato appearance
- d. Cattle trucking appearance

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) Cataract

Ref: A K Khurana 6th ed. P 477

- Globally, MCC of blindness is cataract, affecting 17.6 million (39%), followed by glaucoma which affects 4.5 million (10%) population.
- MCC of blindness in India: Cataract
- MCC of blindness in developed countries: Age Related Macular Degeneration (50% of all blindness in developed countries)
- MCC of blindness in developing countries: Cataract
- MC preventable cause of blindness worldwide: Trachoma

2. Ans. (a) Ipsilateral mydriasis

Ref: A K Khurana 6th ed. P 335

Ocular signs in head injury can be seen due to concussion injury or base of skull bone fracture

Concussion Injury: Associated with subdural hemorrhage and unconsciousness, and produces following ocular signs:

- **Hutchinson pupil:** Characterized by ipsilateral miosis followed by mydriasis, with no light reflex due to raised ICP.
- **Papilloedema:** If occurs within 48 hours of trauma → indicates extra or intracerebral hemorrhage. If occurs after a week of head injury, it is usually due to cerebral edema

Fractured skull base

- **Cranial nerve palsies:** Commonly associated with fractured base of skull. MC being ipsilateral facial paralysis of lower motor neuron type.
- **Optic nerve injury:** Can cause optic nerve atrophy 2-4 weeks after injury
- Subconjunctival Hemorrhage
- **Pupillary signs:** Inconsistent sign. Pupil size is usually dilated on the affected side.

3. Ans. (c) Oculomotor paralysis

Ref: A K Khurana 6th edit pg 504

TABLE: Condition causing miosis and mydriasis

Causes of Miosis	Causes of Mydriasis
<ul style="list-style-type: none"> • Parasympathomimetic drugs • Systemic morphine 	<ul style="list-style-type: none"> • Topical sympathomimetic drug (Phenylephrine) • Topical parasympatholytics (Atropine)

Contd...

Causes of Miosis

- Iridocyclitis (irregular, non-reactive pupil)
- Horner's syndrome
- Head injury (pontine hemorrhage)
- As an effect of strong light
- During sleep

Causes of Mydriasis

- Acute congestive glaucoma; Absolute glaucoma
- Optic atrophy
- Retinal detachment
- CN 3 (oculomotor nerve) palsy
- Belladonna poisoning

4. Ans. (a) Middle and inner

Ref: A K Khurana 6th ed. P 173

- Eyeball has 3 layers: Sclera, Choroid and Retina
- Evisceration is removal of content of eyeball leaving behind the sclera (the outer layer).
- Frill evisceration is preferred over simple evisceration, where about 3 mm frill of the sclera is left round the optic nerve.

Indications:

- Panophthalmitis
- Expulsive choroidal hemorrhage
- Bleeding anterior staphyloma

Extra Mile

- **Enucleation** is excision of eyeball.
- In adults performed under local anaesthetics and in children under general anaesthetics
- **Indications:**
 - Retinoblastoma and Malignant melanoma
 - Painful blind eye
 - MC indication for enucleation: Eye donation from cadaver

5. Ans. (c) Viral keratitis

Ref: A K Khurana 6th ed. P 108-109

- The image shows dendritic ulcer, which is typical lesion for viral keratitis.
- **Signs:**
 - **Punctate epithelial keratitis:** Fine or coarse punctate lesion
 - **Dendritic ulcer:** Typical lesion for recurrent epithelial keratitis. Ulcer in irregular, zigzag, branching shape. Floor of ulcer stains with fluorescein, and the margin is stained with rose Bengal dye.
 - **Geographical ulcer:** Branches of dendritic ulcer coalesce to form geographical ulcer.

Figure: A. Punctate keratitis; B. Dendritic ulcer; C & D. Geographical Ulcer; E. Disciform keratitis

6. Ans. (b) Steroids

Ref: A K Khurana 6th ed. P 64, 75

- Using steroids in active inflammation can cause flare-up of bacterial infection and corneal ulcer may develop.

7. Ans. (a) Arteriolar attenuation

Ref: A K Khurana 6th ed. P 288

Fundal changes in retinitis pigmentosa:

- Retinal pigmentary changes: Perivascular, jet black spots resembling bony corpuscles in shape
- Retinal arterioles are attenuated (narrowed), may become thread like in later stages
- Thinning and atrophy of retinal pigment epithelium
- Pale, waxy optic disc

Clinical features of RP:

- Night blindness: characteristic earliest feature
- Delayed dark adaptation
- Tubular vision (preserved central vision, lost after many years)

RP is inherited as:

- AR:** most common (intermediate severity)
- AD:** least severe
- X-Linked:** least common (Most severe)

8. Ans. (d) Ames test

Ref: A K Khurana 6th ed. P 330-331

- Ames test is utilized to determine the mutagenic activity of chemicals by observing they can cause mutation in test bacteria or not.
- All other test in choices are utilized in color vision testing.

- NOTE:** FM-100 Hue test is the most sensitive test for color vision testing

Figure: FM 100 Hue

9. Ans. (d) Temporal lobe lesion

Ref: A K Khurana 6th edit pg 314

- Superior quadrantic hemianopia is also termed as “*pie in the sky*”.
- It is produced when inferior fibres are involved in temporal lobe lesions. Inferior most fibres of optic radiation form the so called Meyer’s loop.
- Remember, inferior fibres of optic radiations contain fibres from ipsilateral lower temporal retina and contralateral lower nasal retina.
- Inferior quadrantic hemianopia is “*pie on the floor*”. It is produced when superior fibres are involved in parietal lobe lesions
- Other choices like pituitary adenoma (MCC), craniopharyngioma and meningioma are the causes of chiasmal lesions, which causes bitemporal hemianopia.

10. Ans. (a) **Bitemporal hemianopia**

Ref: A K Khurana 6th ed. P 312

- An optic chiasmal lesion can cause bitemporal hemianopia.

A. Monocular scotoma	
B. Right anopia	
C. Bitemporal hemianopia	
D. Right nasal hemianopia	
E. Left homonymous hemianopia	
F. Left homonymous superior quadrantanopia ("Pie in the sky")	
G. Left homonymous inferior quadrantanopia ("Pie on the floor")	
H. Left homonymous hemianopia with macular sparing	

11. Ans. (a) **Weber syndrome**

Ref: A K Khurana 6th ed. P 334

- **Weber syndrome:** Characterized by ipsilateral CN 3 palsy, contralateral hemiplegia and facial palsy of upper motor neuron type.
- **Benedict's syndrome:** Characterized by ipsilateral CN 3 palsy associated with tremors and jerky movements of the contralateral side due to involvement of the red nucleus.
- **Millard-Gubler syndrome:** Consist of ipsilateral CN 6 palsy, contralateral hemiplegia and ipsilateral facial palsy.
- **Foville's syndrome:** CN 6th paralysis is replaced by a loss of conjugate movement on the same side.
- **Terson syndrome:** Combination of bilateral intraocular hemorrhages and subarachnoid hemorrhage due to aneurysmal rupture.

12. Ans. (a) **Intumescent cataract**

Ref: A.K. Khurana 6th ed. P 193, 248

- Phacomorphic glaucoma is most common lens induced glaucoma (secondary ACG).

- It is caused due to intumescent/swollen, cataractous lens.
- The swollen lens pushes the iris forward resulting in secondary ACG.

13. Ans. (c) **Retrolental flare**

Ref: A K Khurana 6th ed. P 437

- Sympathetic ophthalmitis is bilateral granulomatous panuveitis. It occurs as a result of penetrating ocular trauma (exciting eye), which can involve the contralateral eye (sympathizing eye) due to uveal pigment allergen released from the injured eye.
- **Symptom:**
 - Photophobia and transient indistinctness of near object
- **Signs:**
 - **First sign:** Presence of retrolental flare and cells or the presence of few keratic precipitates at the back of cornea.
 - Mild ciliary congestion
 - Edematous disc
- **Treatment:**
 - **Best prophylactic therapy:** Early excision of injured eye

- **If there is hope of saving injured eye:** Repair the wound + topical and systemic steroid and antibiotics along with atropine
- If no relief or photophobia, KP and lacrimation persist after 2 weeks of treatment → excise the injured eye immediately

ANATOMY, PHYSIOLOGY AND EXAMINATION OF EYE

14. Ans. (b) Neural crest

Ref: Comprehensive Ophthalmology by A.K Khurana 6th ed. P 12-13

- Corneal epithelium is derived from surface ectoderm, while corneal endothelium is derived from neural crest.

TABLE: Embryology of eye

Surface ectoderm	Neuroectoderm	Neural crest	Mesoderm
<ul style="list-style-type: none"> • Tarsal plate • Epithelium of cornea & conjunctiva • Lens • Lacrimal gland 	<ul style="list-style-type: none"> • Retina • Optic nerve • Smooth muscle of iris • Epithelium of iris and ciliary muscle, retina • Secondary vitreous 	<ul style="list-style-type: none"> • Trabecular meshwork • Ciliary muscles • Endothelium of cornea • Stroma of cornea • Sclera EXCEPT temporal part 	<ul style="list-style-type: none"> • Extraocular muscles • Primary vitreous • Temporal sclera • Blood Vessels
Mn: TELL	ROSES	To MESS	Extra Pulm. TB

15. Ans. (d) Done from 1 meter distance from patient

Ref: Comprehensive Ophthalmology by A.K Khurana 6th ed. P 5771

- Retinoscopy aka skiascopy or shadow test is done to check the error of refraction by method of neutralization.
- Patient is made to sit at a distance of 1 meter from examiner → a light is thrown into patient's eye → through a hole in retinoscope mirror, the examiner observes the red reflex in the pupillary area of patient.
- Examiner Look for movement of red reflex/orange streak/bar of light.
 - **If NO movement:** Myopia = -1 D
 - **If opposite movement:** Myopia > -1
 - **Same side movement:** Myopia < -1; Emmetropia = 0; Hypermetropia: +1

16. Ans. (b) ERG

Ref: Comprehensive Ophthalmology by A.K Khurana 6th ed. P 287

- Dark adaptation is ability of the eye to adapt itself to decreasing illumination. The time taken to see in dim illumination is dark adaptation time.
- Rods are more sensitive to low light (scotopic vision) while cones are for bright light.
- **Delayed dark adaptation:** Occur due to disease of rods. Ex: Deficiency of vitamin A, retinitis pigmentosa.

RETINITIS PIGMENTOSA

- Degenerative disease of the rods
- MC affects males in childhood and progress slowly
- Inherited as:
 - AR- in 25% cases; intermediate severity
 - AD- in 25% cases; least severe
 - X-linked- least common (10%); most severe
- **Clinical feature:**
 - Night blindness
 - Delayed dark adaptation
 - Tubular vision
 - **Triad:** Arterioles constriction, Bony spicule pigmentation, Waxy pallor of disc
- **IOC:** Electroretinogram (B wave affected before A wave)
- **Treatment:** Vitamin A 15000 IU orally qd, slow down progression.

17. Ans. (a) +2 to +3 D

Ref: Comprehensive Ophthalmology by Khurana; 6/ed. P 9

EYE AT BIRTH

- AP diameter is 16.5 mm, adult size is attained by 7 to 8 years (24 mm).
- Corneal diameter 10 mm, adult size attained by 2 years.
- Lens spherical.
- Lacrimal gland underdeveloped, tears not secreted.
- Orbit is more divergent.
- Visual acuity 6/60.
- Myelination of optic nerve has reached lamina cribrosa.

18. Ans. (b) Lens

Ref: Comprehensive Ophthalmology by Khurana 4/ed. P 4

- Among the given choices, lens has the highest refractive index of about 1.38 to 1.40

Refractive index of different ocular structure

Structure	Refractive index
• Lens	1.38 – 1.40
• Cornea	1.376
• Aqueous humor	1.336
• Vitreous humor	1.336

19. Ans. (c) **Associated with microphthalmia**

Ref: *Ocular Pathology; E-book, P 664*

- The primary vitreous used information of the eye during fetal development remains in the eye upon birth and is hazy and scarred.
- The persistence of primary vitreous even after birth is said to be persistent hyperplastic primary vitreous (PHPV).
- **Symptoms are:** Leukocoria, strabismus, nystagmus and blurred vision, blindness.
- It is seen almost always unilateral (~90% of the cases)
- It is associated with:
 - Small eye (typically occurs in a microphthalmic eye)
 - Retinal detachment
 - Vitreous hemorrhage
- If diagnosed at an early stage it may be possible to aspirate the lens followed by excision of the retrolental membrane and vitrectomy.
- Visual prognosis is poor.

20. Ans. (a) **Temporal**

Extent of normal visual field (in degrees)

- Superior: 50°
- Nasal: 60°
- Inferior: 70°
- Temporal: 90–100°

21. Ans. (b) **10–20**

Ref: *A.K Khurana's Ophthalmology, 6th ed. pg. 223*

- Normal IOP refers to pressure exerted by intraocular fluids on coats of eyeball.
- Normal IOP varies **between 10 to 21 mm Hg** (mean 16.5 +/- 2.5 mm Hg).
- This pressure is essentially maintained by a dynamic equilibrium between the formation and outflow of aqueous humor.
- Normal aqueous production rate: 2.3 µl/L
- Normal aqueous outflow rate: 0.22/min/mm Hg

22. Ans. (b) **2.5 cm**

Ref: *A.K. Khurana, 6th ed. pg. 3*

- Axial length of orbit is 24 mm i.e. 2.4 cm
- Volume of orbit: 6 ml
- Depth of anterior chamber: 3 mm
- Eyeball Made of 3 layers:
 - Sclera: Outer
 - Choroid: Middle (*vascular layer; a dangerous layer*)
 - Retina: Inner
- Cornea forms **anterior 1/6th** of eyeball and sclera forms **posterior 5/6th** of eyeball

23. Ans. (c) **Ora serrata**

Ref: *A.K. Khurana, 6th ed. pg. 264*

The ciliary body extends backward as far as the ora serrata, at which point the retina proper begins abruptly.

The transition from the ciliary body to the choroid, on the other hand is gradual, although this line is conveniently accepted as the limit the two structures. The ora serrata thus circles the globe, but is slightly more anterior on the nasal than on the temporal side.

24. Ans. (b) **Superior oblique**

Ref: *A.K. Khurana, 6th ed. pg. 5-6, 337*

EXTRA-OCULAR MUSCLES

- The extraocular muscles control the movement of the eye.
- **Levator Palpabrae Superioris (LPS):** Muscle which elevates the palpabrae upwards resulting in opening the eye.
- When LPS gets tired, muller's muscle and frontalis muscle helps in elevation of eyelid.
- **Eyeball muscles (6):**
 - **4 Recti muscles:** Superior (SR), inferior (IR), lateral (LR) and medial rectus (MR)]
 - **2 Oblique muscles:** Superior oblique and inferior oblique
- The muscles supplied by the oculomotor nerve (CN III) are: superior, inferior and medial rectus and inferior oblique, sphincter papillae and ciliary muscle.
- Lateral rectus is supplied by abducens (VI)
- Trochlear nerve (CN IV) supplies superior oblique muscle.
- **Mnemonic:** LR6, SO4, O3; which means lateral rectus is supplied by sixth nerve, superior oblique by fourth nerve and all other by EOM by third cranial nerve.

25. Ans. (b) **Its nucleus is located in lower midbrain**

Ref: *A.K. Khurana, 6th ed. pg. 7-8*

- Location of CN III (occulomotor nerve) nucleus is **upper midbrain**
- Location of CN IV (trochlear nerve) nucleus is in the **lower mid-brain.**

TABLE: CN, their Respective Nucleus Location and their Function

Cranial Nerve	Nucleus Location	Function
Oculomotor III	Upper midbrain	Eyeball movements: extrinsic ocular muscles
Trochlear IV	Lower midbrain	Eyeball movements: extrinsic ocular muscles
Abducens VI	Pons	Eyeball movements: extrinsic ocular muscles
Hypoglossal XII	Medulla	Tongue muscles and movements

26. Ans. (b) **Lacrimal gland**Ref: A.K. Khurana, 6th ed. pg. 386**GLANDS OF EYELIDS**

- **Meibomian glands:** Also known as tarsal glands present in the stroma of tarsal plate and are arranged vertically.
 - They are modified sebaceous glands. Their ducts open at the lid margin. Their secretion constitutes the oily layer of tear film.
- **Glands of Zeis:** These are also sebaceous glands which open into the follicles of eyelashes.
- **Glands of Moll:** These are modified sweat glands situated near the hair follicle. They open into the hair follicles or into the ducts of Zeis glands.
- **Accessory lacrimal glands of Wolfring.** These are present near the upper border of the tarsal plate.

Note: Lacrimal gland is one of the gland of lacrimal apparatus. It is NOT among the eyelid glands.

27. Ans. (a) **Superior oblique**Ref: A.K. Khurana, 6th ed. pg. 337-39

- The function of superior oblique is quite contrary to its name. Its action is depression of eyeball, which helps to see down.
- Its yoke muscle is inferior rectus, which also has the similar function as superior oblique. If superior oblique is affected patient will develop difficulty in looking down
- There are 9 Gaze:
 - Primary : Straight
 - Secondary: Up, down, left, right
 - Tertiary : Up left, Up, right, Down left, Down right
- **ACTIONS OF EOM**

Muscle	Function		
	Primary	Secondary	Tertiary
Lateral rectus	Abduction	–	–
Medial Rectus	Adduction	–	–
Inferior Rectus	Depression	Extortion	Adduction
Superior rectus	Elevation	Intortion	Adduction
Inferior Oblique	Extortion	Elevation	Abduction
Superior oblique	Intortion	Depression	Abduction

- **Mnemonics:** SinRad (all superior muscles causes Intortion; all rectus muscles causes Adduction EXCEPT Lateral rectus)

28. Ans. (a) **Adduction and intorsion**Ref: A.K. Khurana, 6th ed. pg. 33929. Ans. (b) **Inferior rectus**Ref: A.K. Khurana, 6th ed. pg. 337-39

- The function of inferior rectus is depression of eyeball, which helps to see down.
- Its yoke muscle is superior oblique, which also has the similar function as inferior rectus.

30. Ans. (c) **Towards the right side**Ref: A.K. Khurana, 6th ed. pg. 337-39

- **VIth nerve palsy leads to** loss of abduction/lateral gaze leading to **abnormal head posture towards the side** of affected muscle
- **There is** Presence of **convergent squint also**.

Extra Mile**IVth nerve palsy**

- Diplopia on looking down
- Inability to look inferomedially

31. Ans. (d) **Right superior rectus**Ref: A.K. Khurana, 6th ed. pg. 339

- **Synergistic muscle** is two muscles *functioning as same, in the same eye*. Function of superior rectus is to elevate the eye, which is same with inferior oblique.
 - Right inferior oblique and right superior rectus elevate the right eye
- Yoke muscle on the contrary, is two extraocular muscles from two eyes having same function.
 - **Ex:** Yoke muscle of right inferior oblique is left superior rectus.

32. Ans. (a) **The superior orbital fissure**Ref: A.K. Khurana, 6th ed. pg. 337, BDC, 4th ed. Vol III, pg. 25-6**TABLE:** Structures passing through superior orbital fissure

Superior orbital fissure		
Medial /lower part	Middle part (through tendinous ring)	Lateral/ Upper part
<ul style="list-style-type: none"> • Inferior Ophthalmic vein • Sympathetic nerves around internal carotid artery Mn: Inferior sympathy	<ul style="list-style-type: none"> • Nasociliary nerve • Oculomotor nerve • Abducent nerve Mnemonic –“NOA”	<ul style="list-style-type: none"> • Superior Ophthalmic vein • Lacrimal nerve • Frontal nerve • Trochlear nerve Mn – “Superior LFT”

Structures passing through Inferior orbital fissure

- Zygomatic branch of maxillary nerve
- Infraorbital nerve & vessels
- Rami of Pterygoid ganglion
- Communicating vein b/w inferior ophthalmic & pterygoid plexus of veins.

Mn-“ZIPC”

33. Ans. (a) Strabismus

Ref: A.K. Khurana, 6th ed. pg. 346

- **Strabismus:** A misalignment of the visual axes of the two eyes is called squint or strabismus.
- **It is classified as:**
 - Pseudostrabismus (apparent squint)
 - Heterophoria (latent squint)
 - Heterotropia (manifest squint)

HETEROPHORIA

- Heterophoria also known as ‘Latent strabismus’
- It is a condition in which the tendency of the eyes to deviate is kept latent by fusion.

Examination of a Case of Heterophoria

- Testing for vision and refractive error.
- Cover-uncover test.
- Prism cover test
- **Maddox rod test:** Patient is asked to fix on a point light in the centre of Maddox tangent scale at a distance of 6 meters.
- A Maddox rod is placed in front of one eye with axis of the rod parallel to the axis of deviation.
- The Maddox rod converts the point light image into a line. Thus, the patient will see a point light with one eye and a red line with the other.
- Due to dissimilar images of the two eyes, fusion is broken and heterophoria becomes apparent.
- **Maddox wing test:** Also used to measure phoria of near distance.

34. Ans. (c) 3 D

Ref: A.K. Khurana, 6th ed. pg. 578

- By pinhole test visual acuity can be neutralized till 3 D. It can't accommodate more than that.
- It is a test to distinguish a refractive error from organic disease.
- A refractive error may, be corrected with glasses, whereas organic disease may signal the development of preventable blindness. If visual acuity is improved after pin hole test, the defect is refractive; if not, it is organic.
 - **Pinhole improves vision:** Refractive error, peripheral cataract
 - **Pinhole worsen vision:** Macular diseases, central lens opacities
 - **Vision static with pinhole:** Amblyopia

35. Ans. (c) Centre of the lens

Ref: A.K. Khurana 6th ed. /179; Parson's 20/e p-52-53

REFRACTIVE INDEX OF DIFFERENT MEDIUM

- Highest refractive index is of center of lens (1.406)
- Anterior and posterior lens cortex forming anterior & posterior lens surface (1.386)
- Cornea (1.376)
- Aqueous and vitreous humor (1.336)
- Air (1)

36. Ans. (c) 45 D

Ref: A.K. Khurana, 6th ed. pg. 95

POWER

- Lens= +16D
- Cornea= +44D
- Total= +60D

37. Ans. (b) **Phacomorphic glaucoma**Ref: A.K. Khurana, 6th ed. pg. 3, 192-93

- **Deep anterior chamber is seen in:** Young, males and myopes
- **Shallow anterior chamber is seen in:** Women, Elderly, and Children (WEC)

Extra Mile

Phacomorphic Glaucoma

- Phacomorphic glaucoma is angle closure glaucoma caused by mature cataract **making the anterior chamber shallow.**

Phacolytic glaucoma

- Phacolytic glaucoma is open angle glaucoma caused by hypermature cataract in which the *anterior chamber is deep* by leaking lens material which blocks the trabecular meshwork.
- Treatment is cataract surgery

Myopia

- Myopia or 'Short sight' is a refractive error that most commonly presents as indistinct distant vision in which the light rays are focused in front of retina. As the maximum distance of clear vision is reduced the far point comes nearer. Following are types of myopia-
 - Axial Myopia
 - Curvature Myopia
 - Index Myopia
- **Axial Myopia**- eyeball larger than normal causes myopia. Every 1 mm increase in axial length has 3D increase in 1 mm = 3D
- **Curvature Myopia**- axial length normal. Cornea is curved as in keratoconus. 1 mm of curvature = 6D. So they are very high myopes.
- **Index Myopia**- corneal curvature normal. Refractive Index increases. More the difference → more the bending between two media. Myopics are typically called short sighted, so all myopics wear concave lenses. Minification 1D = 2%

Aphakia: Aphakia means absence of crystalline lens from eye.38. Ans. (a) **Children**Ref: A.K. Khurana 6th ed. /45-49; Khurana's 4th Ed./ 39-41**ACCOMODATION**

- Mechanism by which we can focus the diverging rays coming from a near object on the retina in an attempt to see clearly is called accommodation.
- During this there occurs increase in the power of crystalline lens due to increase in the curvature of its surface.

Mechanism of Accommodation

- When the eye is at rest (unaccommodated), the ciliary ring is large and keeps the zonules tense.
- Because of zonular tension the lens is kept compressed (flat) by the capsule.
- Ciliary muscles and zonules have inverse relation in function.
- Ciliary ring is shortened due to contraction of the ciliary muscle which releases zonular tension on the lens capsule. This allows the elastic capsule to act unrestrained to deform the lens substance. The lens then alters its shape to become more convex (conoidal).
- The lens assumes conoidal shape due to configuration of the anterior lens capsule which is thinner at the centre and thicker at the periphery
- **Note:** The crystalline protein of lens and contraction of ciliary muscle is finest in child as compared to adult and elderly. Hence children have maximum accommodation.

39. Ans. (a) **Lens of eye**Ref: A.K. Khurana 6th ed. /12**TABLE:** Embryology of eye

Surface ectoderm	Neuroectoderm	Neural crest	Mesoderm
<ul style="list-style-type: none"> • Tarsal plate • Epithelium of cornea & conjunctiva • Lens • Lacrimal gland 	<ul style="list-style-type: none"> • Retina • Optic nerve • Smooth muscle of iris • Epithelium of iris and ciliary muscle, retina • Secondary vitreous 	<ul style="list-style-type: none"> • Trabecular meshwork • Ciliary muscles • Endothelium of cornea • Stroma of cornea • Sclera EXCEPT temporal part 	<ul style="list-style-type: none"> • Extraocular muscles • Primary vitreous • Temporal sclera • Blood Vessels

40. Ans. (b) **Surface ectoderm**Ref: A.K. Khurana, 6th ed. pg. 1241. Ans. (c) **Surface ectoderm**Ref: A.K. Khurana, 6th ed. pg. 12

Please refer to above explanation

FMGE Solutions Screening Examination

1084

42. Ans. (c) Temporal

Ref: A.K. Khurana, 6th ed. pg. 505, Khurana, 4th ed. pg. 481

Extent of Normal Visual Field:

- Superior: 50
- Nasal: 60
- Inferior: 70
- Temporal: 90-100

43. Ans. (b) Inferior

Ref: A.K. Khurana, 6th ed. pg. 265-66

- Neuroretinal rim is the tissue outside the cup and contains the retinal nerve axons as they enter the nerve head.
- It is broadest in lower segment of the disc, then above followed by nasally and temporally.
- There is greater axonal mass and vascularity in the infero-temporal region.
- In case of primary open angle glaucoma, there is progressive loss of retinal ganglion cells, leading to enlargement of the cup, particularly in lower and upper poles of disc, leading to vertically oval cup.

44. Ans. (d) Opacity in the refractive media

Ref: A.K. Khurana, 6th ed. pg. 586

DISTANT DIRECT OPHTHALMOSCOPY

- Used to get a preliminary idea about the status of the ocular media and fundus
- This should be done routinely before doing a direct ophthalmoscopy
- **Equipment needed** - self illuminated ophthalmoscope or plane mirror with a hole in centre
- **Procedure**
 - Should be performed in a semi dark room
 - The ophthalmoscope should be kept at a distance of 20-25 cm from the patient's eye
 - Normally a red reflex is seen at the pupillary area
- **Uses**
 - Opacities in the ocular media are seen as dark spots in the red glow at the pupillar area

- The plane of the opacities can be assessed by asking the patient to move the eye from side to side while the examiner is observing the pupillary glow (based on parallax principle)

- ♦ Opacities in front of the pupil move in the direction of eye movement
- ♦ Opacities in the pupillary plane do not move
- ♦ Opacities behind the pupillary plane move opposite the direction of eye movement
- To differentiate between a mole on the iris and a hole in the iris
 - In oblique illumination, both appear dark
 - In distant direct ophthalmoscopy
 - ♦ Mole—appears dark
 - ♦ Hole—red glow is seen
- To detect a retinal detachment or fundal mass
 - Both of them are visible as a grayish reflex
 - It is not possible to differentiate them in distant direct ophthalmoscopy
- The image in Indirect Ophthalmoscopy is inverted both vertically as well as laterally, which means: *What appears as right upper quadrant is actually in the left lower quadrant.*

Extra Mile

Direct ophthalmoscope

Virtual, Erect and Magnified 15 times: "VEM"

Mnemonic: "DEV" i.e.
Direct = Erect + Virtual

Indirect Ophthalmoscope

Real, Inverted and 4-5 times Magnified: "RIM"

Mnemonic: "IIR" i.e.
Indirect = Inverted + Real

45. Ans. (b) Direct ophthalmoscopy

Ref: A.K. Khurana, 6th ed. pg. 586; Khurana 4th ed. pg. 565

- **Direct ophthalmoscopy:** Disc and macula
- **Indirect ophthalmoscopy:** Whole retina, vitreous (*choice of test in retinal detachment*)
- **Distant direct ophthalmoscopy-** for any opacity, cataract, detachment
- **Retinoscopy:** For calculating refractive error

46. Ans. (a) Strabismus

Ref: A.K. Khurana, 6th ed. pg. 344-58

Classification of Squints (Strabismus)

LATENT SQUINT/HETROPHORIA

- A condition in which the tendency of eyes to deviate is kept latent by fusion. Therefore when the influence of fusion is removed the visual axis of one eye axis of one eye deviates away (Orthophoria is a condition of perfect alignment of two eyes)

- **Types Esophoria is a tendency to converge**
 - Exophoria is a tendency to diverge
 - Hyperphoria is a tendency to deviate upwards
 - Hypophoria is a tendency to deviate downwards
 - Cyclophoria is a tendency to rotate around A-P axis
- **Evaluation**
 - Refraction
 - Uncover test (tells about present & type of heterophoria)
 - Maddox rod test (amount of heterophoria in degrees)
 - **Maddox wing test** (amount of phoria for near distance i.e. 33 cm)
- **Treatment:**
 - Refraction

- Occlusion therapy (in presence of amblyopia)
- Orthoptic exercise
- Operative correction
- Prism correction for remaining error.

MANIFEST SQUINT (HETEROTROPIA)	
Comitant	Incomitant
<ul style="list-style-type: none"> • Amount of deviation in squinting eye remains constant (unaltered) in all directions of gaze & there is no limitation of ocular movements. • Types <ul style="list-style-type: none"> ■ Alternating squint: when one eye fixes, the other eye deviates & either of the eyes can adopt fixation alternately & freely ■ Esotropia (Convergent squint) ■ Exotropia (Divergent squint) ■ Hypertropia (Vertical squint) • Evaluation <ul style="list-style-type: none"> ■ Refraction, visual acuity, ocular motility ■ Direct cover test (confirms the presence of manifest squint) ■ Alternate cover test (reveal whether the squint is U/L or alternate and to differentiate concomitant squint from paralytic squint). ■ Estimation of angle of deviation. ■ Hirschberg corneal reflex test: Roughly the angle of squint is 15° and 45° when the corneal light reflex falls on the border of pupil & limbus respectively. The premise is that every millimeter of deviation from centre of pupil is equal to 7° (15Δ) 	<ul style="list-style-type: none"> • Manifest squint in which amount of deviation varies in different directions of gaze. • Types <ul style="list-style-type: none"> ■ Paralytic squint ■ "A" & "V" pattern heterotropias ■ Special ocular motility defects ■ Clinical presentation: is diplopia, confusion, nausea, vertigo & ocular deviation with restriction of eye movements, compensatory head posture & false projection & orientation, loss of stereopsis, normal visual acuity & no amblyopia. • Evaluation <ul style="list-style-type: none"> ■ All tests of comitant squint ■ Diplopia carting ■ Hess screen test ■ Forced duction test • Treatment of cause, diplopia (by occlusion), surgery (if no recovery in 6 months).

47. Ans. (c) **Inferior rectus**

Ref: A.K. Khurana, 6th ed. pg. 414

- In thyroid eye ophthalmopathy, the ocular motility defects due to restrictive myopathy (*in order of frequency*) are:
 - Elevation (due to fibrosis of inferior rectus)
 - Abduction (due to fibrosis of medial rectus)
 - Depression (due to fibrosis of superior rectus)
 - Adduction (due to fibrosis of lateral rectus).

Mnemonic - "I M Shy Lad"

48. Ans. (a) **Males are more prone**

Ref: A.K. Khurana, 6th ed. pg. 329

- Color blindness is an **X-Linked recessive condition**. Females are always carrier and males are always affected. Hence males are more affected than females.
- Most common type of color blindness: Deutanopia (Green color blindness)

CORNEA, CONJUNCTIVA AND SCLERA

1086

49. Ans. (c) **Conjunctiva invasion making a flap over cornea**

Ref: *Comprehensive Ophthalmology* by A.K Khurana
6th ed. P 87

PTERYGIUM

- It is a degenerative and hyperplastic condition of conjunctiva → elastotic degeneration and proliferation of subconjunctival tissue
- Triangular/wing shaped invasion of conjunctiva upon the cornea. It is common in dry heat, sun exposure (UV rays) and abundant dust.
- Iron deposition in the corneal epithelium at the advancing head of the pterygium is called **Stocker line**.
- It usually asymptomatic.
- **MC site:** Nasal side
 - **Primary double pterygium:** Involvement of both nasal and temporal side
- The corneal epithelium, bowman's layer and superficial stroma are destroyed
- **Treatment:** Surgical excision.
 - The commonest problem after excision is recurrence which is reduced by postoperative use of mitomycin-C/ thiotepa or by doing surgical excision with free conjunctival graft from same/ other eye.

Extra Mile

TABLE: Differences between pterygium and pseudopterygium

	Pterygium	Pseudopterygium
Etiology	Degenerative process	Inflammatory process
Age	Usually occurs in elder persons	Can occur at any age
Site	Always situate in the palpebral aperture	Can occur at any site
Stages	Either progressive, regressive or stationary	Always stationary
Probe test	Probe cannot be passed underneath	A probe can be passed under the neck

50. Ans. (c) **Enterovirus**

Ref: *Comprehensive Ophthalmology* by Khurana
6/ed. P 23

- **Acute hemorrhagic conjunctivitis:** It is also called Apollo conjunctivitis.
- It is caused by picornavirus (enterovirus type 70).

51. Ans. (b) **Keratitis**

Ref: *Yanoff Duker Ophthalmology*; P 220

- Bacteria which cause purulent keratitis after epithelial injury are *Pseudomonas*, *Staphylococcus aureus*, *Pneumococcus*, *Moraxella*, *Streptococcus epidermidis*, *E. coli*, *Proteus*, *Klebsiella*.
- **Clinical feature of keratitis:** Pain, lacrimation, photophobia, red eye, blurred vision.

52. Ans. (a) **Corneal sensation decreased**

Ref: *Comprehensive Ophthalmology* by Khurana
6/ed. P 27

- Dendritic ulcer is seen in viral keratitis which is most commonly caused by HSV. It can involve any layer of cornea but when only corneal epithelium is involved it is known as dendritic ulcer.
- Recurrent ocular herpes present as geographic ulcer, superficial punctate keratitis.
- When stroma is involved it presents as disciform keratitis and diffuse stromal necrotic keratitis.
- The characteristic hypopyon corneal ulcer is caused by pneumococcus (ulcus serpens) and pseudomonas.
- In recurrent epithelial keratitis, there is decreased corneal sensation

53. Ans (b) **Keratoconus**

Ref: *Yanoff Duker*; 4/ed. P 254

- Keratoconus is degenerative disease of cornea, where it becomes conical. It is best treated by keratoplasty.
- Keratoplasty is corneal grafting or in more simple term, corneal transplantation.

- There are two types of keratoplasty:
 - **Penetrating keratoplasty (PK)** also known as full thickness keratoplasty
 - **Lamellar keratoplasty (LK)** also known as partial thickness keratoplasty. It has highest success rate as compared to PK.
- **Indication for keratoplasty:**
 - Corneal scar
 - Non-healing ulcer
 - Chemical injuries
 - Keratoconus
 - Pseudophakic bullous keratopathy

54. Ans. (c) Chlamydia

Ref: Khurana, 6th ed. pg. 73

- **Adenovirus** is considered as the **most common** cause of swimming pool conjunctivitis. Chlorine is unable to eliminate the virus, hence it can often present as an outbreak. But it was not given in choice.
- **However, it can also be caused by chlamydia trachomatis serotypes D to K** and the condition is said to be adult inclusion conjunctivitis.

Adult inclusion conjunctivitis.

- Caused by **chlamydia trachomatis serotypes D to K**.
- **Usually** affects sexually active males and primary source of infection is urethritis in males and cervicitis in females.
- **Transmission:** Either via contaminated fingers or more commonly through contaminated water of swimming pool. Therefore it is also said to be swimming pool conjunctivitis.

55. Ans. (d) Clean hand

Ref: Khurana, 64

- Frequent handwashing is the most effective way to reduce the risk of transmission to the close contacts.
- **Other measures can be:** avoid sharing towels, handkerchief and pillows.

56. Ans. (b) Pterygium

Ref: Khurana, 88

Pterygium

- Triangular invasion of conjunctiva upon the cornea. It is common in dry heat, sun exposure and abundant dust.
- Iron deposition in the corneal epithelium at the advancing head of the pterygium is called **STOCKER LINE**. Usually asymptomatic.
- **Treatment:** Surgical excision. The commonest problem after excision is recurrence which is reduced by post-operative use of mitomycin C/thiotepa or by doing

surgical excision with free conjunctival graft from same/ other eye.

57. Ans. (d) Staphylococcus

Ref: Khurana, 99

- The common cause of corneal ulcer in India is *Streptococcus Pneumoniae* (causes central corneal ulcer) whereas the **commonest cause overall is staphylococcus aureus** (causes peripheral corneal ulcer).
- The bacterial ulcer can present with the formation of a hypopyon (sterile).
- The characteristic hypopyon corneal ulcer is due to pneumococcus and is called *ulcus serpens*.
- **Treatment:** topical gentamicin/ tobramycin and cephalozin with cycloplegics (atropine ointment or drops) and analgesics.

58. Ans. (c) Interstitial keratitis

Ref: Khurana, 121

- Inflammation of corneal stroma without primary involvement of epithelium or endothelium is called interstitial keratitis.
- It can have many causes like: Congenital syphilis, TB, Cogan's syndrome, acquired syphilis, malaria, sarcoidosis, leprosy.

Syphilitic interstitial keratitis

- It is associated more frequently with congenital syphilis and manifestation develops between 5-15 years of age.

Clinical features:

- Can present with Hutchinson triad i.e. interstitial keratitis, Hutchinson teeth and vestibular deafness.
- **Clinically it can present with 3 stages:**
 - **Initial progressive stage:** Lasts for 2 weeks. Begins with edema of endothelium and deeper stroma secondary to anterior uveitis.
 - **Florid stage:** Lasts for 2 months there is development of radial bundle of brush like vessels on cornea. Since these vessels are covered by hazy cornea, they look dull reddish pink which is called **salmon patch appearance**.
 - **Regression stage:** May last for 1-2 years. The acute inflammation resolves with progressive appearance of vascular invasion. Resolution of the lesion leaves behind some opacities and **ghost vessels**.

Treatment:

- **Local:** Topical corticosteroid drops e.g. dexamethasone 0.1%, Atropine ointment 1% 2-3 times a day, Dark goggles or keratoplasty in case of dense corneal opacity.
- **Systemic:** Penicillin, systemic steroid.

FMGE Solutions Screening Examination

1088

59. Ans. (b) Keratoconus

Ref: Khurana, 131

- **Munson's sign:** Localized bulging of lower lid when patient looks down. Seen in late stages of keratoconus.

60. Ans. (a) Moraxella

Ref: A.K Khurana's Ophthalmology, 6th ed. pg. 66

Conjunctivitis type	MC organism/comments
• Acute mucopurulent	<ul style="list-style-type: none"> • Staphylococcus • It is MC type of bacterial conjunctivitis • (+) Halo
• Acute Purulent Conjunctivitis	• Gonococcus
• Membranous Conjunctivitis	<ul style="list-style-type: none"> • C. Diphtheria • Bleeds on separation
• Pseudomembranous Conjunctivitis	<ul style="list-style-type: none"> • Adeno/Staph/Strep • Separates easily
• Angular Conjunctivitis	• Moraxella Axenfeld- MCC
• Epidemic Keratoconjunctivitis/Madras eye	• Adenovirus: MCC
• Acute hemorrhagic/Apollo Conjunctivitis	<ul style="list-style-type: none"> • PicoRNA virus ▪ Enterovirus 70: MCC ▪ Echovirus ▪ Coxsackie virus

61. Ans. (a) Trigeminal nerve

Ref: A.K Khurana's Ophthalmology, 6th ed. pg. 108-109

- Neurotropic keratitis is a corneal degenerative disease characterized by a reduction or absence of corneal sensitivity.
- In this condition, corneal innervation by **trigeminal nerve** is impaired.
- Most common ocular conditions associated with NK are herpes keratitis (zoster and simplex),
- **Other causes can be:** Topical anesthetic abuse, chemical and physical burns, contact lens abuse, topical drug toxicity, irradiation to eye or adnexa and corneal surgery.

62. Ans. (c) Flakes of mucus

Ref: A.K Khurana's Ophthalmology, 6th ed. pg. 63

- Any condition which causes fluid accumulation on cornea, can cause colored haloes.
- **Differential diagnosis of color haloes:**
 - ACG
 - Cataract
 - Mucopurulent conjunctivitis: Due to prismatic effect of mucus present on cornea

Extra Mile

- Acute bacterial conjunctivitis is aka as acute mucopurulent conjunctivitis.
- **Causes:** Staph Aureus, Koch-weeks bacillus, Pneumococcus and streptococcus

63. Ans. (a) Moraxella

Ref: A.K Khurana's Ophthalmology, 6th ed. P 66

64. Ans. (b) Keratoconus

Ref: A.K Khurana's Ophthalmology, 6th ed. pg. 132

- **Fleischer rings** are pigmented rings in the peripheral cornea, resulting from iron deposition in basal epithelial cells, in the form of hemosiderin.
- Fleischer rings are indicative of keratoconus, a degenerative corneal condition that causes the cornea to thin and change to a conic shape.
- Signs of keratoconus:
 - **Munson Sign:** V-Shaped protrusion of cornea on down gaze
 - **Vogt's Striae:** Break in descemet's membrane
 - **Fleischer ring:** Iron deposition at back of cornea
 - Scissoring of reflex upon retinoscopy

Extra Mile

- **Kayser-Fleischer rings** are due to copper deposition, seen in case of Wilsons disease
- **Immune ring of pessary:** In case of fungal keratitis
- Ring shaped ulcer: **Protozoal keratitis**

65. Ans. (c) Prevents infection more than descemet's membrane

Ref: A.K. Khurana 6th ed. pg. 96, Khurana, 4th ed. pg. 80.89

- Bowman's layer of cornea is acellular mass of condensed collagen fibrils
- **Thickness:** 12 µm
- It is NOT a true elastic membrane but simply a condensed superficial stroma
- Once destroyed, never regenerates

- It shows considerable resistance to infection (descemet membrane maintains integrity of eyeball)

66. Ans. (d) **Curvature of cornea**

Ref: A.K. Khurana, 6th ed. pg. 575

Few Instruments Which are Used for Ocular Examination

Measurement parameter	Instruments/for:
• Corneal thickness	Pachymeter
• Corneal curvature	Keratometer
• Angle of anterior chamber	Gonioscope
• Corneal surface	Placido disc
• Corneal endothelium	Specular microscope
• Direct ophthalmoscope	Routine fundus examination. "Image formed is Erect and Virtual and magnified, 15 times"
• Indirect ophthalmoscope	For assessment of retinal detachment and other peripheral retinal lesions. The image is real, inverted and magnified 5 times.
• Perimetry	Optic nerve function

67. Ans. (b) **Pachymetry**

Ref: A.K. Khurana, 6th ed. pg. 95-96; Khurana, 4th ed. pg. 89

- Corneal thickness is measured by the method known as pachymetry. Normal corneal thickness is around (0.52 mm – 0.7 mm) 500–700 μ m.

Extra Mile

- PLACIDO DISC- for corneal surface
- Keratometry- Corneal curvature
- Tonometry- for IOP

68. Ans. (b) **Keyser Fleischer Ring**

Ref: A.K. Khurana 6th ed. pg. 131; Khurana, 4th ed./ 141

- Fleischer's ring is seen in keratoconus and not KF rings.
- KF ring is seen in Wilson's disease (Chalcosis)

KERATOCONUS

- Keratoconus (conical cornea) is a non-inflammatory bilateral (85%) ectatic condition of cornea in its axial part.

Clinical Feature

- Patient presents with a defective vision due to progressive myopia and irregular astigmatism, which does not improve fully despite correction with glasses.
- Slit lamp examination may show thinning and ectasia of central cornea, *opacity at the apex and Fleischer's ring at the base of cone*, folds in Descemet's and Bowman's membranes.
- **Vogt lines:** Very fine, vertical, deep stromal striae which disappear with external pressure on the globe are peculiar feature.
- On retinoscopy a yawning reflex (*scissor reflex*)
- **Munson's sign:** Localized bulging of lower lid when patient looks down is positive in late stages.

69. Ans. (a) **Corneal dystrophy**

Ref: A.K. Khurana, 6th ed. pg. 124-31;

Corneal dystrophies are inherited disorders in which the cells have some inborn defect due to which pathological changes may occur with time leading to hazy cornea.

- Corneal dystrophies are classified according to anatomical site involved: Anterior dystrophy, Stromal dystrophies, Posterior dystrophies.
- Among anterior dystrophies, **epithelial basement membrane dystrophy aka Cogan's microcystic dystrophy is the most common.**
- These lesions involve corneal epithelium and present as bilateral dot-like microcystic or linear finger print opacities. In 10% of cases there is recurrent corneal erosion and majority of cases remains asymptomatic.
- It is characterized by the failure of the cornea's outermost layer of epithelial cells to attach to the underlying basement membrane (Bowman's layer).
- The condition is excruciatingly painful because the loss of these cells results in the exposure of sensitive corneal nerves.
- **Cause:** There is often a history of previous corneal injury (corneal abrasion or ulcer).

FMGE Solutions Screening Examination

- It may also be due to corneal dystrophy or corneal disease.
- **Treatment-** Patching with plain ointment for 1-2 days.

70. Ans. (c) Corneal dystrophy

Ref: A.K. Khurana, 6th ed. pg. 124-31

Please refer to above explanation

71. Ans. (a) Thioridazine

Ref: A.K. Khurana, 6th ed. pg. 502

- Thioridazine is an antipsychotic agent.
- Its ocular side effect (corneal staining) limits its use.
- **Note:** ATT drug **Ethambutol** also causes corneal staining.

72. Ans. (c) Corneal xerosis

Ref: A.K. Khurana, 6th ed. pg. 468

- **Xerophthalmia:** all the ocular manifestation of Vitamin A deficiency.
- **First clinical sign of Vitamin A deficiency:** *Conjunctival Xerosis*
- **First clinical symptom of vitamin A deficiency:** *Night blindness*

WHO Classification of Xerophthalmia

CLASS	SIGNS
X1A	Conjunctival xerosis
X1B	Conjunctival xerosis with bitot's spot
X2	Corneal xerosis
X3A	Corneal xerosis with ulceration
X3B	Keratomalacia

73. Ans. (a) Xerophthalmia

Ref: Harrison's, 19th ed. pg. 96e-6

- MC ocular manifestation of vitamin A deficiency is xerophthalmia. This condition includes milder stages of night blindness and conjunctival xerosis (dryness) with bitot's spot.

Other Features of Vitamin A Deficiency:

- Diarrhea, Dysentery, measles, malaria or respiratory. These condition can pose risk to life if associated with vitamin A deficiency.

Features of Vitamin A toxicity:

- **Acute:** Increased ICP leading to bulging fontanel, vertigo, diplopia, seizure and exfoliative dermatitis.
- **Chronic:** dry skin, Chielosis, glossitis, alopecia, bone demineralization, hyperlipidemia, hypercalcemia, amenorrhea and features of pseudotumor cerebri with increased ICP and papilledema.

74. Ans. (c) Blurring of disc

Ref: A.K. Khurana, 6th ed. pg. 323-24, Khurana, 4th ed. pg. 299

Papilledema: Optic disc edema which is associated with the increased ICP, and is almost always bilateral.

Ophthalmoscopic Features of Early Papilledema:

- Obscuration of disc margin (nasal field involved first followed by superior > inferior > temporal).
- Blurring of peripapillary nerve fibre
- Absence of spontaneous venous pulsation at the disc
- Mild hyperemia

Features of Fully developed/Late papilledema

- Elevation of cup
- Obliteration of physiological cup
- Marked hyperemia of disc
- Multiple soft exudates
- Tortuous and engorged veins
- Separation of nerve-fibre layer by edema.

75. Ans. (d) All of the above

Ref: A.K. Khurana, 6th ed. pg. 116, 4th ed. pg. 109-110

MOOREN'S ULCER

- Mooren's Ulcer/chronic serpiginous or rodent ulcer is a severe inflammatory peripheral ulcerative keratitis.
- **Treatment:**
 - Topical corticosteroids
 - Immunosuppressives with systemic steroids, e.g. cyclosporine
 - Soft contact lens
 - Lamellar or full thickness corneal grafting.

76. Ans. (d) Descemet's membrane

Ref: A.K. Khurana, 6th ed. pg. 434

- **Chalcosis:** Refers to the specific changes produced by accumulation of copper in the eye.
- **Clinical feature:**
 - **Kayser-fleischer ring:** It is a golden brown ring which occurs due to deposition of copper in the peripheral parts of the *Descemet's membrane of the cornea*.
 - **Sunflower cataract:** Produced by deposition of copper on the posterior capsule of the lens.
 - **Retina:** It may show deposition of golden plaques at the posterior pole which reflect the light with a metallic sheen.

77. Ans. (c) HSV infection

Ref: A.K. Khurana, 6th ed. pg. 108

- Viral keratitis causes corneal ulceration. It is caused most commonly by **Herpes simplex, Herpes Zoster and Adenoviruses**.

- Dendritic & geographical corneal ulcers are seen in herpes simplex ocular disease.
- Dendritic ulcer (branching ulcer with knobbed ends), resembles no other condition, and is *pathognomic of herpes simplex ocular infection*.
- The use of **steroids** in dendritic ulcer hastens the formation of geographical ulcer so it is **contraindicated**.

78. Ans. (d) Dexamethasone

Ref: A.K. Khurana, 6th ed. pg. 108-109

- **Dendritic ulcer** is an irregular linear branching ulcer with knobbed ends and reduced corneal sensations seen in epithelial keratitis
- It is caused by herpes simplex infection.
- Steroids cause progression of dendritic ulcer, into **geographical ulcer** so, they are **contraindicated**.
- The treatment is done with **3% acyclovir ointment** and mechanical debridement. Other antibiotics may be required if there is a secondary infection.

79. Ans. (b) Stromal keratitis

Ref: A.K. Khurana, 6th ed. pg. 108-109

STROMAL KERATITIS

- It manifests as disciform keratitis (*disc shape ulcer with a surrounding Wessley immune ring formed due to delayed hypersensitivity to HSV antigen*) or **diffuse stromal necrotic keratitis** (due to active viral invasion and tissue destruction).
- **Treatment:** Steroid drops with acyclovir 3%

Extra Mile

Epithelial keratitis

- Caused by herpes simplex virus. It manifests as dendritic ulcer (irregular, linear, branching ulcer with knobbed ends and reduced corneal sensation) or geographical ulcer (large "amoeboid ulcer"). Steroids cause progression of dendritic ulcer into geographical ulcer, so, they are contradicted.
- Treatment: 3% acyclovir ointment and mechanical debridement.

80. Ans. (b) Herpes zoster keratitis

Ref: A.K. Khurana, 6th ed. pg. 108-109

81. Ans. (d) Syphilis

Ref: A.K. Khurana, 6th ed. pg. 120-121

- Keratitis means corneal inflammation
- **Interstitial Keratitis** basically means corneal scarring due to chronic inflammation of the corneal stroma. Interstitial means space between cells i.e. corneal stroma which lies between the epithelium and the endothelium.
- It is most commonly seen in infection like syphilis

SYPHILITIC KERATITIS

- It is seen more frequently with congenital syphilis than acquired syphilis. It may present as part of Hutchinson's triad of:
 - **Interstitial keratitis**
 - Hutchinson teeth
 - Vestibular deafness

82. Ans. (b) Propomidine isothionate

Ref: A.K. Khurana, 6th ed. pg. 112

ACANTHAMOEBA KERATITIS

- Acanthamoeba is a free lying amoeba found in soil, fresh water, well water, sea water, sewage and air.
- **Mode of infection-** direct corneal contact with any material or water contaminated with the organism. **For eg:**
 - *Contact lens wearers using home-made saline from contaminated tap water is the commonest situation recognized for acanthamoeba infection.*
 - Other situations may be: mild trauma associated with contaminated vegetable matter, salt water diving, wind blown contaminant and hot tub use.
 - Opportunistic infection
- **Symptoms.** Very severe pain (out of proportion to the degree of inflammation), watering, photophobia, blepharospasm and blurred vision.
- **Treatment:** Specific medical treatment includes:
 - 0.1 % propamidine isothionate (brolene) drops;
 - Neomycin drops
 - Polyhexamethylene biguanide (0.01% - 0.02% solution)
 - Chlorhexidine

83. Ans. (c) Wearing of soft contact lenses

Ref: A.K. Khurana, 6th ed. pg. 112

84. Ans. (d) All of the above

Ref: A.K. Khurana, 6th ed. pg. 82-83

GIANT PAPILLARY CONJUNCTIVITIS

- It is the inflammation of conjunctiva with formation of very large sized papillae.
- **Cause:** It is a localized allergic response to a physically rough or deposited surface (*contact lens, prosthesis, left out nylon sutures*).
- **Symptoms:** Itching, stringy discharge and reduced wearing time of contact lens or prosthetic shell.
- **Treatment:** The offending cause should be removed.
 - Disodium cromoglycate is known to relieve the symptoms and enhance the rate of resolution.

85. Ans. (b) **Contact lens**

Please refer to previous explanation.

86. Ans. (b) **Gaint papillary conjunctivitis**

Ref: A.K. Khurana, 6th ed. pg. 82-83

Please refer to above explanation

Extra Mile

Inclusion Conjunctivitis

- Caused by Chlamydia trachomatis D-K within 5–14 days of birth. Clinical features include mucoid/mucopurulent discharge, redness in conjunctiva, swollen lids and pain in eyeballs.

Follicular conjunctivitis

- It is characterized by redness in conjunctiva, formation of follicles and discharge from the eyes. It is of following types:
 - Epidemic keratoconjunctivitis:** Adenovirus 8, 19; can cause “acute pseudomembranous conjunctivitis” in severe infection.
 - Pharyngo-conjunctival fever:** Caused by adenovirus.
 - Herpetic conjunctivitis:** Caused by HSV1 (more commonly) and HSV 2 (less commonly)

87. Ans. (d) **Pseudomonas**

Ref: A.K. Khurana, 6th ed. pg. 98

PSEUDOMONAS

- Pseudomonas is the commonest organism affecting long term use of contact lens followed by acanthamoeba. SIGNS suggesting the former infection: presence of ring shaped ulcer, lack of vascularization, pain out of proportion, pseudodendritis.

PNEUMOCOCCUS

- The commonest cause of corneal ulcer in India is Streptococcus Pneumonia (causes central corneal ulcer) whereas the commonest cause in the world is staphylococcus aureus (causes peripheral corneal ulcer).
- The bacterial ulcer can present with the formation of a hypopyon (sterile).
- The characteristic hypopyon corneal ulcer is due to pneumococcus and is called **ulcus serpens**.
- Treatment:** Topical gentamicin/tobramycin and cephalozin with cycloplegics (atropine ointment or drops) and analgesics.

88. Ans. (a) **Fungal corneal ulcer**

Ref: A.K. Khurana 6th ed./106, Khurana 4th ed./100

- Fungal corneal ulcer aka fungal keratitis is most commonly caused by **Aspergillus fusarium**. Patient in this condition presents with history of trauma with vegetative matter.

- Symptoms shown by patients here are milder than signs. Signs are dry looking, greyish white corneal ulcers with feather finger like extensions (due to hypae)

Signs of Fungal Keratitis:

- Satellite nodule** (satellite lesion present around ulcer)
- Large organized hypopyon (non-sterile)
- Immune ring of pessary**

Predisposing factors- topical steroids, organic matter. Worst prognosis.

Treatment: 5% natamycin or .2% fluconazole for 6-8 weeks.

89. Ans. (c) **Fungal ulcer**

Ref: A.K. Khurana, 6th ed. pg. 106, Khurana, 4th ed. pg. 100

Please refer to above explanation

90. Ans. (a) **Azithromycin**

Ref: A.K. Khurana, 6th ed. pg. 65-66

- Trachoma is caused by C. Trachomatis.
- I.P.- 5-12 days
- SAFE strategy used for control of trachoma
 - S: Surgery
 - A: Antibiotic
 - F: Face wash
 - E: Environment
- DOC for Trachoma: Azithromycin > tetracycline

91. Ans. (d) **Upper palpebral conjunctiva**

Ref: A.K. Khurana, 6th ed. pg. 69

- Conjunctival scarring seen in **trachoma** as irregular stellate shaped scars over sulcus subtarsalis is called Arlt's line.
- It is seen in upper palpebral conjunctiva.

92. Ans. (a) **Limbus**

Ref: A.K. Khurana, 6th ed. pg. 69-70; Parson's 21st ed. pg. 173

- Herbert pits are oval or circular scar which is left after healing of Herbert pit in the limbus area.

Other Signs of Trachoma:

- Conjunctival scarring (**Arlt's line**)
- Sago grain** follicles/Bulbar follicles (*pathognomonic*)

93. Ans. (b) **Adeno virus**

Ref: AK Khurana, 6th ed. pg. 73-74

- Adenovirus is considered as most common cause of swimming pool conjunctivitis.
- Chlorine is unable to eliminate the virus, hence it can often present as an outbreak.

Disease	Causative agent
Swimming pool conjunctivitis	Adenovirus
Swimming pool granuloma	Mycobacterium marinum
Swimmer's itch	Schistosoma mansoni S. japonicum

94. Ans. (a) **Vernal keratoconjunctivitis**Ref: A.K. Khurana, 6th ed. pg. 79**CONJUNCTIVITIS**

- The inflammation of the conjunctiva is characterized by redness associated with watery or mucopurulent discharge.

VERNAL KERATO-CONJUNCTIVITIS OR SPRING CATARRH

- It is a recurrent, bilateral, interstitial, self limiting, allergic inflammation of the conjunctiva seen in children usually in summer months.
- Etiology:** It is considered a hypersensitivity reaction to some exogenous allergen such as grass pollen etc.
- Clinical features:** Characterized by marked burning and itching sensation which is usually in tolerable.
 - Lacrimation.
 - Stringy (**ropy**) discharge.
 - Usually upper tarsal conjunctiva of both eyes are involved.
 - Lesion are characterized as “cobble-stone” or “pavement stone” fashion.
 - Horner Tranta's spots:** Presence of discrete whitish raised dots along the limbus.
- Treatment**
 - Mast Cell Stabilizers (Olopatadine)
 - Sodium Chromoglycate

Simple allergic conjunctivitis: Non specific allergic rhinitis associated with hay fever or seasonal/perennial allergic conjunctivitis.

GIANT PAPILLARY CONJUNCTIVITIS

- Conjunctivitis with formation of large sized papillae in upper tarsal conjunctiva due to localized allergy
- Against contact lens /nylon sutures/prosthesis.
- Treatment:** Removal of offending agent
 - Mast Cell Stabilizers
- Acute hemorrhagic conjunctivitis:** It is also called Apollo conjunctivitis. It is caused by picornavirus (enterovirus type 70).

Extra Mile

Discharge	Etiological Agent
Purulent/ mucopurulent	Bacterial conjunctivitis
Watery	Viral conjunctivitis
Ropy	Allergic conjunctivitis
Mucopurulent	Chlamydial conjunctivitis

95. Ans. (a) **Olopatadine drops**Ref: A.K. Khurana, 6th ed. pg. 79-80

Please refer to above explanation

96. Ans. (d) **Trachoma**Ref: A.K. Khurana, 6th ed. pg. 61, 65

Trachoma: is a chronic keratoconjunctivitis, primarily affecting the superficial epithelium of conjunctiva and cornea simultaneously.

- It is one of the leading causes of preventable blindness in the world.

Etiology

- Causative organism:** Caused by Chlamydia trachomatis.
- The organism is epitheliotropic and produces intracytoplasmic inclusion bodies called H.P. bodies.
- There are 11 identified serotypes of Chlamydia: A, B, Ba, C, D, E, F, G, H, J and K
- Serotypes A, B, Ba and C are associated with hyperendemic (blinding) trachoma
- Serotypes D-K are associated with paratrachoma.

OPHTHALMIA NEONATORUM

- Bilateral inflammation of the conjunctiva occurring in an infant, less than 30 days old.

Source and Mode of Infection

- Before birth:** Very rare; through infected amniotic fluid in case of ruptured membranes.
- During Birth:** Most common mode of infection; from infected birth canal when the child is born with face presentation or with forceps.
- After birth:** Infection during first bath of newborn or from infected clothes or hands.

Causative Agents

- Chemical conjunctivitis:** Silver nitrate or antibiotics used for prophylaxis.
- Gonococcal infection**
- Neonatal inclusion conjunctivitis** caused by serotypes D to K of Chlamydia trachomatis is the commonest cause of ophthalmia neonatorum.

97. Ans. (d) **Vernal conjunctivitis**Ref: A.K. Khurana, 6th ed. pg. 79-80

Please refer to above explanation

98. Ans. (b) **Pinguecula**Ref: A.K. Khurana, 6th ed. pg. 86**PINGUECULA**

- Conjunctival fatty degeneration near limbus. It is bilateral condition, affects more commonly nasal side followed by involvement of the temporal side. No treatment required.
- Totally benign.

FMGE Solutions Screening Examination

1094

PTERYGIUM

- Triangular invasion of conjunctiva upon the cornea. It is commoner in dry heat, sun exposure and abundant dust. Iron deposition in the corneal epithelium at the advancing head of the pterygium is called STOCKER LINE. Usually asymptomatic.
- **Treatment:** Surgical excision. The commonest problem after excision is recurrence which is reduced by postoperative use of mitomycin C/thiotepa or by doing surgical excision with free conjunctival graft from same/other eye.

CHALAZION

- Chronic granulomatous inflammation of Meibomian Gland. No pain.
- **Treatment:** Incision and drainage

HORDEOLUM

- **External hordeolum/ STYE-** Staphylococcus infection of Zeiss gland.
 - **Treatment**
 - ◆ Topical antibiotics.
 - ◆ Hot fomentation.
- **Internal hordeolum-** Acute Staphylococcus infection of Meibomian gland. Extremely painful.
 - **Treatment :** Incision and Drainage.

99. Ans. (c) **Bulge in limbal area lined by root of iris**

Ref: A.K. Khurana, 6th ed. pg. 144

- **Intercalary staphyloma** is a localized ectasia of limbal tissue lined by the root of iris.
- **Cause:** perforating injury of the peripheral cornea or perforation of marginal corneal ulcer.

Extra Mile

- **Anterior staphyloma:** Formation of pseudo cornea after perforation of a large sloughing corneal ulcer.
- **Ciliary staphyloma:** Incarceration of ciliary body and is arises due to complication of scleritis.
- **Equatorial staphyloma:** The ectasia of the sclera of equatorial region with incarceration of the choroid is known as equatorial staphyloma.
- **Posterior staphyloma** is an ectasia of the sclera at the posterior pole which is lined by the choroid.

100. Ans. (d) **Scleritis**

Ref: A.K. Khurana, 6th ed. pg. 144

101. Ans. (d) **Degenerative myopia**

Ref: A.K. Khurana, 6th ed. pg. 144

- Posterior staphyloma is seen in conditions like pathological myopia, posterior scleritis and perforating injuries.

Important Features Associated with Myopia

- **Simple/developmental myopia is the commonest type of myopia.**
- Foster flecks is the choroidal haemorrhage in the macular region.
- Lacquer cracks are breaks in the bruchs membrane
- **Retinal detachment is the most serious complication of myopia.**

102. Ans. (b) **Rheumatoid arthritis**

Ref: A.K. Khurana, 6th ed. pg. 141, Khurana, 4th ed. pg. 129

- Scleritis is chronic inflammation of the sclera. Most commonly seen in elderly females (40-70 years).
- Scleritis is associated with autoimmune collagen disorders, **most commonly with rheumatoid arthritis.**
- Other causes can be PAN, SLE, ankylosis spondylitis, Wegener's granulomatosis, thyrotoxicosis, TB, syphilis.

103. Ans. (c) **Aqueous deficiency**

Ref: A.K. Khurana, 6th ed. pg. 389

Tear Film Consists of 3 Layers:

- **Lipid layer-** Outermost layer. Secreted by Meibomian, Zeiss and Moll gland
- **Aqueous layer-** intermediate layer. Forms bulk of tear. Secreted by lacrimal gland
- **Mucous/Mucin layer:** Innermost layer. Secreted by conjunctival goblet cells

KERATOCONJUNCTIVITIS SICCA

- It is the disease entity most commonly seen due to aqueous tear deficiency.
- Causes can be: Sjogren syndrome, hyposecretion, congenital alacrimia. Decreased secretion or lack of secretion from other tear glands also contribute to this condition.
- **Symptoms of keratoconjunctivitis sicca:** Foreign body sensation, photophobia. Test is done by wetting of a filter paper (Schirmer strip test)

Extra Mile

Mucin layer deficiency can lead to xerophthalmia, conjunctival scarring. Can be seen in SJS, chemical burns, trachoma.

RETINA AND UVEAL TRACT

104. Ans. (c) **Anterior uveitis**

Ref: Comprehensive Ophthalmology by A.K Khurana 6th ed. P 167

UVEITIS IN SARCOIDOSIS

- Sarcoidosis is one of the chronic granulomatous disease that can cause non-infective uveitis
- **MC age group:** 20–50 years; F > M
- **Associated feature:** Bilateral hilar lymphadenopathy, pulmonary infiltration, skin and ocular lesions
- 20–50% of sarcoidosis patients present with ocular lesions like:
 - **Sarcoid uveitis:** Can cause anterior, posterior or intermediate panuveitis
 - **Anterior uveitis:** Large mutton fat KP, busaca nodule, anterior chamber cells and flare
 - **Intermediate uveitis:** Characterized by snow balls and snow banking
 - **Posterior uveitis:** Present with cystoid macular edema, periphlebitis retinae with sheathing, appearing as candle wax dripping, peripheral multifocal chorioretinitis characterised by small, punched out atrophic spots (*it is highly suggestive of sarcoidosis*).
- **Uveoparotid fever:** Aka Heerfordt's syndrome:
 - Characterized by bilateral granulomatous panuveitis with painful enlargement of parotid gland, rash, fever and cranial nerve palsies.

DIAGNOSIS:

- Abnormal Chest X-ray (in 90% cases)
- **Kveim test:** +ve
- Serum ACE level

Treatment: Steroids

- Raised aldosterone level usually among type A personalities
- Cushing syndrome, idiopathic. Fluorescein angiography shows ink blot pattern and smoke stack pattern.
- **Diabetic retinopathy:** It is of 2 types:
 - **Nonproliferative diabetic retinopathy (NPDR):** Findings/changes in NPDR are:
 - ♦ **Microaneurysm:** Earliest change
 - ♦ Retinal hemorrhage
 - ♦ Hard and soft exudates.
 - **Proliferative diabetic retinopathy (PDR):** Findings/changes in PDR are:
 - ♦ **Neovascularization:** Hallmark
 - ♦ Vitreous hemorrhage, and
 - ♦ Retinal detachment.

106. Ans. (b) 1.5 mm

Ref: Comprehensive Ophthalmology by Khurana 6/ed. P 6

- The average optic disc is 1500 microns (or 1.5 millimeters) in size where optic nerve enters into the back of the eye.
 - Small optic disc is said when vertical diameter of optic disc is <1.5 mm
 - Large disc is said when size of vertical diameter is >2.2 mm.
- Length of optic nerve is 47–50 mm and has 4 parts:
 - **Intraocular:** 1 mm
 - **Intraorbital:** 30 mm
 - **Intracanalicular:** 6–9 mm
 - **Intracranial:** 10 mm

107. Ans. (b) Corneal endothelium

Ref: Comprehensive Ophthalmology by Khurana 6/ed. P 34

- Keratic precipitate (KP) is deposition of protein on the corneal endothelium in patients with anterior uveitis.
- This KP is deposited in a triangular fashion, known as Arlt's triangle.
- In some chronic granulomatous diseases like sarcoidosis, leprosy, TB, there is deposition of special KP's known as mutton fat KP.

105. Ans. (b) Central retinal artery occlusion

Ref: Walsh and Hoyt; Vol. 3, P 3370

- **Central retinal artery occlusion (CRAO):** Presents with sudden painless loss of vision. Causes are:
 - **Artery occlusion by the Emboli:** It is most common cause.
 - **Other causes:** Giant cell arteritis, SLE, scleroderma.
 - Fundus appears milky white because of retinal edema. There is cherry red spot. Due to embolus the blood column within the retina is segmented and is known as cattle tracking.
- **Central retinal vein occlusion (CRVO):** Its incidence is more common than CRAO. Causes are:
 - Hypertension, diabetes mellitus, atherosclerosis.
 - **Upon examination:** Tortuous and engorged veins, disc edema, soft exudate and evidence of rubeosis iridis (new vessel on iris)
- **Central serous retinopathy (CSR):** It is due to accumulation of transparent fluid at the posterior pole specially macula causing a circumscribed area of retinal detachment in the macular region. Causes are:

FMGE Solutions Screening Examination

1096

108. Ans. (a) 1-5

Ref: Harrison 19th ed. P 2424

- Poor sugar control (glycosylated hemoglobin > 7%) leads to development of diabetic retinopathy within 5 years in type 1 diabetes mellitus and over 15–20 years in type 2 diabetes mellitus.
- Diabetics have 25 times higher chances of blindness as compared to nondiabetics.

Extra Mile

- Most common cause of *visual loss* in a diabetic is macular edema.
- Best method to *detect visual loss* is FFA or optical coherence tomography.
- Most common cause of blindness in diabetic is retinal detachment.
- Diabetic retinopathy and nephropathy progress over same duration and *always co-exist*.
- Best *predictor for development of retinopathy* is duration of diabetes.

109. Ans. (a) Cycloplegics

Ref: Khurana, 6th ed. pg. 159-60

- **DOC for acute anterior uveitis:** Topical glucocorticoids
- **1st line agent for immediate management of acute uveitis:** Cycloplegics
- **Khurana states:** “Cycloplegics are very useful and most effective during acute phase of iridocyclitis”
- Commonly used drug is 1% atropine sulphate eye ointment or drops to be instilled 2-3 times a day.
- **Mechanism of action:**
 - Relieves spasm of iris sphincter and ciliary body, which gives immediate relief and comfort from pain.
 - Prevents synechiae formation and breaks them as well.
 - Decreases hyperemia which reduces exudation.
 - Increases blood supply to anterior uvea by relieving pressure on anterior ciliary artery, which adds to more absorption of toxin.

110. Ans. (a) Nongranulomatous uveitis

Ref: Khurana, 6th ed. pg. 154

- **Granular KPs** are small and medium keratic precipitate, and are pathognomonic of non-granulomatous uveitis.
- These are small, dirty white KP arranged irregularly at the back of cornea and are usually numerous.

Extra Mile

- **Fine KP:** Aka stellate KP. They usually cover whole corneal endothelium and form endothelial dusting. They are seen in: Fuch's heterochromic iridocyclitis, Herpetic iritis and CMV retinitis.
- **Old KP:** They are irregular in shape and this is a sign of healed uveitis.

111. Ans. (a) Granulomatous uveitis

Ref: Khurana, 6th ed. pg. 154

- **Mutton fat keratic precipitates** are typically seen in granulomatous uveitis. These are composed of epithelioid cells and macrophages.
- These are large, thick, fluffy, lardaceous KP having waxy or greasy appearance. They are usually 10-15 in number

112. Ans. (c) Reiter syndrome

Ref: Khurana, 6th ed. pg. 168

- **Reiter syndrome** is characterized by triad of: Urethritis, arthritis and conjunctivitis with or without iridocyclitis.
- It mostly affects males who are positive for HLA B27.

113. Ans. (b) Hyperoxia

Ref: Khurana, 6th ed. pg. 283

- Retinopathy of prematurity (ROP), (*earlier known as retrolental fibroplasia*) is a bilateral proliferative retinopathy occurring in premature infants with low birth weight who often have been exposed to high concentration of oxygen.
- **Risk factors:**
 - Low gestation age <32 weeks
 - Low birth weight <1500 gm
 - Supplemental oxygen therapy
 - Vitamin E deficiency in mothers, respiratory distress syndrome, asphyxia, shock etc.

114. Ans. (b) Periphery of pupil

Ref: A.K Khurana's Ophthalmology, 6th ed. pg. 153

- Granulomatous uveitis is characterized by infiltration with lymphocytes, plasma cells and mobilization and proliferation of large mononuclear cells → collectively known as iris nodule
- Iris nodule is a feature of granulomatous uveitis.
- If formed near pupillary border: **Koepppe's nodule**
- If formed near collarette: **Busaca nodule**
- If deposited at the back of cornea: Keratic precipitates

115. Ans. (c) Sensory and pigmentary layer

Ref: A.K. Khurana, 6th ed. pg. 299

- Retina has 10 layers.
- Inner 9 layers are known as neurosensory layer and outer one layer is known as pigmentary layer.
- *Retinal detachment is defined as separation of neurosensory layer of retina from pigmentary retinal layer.*

116. Ans. (a) X linked

Ref: A.K. Khurana, 6th ed. pg. 287

INVERSE RETINITIS PIGMENTOSA

- Inverse RP is a degeneration of the nerve cells in the macula, which is located in the center of the retina.

Inverse or central RP is characterized by a bilateral and often symmetrical loss of cone function in the presence of a reduced rod function. Individuals with macular degeneration secondary to a central vision loss experience difficulty reading, recognizing faces, shapes and contours of objects or things.

- This is a general term for a disparate group of rod-cone dystrophies characterized by progressive **night blindness**, visual field constriction with a **ring scotoma/tubular vision**, **loss of acuity**, **waxy pallor optic disc**, and an abnormal electroretinogram (ERG).
- It occurs sporadically or in an autosomal recessive, dominant, or X-linked **pattern**.
- **MC inheritance pattern: Autosomal Recessive**
- Irregular black **deposits of clumped pigment in the peripheral retina**, called **bone spicules** because of their vague resemblance to the spicules of cancellous bone, give the disease its name.
- **No definite treatment. However, Vitamin A can slow down the progression.**

117. Ans. (c) **Central scotoma**

Ref: A.K. Khurana, 6th ed. pg. 233, 287-88

Central scotoma is a feature of open angle glaucoma.

All other choices are considered as triad of retinitis pigmentosa (Bony spicule on retina, waxy pallor disc, Ring scotoma)

Visual field abnormalities in glaucoma are initially observed on kinetic perimetry are as follows

- **Relative paracentral scotoma:** These are areas where smaller or dimmer targets are not visualized by the patient, but larger or brighter targets are appreciated.
- **Bjerrum's Scotoma:** Extension of the blind spot in the shape of an arc in the central bjerrum's area.
- **Siedel scotoma:** One that appears to start at the poles of the blind spot and arches over the macular area, without reaching the horizontal meridian nasally.
- **Arcuate scotoma:** Also appear to start at the superior or inferior poles of the blind spot and arch over the macular area, widening as they curve down or up to end as a horizontal line nasally, which never crosses the horizontal divide of the visual field.
- **Double arcuate or ring scotoma:** Advanced glaucomatous field defects - only central and temporal islands of vision are left when two arcuate scotomas expand to involve the peripheral visual field
- **Nasal step:** The appearance of a horizontal shelf in the nasal visual field is caused by an asymmetry in the nerve fiber loss at the two poles.
- **End-stage or near-total field defect** with only a residual temporal island of vision, occurs at the last stage, sparing of blind spot.

118. Ans. (c) **Tractional retinal detachment not involving the macula**

Ref: A.K. Khurana, 6th ed. pg. 276-77

- Diabetic retinopathy leads to tractional retinal detachment, which presents with slowly progressive loss of vision.
- There is no photopsia or floaters unless macula is involved because the vitreo-retinal traction develops very slowly.

119. Ans. (a) **Microaneurysms**

Ref: A.K. Khurana, 6th ed. pg. 276-77

DIABETIC RETINOPATHY

- The retinal change seen in diabetes are called as diabetic retinopathy. In diabetes, there is pericytes necrosis. Normally ratio 1 pericytes: 1 endothelial cell. But in diabetic retinopathy 1 pericyte: 3 endothelial cell. The vessels wall is weakened and leakage occurs. Classification –
 - Non proliferative diabetic retinopathy
 - Proliferative diabetic retinopathy

Non proliferative diabetic retinopathy (NPDR)	Proliferative diabetic retinopathy (PDR)
<ul style="list-style-type: none"> • Microaneurysms- early manifestation • Dot and Blot hemorrhages • Hard exudates • Soft exudates 	<ul style="list-style-type: none"> • Neovascularization of the disc • Neovascularization of anywhere else from the disc • Neovascularization of iris-RUBIOSIS IRIDIS

120. Ans. (d) **Iris neovascularization**

Ref: A.K. Khurana, 6th ed. pg. 250-51

- Neovascular glaucoma results from the formation of a neovascular membrane involving the anterior chamber secondary to diffuse retinal hypoxia. There is release of factors like vascular endothelial growth factor (VEGF) from the vitreous which causes formation of abnormal new blood vessels over the iris. The fibrovascular membrane then progressively closes the angle of the anterior chamber.
- It is usually associated with **neovascularisation of the iris (rubeosis iridis)**.

121. Ans. (b) **5FU**

Ref: A.K. Khurana, 6th ed. pg. 251-52

- Anti-VEGF are class of drugs which are used for treatment of diabetic retinopathy with neovascularization (proliferative diabetic retinopathy-PDR).
- Available anti-VEGF are: Ranibizumab, Bevacizumab, Pegaptanib.

Note: TOC for PDR- Laser photocoagulation

122. Ans. (c) **Vitreous hemorrhage**

Ref: A.K. Khurana, 6th ed. pg. 260-61

- Vitreous haemorrhage usually occurs from the retinal vessels and may present as pre-retinal or an intragel haemorrhage.

CAUSES

Causes of Vitreous Haemorrhage are as Follows:

- **Spontaneous** vitreous haemorrhage from retinal breaks especially those associated with PVD.
- **Trauma to eye:** Blunt or perforating
- **Inflammatory diseases** such as chorioretinitis and periphlebitis
- **Vascular disorders** e.g., hypertensive retinopathy, and central retinal vein occlusion.
- **Metabolic diseases** as diabetic retinopathy.
- **Blood dyscrasias** eg: Retinopathy of anaemia, leukaemias, polycythemia sickle-cell
- **Neoplasms**

Clinical Features

- **Symptoms:** Sudden development of floaters occurs when the vitreous haemorrhage is small.
 - In massive vitreous haemorrhage, sudden painless loss of vision.
- **Signs**
 - Distant direct ophthalmoscopy reveals black shadows against the red glow in small haemorrhages and no red glow in a large haemorrhage.
 - Direct and indirect ophthalmoscopy may show presence of blood in the vitreous cavity.
 - Ultrasonography with b-scan is particularly helpful in diagnosing vitreous haemorrhage.

123. Ans. (a) Vitreous haemorrhage

Ref: A.K. Khurana, 6th ed. pg. 260-61

Causes of Painless and Painful Loss of Vision

Sudden painless loss of vision	Sudden painful loss of vision
<ul style="list-style-type: none"> • Vascular occlusion (CRAO, CRVO) • Retinal detachment • Vitreous hemorrhage • Ischemic optic neuropathy 	<ul style="list-style-type: none"> • Acute iridocyclitis • Chemical injuries • Mechanical injuries • Acute congestive glaucoma • Optic neuritis
Gradual painless loss of vision	Gradual painful loss of vision
<ul style="list-style-type: none"> • Progressive pterygium involving the pupil • Corneal degeneration • Corneal dystrophy • Developmental cataracts • Senile cataracts • Optic atrophy • Chorioretinal degeneration • Age- related macular degeneration • Diabetic retinopathy • Refractive errors • Papilloedema and Papillitis 	<ul style="list-style-type: none"> • Chronic iridocyclitis • Corneal ulceration • Chronic simple glaucoma

124. Ans. (d) Trauma

Ref: A.K. Khurana, 6th ed. pg. 260-61

- Vitreous hemorrhage is defined as the presence of extravasated blood within the space outlined by the zonular fibers and posterior lens capsule anteriorly, the nonpigmented epithelium of the ciliary body laterally, and the internal limiting membrane of the retina (lamina limitans interna) posteriorly and posterolaterally. **The 3 most common causes of vitreous hemorrhage are proliferative diabetic retinopathy, posterior vitreous detachment (PVD) with or without retinal tears, and ocular trauma (eg, shaken baby syndrome).**
 - Any cause of peripheral neovascularization may result in vitreous hemorrhage, **but trauma is the leading cause of vitreous hemorrhage in young people.**

The most common cause found in adults is diabetic retinopathy
MCC of recurrent vitreous hemorrhage in young adult: Eale's disease

125. Ans. (b) Exudative retinal detachment

Ref: A.K. Khurana, 6th ed. pg. 273

Please refer to above table.

RETINAL DETACHMENT

- Retinal detachment is the separation of neurosensory retina from the retinal pigmentary epithelium by subretinal fluid. Depending on the mechanism of subretinal fluid accumulation retinal detachment are of following types:
 - Exudative retinal detachment
 - Tractional retinal detachment
 - Rhegmatogenous retinal detachment
- Exudative retinal detachment:** Lesions of retinal pigment epithelium. **Commonest causes are:**
 - **Malignant melanoma of choroid**
 - **Followed by pregnancy induce hypertension, 140/90 after 20th week of gestation.**
 - Malignant hypertension 200/120 end stage hypertension.

TRACTIONAL RETINAL DETACHMENT

- Caused by mechanical traction (progressive contraction) of fibrovascular membranes over large areas of vitreoretinal adhesion. *Characterized by slow painless loss of vision* (only retinal detachment that is slow). Causes are:
 - *Most common cause is diabetes mellitus*
 - Retinopathy of pregnancy
 - Sickle cell anemia

RHEGMATOGENOUS RETINAL DETACHMENT

- Characterized by the presence of retinal break held open by vitreo retinal traction that allows accumulation of liquefied vitreous (syneresis) under neurosensory retina, separating it from retinal pigment epithelium.

- The predisposing conditions of **rhegmatogenous retinal detachment** are **Myopia**, previous intraocular surgery such as **aphakia** or pseudophakia, a family history of retinal detachment, **trauma** and inflammation.

VITREOUS HEMORRHAGE

- Vitreous hemorrhage is not a (clinical) feature of retinal detachment. *Characterised by sudden painless loss of vision; floaters, no flashing of light. Causes are:*
 - **Diabetic retinopathy: most common cause**
 - In young patient most common cause is Trauma and Eale's disease.

126. Ans. (a) Exudative retinal detachment

Ref: A.K. Khurana, 6th ed. pg. 273, 299

127. Ans. (b) Diabetic retinopathy

Ref: A.K. Khurana, 6th ed. pg. 273, 299; Parson's Ophthalmology 20/312

128. Ans. (d) CRVO

Ref: A.K. Khurana, 6th ed. pg. 269, 431

Cherry Red Spot of Retina is seen in—

- CRAO
- Trauma (Blunt trauma, Berlin's edema)
- Neimann pick disease
- Gaucher's disease
- Tay – Sach's disease
- Sand hoff's disease

Mnemonic: Cherry Tree Never Grow Tall in Sand.

129. Ans. (c) Central retinal vein occlusion

Ref: A.K. Khurana, 6th ed. pg. 214, 271, 294

CYSTOID MACULAR EDEMA (CME)

- Collection of fluid in the **outer plexiform (Henle's layer) a nuclear layer** of the retina is called CME.
- It is associated with Central Retinal Vein Occlusion/ post operative complication of cataract extraction and penetrating keratoplasty/ diabetic retinopathy/ Retinitis pigmentosa
- Minimal to moderate loss of vision is seen.
- It is **best examined with slit lamp/+90D lens**
- Ophthalmoscopy shows "**honeycomb appearance**" of macula.
- Fundus fluorescein angiography shows "**flowerpetal appearance**".
- Treatment of underlying primary cause and drugs (topical steroids triamcinolone/ topical NSAIDs like flurbiprofen) is beneficial.

Extra Mile

- **100 day glaucoma'** is seen with CRVO
- **CATTLE TRUCK** appearance seen with CRAO
- **IRVIN GASS SYNDROME** is seen with post cataract CME

130. Ans. (a) Sarcoidosis

SARCOIDOSIS

- Sarcoidosis is a granulomatous disease of unknown etiology.
- It occurs most frequently in young adults (20 to 40 years), has a predilection for women.
- Around 20% patients with sarcoidosis has ocular involvement.
- **The most prevalent ocular sign** is unilateral, anterior, granulomatous uveitis.
- The common clinical ocular findings associated with sarcoid uveitis include:
 - Decreased or hazy vision, pain, photophobia, lacrimation, conjunctival injection, cells and flare in the anterior chamber, granulomatous iritis with large "**mutton fat**" keratic precipitates scattered over the back surface of the corneal endothelium, iritis spill over leading to anterior vitritis, true vitritis with white exudative debris in the region of the ora serrata (snowball or snowbank retinopathy) with retinal vasculitis (**candle wax drippings**) and phlebitis (venous sheathing).

AMYLOIDOSIS

- **Orbit/adnexal:** Include ptosis, keratoconjunctivitis sicca, proptosis, ocular motility disturbances, palpable mass lesions and pupillary abnormalities. Pain uncommonly accompanies orbital amyloidosis, and its presence should prompt the examiner to consider alternative diagnosis.
- **Conjunctiva:** Ptosis, a visible or palpable mass, and recurrent subconjunctival hemorrhage are commonly reported symptoms.
- **Anterior chamber/iris:** A "scalloped" configuration of the iris margin may signify amyloid deposition in the iris stroma or, alternatively, disruption of the parasympathetic innervation of the iris sphincter. Anterior chamber involvement appears as whitish, flocculent debris in the aqueous, on the lens capsule or on the iris surface.
- **Lens:** Pseudopodia lentis, punctate dots on the posterior capsule resembling ameboid foot processes, are considered pathognomonic of vitreoretinal amyloidosis in patients with hereditary disease.
- **Vitreous/retina:** Vitreoretinal amyloidosis manifests as "**lacy**," "**cobweb-like**," "**sheet-like**" or "**stringy**" veils of gray or yellowish-white material in the vitreous. Symptoms include floaters, blurry vision or glare, or patients may be asymptomatic.

FMGE Solutions Screening Examination

- **Diagnosis:** Congo red staining demonstrating apple-green birefringence when viewed through crossed polarimetric filters remains the gold standard for establishing the diagnosis of amyloidosis.
- **Treatment:** Surgical excision or debulking remains the treatment of choice.

131. Ans. (a) Pars planitis

Ref: A.K. Khurana, 6th ed. pg. 150-51

INTERMEDIATE UVEITIS (PARS PLANITIS)

- It denotes inflammation of pars plana part of ciliary body and most peripheral part of the retina.
- **Etiology:** It is an idiopathic disease usually affecting both eyes (80 percent) of children and young adults.

Clinical Features

- **Symptoms:** Most of the patients present with history of floaters.
- **Signs:** The eye is usually quiet.
 - Slit-lamp examination may show: mild aqueous flare, and fine KPs at the back of cornea.
 - Fundus examination with indirect ophthalmoscope reveals the whitish exudates in the inferior quadrant present near the ora serrata.
 - These typical exudates are referred as *snow ball opacities*. These may coalesce to form a grey white plaque called *snow banking*.

Extra Mile

TABLE: Comparison of Anterior, Intermediate and Posterior Uveitis

	Anterior	Intermediate	Posterior
Aka	Iridocyclitis	Pars Planitis	Chorioretinitis
Cause	Idiopathic	Idiopathic	Toxoplasmosis
Clin. Feature	Sudden painless loss of vision	Floaters	Sudden painless loss of vision
Cells	WBC's Keratic precipitate	Snowballs/ snowbanks	Headlight in fog appearance
Treatment	Topical steroids-DOC Cycloplegics	Inj: Triamcinilone	Antimicrobials Systemic steroids

132. Ans. (c) 7–10 days

Ref: A.K. Khurana, 6th ed. pg. 573, Khurana, 4th ed. pg. 146

TABLE: Cycloplegics and its duration of action

Drug	Duration of Effect (days)
Atropine	7–10
Scopolamine	3–7

Contd...

Drug	Duration of Effect (days)
Homatropine	1–3
Cyclopentolate	1
Tropicamide	days (6 hrs)

133. Ans. (a) Pilocarpine

Ref: A.K. Khurana, 6th ed. pg. 159-50, Khurana's, 4th ed. pg. 146, 47

- **DOC for acute anterior uveitis:** Topical glucocorticoids
- **1st line agent:** Cycloplegics
- In case of uveitis, there is spasm of ciliary muscle and constriction of pupil (miosis). Pilocarpine is a parasympathomimetic agent, which causes further spasm of ciliary muscles and miosis.
- **Note:** In case of anterior uveitis, there is irregular constriction of pupil called, *festooned pupil*.

134. Ans. (c) Pilocarpine eye drops

Ref: A.K. Khurana, 6th ed. pg. 159-60

135. Ans. (a) Secondary glaucoma

Ref: A.K. Khurana, 6th ed. pg. 157

Complications of Anterior Uveitis:

- Secondary glaucoma (most common)
- Band shaped keratopathy: More common in children with JRA
- Anterior & posterior synechiae
- Seclasio oclasio pupillae
- Complicated cataract
- Pseudoglioma due to vitreous exudation
- Cystoid macular oedema is common cause of visual impairment
- Pthisis & atrophic bulbi
- Tractional retinal detachment

Extra Mile

- Retinal detachment is a rare and late complication of anterior uveitis
- It is more common in pars-planitis and posterior uveitis).

EYELID AND LACRIMAL APPARATUS

136. Ans. (b) Middle meatus

Ref: Comprehensive Ophthalmology by A.K Khurana 6th ed. P 396

- **Dacryocystorhinostomy (DCR)** is a surgical procedure of choice in patients with dacryocystitis (inflammation of lacrimal sac)

- It is done by creating a new drainage of tear into nose, which opens in middle meatus.
 - Remember:** Normally nasolacrimal duct opens into inferior meatus.
- The medial wall of lacrimal sac is anastomosed with middle meatus of nose → overcoming the obstruction at the junction of lacrimal sac and nasolacrimal duct.
- Performed in patients below 60 years.

Extra Mile

- Dacryocystectomy (DCT):** used only when DCR is contraindicated or when the patient is too young (<4 years) or too old (>60 years) or in cases of chronic granulomatous disease induced obstruction like syphilis, TB, leprosy.
- Conjunctivodacryocystorhinostomy (CDCR):** Done in presence of blocked canaliculi

137. Ans. (b) **Meibomian gland**

Ref: Yanoff Duker; 4/ed. P 1431

GLANDS OF EYE AND ITS ASSOCIATED PATHOLOGY

Gland	Associated pathology
Meibomian gland	Internal hordeolum: Staphylococcal infection of meibomian gland. Painful condition. Treated with I/D and antibiotics support Chalazion: Chronic granulomatous disease occurred due to blocked meibomian gland. Non painful condition. Treated with incision and curettage.
Zeis gland	External hordeolum/Stye: Staphylococcal infection of Zeis gland. Treated with topical antibiotics.

138. Ans. (c) **Ankyloblepharon**

Ref: A.K. Khurana, 6th ed. pg. 377

- Symblepharon:** Lids become adherent with the eyeball as a result of adhesions between the palpebral and bulbar conjunctiva.
- Ankyloblepharon:** Adhesions between margins of the upper and lower lids.
 - It may occur as a congenital anomaly or may result after healing of chemical burns, thermal burns, ulcers and traumatic wounds of the lid margins.

- Blepharophimosis:** In this condition the extent of the palpebral fissure is decreased. It appears contracted at the outer canthus.
- Lagophthalmos:** This condition is characterized by inability to voluntarily close the eyelids

139. Ans. (d) **Dacryocystorhinostomy**

Ref: A.K. Khurana, 6th ed. pg. 395-96

Dacrocystitis is inflammation of the lacrimal sac

CHRONIC DACROCYSTITIS

- Chronic dacryocystitis is more common than the acute dacryocystitis.
- Cause:** Vicious cycle of stasis and mild infection of long duration.
- Factors responsible for stasis of tears in lacrimal sac:**
 - Anatomical factors: Narrow bony canal
 - Foreign bodies** in the sac may block opening of NLD.
 - Excessive lacrimation**
 - Mild grade inflammation:** May block the NLD
 - Obstruction of lower end of the NLD** by nasal diseases such as polyps, hypertrophied inferior concha, severe deviated nasal septum.
- Source of infection:** It may get infected from the conjunctiva, nasal cavity (retrograde spread), or paranasal sinuses by: Staphylococci, pneumococci, streptococci and pseudomonas pyocyanea.
- Clinical Feature**
 - Stage of chronic catarrhal dacryocystitis:** Characterised by mild inflammation of the lacrimal sac associated with blockage of NLD.
 - Stage of lacrimal mucocoele:** Characterized by constant epiphora associated with a swelling just below the inner canthus.
 - Stage of chronic suppurative dacryocystitis:** Characterized by epiphora, associated recurrent conjunctivitis and swelling at the inner canthus with mild erythema.
 - Stage of chronic fibrotic sac:** Repeated infections may result in a small fibrotic sac due to thickening of mucosa, which is associated with epiphora and discharge.
- Treatment**
 - Conservative treatment** by repeated lacrimal syringing.
 - Dacryocystorhinostomy (DCR).** It is considered as surgery of choice as it re-establishes the lacrimal drainage.
 - Dacryocystectomy (DCT).** It should be performed only when DCR is contraindicated.
 - Conjunctivodacryocystorhinostomy (CDCR).** It is performed in the presence of blocked canaliculi.

FMGE Solutions Screening Examination

1102

140. Ans. (a) 3rd CN palsy

Ref: A.K. Khurana, 6th ed. pg. 379

- Ptosis is drooping of eyelid.
- Eyelid is comprised of 4 muscles:

TABLE: Muscles, their innervation and function

Muscle	CN innervation	Function
LPS	III	Opens the eyelid
Muller's muscle	III	Opens eyelid when LPS tired
Frontalis	VII	Closes the eyelid
Orbicularis oculi	VII	Closes the eyelid

- CN III palsy leads to drooping of eyelid (Ptosis).
- CN VII palsy may also cause ptosis.

Extra Mile

- All the extraocular muscles are supplied by CN III except lateral rectus and superior oblique.
- Lateral rectus supplied by- CN VI
- Superior oblique supplied by- CN IV

Remember: LR6, SO4; all other by CN III

LENS/CATARACT

141. Ans. (b) ND:YAG laser

Ref: Comprehensive Ophthalmology by A.K Khurana
6th ed. P 462

- Lasers for glaucoma:
 - Laser iridotomy for ACG (uses ND:YAG laser)
 - Argon laser trabeculoplasty for OAG
 - Laser goniopunctures for developmental glaucoma
 - Pan retinal photocoagulation: For prophylactic/treatment of neovascular glaucoma
 - **Cyclophotocoagulation:** For absolute glaucoma or near absolute glaucoma
- Nd:YAG laser typically emits light with wavelength of **1064 nm** in the infrared
- **Uses of Nd:YAG laser:**
 - Correct posterior capsular opacification
 - Peripheral laser iridotomy in ACG
 - Double frequency ND:YAG (wavelength: 532 nm) used for pan-retinal photocoagulation.

Extra Mile

- **Excimer lasers** are used for photoablation—these lasers act by tissue remodelling. Used for:
 - Photorefractive keratectomy (PRK)
 - LASIK surgery
 - Phototherapeutic keratectomy (PTK) for corneal diseases such as band shaped keratopathy.

TABLE: Lasers used in ophthalmology

Type of laser	Wave length (nm)	Atomic environment used	Effects produced
• Argon	514	Argon gas	Photocoagulation
• Krypton	647	Krypton gas	Photocoagulation
• Diode	840	Diode crystal	Photocoagulation
• Diode Pumped frequency doubled Nd:YAG	532	Diode and Nd:YAG crystals	Photocoagulation
• Nd: YAG	1064	A liquid dry or a solid compound of yttrium-aluminium garnet and neodymium	Photodisruption
• Excimer	193	Helium and fluorine gas	Photoablation
• Femto-second	1053	Neodymium-glass	Photodisruption

142. Ans. (a) Blunt trauma to eye

Ref: Comprehensive Ophthalmology by A.K Khurana
6th ed. P 430

BLUNT TRAUMA TO LENS CAN PRODUCE

- **Vossius ring:** Circular ring of brown pigment at the anterior capsule. Occurs due to striking of pupillary margin against lens capsule.
- **Concussion cataract:** Mainly due to imbibition of aqueous on the lens fibres. It can assume following shapes:

- **Discrete sub epithelial opacity:** Most commonly occurred
- **Early rosette cataract (Punctate):** Most typical form. Appears as feathery lines of opacities along the star shaped suture lines, in posterior cortex
- **Late rosette cataract:** Develops 1-2 years after injury in the posterior cortex
- Traumatic zonular cataract
- Diffuse concussion cataract

143. Ans. (a) **Homocystinuria**

Ref: *Comprehensive Ophthalmology by A.K Khurana*
6th ed. P 216

Systemic conditions associated with ectopia lentis:

- **Marfan syndrome:** MCC of hereditary ectopia lentis. AD condition. Lens displaced supero-temporally (bilaterally symmetrical)
- **Homocystinuria:** 2nd MCC of hereditary ectopia lentis. AR condition. Lens subluxated inferior and nasally.
- **Weil Marchesani syndrome:** AR condition. Associated with mental retardation, short stature and stubby fingers. Lens subluxated anteriorly.
- **Sulphite oxidase deficiency:** AR condition. Ectopia lentis is universal ocular feature
- Hyperlysinemia

Extra Mile

- **Simple ectopia lentis:** Superior displacement of lens
- **Sunset syndrome:** Inferior subluxation of IOL
- **Sunrise syndrome:** Superior subluxation of IOL
- **Lost lens syndrome:** Complete dislocation of IOL into vitreous cavity.

144. Ans. (a) **Nd:YAG**

- ND-YAG (Neodymium- Yttrium-Aluminium-Garnet) laser is used for posterior capsulotomy in after cataract surgery.

145. Ans. (a) **Blunt trauma**

- Rosette cataract is seen in concussion injuries which appears as feathery line of opacities along the star shaped suture lines.
- In rosette cataract there is circular ring of brown pigment of pupillary margin seen on anterior capsule of lens.

146. Ans. (c) **Nuclear cataract**

Ref: *A.K Khurana's Ophthalmology, 6th ed. pg. 191*

- Nuclear cataract can cause nuclear sclerosis, which causes deterioration of distant vision (due to progressive index myopia). These patients may be able to read

without presbyopic glasses. This improvement in near vision is referred to as "second sight"

147. Ans. (d) **Posterior-subscapular cataract due to long term use of steroids**

Ref: *A.K Khurana's Ophthalmology, 6th ed. pg. 194-95*

148. Ans. (a) **Cataract**

Ref: *A.K. Khurana, 6th ed. pg. 180-81, Khurana 4th ed. pg. 171, 175*

- **MCC of blindness in world & India:** Cataract
- Cataract most commonly seen in females
- **2nd MCC of blindness-** Glaucoma
- **MC infective cause of blindness-** Trachoma
- **MCC of ocular morbidity-** Refractive error

149. Ans. (b) **ND-YAG**

Ref: *A.K. Khurana, 6th ed. pg. 187-89*

- ND-YAG (Neodymium- Yttrium-Aluminium-Garnet) laser is used for posterior capsulotomy in after cataract.
- Diode, Argon and Krypton laser is used for retinal photocoagulation.

150. Ans. (d) **In the lens capsule**

Ref: *A.K. Khurana, 6th ed. pg. 186, 195-96*

INTRAOCULAR LENS IMPLANTATION

- Presently, intraocular lens (IOL) implantation is the method of choice for correcting aphakia.

Types of Intraocular Lenses

- **Anterior chamber IOL:** These lenses lie in front of the iris and are supported in the angle of anterior chamber.
- ACIOL can be inserted after ICCE or ECCE (*Intra/Extra Capsular Ccataract Extraction*).
- **Iris -supported lenses:** These lenses are fixed on the iris with the help of sutures or claws.
- **Posterior Chamber lenses:** PCIOL implanted behind the iris. They may be supported by the ciliary sulcus or capsular bag.
- **At present** the trend is "In the Bag" fixation.

Extra Mile**Cataract Surgeries and their Main Indications**

Cataract	Surgery
Immature cataract	Phacoemulsification
Mature/hyper mature cataract	ECCE
Subluxated	ICCE

151. Ans. (c) **Opacity along sutures**

Ref: A.K. Khurana, 6th ed. pg. 194-95

- **Complicated cataract:** Cataract secondary to some intraocular disease which may be:
 - **Anterior cortical** in anterior segmental lesion as glaucoma, acute iritis, or,
 - **Posterior cortical** in posterior segmental lesion as uveitis, RD, pigmentary retinal dystrophy.
- The second type of complicated cataract presents with posterior cortical bread crumb appearance/ polychromatic lusture or rainbow cataract.
- *Bread crumbs appearance* is Pathognomonic of posterior cataract.
- *Opacity usually commence in posterior cortex and spread axially and NOT along sutures.*
- Vision is much impaired even in early stage, owing to the position of the opacity near the nodal point of the eye.

152. Ans. (c) **Vitreous movement**

Ref: A.K. Khurana, 6th ed. pg. 194-95

- **Complicated cataract occurs secondary intraocular disease e.g.**
 - Inflammatory conditions as uveitis.
 - Degenerative conditions as retinitis pigmentosa, high myopia etc.
 - Intraocular tumors
 - Retinal detachment, Glaucoma etc.

Extra Mile

TABLE: Types of cataract and their causes

Type of cataract	Cause
Snow flake/snow storm cataract	Diabetes mellitus/Down's syndrome
Sunflower/Petals of flower cataract	Wilson's disease Chalcosis (mild reaction to copper) Penetrating trauma (with retention to copper)
Blue dot cortical cataract	Atopic dermatitis Myotonic dystrophy
Vossius ring/Rosette shaped cataract	Blunt trauma
Christmas tree cataract	Myotonic dystrophy
Oil drop cataract Dust like lenticular opacity	Galactosemia
Breadcrumb appearance Polychromatic lusture Rainbow cataract	Complicated cataract/Secondary cataract
Morgagnian cataract	Hypermaturation senile cataract

153. Ans. (a) **Trauma**

Ref: A.K. Khurana, 6th ed. pg. 429, Khurana, 4th ed. pg. 405

154. Ans. (c) **Anterior capsule of the lens**

Ref: A.K. Khurana, 6th ed. pg. 429, Parsons' Diseases of the Eye, 20th ed. pg. 367

- **Blunt trauma** to eye leads to formation of *vossius ring on anterior surface of lens*
- It is a faint or stippled opacity seen on the anterior capsule of the lens due to multitudes of brown amorphous granules of pigment lying on the capsule
- Produced by the impress of the iris on the lens as a result of a force that drives cornea and iris backwards.
- It is about the same diameter as the *contracted pupil*.

155. Ans. (a) **Posterior subcapsular cataract**

Ref: Levin's ophthalmology, 232

"**Posterior sub capsular cataracts** typically account for less than 10% of age related cataracts. They arise from epithelial cells that fail to differentiate properly into fiber cells. These cells migrate or are carried by their neighbors to the posterior pole of lens where they swell and form a plaque that scatters light. Because these plaques are in the **optic axis** they **significantly degrade vision** even when quite small.

156. Ans. (d) **Secondary cataract**

Ref: A.K. Khurana, 6th ed. pg. 214

157. Ans. (a) **Phenylketonuria**

Ref: A.K. Khurana, 6th ed. pg. 181-215

158. Ans. (d) **Alport's syndrome**

Ref: A.K. Khurana, 6th ed. pg. 218-219

- Anterior lenticonus is seen in *Alport's syndrome* (90%)
- It is a disorder of basement membrane and is characterized by:
 - *Familial haemorrhagic nephritis*
 - *Sensory-neural deafness* and
 - *Ocular features like anterior lenticonus*, cataract, retinal flecks and posterior polymorphous corneal dystrophy.

159. Ans. (b) **Superotemporal subluxation of lens**

Ref: Khurana, 4th ed. pg. 202

- Marfan's syndrome is an **autosomal dominant** condition.
- Subluxation of lens is a common finding, which is seen in upward and temporal area, bilaterally symmetrical.

- Other abnormalities includes: Spider finger, long extremities, high arched palate and dissecting aortic aneurysm with normal IQ.

Extra Mile

Suluxation of lens also seen in-

- **Homocystinuria:** Autosomal Recessive condition; Downward and nasally displaced lens.
- **Weil marchesani syndrome:** Forward subluxation and spherophakia
- **Sulphite oxidase deficiency:** Ectopia lentis is universal ocular feature
- **Ehler's danlos syndrome**
- Hyperlysinemia
- Stickler syndrome

160. Ans. (b) Superior and temporally

Ref: A.K. Khurana, 6th ed. pg. 215

Please refer to above condition

161. Ans. (b) Aphakia

Ref: A.K. Khurana, 6th ed. pg. 37, 187

- Jack in a box phenomenon is seen after cataract surgery where the lens of the patient is removed. This causes disproportion in power of the eye. To correct aphakia, patients are prescribed with glasses.
- To correct the refractive error in aphakia about 10 dioptre of convex lenses are required for distance vision and about 13 dioptre for near vision. Such high power lenses are associated with numerous physical and optical problems. The most important of these problems are:
 - Magnification
 - Roving Ring Scotoma
 - Jack-in-the-box Phenomenon

162. Ans. (b) Cataract

- Side of oral/systemic steroid: **Cataract**
- Side effect of topical steroid: **Glaucoma**
 - Mn: GTCS (Glaucoma-topical; Cataract- Systemic)
- Blepharconjunctivitis is Side effect of **Timolol**

163. Ans. (b) Subluxation of lens

Ref: A.K. Khurana, 6th ed. pg. 215, 500;
Khurana, 4th ed. pg. 203-204, 473

- Iridodonesis is tremulousness of iris.
- It is observed when its posterior support is lost as in aphakia and subluxation of lens.

GLAUCOMA

164. Ans. (d) Dorzolamide

Ref: Katzung Pharmacology; 11th ed. P 89

- **Timolol:** Beta blocker. Decreases aqueous secretion from ciliary epithelium. DOC for POAG in India.
 - Overall, DOC for OAG is latanoprost.

- **Mannitol:** A hyperosmotic agent. Reduces vitreous volume and deepens anterior chamber.
- **Prostaglandin analogue: Latanoprost, Bimatoprost:** Increases uveoscleral aqueous outflow. Considered as DOC for OAG.
- **Carbonic anhydrase inhibitor: Acetazolamide, dorzolamide, brinzolamide.** Acts by decreasing aqueous secretion.

165. Ans. (c) Angle closure glaucoma

Ref: A.K. Khurana, 6th ed. pg. 239-40

- In case of angle closure glaucoma, pupil is mid-dilated, vertically fixed. At this position of pupil, iris and lens are at maximum approximation which precipitate the condition and patient presents with sudden painful loss of vision.
- Open angle glaucoma is due to blockage of trabecular meshwork. Patient gives a history of slow painless loss of vision.
- Uveitis is inflammation of uveal component. Pupil here called festooned pupil (*anterior uveitis*).

166. Ans. (a) Vertically dilated

Ref: A.K. Khurana, 6th ed. / 239-40, Khurana 4th ed./ 225

- In case of angle closure glaucoma, pupil is mid dilated, vertically fixed.
- Irregularly constricted fixed pupil is seen in anterior uveitis (*known as festooned pupil*).

167. Ans. (c) Acute congestive glaucoma

Ref: A.K. Khurana, 6th ed. pg. 239-41

- Acute congestive glaucoma usually presents with sudden painful loss of vision associated with colored haloes. ACG more commonly seen in middle to elderly females.
- **D/dx of color haloes:**
 - ACG
 - Cataract
 - Mucopurulent conjunctivitis (Not in angular)
- RD presents with sudden painless loss of vision associated with flashes of light.

168. Ans. (b) **Latanoprost**

Ref: A.K. Khurana, 6th ed. pg. 228-30

GLAUCOMA

- It is a group of conditions characterized by progressive optic neuropathy with characteristic optic disc appearance and irreversible visual field defects.
- It is caused due to retinal ganglion cell death by increase in intraocular pressure (IOP) (usually) or other factors (excitotoxicity/optic nerve spasm)

Classical Triad

- Increase IOP (>21)
- Visual Field decrease
- Optic disk/ Nerve changes (damage)

Atleast 2 conditions is required for diagnosis

PRIMARY OPEN ANGLE GLAUCOMA

- It is also known as chronic simple glaucoma of adult onset and is characterized by the-
 - Slowly progressive raised IOP
 - Optic disc cupping
 - Specific visual field defects

Clinical Features and Risk Factors for OAG

Clinical features	Risk factors
<ul style="list-style-type: none"> • Frequent change in presbyopic glasses. • Delayed dark adaption. • Painless • No corneal edema • No loss of vision • No coloured halos 	<ul style="list-style-type: none"> • Age • Race- Indians, Japanese. • Myopes • Diabetes, hypertension, hyperthyroidism • Mustard oil intake

Treatment: POAG is best treated by PG analogue Latanoprost (DOC)

Surgery: Trabeculectomy

- Surgical-Argon/ diode laser trabeculoplasty can also be done.

Extra Mile

- **Peripheral Iridectomy:** Surgical treatment done in primary angle closure glaucoma. *Treatment of choice for acute congestive glaucoma.*
- **Laser Iridotomy:** Treatment of choice for angle closure glaucoma.

169. Ans. (c) **Paracentral scotoma**

Ref: A.K. Khurana, 6th ed. pg. 233, 238

Visual field defects in glaucoma

1. Isopter contraction: *Earliest*
2. Baring of blind spot
3. Isolated paracentral scotoma (earliest clinically significant)
4. Seidel scotoma
5. Bjerrum or arcuate scotoma
6. Roenne's central nasal step
7. Double arcuate scotoma leads to tubular vision
8. Temporal island of vision is also lost with no light perception

170. Ans. (d) **Decrease aqueous production**

Ref: A.K. Khurana, 6th ed. pg. 451-52

- **ACETAZOLAMIDE** is a carbonic anhydrase inhibitor which acts in OAG by decreasing aqueous production.
- **Carbonic anhydrase derivatives are:** Acetazolamide, Dorzolamide, Brinzolamide
- Dorzolamide is mildest carbonic anhydrase inhibitor, hence considered as DOC for glaucoma in children.
- Alpha-2 agonist (Brimonidine, Apraclonidine) also act by decreasing aqueous production.
- **Class of drugs which act by increasing outflow:**
 - ↑ **Trabecular outflow:** Pilocarpine, Epinephrine
 - ↑ **Uveoscleral outflow:** PG Analogue (Latanoprost)

Extra Mile

TREATMENT OF Glaucoma

- **First line DOC for ACG:** Mannitol
- **TOC for ACG:** Laser iridotomy
- **DOC for OAG:** PG analogue (Latanoprost)
- **Most powerful anti glaucoma drug:** Latanoprost
- **DOC for OAG in India-** Timolol
- **Safest anti-glaucoma for children-** Dorzolamide

171. Ans. (b) **Latanoprost**

Ref: A.K. Khurana, 6th ed. pg. 453

172. Ans. (d) **Dorzolamide**

Ref: A.K. Khurana, 6th ed. pg. 452-454

173. Ans. (a) **Timolol maleate**

Ref: A.K. Khurana, 6th ed. pg. 236-37

- Although timolol is considered as DOC for OAG in India, it is contraindicated in glaucoma patients suffering from bronchial asthma.
- Timolol is a non selective Beta blocker which might aggravate the asthma of the patient.
- For such patient Betaxolol is next best choice.

174. Ans. (c) **Surgical management**Ref: A.K. Khurana, 6th ed. pg. 225-227

- Once the patient presents with symptoms of primary developmental glaucoma like photophobia, blepharospasm, lacrimation, eye rubbing, the next procedure is to do careful examination in which following things done: IOP measurement, ophthalmoscopy and gonioscopic examination of the angle of anterior chamber.
- The next best step once examination confirms glaucoma is to undergo surgical management (goniotomy) in order to decrease the IOP.

175. Ans. (b) **Trabeculotomy**Ref: A.K. Khurana, 6th ed. pg. 225-227,

- Manifestation of congenital glaucoma below age of 3 years is termed as buphthalmos (*as given in case*). This condition occur due to developmental anomaly of the angle of anterior chamber.
- Treatment:**
 - Goniotomy** is preferred treatment, where barkaan's goniotomy knife is used to make an incision in the angle under gonioscopic control.
 - Trabeculotomy** is preferred when corneal clouding prevents visualization by gonioscopy. (*as seen in given case*)
 - Combined trabeculotomy and trabeculectomy** is preferred treatment nowadays with better result.

176. Ans. (d) **Laser iridotomy**Ref: A.K. Khurana, 6th ed. pg. 247

- Laser Iridotomy:** Treatment of choice for angle closure glaucoma.
- Peripheral Iredectomy:** Surgical treatment done in primary angle closure glaucoma. Treatment of choice for acute congestive glaucoma.
- Trabeculectomy:** It is a filtration surgery done in primary open angle glaucoma.
- Trabeculoplasty:** Primary open angle glaucoma is also treated by Trabeculoplasty.

177. Ans. (a) **Angle closure glaucoma**Ref: A.K. Khurana, 6th ed. pg. 247178. Ans. (a) **Laser Iridotomy**Ref: A.K. Khurana, 6th ed. pg. 247-48

- Please refer to above explanation
- Treatment of choice for primary angle closure glaucoma (*fellow eye, latent stage, subacute or intermittent stage, chronic stage*) is *laser iridotomy*
- Peripheral surgical iridectomy can also be used.
- In acute congestive stage of PACG *drug of choice* is *Pilocarpine*, till the time laser iridotomy can be performed.

179. Ans. (b) **Laser trabeculoplasty**

Please refer to above explanation

180. Ans. (b) **Open angle glaucoma**

- In case of OAG colored haloes are very late feature.
- Coloured halos are most commonly seen in **primary angle closure glaucoma, cataract & acute purulent conjunctivitis**. These are differentiated by:
 - Emsley-Fincham's test:** a stenopaic slit is passed across the pupil.
 - In case of Primary angle closure glaucoma: Haloes remain intact
 - In case of Immature cataract: Haloes broken into segments.
 - Conjunctivitis:** Haloes eliminated after irrigating the discharge.
- Therefore given these options, our best choice will be OAG.

181. Ans. (a) **Open angle glaucoma**Ref: A.K. Khurana, 6th ed. pg. 229

Frequent change of presbyopic lens is a typical characteristic feature of open angle glaucoma.

Extra Mile

FREQUENT CHANGE OF GLASSES in young:

- If power also increases → **PATHOLOGICAL Ex: OAG**
- If NO increment in power → **KERATOCONUS**

182. Ans. (b) **Cornea posterior surface**Ref: A.K. Khurana, 6th ed. pg. 250; Khurana, 4th ed. pg. 234

- Krukenberg spindles are pigmentary granules which are seen on posterior surface of cornea in shape of spindles in **cases of secondary open angle glaucoma** (pigmentary glaucoma). It can be seen on iris.
- This condition is most commonly seen in young males and myopics.

REFRACTIVE ERROR

183. Ans. (a) +2.5 D

Ref: *Comprehensive Ophthalmology by A.K Khurana*
6th ed. P 13

- A newborn is hypermetropic by +2 to +3 D (average: 2.5 D)

EYE AT BIRTH

- **AP diameter:** 16.5 mm (adult size 24 mm by 7–8 years)
- **Corneal diameter:** 10 mm (adult size 11.7 mm 2 years)
- NB hypermetropic by 2–3 D
- Fixation starts at 1 month. Completed by 6 months
- **Retina:** Fully developed except macular area
 - Macula fully developed by 4–6 months
 - Fusional reflex and accommodation well developed by 4–6 months
 - 3D depth perception/stereopsis - 6 years
- **Lacrimal gland:** Underdeveloped (tears not secreted)
- **Anterior chamber:** Shallow and angle is narrow
- Orbit is more divergent (50°) as compared to adults (45°)

184. Ans. (d) All of the above

Ref: *Comprehensive Ophthalmology by A.K Khurana*
6th ed. P 347-348

- **Manifest squint is of two types:** Concomitant squint and Incon-comitant squint.
- Concomitant squint:
 - Due abnormality/obstacle in binocular vision development, namely sensory, motor and central

TABLE: Obstacle in central vision development

Sensory obstacle	Motor obstacle	Central obstacle
<ul style="list-style-type: none"> • Refractive error • Corneal and lenticular opacity • Macular disease • Incorrect spectacle use • Optic atrophy 	<ul style="list-style-type: none"> • Congenital abnormality of shape and size of orbit • Abnormalities of extraocular muscles (faulty innervation & insertion) • Abnormalities of accommodation and convergence 	<ul style="list-style-type: none"> • Deficient development of fusion • Abnormality of cortical control of ocular movement (as seen in mental trauma, hyperexcitability of CNS)

185. Ans. (b) Amblyopia

Ref: *Handbook of Pediatric Strabismus and Amblyopia*
edited by Kenneth W. Wright, Peter H. Spiegel, P 116

The visual deficit associated with amblyopia has certain unique characteristics, including the crowding phenomenon, the neutral density filter effect, and eccentric fixation. The crowding phenomenon relates to the fact that

patients with amblyopia have better visual acuity reading single optotype than reading multiple optotypes in a row (linear optotypes). Often, patients with amblyopia will perform 1 or 2 Snellen lines better when presented with single optotypes versus linear optotypes. This crowding phenomenon may have something to do with the relatively large receptive field associated with amblyopia. Crowding bars are often used around a single optotype to provide a more sensitive test for amblyopia.

186. Ans. (a) Occlusion

Ref: *Comprehensive Ophthalmology by Khurana;*
6/ed. P 63

- Amblyopia refers to a reversible decrease of vision, and is also referred as to lazy eye.
- Treatment of amblyopia should be started as early as possible, younger the child better is the prognosis.
- Occlusion therapy is the mainstay of therapy in which healthy eye is occluded to force the fixation of amblyopic eye.
- Before occlusion any opacity in the media should be removed and any refractive error should be corrected.
- However atropine penalization can also be done in better eye. Atropine causes cycloplegia and hence blurring of vision, which also forces the fixation of amblyopic eye.

187. Ans. (b) Head tilt towards the rectus muscle paralysis

Ref: *Khurana, 6th ed. pg. 354*

Paralytic squint

- Refers to ocular deviation resulting from complete or incomplete paralysis of one or more extraocular muscles.
- **Causes may be:** Neurogenic, myogenic or at the level of neuromuscular junction.

Clinical features:

Symptoms	Signs
<ul style="list-style-type: none"> • Diplopia: It is the main symptom and is more marked in the field of action of paralyzed muscle • Confusion • Nausea and vertigo • Ocular deviation 	<ul style="list-style-type: none"> • Primary deviation: Deviation of the affected eye and is away from the action of paralyzed muscle. Eg: if medial rectus palsy, the eye is diverged. • Secondary deviation: Deviation of normal eye • Ocular movement restriction: Occurs in direction of action of paralyzed muscle • Compensatory head posture: In the direction of action of paralyzed muscle. It is adopted to avoid diplopia and confusion.

Note: In case of paralytic squint, visual acuity is normal and there is no amblyopia as in most cases paralytic squint develops in adults when visual acuity has already developed.

188. Ans (c) **Refractive error**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 34-36;
Harrison's, 19th ed. pg. 195

- Most common cause of blindness in the world: Cataract
- Second Most common cause of blindness in world: Glaucoma > ARMD
- Most common infective cause of blindness: Trachoma
- Most common cause of ocular morbidity: Refractive error
- Given these choices, refractive error is the least common cause of blindness. **Harrison states:** "Refractive errors usually develop slowly and **remain stable** after adolescence, except in unusual circumstances. For example, the acute onset of diabetes mellitus can produce sudden myopia because of lens edema induced by hyperglycemia."
- Corneal opacities like Nebula, Macula and Leucoma also contribute significantly to blindness.

189. Ans. (b) **Hypermetropia**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 36

- Convex lens (plus lens) is used for treatment of hypermetropia.

Extra Mile

- Lens used in myopia: Concave lens (Minus lens)
- Lens used in presbyopia: Convex lens

190. Ans. (d) **30°**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 348

Concomitant squint is of three types:

- Convergent squint (esotropia)
- Divergent squint (exotropia)
- Vertical squint (hypertropia)

CONVERGENT SQUINT (ESOTROPIA)

- It denotes inward deviation of one eye. It is the most common type of squint in children

TYPES• **Infantile esotropia**■ **Clinical features:**

- ♦ Age: Onset at 1–2 month, but can occur at any time in first 6 months of life
- ♦ **Angle of deviation:** Usually constant and fairly large (>30°)
- ♦ Amblyopia in 25–40% of cases
- ♦ Fixation pattern: Binocular vision does not develop and there is alternate fixation in primary gaze and cross fixation in lateral gaze.

■ **TOC: Surgery**

- Time for surgery: Between first 6 months to 2 years (preferable before 1 year of age).

- **Accommodative esotropia:** Develops at around 2–3 years of age. Associated with high hypermetropia (+4 to +7 D)

- **Acquired non-accommodative esotropia**
- **Sensory esotropia**
- **Consecutive esotropia**

191. Ans. (a) **Large optic disc**

Ref: A.K. Khurana, 6th ed. pg. 38

MYOPIA

- Also known as short sightedness.
- It is a type of refractive error in which parallel rays of light coming from infinity are focused in front of retina when accommodation is at rest.
- Myopic patients have short eyeballs.

Fundus Examination of Myopia

- *Optic disc appears large and pale* and at its temporal edge a characteristic myopic crescent is present
- Degenerative changes in retina and choroid are common in progressive myopia
- Posterior staphyloma at posterior pole may be apparent due to ectasia of sclera.
- Degenerative changes in vitreous include: liquefaction, vitreous opacities, and posterior vitreous detachment (PVD).

192. Ans. (a) Pseudomyopia

Ref: A.K. Khurana, 6th ed. pg. 47

“Accommodation refers to a process whereby a change in position as well as **increased curvature of the crystalline lens** increases the conjugation power of the eye i.e. its ability to **converge an image to focus on retina**.

From the above paragraph it can be concluded that more is the accommodation, more is the curvature of lens and the ray will converge more and hence image will be formed in front of retina i.e. pseudomyopia.

193. Ans. (b) Contact lens

Ref: A.K. Khurana, 6th ed.

- Anisometropic patients cannot wear glasses as it causes diplopic vision so contact lens are prescribed.
- Glasses can only tolerate and correct upto 4D.
- **Trabeculectomy**: It is a filtration surgery done in primary angle closure glaucoma.
- **Trabeculoplasty**: Primary open angle glaucoma is treated by Trabeculoplasty.

194. Ans. (b) Cylindrical

Ref: A.K. Khurana, 6th ed. pg. 42-423

- Astigmatism is a common eye condition that's easily corrected by eyeglasses, contact lenses, or surgery.
- It is caused by an eye that is not completely round. It is a type of refractive error.
- **Cause**: Astigmatism is a natural and commonly occurring cause of blurred or distorted vision. The exact cause is not known.
- **Symptom**: Blurring of vision which can be associated with fatigue and eyestrain.
- **Cylindrical lens** is used for the management of astigmatism.

Extra Mile

- Myopics are said to be short sighted. Concave lenses are used in myopics
- Convex lens are used in hypermetropics.

195. Ans. (c) Binocular vision

Ref: A.K. Khurana, 6th ed. pg. 342

- **Worth four dot test (WFDT)** is a test for binocular vision using red-green color dissociation.
- It is a dissociation test which can be used with both distance and near fixation and differentiate between binocular single vision, abnormal retinal correspondence and suppression.
- **Note**: Result of WFDT can only be interpreted if the presence or absence of manifest squint is known at the time of testing.

196. Ans. (c) Anisometropia

Ref: A.K. Khurana, 6th ed. pg. 44-45,
Khurana, 4th ed. pg. 38

- **Isometropia**: Two eye with equal refraction
- **Anisometropia**: Two eye with unequal refraction of power >2.5D
- **Aniseikoinia**: Difference in size/shape of image of >5% on visual cortex by retina.

197. Ans. (d) Astigmatism

Ref: A.K. Khurana, 6th ed. /42-43, Harrison's 19th ed./ 195

- Astigmatism is a type of refractive error which arises due to irregular curvature of cornea.
- Correction of astigmatism is done by using cylindrical lens.

OCULAR INJURY AND MALIGNANCY

198. Ans. (a) Only i and ii are correct

Ref: Comprehensive Ophthalmology by A.K Khurana
6th ed. P 422-23

- Blow out fracture is comminuted fracture of orbital floor >> and medial wall.
- It result from trauma to orbit by relatively large, round object like tennis ball, cricket ball, human fist or a part of automobile.
- Orbit is made of 7 bones:
 - **Orbital floor**: Maxillary and palatine bone
 - **Medial wall**: Ethmoid and Lacrimal bone
 - **Lateral wall**: Zygomatic and Greater wing of sphenoid
 - **Roof**: Frontal bone
- **Clinical picture**:
 - Periorbital edema
 - **Paraesthesia and anaesthesia**: Over cheek, side of nose, lower eye-lid, upper lip due to involvement of infraorbital nerve.
 - **Enophthalmos**: Due to protrusion of orbital fat into maxillary sinus (X-ray: Tear drop sign).
 - **Diplopia**: Due to extraocular nerve entrapment
- **Treatment**:
 - Avoid nose blowing
 - Systemic antibiotics (as prophylaxis) and analgesics
 - Cold compress (decreases swelling by vasoconstriction)
 - Surgical repair of plate (10-14 days after injury)

199. Ans. (a) Tennis ball injury

Ref: Comprehensive Ophthalmology by A.K Khurana
6th ed. P 422-23

Refer to above explanation

200. Ans. (a) **Rhabdomyosarcoma****Common Malignancies of Eye**

- **Retinoblastoma** is most common secondary intraorbital tumor of children
- **Squamous cell CA** is most common secondary orbital tumor of adult
- **Rhabdomyosarcoma** is most common primary malignant orbital tumor of children and most common soft tissue malignancy of childhood.
- Lymphoma is the most common primary malignant orbital tumor of adult
- **Choroid melanoma** is most common intraocular malignancy in adult
- **Capillary haemangioma** is most common tumor of orbital & periorbital areas in children.
- **Cavernous haemangioma** is most common benign orbital tumor in adults.
- **Pleomorphic adenoma** (benign mixed tumor) is most common epithelial tumor of lacrimal gland.
- **Neuroblastoma** is most common cause of orbital metastasis in children
- **Breast** (> Bronchus > Prostate > Skin melanoma) is the most common cause of orbital metastasis in adult.
 - CA Breast (Female)
 - CA Breast (Male)
- **Choroid** is the most common site for metastasis (90%) followed by iris & ciliary body. *Metastatic tumors to choroid are more common than primary malignancies.*

201. Ans. (b) **Orbital floor**

- Orbital floor is made of maxillary and palatine bone. In case of orbital floor fracture, content of orbit protrudes into maxillary sinus which on radiological image is seen as tear drop.

202. Ans. (a) **RB gene**Ref: Khurana, 6th ed. pg. 303

- Retinoblastoma (RB) gene has been identified as 14 band on long arm of chromosome 13 (13q14) and is a cancer suppressor or antioncogenic gene. Deletion or inactivation of both the normal alleles of this protective gene by two mutation (**Knudson two hit hypothesis**) results in occurrence of retinoblastoma.

203. Ans. (d) **Conservative**Ref: Khurana, 6th ed. pg. 429

- It is a case of traumatic hyphaema (blood in anterior chamber).
- **Khurana states:** "Conservative treatment is aimed at prevention of rise in IOP and occurrence of secondary haemorrhage. A small hyphaema usually clears up with conservative treatment, however a large non resolving hyphaema should be drained to avoid blood staining of cornea"
- If hyphaema is associated with rise in IOP, it can be lowered by acetazolamide and hyperosmotic agents.

204. Ans. (d) **Keratometry****INSTRUMENTS USED FOR OCULAR EXAMINATION**

Measurement parameter	Instruments for:
• Corneal thickness	Pachymeter
• Corneal curvature	Keratometer
• Angle of anterior chamber	Gonioscope
• Corneal surface	Placido disc
• Corneal endothelium	Specular microscope
• Direct ophthalmoscope (Remembered as: "DEV")	Routine fundus examination. "Image formed is Erect and Virtual and magnified, 15 times"
• Indirect ophthalmoscope	For assessment of retinal detachment and other peripheral retinal lesions. The image is real, inverted and magnified 5 times.
• Perimetry	Optic nerve function

205. Ans. (b) **Optic nerve glioma**Ref: Khurana, 6th ed. pg. 419**Optic nerve glioma**

- It is a slow growing tumor arising from the astrocytes, usually occurs in 1st decade of life in a child between 4-8 years of age.
- It may present either as a solitary tumor or as a part of von Recklinghausen neurofibromatosis.

FMGE Solutions Screening Examination

1112

Clinical features:

- It is characterized by gradual vision loss associated with a gradual, **painless unilateral axial proptosis**.
- **Fundus exam shows:** Optic atrophy or papilloedema and venous engorgement.

Treatment: observation, followed by surgical excision.

206. Ans. (a) **Retinoblastoma**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 303

COMMON MALIGNANCIES OF EYE

- **Retinoblastoma** is most common intraocular (not orbital) malignancy in children (1 in 15000 to 20,000 live births)
- Retinoblastoma is confined to infancy and very young children usually seen between 1 and 2 years of age.
- Occurs bilaterally in 25-30% cases

207. Ans. (a) **Loss of accommodation**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 355

FUNCTION OF OCULOMOTOR NERVE (CN.III)

- The third cranial nerve controls the movement of four of the six eye muscles. These muscles move the eye inward, up and down, and they rotate the eye. The third cranial nerve also controls constriction of the pupil, the positioning of the upper eyelid, and the ability of the eye to focus.
- With unilateral third nerve palsy, diplopia is masked due to development of ptosis.
- **Other findings:**
 1. Ptosis: Due to paralysis of LPS muscle
 2. Deviation: Eyeball is turned *downward and outward*
 3. Restricted ocular movements in all direction except outward.
 4. Fixed and dilated pupil: Due to paralysis of sphincter pupillae muscles.
 5. **Accommodation is completely lost** due to paralysis of ciliary muscle.

208. Ans. (b) **Loss of accommodation**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 147-48

FUNCTION OF CILIARY BODY

- Formation of aqueous humor (by *pars plicata*)
- Ciliary muscles helps in accommodation (*its damage leads to loss of accommodation*)

209. Ans. (b) **Orbital apex**

Ref: A.K Khurana's *Ophthalmology*, 6th ed. pg. 413

- Tolosa hunt syndrome refers to idiopathic non-specific granulomatous inflammation involving the superior orbital fissure and/or orbital apex and/or cavernous sinus

• Clinical presentation:

- Depending on the involvement of orbital, it can present as either orbital apex syndrome or as superior orbital fissure syndrome.
 - ♦ **Superior orbital fissure syndrome:** Symptoms depend on involvement of structure passing through the superior orbital fissure.
 - ★ CN V #: Retroorbital pain, loss of sensation in ophthalmic division of CN V.
 - ★ CN III, IV, VI #: Ipsilateral ophthalmoplegia
 - ★ CN III #: Ptosis
- **Orbital apex syndrome:** Symptoms are due to involvement of structure present at orbital apex. Optic nerve involvement causing early vision loss and afferent pupil defect plus symptoms of superior orbital fissure syndrome.

210. Ans. (b) **Sympathetic ophthalmitis**

Ref: A.K. Khurana, 6th ed. pg. 163, 437

- Sympathetic ophthalmitis is a serious bilateral granulomatous panuveitis which usually occurs due to penetrating trauma to ciliary body.
- The injured eye is called exciting eye.
- Fellow eye which also develops uveitis is called sympathizing eye.

Features

- Always follows a penetrating wound.
- More common in children than in adults.
- It doesn't occur when actual suppuration develops in the injured eye

Pathologies

- Uveal pigment acts as allergen and excites plastic uveitis in the sound eye.
- Dalen-Fuchs' nodules are formed due to proliferation of the pigment epithelium (of the iris, ciliary body and choroid) associated with invasion by the lymphocytes and epitheloid cells.

Clinical Picture

- **Prodromal stage:** Sensitivity to light (photophobia) transient indistinctness of near objects is *the earliest symptoms*.
- *First sign* may be presence of retrolental flare or the presence of a keratic precipitates (KPs) at back of cornea.
- **Fully-developed stage:** has typical signs and symptoms consistent with acute plastic iridocyclitis.
- **Dalen Fuch's Nodules** are characteristic of SO.
- **Exciting (injured) eye:** Keratic precipitates may be present at the back of cornea
- **Sympathizing (sound) eye:** Usually involved after 4-8 weeks of injury in the other eye.
- **Treatment** – Early excision of the injured eye.
 - Topical cycloplegics + IV/oral steroids are also used for treatment.

211. Ans. (c) **Penetrating injury to Ciliary body**Ref: A.K. Khurana, 6th ed. pg. 163, 437*Please refer to above explanation.*212. Ans. (b) **Hammer and chisel**Ref: A.K. Khurana, 6th ed. pg. 163, 437213. Ans. (b) **Trauma**Ref: A.K. Khurana, 6th ed. pg. 91, 335**SUBCONJUNCTIVAL HEMORRHAGE**

- A subconjunctival hemorrhage is blood that is located between the conjunctiva and the underlying sclera.
- This results from rupture of small vessels bridging the potential space between the episclera and the conjunctiva. Blood dissecting into this space can produce a spectacular red eye, but vision is not affected and the hemorrhage resolves without treatment.

- Subconjunctival hemorrhage is usually spontaneous **but can result from blunt trauma**, eye rubbing, or vigorous coughing. Occasionally it is a clue to an underlying bleeding disorder.
- **Sx:** The most obvious sign of a subconjunctival hemorrhage is a bright red patch on the white (sclera) of your eye.
- Despite its bloody appearance, a subconjunctival hemorrhage should **cause no change in vision**, no discharge from eye and no pain.
- **Note:** If trauma is not an option, the next best option you can choose is pertussis or chronic cough.

214. Ans. (b) **Optic disc**

- Optic disc is not involved in papillary light reflex.
- Pathway of papillary light reflex:

Retina → Optic Nerve → Optic Chiasma → Optic Tract
 → Prerectal Nucleus → Edinger Westphal Nucleus →
 Inferior Division of 3rd Nerve → Ciliary Ganglion → Short
 Ciliary Nerves → Sphincter Pupillae

215. Ans. (d) **Exophthalmos**Ref: A.K. Khurana, 6th ed. pg. 422-23,
Khurana's, 4th ed. pg. 397-398

- Blowout fractures mainly involve orbital floor and medial wall.
- It usually results from trauma to the orbit by a relatively large, often rounded object, such as tennis ball, cricket ball etc.
- With a resultant fracture of the weakest point of the orbital wall.

Classification

- **Pure blow-out fractures:** Not associated with involvement of the orbital rim.
- **Impure blow-out fractures:** Associated with other fractures about the middle third of the facial skeleton.

Clinical Feature

- Periorbital oedema and blood extravasation in and around the orbit
- Emphysema of the eyelids occurs more frequently with medial wall than floor fractures.
- Paraesthesia and anaesthesia
- Ipsilateral epistaxis
- Ptosis and Proptosis
- Enophthalmos; NOT Exophthalmos
- Diplopia
- **Plain x-rays (Water's view):** Fragmentation and irregularity of the orbital floor; depression of bony fragments and 'hanging drop/tear drop' opacity of the superior maxillary antrum from orbital contents herniating through the floor.

216. Ans. (b) **Neurofibromatosis**Ref: A.K. Khurana, 6th ed. pg. 309-10

- In some patients who have neurofibromatosis type 1, multiple uveal nevi develop in both eyes. These lesions must be differentiated from the small, tan, melanocytic iris lesions (**Lisch nodules**) that arise multifocally from the anterior surface of the iris.
- Lisch nodules appear to be nodular aggregates of dendritic melanocytes and not true nevi.
- They usually become evident by the age of 10–15 years and are *highly characteristic of NF-1*.

217. Ans. (b) **Basal carcinoma**Ref: A.K. Khurana, 6th ed. pg. 384**BASAL CELL CANCER OR RODENT ULCER**

- It is the most common malignant tumor of the eyelid.
- Most common site of origin of BCC: Lower eyelid followed by medial canthus.

FMGE Solutions Screening Examination

1114

- Noduloulcerative basal cell cancer is the most common presentation
- The treatment is done by surgical excision with primary repair.

218. Ans. (b) Pleomorphic adenoma

Ref: A.K. Khurana, 6th ed. pg. 399-400

- Most common Epithelial tumor of lacrimal gland: Pleomorphic Adenoma (MC benign lacrimal gland tumor)
- Most common malignant eyelid tumor: Basal cell CA > Squamous cell CA
- Most common benign eyelid tumor: Papilloma

219. Ans. (b) Brain

Ref: A.K. Khurana, 6th ed. pg. 303-304

- The child is usually brought to the surgeon on account of a peculiar white reflex from the pupil, sometimes called leucocoria 'amaurotic cat's eye'
- Other modes of presentation include a convergent or divergent squint, cataract, buphthalmos, a hypopyon or proptosis,
- If left untreated retinoblastoma runs through the same stages as melanoma of the choroid:
 - Quiescent stage, lasting from six months to a year
 - Glaucomatous stage
 - Stage of extraocular extension
 - Stage of metastasis
- Metastasis first occurs in the pre-auricular and neighbouring lymph nodes, later in the cranial and other bones.
- **Direct extension by-continuity to the optic nerve (which is affected early) and Brain is more common, while metastases in other organs, usually the liver are relatively rare.**
- Clinically cauliflower-like mass arising from the retina is seen extending into the vitreous. There is neovascularization on the surface with white areas of calcification. Vitreous or anterior chamber seedings are seen as fluffy whitish-grey deposits. The endophytic type of retinoblastoma presents as an exudative retinal detachment.

220. Ans. (a) Esotropia

Ref: A.K. Khurana, 6th ed. pg. 303-304

NEURO-OPHTHALMOLOGY

221. Ans. (b) Pituitary adenoma

Ref: A.K. Khurana's Ophthalmology, 6th ed. pg. 313-14

Type of visual field defect

1. **Unilateral blindness:** U/L optic nerve lesion
2. **Bitemporal hemianopia:** Optic chiasmal lesion (*ex: Pituitary adenoma*).
- **Binasal hemianopia:** 2 separate lesion at chiasma laterally
4. **Homonymous hemianopia:** Lesion at U/L optic tract.
5. **Superior quadrantanopia:** Temporal lobe lesion (*pie on the sky*).
6. **Inferior quadrantanopia:** Parietal Lobe lesion (*pie on the floor*)
7. **Homonymous hemianopia with macular sparing:** Occipital lobe lesion

Site of lesion

222. Ans. (b) Red green

Ref: A.K. Khurana, 6th ed. pg. 329

- Optic neuritis, the most serious adverse effect reported due to ethambutol toxicity, typically presents as reduced visual acuity, central scotoma, and loss of the ability to see green (or, less commonly, red).
- Please refer to pharmacology section for detailed discussion on ATT and their side effect.

223. Ans. (d) Fasanella servat operation

Ref: A.K. Khurana, 6th ed. pg. 381

- **Fasanella-servat operation** or Tarso-conjunctivo-mullerectomy is the surgery of choice for ptosis due to Horner syndrome: as the ptosis in Horner syndrome is mild (2 mm) and is due to Muller's muscle dysfunction (sympathetic supply)
- **Sling surgery** is done in severe ptosis with poor Levator action. Here the ptosis is mild so sling is not advised
- Levator resection upto 15 mm strengthens levator muscle and is done to correct mild degree of ptosis. If fasanella Servat operation is not provided, that it is the best correct option.

224. Ans. (b) Lateral rectus

- In raised intracranial tension, the nerves affected are the ones which have long intracranial course leading to false localizing signs. Since the CN VI emerges straight from the brainstem (while others originate obliquely), this nerve is more liable to get affected in increased intracranial pressure.
- CN VI supplies, lateral rectus muscle. Hence lateral rectus muscle is the first one to be affected in increased ICP.

225. Ans. (d) Homonymous hemianopia with macular sparing

Ref: Harrison's, 19th ed. pg. 198-199

Please look at the diagram carefully to understand the visual pathway and its corresponding pathology.

- Unilateral optic nerve lesion: Unilateral blindness
- **Binasal hemianopia:** Bitemporal optic chiasma lesion. Two different lesions compressing the chiasma from the lateral parts.
- **Bitemporal hemianopia:** Binasal retinal damagedà **optic chiasmal lesion**. Commonest lesion is *pituitary adenoma*.
- **Homonymous hemianopia:** Lesion at optic tract AND optic radiation
- **Homonymous superior quadrantonopia:** All superior quadrantonopia goes to the temporal lobe (*pie in the sky*).
- **Homonymous inferior quadrantonopia:** All inferior quadrantonopia goes to the parietal lobe (*Pie on the floor*).
- **Homonymous hemianopia w/ macular sparing:** Lesion in occipital cortex lesion.

226. Ans. (d) Homonymous hemianopia

Ref: Harrison's, 19th ed. pg. 198-199

Please refer to above explanation.

227. Ans. (c) Left optic tract

Ref: Harrison's, 19th ed. pg. 198-199

228. Ans. (d) Bitemporal hemianopia

Ref: Harrison's, 19th ed. pg. 198-199

"Bitemporal hemianopia is usually caused by tumors in the region of the sella turcica, pressure by a suprasellar aneurysm or by chronic arachnoiditis; these press upon the chiasma so that the fibers going to the nasal halves of each retina are destroyed. **Tumors of the pituitary body**^Q are most common.

229. Ans. (c) Diabetes

Ref: Harrison's, 19th ed. pg. 202

- **Isolated third nerve palsy with pupillary sparing** is seen in **diabetic neuropathy** involving cranial nerves
- Other causes which can also cause pupillary sparing oculomotor palsy are **Vascular diseases** and HTN.

230. Ans. (b) AION (Anterior Ischemic Optic Neuropathy)

Ref: Harrison's, 19th ed. pg. 202

- Anterior Ischemic Optic Neuropathy refers to a segmental or generalized infarction of anterior part of the optic nerve

FMGE Solutions Screening Examination

1116

- It occurs due to occlusion of the **short posterior ciliary arteries**
- Visual field defects show typically **altitudinal hemianopia involving the inferior (commonly) or superior half.**

231. Ans. (c) **Bilateral constricted and irregular pupil**

Ref: A.K. Khurana, 6th ed. pg. 317

- Bilaterally constricted and irregular pupil is a feature of Argyll Robertson Pupil aka Prostitue's pupil

Argyll (Neurosyphillis)

- Bilateral constricted and irregular pupil
- Light reaction: **-ve**
- Accomodation: **+ ve**
- Aka prostitute's pupil

Adie's

- Seen post viral illness → inflammation of ciliary ganglion → sympathetic stimulation
- Dilated pupil, other is N.
- NO RESPONSE TO LIGHT
- Accomodation slow
- Pupil is super sensitive to pilocarpine

ANSWERS TO BOARD REVIEW QUESTIONS

232. Ans. (b) **6.5 ml**

Ref: Ocular pathology by Myron Yanoff, Joseph William Sassan p. 529

233. Ans. (d) **200,000 IU per dose**

Ref: Khurana, 4th ed. pg. 436

Ref: Khurana 4/e, p 90, Parson 21/e, p 120

348. Ans. (a) **<3/60**

Ref: <http://www.who.int/blindness/en/>

- According to WHO definition of blindness is vision <3/60
- India has also adopted the same definition (Inability to count fingers from a distance of 3 meters)
- **Ultimate WHO goal:** Reduce blindness prevalence (in India) to 0.3% of total population by 2020.

ANSWERS TO IMAGE-BASED QUESTIONS

349. Ans. (b) **Pterygium**

350. Ans. (a) **Hypopyon**

351. Ans. (a) **Retinitis pigmentosa**

The image shows a fundus with bony spicules and a pale disc with thinned out blood vessels suggestive of diagnosis of Retinitis Pigmentosa.

352. Ans. (b) **Dot blot haemorrhages**

The fundus shows dot in the middle and blotted ink appearance of fundus haemorrhage suggestive of diagnosis of diabetic retinopathy.

Dermatology

MOST RECENT QUESTIONS 2019

1. A 25-year-old female presents with history of fever and oral ulcers and has developed erythematous lesions on her face. Comment on the diagnosis.

- a. SLE
 - b. Dermatomyositis
 - c. Melasma
 - d. Rosacea
2. The following lesion was noticed in a patient with history of involuntary weight loss. What is the diagnosis?

- a. Acanthosis nigricans
- b. Leser-Trélat sign
- c. Actinic keratosis
- d. Intertriginous Candida

3. Which is not correct about the lesion shown?

- a. The lesions are infectious to seronegative individuals
 - b. Can be associated with meningoencephalitis
 - c. Bilaterally symmetrical dermatomal vesicular eruption
 - d. Geniculate ganglion is involved in Ramsay Hunt syndrome
4. The shown instrument is:

- a. Single cutting razor
 - b. Double cutting razor
 - c. Humby's knife
 - d. Finocchio knife
5. Most appropriate Management to reduce recurrence of keloid:
- a. Intralesional steroids
 - b. Surgery
 - c. Cryotherapy
 - d. Electrocoagulation

6. An infant presents with the condition as shown below after a pharyngeal infection. The shown condition is:

- a. Staphylococcal scalded skin syndrome
- b. Epidermolysis bullosa simplex
- c. Impetigo contagiosa
- d. Pemphigus foliaceus

7. The shown penile lesion is:

- a. Genital wart
- b. Pearly penile papule
- c. Balanitis
- d. Sebaceous gland prominence

8. The shown lesions are:

- a. Molluscum contagiosum
- b. Chicken pox
- c. Pemphigus
- d. Common warts

9. Identify condition in the shown image:

(Recent Pattern Question 2018-19)

- a. Impetigo
- b. Chickenpox
- c. Pemphigus
- d. Traumatic crust

10. Common neurological tumour associated with NF-2:

(Recent Pattern Question 2018-19)

- a. Acoustic neuroma
- b. Optic glioma
- c. Café-Au-Lait macules
- d. Meningioma

11. What are these colored divisions on body called:

(Recent Pattern Question 2018-19)

- a. Lymphatic development
- b. Dermatomes
- c. Blaschko Lines
- d. Vascular development

12. Which of the following is NOT seen in congenital syphilis:

(Recent Pattern Question 2018-19)

- a. Maculopapular skin lesion
- b. Hutchinson teeth
- c. Bow legs
- d. Gumma ulcers

13. Which of the following is used for treatment of Vitiligo?

(Recent Pattern Question 2018-19)

- a. Retinoids
- b. Systemic steroids
- c. Psoralen PUVA
- d. Nd-YAG laser

14. Tzanck smear as shown in the image shows:

- a. Acanthosis
- b. Acantholytic cells
- c. Smudge cells
- d. Anaplasia

15. Name the horizontal lines shown in the image:

(Recent Pattern Question 2018-19)

- a. Langer lines
- b. Blaschko lines
- c. Kraissl lines
- d. Borges lines

16. In which condition is Nikolsky's sign positive and bulla spread sign seen? (Recent Pattern Question 2018)

- a. Dermatitis herpetiformis
- b. Pemphigus vulgaris
- c. Bullous pemphigoid
- d. Erythema multiforme

17. Identify the given image: (Recent Pattern Question 2018)

- a. Chicken pox
- b. Eczema
- c. Molluscum contagiosum
- d. Impetigo

18. Fordyce's spots involves: (Recent Pattern Question 2018)

- a. Sweat gland
- b. Mucus gland
- c. Sebaceous gland
- d. Moll glands

19. The shown image is the causative agent for:

(Recent Pattern Question 2018)

- a. Scabies
- b. Pediculosis
- c. Molluscum contagiosum
- d. Pthirus pubis

20. Identify the type of nevus:

(Recent Pattern Question 2018)

- a. Café au lait macule
- b. Plexiform neurofibroma
- c. Becker nevus
- d. Nevus of Ota

21. Identify the lesion on trunk:

(Recent Pattern Question 2018)

- a. Pityriasis alba
- b. Pityriasis rosea
- c. Pityriasis versicolor
- d. Chicken pox

22. Possible diagnosis based on wood lamp examination?
(Recent Pattern Question 2017)

- a. Psoriasis
- b. Erythrasma
- c. Pityriasis versicolor
- d. Tinea versicolor

23. Identify the type of nevus: (Recent Pattern Question 2017)

- a. Becker nevus
- b. Nevus of ota
- c. Café au lait macule
- d. Plexiform neurofibroma

24. Identify the lesion present on trunk of patient:
(Recent Pattern Question 2017)

- a. Pityriasis alba
- b. Pityriasis rosea
- c. Pityriasis versicolor
- d. Pityriasis rubra pilaris

25. A middle age patient presented to you with the shown type of baldness. Diagnosis: (Recent Pattern Question 2017)

- a. Alopecia areata
- b. Telogen effluvium
- c. Male pattern baldness
- d. Cicatricial hair loss

26. Pemphigus foliaceus is a condition which is seen due to antibody against: (Recent Pattern Question 2017)

- a. Desmoglein 1
- b. Desmoglein 2
- c. Desmoglein 3
- d. Desmoglein 4

27. Pemphigus vulgaris can be seen due to antibodies against desmosomal cadherin cell binding protein:

(Recent Pattern Question 2017)

- a. Desmoglein 1
- b. Desmoglein 3
- c. Both
- d. None

28. Row of tombstone is seen in which skin disorder:

- a. Pemphigus vulgaris (Recent Pattern Question 2017)
- b. Pemphigus foliaceus
- c. Paraneoplastic pemphigus
- d. Bullous pemphigoid

29. The shown immunofluorescence pattern in skin biopsy is suggestive of: (Recent Pattern Question 2017)

- a. Pemphigus vulgaris
- b. Pemphigus foliaceus
- c. Paraneoplastic pemphigus
- d. Bullous pemphigoid

FMGE Solutions Screening Examination

30. Identify the lesion: (Recent Pattern Question 2017)

- a. Erythema marginatum
- b. Dermatitis herpetiformis
- c. Psoriasis
- d. Dermatomyositis

31. Hertoghe's sign is seen in:

(Recent Pattern Question 2017)

- a. Contact dermatitis
- b. Atopic dermatitis
- c. Seborrheic dermatitis
- d. Neurodermatitis

32. A young girl having low intelligence presented as shown below. There is history of epilepsy. Diagnosis:

- a. Neurofibromatosis (Recent Pattern Question 2017)
- b. Tuberous sclerosis
- c. Systemic lupus erythematosus
- d. Systemic sclerosis

33. A patient presented with blue marks on face as shown in image. Most likely diagnosis:

(Recent Pattern Question 2017)

- a. Nevus Ito
- b. Nevus ota
- c. Blue nevus
- d. Tuberous sclerosis

34. A patient presented with lesions in interdigital clefts. The oral drug used is? (Recent Pattern Question 2017)

- a. Permethrin
- b. Ivermectin
- c. Benzyl benzoate
- d. Sulphur

35. A baby presents with fever, erythema around face and rash all over body. Treatment to be initiated:

(Recent Pattern Question 2017)

- a. Acyclovir
- b. Valacyclovir
- c. Raltegravir
- d. Antipyretics

36. A patient presents with lesion on occipitotemporal region of head as shown in image. Possible diagnosis:

(Recent Pattern Question 2017)

- a. Dermatitis herpetiformis
- b. Lichen planus
- c. Tinea capitis
- d. Traumatic alopecia

37. Patient presented with patchy rash involving trunk and back as shown in image. Diagnosis is?

(Recent Pattern Question 2017)

- a. Candida
- b. Tinea corporis
- c. Tinea versicolor
- d. Tinea capitis

38. Possible diagnosis is? (Recent Pattern Question 2017)

- a. Molluscum contagiosum b. Pityriasis versicolor
c. Pityriasis rosea d. Tinea corporis

39. A 60-year-old lady presents with lesion on upper eyelid as shown in image. Diagnosis is?

(Recent Pattern Question 2017)

- a. Kerato-acanthoma b. Basal cell cancer
c. Bowen's disease d. Psoriasis

40. A hypothyroid female patient presents with alopecia. Diagnosis is? (Recent Pattern Question 2017)

- a. Alopecia areata b. Androgenic alopecia
c. Telogen effluvium d. Traumatic alopecia

41. Acrodermatitis enteropathetica occurs due to?

(Recent Pattern Question 2017)

- a. Copper deficiency b. Zinc deficiency
c. Iron deficiency d. Folic acid deficiency

42. Malassezia furfur is a causative organism for:

(Recent Pattern Question 2017)

- a. Tinea versicolor b. Tinea coli
c. Tinea capitis d. Tinea corporis

43. In the shown lesion scratching leads to bleeding followed by further formation of similar lesion is suggestive of?

(Recent Pattern Question 2017)

- a. Pityriasis versicolor b. Psoriasis
c. Lichen vulgaris d. Psoriasis

44. 25-year-old Truck driver with repeated Herpes infection presents with following skin lesions. Diagnosis is:

(Recent Pattern Question 2017)

- a. Hand foot mouth disease b. Steven Johnson syndrome
c. Erythema multiforme d. Dermatitis herpetiformis

45. True about chickenpox rash are all EXCEPT:

(Recent Pattern Question 2016)

- a. Superficial b. Pleomorphic
c. Centripetal d. Palms and soles involved

46. A 25-year-old patient present with violaceous lesion on arms. What is the likely diagnosis:

(Recent Pattern Question 2016)

- a. Psoriasis b. Pityriasis rosea
c. Lichen planus d. Dermatophytosis

47. What is the diagnosis of the given image?

(Recent Pattern Question 2016)

- a. Lichen planus b. Lichenoid dermatitis
c. Psoriasis d. Pityriasis rosea

48. Best treatment of 24-year-old female with the following lesions? *(Recent Pattern Question 2016)*

- a. Steroids b. Isotretinoin
c. Tetracycline d. Erythromycin
49. Patient present with axillary freckling (as shown in image).
Diagnosis: *(Recent Pattern Question 2016)*

- a. Neurofibromatosis b. Tuberous sclerosis
c. Ichthyosis vulgaris d. Von Hippel–Landau
50. What is the likely diagnosis? *(Recent Pattern Question 2016)*

- a. Alopecia areata b. Androgenic alopecia
c. Telogen effluvium d. Tinea capitis
51. Sunscreen lotion contains: *(Recent Pattern Question 2016)*
- a. Mercury b. Selenium
c. Sulfide d. Zinc oxide
52. Average weight of skin:
- a. 5 kg b. 10 kg
c. 15 kg d. 18 kg

53. Deepest layer of epidermis:

- a. Stratum corneum b. Stratum spinosum
c. Stratum granulosum d. Stratum germinatum

54. Synthesis of keratin mainly takes place in this layer of epidermis:

- a. Stratum basale b. Stratum corneum
c. Stratum granulosum d. Stratum spinosum

55. Hyperkeratosis is:

- a. Thinning of stratum corneum
b. Thickening of stratum corneum
c. Thinning of stratum basale
d. Thickening of stratum basale

56. Odland bodies are seen in this layer of epidermis:

- a. Stratum corneum b. Stratum granulosum
c. Stratum spinosum d. Stratum basale

57. Principal cell of epidermis:

- a. Melanocytes b. Langerhan cell
c. Keratinocytes d. Merkel cell

58. Langerhan cell present in which layer of epidermis:

- a. Basale b. Corneum
c. Granulosum d. Spinosum

59. Merkel cells are present in which of the following layers on epidermis:

- a. Basale b. Corneum
c. Granulosum d. Spinosum

60. Acantholysis is:

- a. Lysis of basale cell layer
b. Separation of keratinocytes
c. Thickening of granular layer
d. Thickening of corneum layer

61. Acanthosis is:

- a. Separation of keratinocytes
b. Thickening of granular layer
c. Thickening of corneum layer
d. Thickening of prickle cell layer

62. Parakeratosis is:

- a. Absence of nucleus in stratum corneum
b. Persistence of nucleus in stratum corneum
c. Thickening of corneum layer
d. Thickening of prickle cell layer

63. Skin turnover time in case of psoriasis:

- a. 2 days b. 4 days
c. 8 days d. 10 days

64. A person starts to sweat on forehead and gets a runny watery nose whenever he eats hot and spicy meals. This kind of sweating is:

- a. Mental sweating b. Physical sweating
c. Thermogenic sweating d. Gustatory sweating

65. True about fordyce spot:

- a. Axilla is most common site
b. Lips are most common site
c. Blockage of eccrine gland ducts
d. Blockage of apocrine gland ducts

66. Most common site of fordyces spot:
 - a. Lips
 - b. Below tongue
 - c. Axilla
 - d. Groin
67. True about macule:
 - a. Flat lesion >2 cm
 - b. Flat lesion <2 cm
 - c. Elevated lesion >2 cm
 - d. Elevated lesion <2 cm
68. Size of papule:
 - a. <5 cm
 - b. <5 mm
 - c. <0.5 mm
 - d. <0.05 cm
69. A papule that is raised, non-purulent is most probably due to:
 - a. Insect bite
 - b. Urticaria
 - c. Angioedema
 - d. Erythema nodosum
70. Green color at bruise site is due to:
 - a. Hemotidin
 - b. Bilirubin
 - c. Hemosiderin
 - d. Biliverdin
71. All of the following statements are true about *Propionibacterium acnes* EXCEPT:
 - a. Normal flora of skin
 - b. Causes acne vulgaris
 - c. Sulfur granules in the purulent sinuses are characteristic
 - d. Can be found in G.I. tract also
72. Deposition of IgA in dermoepidermal junction. What could be probable diagnosis:
 - a. Nummular eczema
 - b. Pemphigus vulgaris
 - c. Bullous pemphigoid
 - d. Dermatitis herpetiformis
73. Acantholytic cells are seen in?
 - a. Pemphigus vulgaris
 - b. Bullous pemphigoid
 - c. Cicatricial pemphigoid
 - d. Dermatitis herpetiformis
74. Pemphigus vulgaris is caused by:
 - a. Bacteria
 - b. Virus
 - c. Autoimmune
 - d. Fungal
75. Pemphigus bullae are located at:
 - a. Subepidermal
 - b. Intraepidermal
 - c. Subdermal
 - d. All of the above
76. Subepidermal lesions are seen in?
 - a. Pemphigus vulgaris
 - b. Pemphigoid bullae
 - c. Burns
 - d. Bullous impetigo
77. Intraepidermal bulla are seen in:
 - a. Bullous pemphigoid
 - b. Pemphigus vulgaris
 - c. Bullous impetigo
 - d. Dermatitis herpetiformis
78. All are true about pemphigus bullae except:
 - a. Flaccid bullae located intradermal area
 - b. Nikolsky sign absent
 - c. Usually involves mucosa
 - d. Acantholysis present
79. Intercellular antibodies deposition on immunofluorescence is seen in:
 - a. Psoriasis
 - b. Pemphigus
 - c. Pemphigoid
 - d. Propyria
80. Drug of choice for dermatitis herpetiformis:
 - a. Dapsone
 - b. Rifampicin
 - c. Ketokonazole
 - d. Azithromycin
81. Darrier sign is seen in:
 - a. Atopic dermatitis
 - b. Pemphigus vulgaris
 - c. Urticaria pigmentosa
 - d. Bullous pemphigoid
82. Most common site of angioedema:
 - a. Hands
 - b. Lips
 - c. Skin
 - d. Eyelid
83. Angioedema is characterized by swelling of the:
 - a. Subcutaneous tissue
 - b. Epidermis
 - c. Dermis
 - d. Blood vessels
84. All are true about Xeroderma Pigmentosa except:
 - a. Due to deficiency of IgA
 - b. Has marked sensitivity to UV light
 - c. Due to defective DNA repair
 - d. Autosomal recessive
85. Acrodermatitis enteropathica is due to deficiency of:
 - a. Iron
 - b. Copper
 - c. Zinc
 - d. Magnesium
86. All are true about Keloid except:
 - a. May be familial
 - b. Appears mostly on sternum
 - c. Subsides over time
 - d. Hyperkeratotic
87. Which of the following presents with hypopigmented patches:
 - a. Blue nevus
 - b. Nevus ito
 - c. Nevus becker
 - d. Nevus Anemicus
88. Dermatophytes are:
 - a. Tinea versicolor
 - b. Trichophyton rubrum
 - c. Sporothrix
 - d. All of the above
89. Which of the following structure is affected by dermatophytes:
 - a. Skin
 - b. Hair
 - c. Nail
 - d. All of the above
90. Trichophyton infects:
 - a. Skin + nail
 - b. Skin + hair
 - c. Hair + nail
 - d. Skin + hair + nail
91. Which of the following infects skin and hair:
 - a. T. verrucosum
 - b. M. Gypseum
 - c. Both
 - d. None
92. A case of 12-years-old boy presents to you with boggy swelling and easily pluckable hair. What would be the probable diagnosis:
 - a. Lichen planus
 - b. Tinea capitis
 - c. Epidermophytosis
 - d. Alopecia areata
93. An adult male presented 4 weeks after intercourse with fever, rubbery consistency ulcer, inguinal lymphadenopathy. Causative organism:
 - a. LGV
 - b. Syphilis
 - c. Chancroid
 - d. HIV

94. Painful ulcer on glans penis is seen in:

- a. Syphilis
- b. Lymphogranuloma venerum
- c. Chancroid
- d. Chancre

95. School of fish appearance is seen in?

- a. Bacterial vaginosis
- b. Hemophilus Ducreyi
- c. Gonococcus
- d. Chlamydia

96. Moth eaten alopecia is caused by:

- a. Secondary syphilis
- b. Primary syphilis
- c. Tertiary syphilis
- d. Early relapsing syphilis

97. All cause genital ulcer except:

- a. Gonorrhoea
- b. Chancroid
- c. HSV
- d. LGV

98. Child with recurrent mouth ulcer which usually begin as a round yellowish elevated spot surrounded by a red halo and heals within 7–10 days:

- a. Gingivitis
- b. Aphthous ulcers
- c. Malignancy
- d. Herpetic ulcer

99. Alopecia areata is due to defect of this stage of hair growth:

- a. Anagen effluvium
- b. Telogen effluvium
- c. Catagen
- d. None

100. Infection caused by human papilloma virus is called as?

- a. Condyloma lata
- b. Condyloma acuminata
- c. Verrucous wart
- d. Plantar wart

101. Which of the following is the causative organism of Verruca vulgaris:

- a. CMV
- b. Human immunodeficiency virus
- c. Human papilloma virus
- d. Epstein barr virus

102. All of the following tests are used for diagnosis of leprosy EXCEPT:

- a. Clinical examination
- b. Lepromin test
- c. Slit skin smear
- d. Skin biopsy

103. Thalidomide is mostly effective in:

- a. Nerve Abscess
- b. Type I Lepra reaction
- c. Type II Lepra reaction
- d. Both type I and II leprae reaction

104. TB presents with all of the following skin conditions, except:

- a. Lupus vulgaris
- b. Scrofuloderma
- c. Erythema nodosum
- d. Lichen scrofulosorum

105. Lichen planus is associated with:

- a. Koilonychia
- b. Tinea versicolor
- c. Psoriasis
- d. Pterygium of nail

106. Bandlike infiltrate of lymphocytes at the dermoepidermal junction, and “saw-tooth” rete ridges are diagnostic histological features of:

- a. Lichen planus
- b. Lupus erythematosus
- c. Psoriasis vulgaris
- d. Seborrheic dermatitis

107. Treatment of choice in severe cystic acne:

- a. Isotretinoin
- b. Tretinoin
- c. Benzoyl peroxide
- d. Azelaic acid

108. Oral treatment of acne is:

- a. Ivermectin
- b. Benzyl peroxide
- c. Doxycycline
- d. Adapalene

109. Target or Iris lesion are seen in:

- a. Urticaria
- b. Erythema multiformae
- c. Scabies
- d. Lichen planus

110. Annular herald patch is seen in:

- a. Lichen planus
- b. Psoriasis
- c. Pityriasis alba
- d. Pityriasis rosea

111. Pityriasis alba is a type of:

- a. Vitiligo
- b. Atopic eczema
- c. Photoallergy
- d. Infection

112. A girl presented with the lesions shown below: treatment of choice:

- a. Topical imidazole
- b. Terbinafine
- c. Fluconazole
- d. Selenium sulphide

113. Pityriasis Versicolor is caused by:

- a. Tinea rubrum
- b. Malassezia furfur
- c. Tinea capitis
- d. Varicella

114. Nikolsky sign is seen in:

- a. Herpes simplex
- b. Herpes zoster
- c. Pemphigus vulgaris
- d. All of the above

115. Diagnose the following:

- a. Melanoma
- b. Sebaceous cyst
- c. Basal cell carcinoma
- d. Papulo-squamous disorder

116. Erythrasma is caused by

- a. Corynebacterium minutissimum
- b. Corynebacterium Jeikeium
- c. Corynebacterium parvum
- d. Corynebacterium amycolatum

BOARD REVIEW QUESTIONS

117. Substance common in skin, hair and nail is?
 - a. Vimentin
 - b. Keratin
 - c. Laminin
 - d. Nectin
118. Stratum lucidum is present between which two layers?
 - a. Corneum and granulosum
 - b. Granulosum and spinosum
 - c. Spinous and basale
 - d. Basal and subbasale
119. Which of the following is not a component of sebum?
 - a. Cholesterol
 - b. Wax
 - c. Glycerides
 - d. Propylene
120. Which of the following drug causes pigmentation of skin?
 - a. Minocycline
 - b. Penicillin
 - c. Furosemide
 - d. Amefostine
121. Most common cause of TEN?
 - a. Drugs
 - b. Herpes simplex
 - c. Autoimmune
 - d. Porphyria
122. Diascopy is done for?
 - a. Change in color of lesion on wood's light exposure
 - b. Scraping of lesion for KOH mount
 - c. Change in color of lesion on pressure with glass slide
 - d. Aspiration of lesion for inflammatory exudates
123. Civatte bodies are seen in
 - a. Linchen planus
 - b. Tinea cruris
 - c. Psoariasis
 - d. SSSS
124. Cradle cap is
 - a. Atopic dermatitis
 - b. Seborrheic dermatitis
 - c. Vernix caseosa
 - d. Urticarial dermatitis
125. Incorrect about scabies
 - a. Burrows are pathognomonic
 - b. Itch mites buries in stratum corneum
 - c. High yield Lesions on palms and face
 - d. Ivermectin blocks glutamate driven chloride lesions
126. Tinea corporis gladiatorum involves
 - a. Glans penis
 - b. Trunk
 - c. Scalp
 - d. Nails
127. Merkel cells are seen in
 - a. Epidermis
 - b. Dermis
 - c. Hypodermis
 - d. All of the above
128. First cutaneous manifestation in leprosy
 - a. Hypopigmented macule
 - b. Hypoanesthetic macule
 - c. Painless bun in hand
 - d. Inverse ptosis
129. Sausage digits are seen in
 - a. Bronchiectasis
 - b. Psoriatic arthritis
 - c. Scleroderma
 - d. Koenen tumors
130. Mechanic hands are seen in
 - a. Guttate psoriasis
 - b. Scleroderma
 - c. Dermatomyositis
 - d. Pustular psoriasis
131. Infection caused by human papilloma virus:
 - a. Condylomalata
 - b. Condyloma acuminata
 - c. Verrucous wart
 - d. Plantar wart
132. Thalidomide is mostly effective in:
 - a. Nerve Abscess
 - b. Type I Lepra reaction
 - c. Type II Lepra reaction
 - d. Both type I and II leprae reaction
133. Deposition of IgA in dermo-epidermal junction. What could be probable diagnosis:
 - a. Nummular eczema
 - b. Pemphigus vulgaris
 - c. Bullous pemphigoid
 - d. Dermatitis herpetiformis
134. Pathergy test is used for
 - a. Sarcoidosis
 - b. Scleroderma
 - c. Behçet disease
 - d. Kaposi sarcoma
135. Nikolsky sign is absent in
 - a. Pemphigus vulgaris
 - b. Bullous pemphigoid
 - c. Toxic epidermal necrolysis
 - d. Necrolytic migratory erythema
136. Target lesion are seen in
 - a. Erythema multiforme
 - b. TSS
 - c. Acanthosisnigricans
 - d. All of the above
137. Pterygium of nail is seen in?
 - a. Psoriasis
 - b. Pemphigus
 - c. Pemphigoid
 - d. Lichen planus
138. Oil drop sign of nail is seen in?
 - a. Lichen planus
 - b. Dermatophytes
 - c. Lupus vulgaris
 - d. Psoriasis

139. Necrobiosis Lipoidica diabeticorum is seen in?

- a. Sarcoidosis b. Renal cell carcinoma
- c. Diabetes mellitus d. Leprosy

140. Darrier's sign is seen in?

- a. Urticaria pigmentosa b. Xanthogranuloma
- c. ALL d. All of the above

141. Follicular hyperkeratosis is related to deficiency of?

- a. Vitamin A b. Vitamin C
- c. Zinc d. Vitamin E

142. Carpet track sign is seen in?

- a. Lupus vulgaris b. Lupus pernio
- c. DLE d. SLE

143. Fat is present in relation to which anatomical structure?

- a. Epidermis b. Dermis
- c. Subcutaneous tissue d. Nail bed

144. Groove sign is seen in?

- a. Chancroid b. Syphilis
- c. LGV d. Psoriasis

145. Gottron's papules are seen in?

- a. SLE b. MTCD
- c. Dermatomyositis d. Rheumatoid arthritis

146. Dry ice is?

- a. Methane hydrate b. Liquid nitrogen
- c. Solid carbon dioxide d. Frozen water

147. Linear deposition of IgG and C3 in lamina lucida is seen in?

- a. Dermatitis herpetiformis
- b. Pemphigus vulgaris
- c. Pemphigus foliaceus
- d. Bullous pemphigoid

148. Tomb stone appearance is seen in?

- a. Bullous pemphigoid b. Pemphigus vulgaris
- c. Linear IgA disease d. Dermatitis herpetiformis

149. Wickham's striae are seen in?

- a. Lichen planus b. Psoriasis
- c. Prurigo d. DLE

150. Vagabond's disease is caused by?

- a. Scabies b. Herpes genitalis
- c. Pediculosis corporis d. Ant bite reaction

151. Koebner's phenomenon is seen in?

- a. Acne vulgaris b. Pemphigus vulgaris
- c. Psoriasis d. Ichthyosis

152. Obliteration of apocrine duct leads to?

- a. Fordyce's disease b. Fox Fordyce's disease
- c. Moll's gland d. Pearly benign papules

153. Norwegian scabies is seen in?

- a. Children
- b. Pregnant women
- c. Patients on chemotherapy
- d. Infants

154. Groove sign is seen in?

- a. Chancroid b. Syphilis
- c. LGV d. Psoriasis

155. Melanocytes are located in which layer?

- a. Stratum malpighii
- b. Stratum basale
- c. Stratum corneum
- d. Stratum granulosum

156. Coarse pitting of nails is seen in?

- a. Psoriatic arthritis
- b. Dermatitis herpetiformis
- c. Bullous pemphigoid
- d. Pemphigus vulgaris

157. Fungus causing hair skin and nail infection is?

- a. T. rubrum b. E. flocculosum
- c. M. Canis d. M. Ayouni

158. Pathognomonic lesion of scabies is?

- a. Papules b. Vesicle
- c. Burrow d. Pits

159. Christmas tree arrangement of skin lesion is seen in?

- a. P. versicolor b. P. rosea
- c. P. folliculitis d. Tinea corporis

160. Buschke ollendorf sign is seen in?

- a. Gonorrhoea b. Congenital syphilis
- c. Secondary syphilis d. Herpes genitalis

161. Salt and pepper skin is seen in?

- a. Dermatomyositis b. SLE
- c. Scleroderma d. Syphilis

162. Apple jelly nodules are seen in?

- a. Lupus vulgaris
- b. Scrofuloderma
- c. Chancre
- d. Atypical mycobacterial infection

163. Munro's micro abscess is seen in?

- a. Psoriasis b. DLE
- c. Lichen planus d. Mycosis fungoides

164. All are causes of erythema multiforme EXCEPT:

- a. Chronic renal failure
- b. Infectious mononucleosis
- c. Mycoplasma
- d. Collagen vascular disease

165. Saucer right side up is a characteristic feature of this type of leprosy:

- a. Borderline borderline b. Tuberculoid
- c. Borderline tuberculoid d. Intermediate

166. Swiss cheese lesion is a characteristic feature seen in this type of leprosy:

- a. Borderline borderline b. Tuberculoid
- c. Borderline tuberculoid d. Intermediate

IMAGE-BASED QUESTIONS

167. Identify the instrument

- a. Infra-red lamp
- b. UV rays lamp
- c. Wood lamp
- d. Slit lamp

170. These typical lesions are present in?

- a. Pemphigus
- b. Bullous pemphigoid
- c. Erythema multiforme
- d. Dermatitis herpetiformis

168. This finding is characteristic of?

- a. Leucoderma
- b. Piebaldism
- c. Nevus anemicus
- d. Nevus achromicus

171. This classical presentation is of?

- a. Pityriasis rosea
- b. P. alba
- c. P. rubra
- d. P. versicolor

169. This test is used for diagnosis of?

- a. Behçet's syndrome
- b. Contact dermatitis
- c. Pyoderma gangrenosum
- d. Atopic dermatitis

172. What is the treatment of choice for this condition?

- a. Anti-histaminic
- b. Steroid
- c. Clotrimazole paint
- d. Selenium sulphide

173. All are correct about the lesion shown except?

- a. Molluscum contagiosum
- b. Caused by RNA virus
- c. Propagate via auto-inoculation
- d. Not seen in soles or palms

174. A patient develops honey colored pustules on the skin. The diagnosis is?

- a. Impetigo
- b. Staphylococcal scalded skin syndrome
- c. Carbuncle
- d. Sycosis barbae

175. The image shows?

- a. Pterygium nail
- b. Tinea unguium
- c. Botryomycosis
- d. Onchomycosis

176. The image shows?

- a. Lichen planus
- b. Psoriasis
- c. Tinea corporis
- d. Pityriasis versicolor

177. The image shows which skin lesion?

- a. Lichen planus
- b. Psoriasis
- c. Tinea corporis
- d. Pityriasis versicolor

178. Multiple painful bleeding ulcers with inguinal bubo is seen with

- a. Chancere
- b. Granuloma inguinale
- c. Lymphogranuloma venerum
- d. Chancroid

179. All are true about the lesions shown except?

- a. Itchy lesions on palms
- b. Potent topical steroids resolve most cases
- c. Associated with anhidrosis
- d. Painful deep seated vesicles

182. The given image shows?

- a. Favus
- b. Kerion
- c. Seborrheic
- d. Scutula

180. The image shows presence of?

- a. Lentiginosis
- b. Freckles
- c. Shagreen patch
- d. Congenital nevus

183. Which of the following is not effective against this condition?

- a. Topical ketoconazole
- b. Griseofulvin
- c. Topical selenium sulphide
- d. Topical sulfur preparations

181. Identify the type of leprosy based on shown lesion:

- a. Borderline borderline
- b. Tuberculoid
- c. Borderline tuberculoid
- d. Intermediate

184. All are true about the lesion shown *except*?

- a. HHV-7
- b. Herald patch
- c. Predominantly occurs on genitals
- d. Spontaneous healing

185. A 25-year-old woman presents with skin lesion on left supra-orbital margin. Eye examination is within normal limits. CXR done was normal. Diascopy shows apple jelly nodules. The image shows presence of?

- a. Lupus vulgaris b. Lupus Pernio
- c. Erythema marginatum
- d. Leprosy

188. The image shows presence of?

- a. Muehrcke's nails b. Lindsay nails
- c. Leukonychia d. Beau's lines

186. The image shows presence of?

- a. Vitiligo
- b. Piebaldism
- c. Xeroderma pigmentosum
- d. Incontinentia pigmenti

189. The image shows presence of?

- a. Muehrcke's nails b. Lindsay nails
- c. Leukonychia d. Beau's lines

187. A 20-year-old man with history of melena and abdominal pain has pigmentation of lips. Probable diagnosis is?

- a. Incontinentia pigmenti
- b. Cronkhite Canada syndrome
- c. Brooke Spiegler syndrome
- d. Peutz Jeghers syndrome

190. A 25-year-old young adult female presents with following lesions in axilla, as shown by the arrow:

- a. Hidradenitis suppurativa
- b. Fordyce spot
- c. Acne fulminans
- d. Acne conglobate

191. The given KOH mount of patient shows?

- a. Spaghetti and meat ball appearance
- b. Budding yeasts and pseudohyphae
- c. Clusters of pigmented cells
- d. Septate hyphae

192. A 20-year-old patient presents with an extremely itchy lesion on one arm. Diagnosis is?

- a. Tinea corporis
- b. Tinea imbricata
- c. Tinea incognito
- d. Tinea manuum

193. These lesions are seen in which of the following?

- a. Erythema infectiosum
- b. Erythema nodosum
- c. Erythema induratum
- d. Erythema multiforme

194. A 28-year-old lady has asymptomatic dome shaped small lesions on a forehead for last 2 months. She has a 2-year-old daughter with similar lesions. What is the causative agent?

- a. Papillomavirus
- b. Poxvirus
- c. Herpes virus
- d. Coxsackie virus

195. A patient after a trip to Bangkok developed fever and perioral vesicles. What is the diagnosis?

- a. Herpes simplex
- b. Impetigo
- c. Molluscum contagiosum
- d. Bullous pemphigoid

196. Identify the lesion:

- a. Molluscum contagiosum
- b. Herpes simplex
- c. Pityriasis rosea
- d. Gianotti-Crosti syndrome

197. A 13-year-old boy presents with patchy depigmented skin on the right flank and upper thigh in segmental distribution. The depigmentation started 1 year back but has been static for last 4 months. Mother reports use of topical steroids which was ineffective. Diagnosis is?

- a. Piebaldism
- b. Segmental vitiligo
- c. Hypomelanosis of Ito
- d. Hypopigmented streaks

198. Identify the lesion:

- a. Koenen tumor
- b. Onychomycosis
- c. Onychodystrophy
- d. Onychogryphosis

199. All of the following statements regarding this image are true EXCEPT:

- a. Dhobi itch
- b. Jock itch
- c. More common in tropics
- d. Caused by *Candida*

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) SLE

Ref: Harrison 20th ed. page 2518-2519

- The image shows an erythematous rash sparing the nasolabial folds which coupled with clinical history points to diagnosis of SLE.
- Choice B leads to heliotrope rash involving the upper eye lid and proximal muscle weakness.
- Choice C presents as grey-brown patches, usually on the face on the cheeks, bridge of the nose, forehead, chin, and above the upper lip. It can also appear on sun-exposed parts of body, such as the forearms and neck.
- Choice D presents as redness, and can slowly spread beyond the nose and cheeks to the forehead and chin. There will be flushing, visible blood vessels and acne like breakouts.

2. Ans. (a) Acanthosis nigricans

Ref: Fitzpatrick Colour Atlas and Synopsis of Clinical Dermatology page 88

- The image shows presence of *asymmetric, velvety hyperpigmentation* at the back of the neck of the patient suggestive of diagnosis of acanthosis nigricans. It is seen in patients with impaired glucose tolerance and internal malignancy.
- Choice B is seen in patients with internal malignancy but has multiple pigmented skin lesions.
- Choice C is a crusty, scaly growth caused by damage from exposure to ultraviolet (UV) radiation.
- Choice D has red inflamed lesions and is hence ruled out.

3. Ans. (c) Bilaterally symmetrical dermatomal vesicular eruption

Ref: Harrison 20th ed. page 1355

- The image shows lesions of Herpes Zoster that develop unilaterally in a single dermatome.
- Choice A is correct since seronegative individuals on contact with these patients can develop chicken pox.
- Choice B is correct since neurological complication can develop in the form of meningoencephalitis.
- Choice D is correct since Ramsay Hunt syndrome leads to eruption in external auditory canal and the geniculate ganglion of sensory division of facial nerve is involved.

4. Ans. (c) Humby's knife

- The shown instrument is used in plastic surgery for skin feeling during grafting procedure. The instrument is Humby's knife.

5. Ans. (a) Intralesional steroids

- In patients with recurrent keloids, intralesional steroids are often very effective.
- Uniform protocol of corticosteroid injections and ointment application reduces recurrence rate of keloid drastically.
- Book says: "Intralesional steroids have been the mainstay of treatment of keloids"
- MC used steroid: Triamcinolone acetonide in concentration 10–40 mg/mL, administered intra-lesionally with 25–27 G needle at 4–6 weeks interval.
- Other modalities that can be used (less effective)
 - Silicon gel sheets and silicone occlusive dressing
 - Topical corticosteroid impregnated tape
 - Cryotherapy
 - Radiation therapy

6. Ans. (a) Staphylococcal scalded skin syndrome

- Staphylococcal Scalded Skin Syndrome aka Dermatitis Exfoliativa Neonatorum
- **Cause:** Toxin producing Staph Aureus (exfoliative toxins A and B)
- **Characterized** by erythema and widespread loss of superficial epidermal layers, resembling burn
- **Symptoms:**
 - After staphylococcal infection like otitis, pharyngitis or conjunctivitis → fever with ery-thema resembling scarlet fever
 - It later becomes small unstable blisters → erodes quickly and leads to widespread skin loss (generalized).
 - Blister contains stratum corneum (in TEN, full thickness epidermal damage), subcorneal blisters and acantholysis.
- **Treatment:** Fluid replacement + Antibiotics

7. Ans. (b) Pearly penile papule

Ref: Dermatology Essentials E-Book, P 936

- The shown condition is pearly penile papule (PPP)
- Patients with pearly penile papule usually present with concern that they might have genital warts.
- PPP are benign, 1–2 mm dome shaped spots, asymptomatic angiofibromas that occur in rows, circumferentially around the coronal sulcus of penis.

FMGE Solutions Screening Examination

- **Incidence:** 8–30%; MC in 3rd decade
- Mostly seen in circumcised males. It is not related to HPV
- **NOTE:** Warts are not as linear or as clearly defined as PPP.
- **Treatment:**
 - ◆ Usually not required; Reassurance
 - ◆ For lesion removal: Podophyllin application, cryotherapy, Electrodesiccation and curettage and CO₂ laser.

Extra Mile

- **Balanitis:** It is inflammation of glans of penis or prepuce due to poor personal hygiene by Candida species, streptococci, HPV, HSV, Gardnerella etc.

BALANITIS

- Sebaceous gland prominence

- Psoriasis of glans and shaft of penis

8. Ans. (a) **Molluscum contagiosum**

- Molluscum contagiosum caused by large DNA virus of pox group.
- Characterized by multiple, umbilicated pearly lesion
- More common in childhood and on face
- It tends to resolve spontaneously
- Lesion occurring on genitalia or lower abdomen in adult are almost always sexually transmitted.
- **HPE:** Molluscum bodies—multinucleated giant cell in the central keratinous core of lesion of giemsa stain.
- **Treatment:** Cryotherapy or KOH or Phenol application

9. Ans. (a) **Impetigo**

Ref: Pediatric Dermatology E book by Lawrence Schachner p 1338

- Impetigo is a highly contagious bacterial infection of superficial layer of epidermis.
- MCC: *Staphylococcus aureus* and *Streptococcus*.
- **It occurs in two forms:**
 1. **Non-bullous impetigo:** Caused by *Staphylococcus aureus*. Most commonly affects child age group and characterized by honey colored crust (*as seen in this patient*).
 2. **Bullous impetigo:** Can be caused by *Staphylococcus aureus* or *Streptococcus*. Common in all age groups.

10. Ans. (a) **Acoustic neuroma**

Ref: Neurofibromatoses in Clinical Practice, P 47-48

- Neurofibromatosis is a type of autoimmune skin disorder, and is associated with several other systemic conditions/tumors.
- Acoustic neuroma is the most common neural tumor associated with NF-2

TABLE: Differences between NF1 and NF2

NF1	NF2
• Common (90% of all NF cases)	• Much less common (10% of all NF cases)
• Chromosome 17 mutations	• Chromosome 22 mutations
• Almost always diagnosed by age 10	• Usually diagnosed in second to fourth decades
• Cutaneous lesions common (>95%) <ul style="list-style-type: none"> ■ Cafe au lait spots ■ Lisch nodules ■ Cutaneous NFs (often multiple) ■ Plexiform NFs (pathognomonic) 	• Cutaneous, eye lesions less prominent <ul style="list-style-type: none"> • Mild/few cafe au lait spots • Juvenile subcapsular opacities

Contd...

NF1	NF2
<ul style="list-style-type: none"> • CNS lesions less common (15-20%) <ul style="list-style-type: none"> ■ 72/FLAIR hyperintensities (myelin vacuolization; lesions wax, then wane) ■ Astrocytomas (optic pathway gliomas—usually pilocytic—other gliomas) ■ Sphenoid wing, dural dysplasias ■ Moyamoya ■ Neurofibromas of spinal nerve roots 	<ul style="list-style-type: none"> • CNS lesions in 100% <ul style="list-style-type: none"> ■ Bilateral vestibular schwannomas (almost all) ■ Nonvestibular schwannomas (50%) ■ Meningiomas (50%) ■ Cord ependymomas (often multiple) ■ Schwannomas of spinal nerve roots

Extra Mile

Diagnostic criteria of NF1

Two or more of the following:

- At least six café-au-lait macules (>5 mm diameter in prepubertal individuals and >15 mm in postpubertal individuals)
- Freckling in axillary or inguinal regions
- Optic glioma
- At least two Lisch nodules (iris hamartomas)
- At least two neurofibromas of any type, or one plexiform neurofibroma
- A distinctive osseous lesion (sphenoid dysplasia or tibial pseudarthrosis)
- A first degree relative with NF1

TABLE: Diagnostic criteria for NF-2**Main criteria**

Bilateral vestibular schwannomas or
First-degree relative with neurofibromatosis type 2 plus
1. Unilateral vestibular schwannomas or
2. Any two of the following: Meningioma, glioma, schwannoma, or juvenile posterior lenticular opacities

11. Ans. (b) Dermatome*Ref: PubMed*

- The shown division is dermatomal division
 - Dermatome is the area of the skin of the human anatomy that is mainly supplied by branches of a single spinal sensory root.
- Blaschko lines or the lines of Blaschko are thought to represent pathways of epidermal cell migration and proliferation during the development of the fetus.
 - These lines are invisible but many inherited and acquired diseases of skin manifest themselves according to these patterns creating the visual appearance of these lines.

**12. Ans. (c) Bow legs***Ref: Avery's Neonatology: Pathophysiology & Management of the New born, P 1040-41***FEATURES OF CONGENITAL SYPHILIS:**

- Skin lesion: Maculopapular rash
- Hepatosplenomegaly and lymphadenopathy
- Failure to thrive
- Anaemia, jaundice
- Gummatous ulcer
- Saddle nose, prominent forehead
- Interstitial keratitis
- CN-VIII involvement: SNHL
- Syphilitic rhinitis- purulent nasal discharge
- Dental deformities: Hutchinson's teeth

Extra Mile

Hutchinson triad:

- Interstitial keratitis
- SNHL
- Hutchinson teeth

13. Ans. (c) Psoralen PUVA*Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 209-210*

- Vitiligo is an acquired autoimmune condition targeting melanocytes and presents with localized or widespread white depigmented patches.
- Thyroid dysfunction is the most common association.

TREATMENT OF VITILIGO

- Mainstay of therapy: Psoralen with UVA (PUVA)
- No therapy is effective alone
 - Topicals
 - ◆ Corticosteroids
 - ◆ Immunomodulators

FMGE Solutions Screening Examination

- Light Therapy:
 - ◆ UVA or UVB 2
 - ◆ UVA + Psoralen = PUVA (Topical and Systemic)
 - ◆ UVB = Laser
- Systemic Treatment: NOT USED
- Surgical Rx:
 - ◆ Melanocyte Transplant
 - ◆ Skin Grafts Transplant
- Bleaching Agents: Depigment all skin

14. Ans. (b) Acantholytic cells

Ref: Fitzpatrick Colour Atlas, 8th ed. pg. 681

- The image shows Acantholytic cells with ground glass nuclei consistent with tzanck cells.
- Acantholysis is defined as the loss of coherence between epidermal cells due to the breakdown of their intercellular bridges. In contrast Acanthosis implies thickening of skin due to diffuse epidermal hyperplasia.

Extra Mile

- **Hyperkeratosis:** Hyperplasia of the stratum corneum with abnormal keratin.
- **Papillomatosis:** Surface elevation caused by hyperplasia and enlargement of dermal papillae.
- **Parakeratosis:** Keratinization characterized by retention of the nuclei in the stratum corneum. On squamous mucosal membranes, such as buccal mucosa parakeratosis is normal.
- **Spongiosis:** Intercellular edema of the epidermis

15. Ans. (b) Blaschko lines

Ref: Fitzpatrick Dermatology, 9th ed. pg. 302

- The image shows lines of Blaschko which represent a pattern assumed by many different nevoid and acquired skin diseases on the human skin and mucosae.
- They represent *normal developmental growth pattern of skin*
- These lines do not correspond to any known nervous, vascular or lymphatic structures.
- Langer's lines correspond to alignment of collagen fibers in the dermis. They are used to determine direction with the human skin along which the skin has the least flexibility.
- Kraissl lines differ from Langer's lines in that unlike Langer's lines, which are defined in term of collagen orientation, Kraissl's lines are oriented *perpendicular to the action of the underlying muscles*.
- Borges lines are relaxed skin tension lines. The relaxation is achieved by joint mobilization, muscle contraction, or pinching.

16. Ans. (b) Pemphigus vulgaris

Ref: TB of Dermatology, leprology & Venereology
Devinder Mohan Thappa E book Chapter 4

- **Pemphigus vulgaris:** The antibodies are directed against Desmoglein 3 (which binds the epidermal cells together), causing loss of cell to cell adhesion.
 - In mucosal *Proteus vulgaris*: Antibody against only DSG3
 - In mucocutaneous *P. vulgaris*: Antibody against DSG 1 and 3
- Upon examination and HPE following findings are seen:
 - Bulla spread sign, Nikolsky's sign, acantholytic cells.
 - HPE shows suprabasal blister with row of tomb stone appearance.
 - Direct immunofluorescence shows intraepidermal IgG deposits in fishnet pattern.

- **Bullous pemphigoid:** Most common autoimmune bullous disease. Presence of large, tense bullae. Common in elderly.
- **Dermatitis herpetiformis:** Gluten sensitive enteropathy. Very commonly (70–100%) have coeliac disease. Its dermal manifestation is severe itching. HPES shows IgA deposited in dermal papilla.
 - Rx: Gluten free diet and dapsone (DOC) is used for treatment.

- **Erythema multiforme:** Most commonly caused by HSV virus. Others causes can be malignancy, drug, mycoplasma, idiopathic. Has a characteristic target lesion.

Extra Mile

TABLE: Autoimmune bullous diseases—target antigens

Disease	Target antigens
Pemphigus foliaceus	Desmoglein 1
Herpetiform pemphigus	Desmoglein 1
IgA pemphigus (SPD type)	Desmocollin 1
IgA pemphigus (IEN type)	Desmoglein 1 or 3
Pemphigus vulgaris	Desmoglein 3
Epidermolysis bullosa acquisita	Type VII collagen

17. Ans. (d) **Impetigo**

Ref: Pediatric Dermatology E book by Lawrence schachner p 1338

- Impetigo is a highly contagious bacterial infection of superficial layer of epidermis. It is caused most commonly by *Staphylococcus aureus* and *Streptococcus*.
- **It occurs in 2 forms:**
 - **Non-bullous impetigo:** Caused by *Staphylococcus aureus*. Most commonly affects child age group and characterized by honey colored crust (as seen in this patient).
 - **Bullous impetigo:** Can be caused by *Staphylococcus aureus* or *Streptococcus*. Common in all age groups.

18. Ans. (c) **Sebaceous gland**

Ref: Illustrated Synopsis of Dermatology & Sexually transmitted diseases E book by Neena Khanna P123

- Fordyce spot is ectopic sebaceous gland.
- **Most common site:** Upper lip and buccal mucosa.
- Usually asymptomatic condition. No treatment required.

Extra Mile

- **Fox Fordyce disease:** Keratin obstruction of apocrine ducts
- **Hidradenitis suppurativa:** Keratin obstruction of apocrine ducts extending into hair follicles. Also known as inverse acne.
 - Most common site axilla.
- **Acne vulgaris:** Obstruction of pilosebaceous gland.
- **Miliaria:** Occlusion of eccrine gland due to *Staphylococcus epidermidis*.

19. Ans. (a) **Scabies**

Ref: Illustrated Synopsis of Dermatology & Sexually transmitted diseases E book by Neena Khanna P 14-15

- Scabies is a contagious skin infestation caused commonly by female mite *sarcoptes scabiei* (the shown image).
- Incubation period 3–4 weeks.
- **In infant scabies:** Face, palms and soles involved.
- S shaped burrow is pathognomonic of scabies infestation.
- Adult scabies spares face.
- Scabies is one of the water washed disease, involves axillae, elbow, flexures, wrist, finger, webs, umbilicus, lower abdomen and genitalia. These involved areas if joined with an intersecting lines is known as circle of hebra.
- **DOC:** 5% permethrin.
- **Oral DOC for scabies:** Ivermectin.

Circle of hebra

Extra Mile

- **Pediculosis (vagabond disease)**
 1. Head louse : *P. capitis*
 2. Body louse : *P. corporis*
 3. Pubic/crab louse : *Phthirus pubis* DOC is 1% permethrin.
- **Molluscum Contagiosum**
 - Caused by Pox virus. Pearly white papules with umbilication. Common in children on face. Inclusion body known as molluscum body or *Henderson Peterson body*.

20. Ans. (c) **Becker nevus**

Ref: Illustrated Synopsis of Dermatology & Sexually transmitted diseases E book by Neena Khanna P35

- Becker's nevus, also called pigmented hairy epidermal nevus, is a cutaneous hamartoma that can have increased epidermal (melanocyte), dermal (smooth muscle), and appendageal (hair follicle) components.
- Classically, Becker's nevus is first noticed around puberty on the shoulders and chest in males. The prevalence in postpubertal males is approximated to be 0.5%, or 1 in 200.
- It may involve only surface of body in women.

Note:

- **Nevus of Ota:** Seen usually around eyes.
- **Café au lait macule** is light brown macule commonly seen on trunk and has smooth edges.

21. Ans. (b) **Pityriasis rosea**

Ref: Illustrated Synopsis of Dermatology & Sexually transmitted diseases E book by Neena Khanna P39

- Pityriasis rosea is a noncontagious, erythematous skin lesion, caused by human herpesvirus 6 and 7.
- Classically it begins with typical **Herald patch** (single red and scaly), and then becomes generalized patch.
- Sometimes, these patches are also referred to as Cigarette paper scales.
- Herald/mother's patch is the first sign of Pityriasis rosea.
- *Fir-tree or Christmas-tree appearance* due to distribution of lesion along the line of cleavage on trunk.
- Mainly involves trunk. Sparing palm and soles (*this feature differentiates it from secondary syphilis*)

22. Ans. (b) **Erythrasma**

Ref: Dermatology by Jean L. Bolognia, Joseph L. Jorizzo, Ronald P.

- **Erythrasma** is a superficial, localized, mild and often chronic skin infection caused by *Corynebacterium minutissimum*.
- The growth of the organism is favoured by moist, occluded intertriginous areas, including groin, axilla, intergluteal fold and inframammary and periumbilical areas.
- These lesions are irregular in shape and size, red, well defined patches covered with fine scales and wrinkling.
- The infection begins as a proliferation of *C. minutissimum* within the stratum corneum.
- **Under wood's lamp examination:** Bright coral red fluorescence.
- This *bright coral red fluorescence under wood's lamp* is as a result of porphyrin production by the bacteria. It is considered as the best way to make diagnosis.

Extra Mile

- Tinea versicolor may resemble erythrasma, but does not tend to localize to body folds.

23. Ans. (a) **Becker nevus**

Ref: Diagnostic Pathology: Nonneoplastic Dermatopathology pg. 477

Becker's nevus, also called *pigmented hairy epidermal nevus*, is a cutaneous hamartoma that can have increased epidermal (melanocyte), dermal (smooth muscle), and appendageal (hair follicle) components. Classically, Becker's nevus is first noticed around puberty on the shoulders and chest in males, but may be congenital, involve any area of the body, and occur in women. The prevalence in postpubertal males is approximated to be 0.5%, or 1 in 200.

Epidemiology

- Age
 - Most often presents in adolescence following puberty
- Sex
 - Much more common in males (M:F = 6:1)

Site

- Often seen on shoulder girdle or trunk

Presentation

- Well-demarcated, irregular, tan to dark brown, slightly raised plaque, often with hypertrichosis
- Usually solitary, wide variety in size though typically >1 cm
- Rarely associated hypoplasia of ipsilateral breast/arm, scoliosis, spina bifida, or with accessory areola/scrotum (**Becker nevus syndrome**)

Treatment

- As lesions generally asymptomatic, no treatment is required
- Laser therapy
 - Variety of laser therapy for both hypertrichosis and hyperpigmentation has been employed with variable success.

24. Ans. (b) **Pityriasis rosea**

- The shown lesion on trunk is a case of pityriasis rosea.
- **Pityriasis rosea** is a common skin problem that causes a rash.
- *Multiple round to oval erythematous patches* with fine central scales distributed along the skin tension lines of cleavage on the trunk in *Christmas (fir) tree pattern*.

Characteristic features

1. Classically it begins with typical **Herald patch**, and then becomes generalized patch.
2. Herald/mother's patch is the first sign of Pityriasis rosea.
3. *Fir-tree or Christmas-tree appearance* due to distribution of lesion along the line of cleavage on trunk.
4. Cigarette paper scales
5. Mainly involves trunk; *sparing palms & soles (this feature differentiate it from secondary syphilis which commonly involves palms & soles)*.

Extra Mile

25. Ans. (c) **Male pattern baldness**

- The shown image is a case of *male pattern baldness*.
- Male pattern hair loss is an androgen dependent process.
- In majority of cases, this balding is patterned. The two major components being *frontotemporal recession* and *loss of hair over the vertex*.

1143

Alopecia areata: Autoimmune disease characterized by patchy hair loss with no visible signs of inflammation, exclamation mark hair and geometric pitting of the nails

Telogen effluvium: This type of hair loss happens when hair follicles are fluctuated into the telogen or resting phase prematurely.

There are large amount of hair that begin to fall prematurely at the same time secondary to certain stress like chronic illness, pregnancy, depression, etc. Mostly seen in female.

Cicatricial alopecia

Occurs due to inflammatory disorders that cause permanent destruction of pilosebaceous unit and irreversible hair loss

26. Ans. (a) **Desmoglein 1**

Ref: *Inflammatory Dermatopathology: A Pathologist's Survival Guide*, pg. 159

- Pemphigus foliaceus is a condition which arises due to antibody against desmoglein 1 (*remember F = First*)
- *Desmogleins* along with *desmocollins* connect two cells of epidermis. It is expressed in different layers of skin and mucosa.
- Desmogleins have several isoforms and if antibody forms against them, it will lead to different disease entity.

Desmogleins	DSG 1	DSG 3
Location	Epidermis, <i>subcorneal layer</i> It is not expressed in mucosal layer	Epidermis, <i>stratum basale</i> It is expressed in mucosal layer as well
Associated disease if antibody formed (IgG antibody)	Pemphigus foliaceus (subcorneal blister)	Pemphigus vulgaris (can involve DSG 1 as well)
		

FMGE Solutions Screening Examination

27. Ans. (c) Both

Ref: *Inflammatory Dermatopathology: A Pathologist's Survival Guide* P 159

The antibodies in *pemphigus vulgaris* are directed against *desmoglein 3*, a desmosomal cadherin that mediates cell binding. Desmoglein 3 is expressed in greater concentration in the lower epidermis, the location of the suprabasal acantholytic blister of pemphigus vulgaris.

- More than half of sera from patients with pemphigus vulgaris also have circulating antibodies against desmoglein 1.
- Established lesions of pemphigus vulgaris demonstrate suprabasilar acantholysis with frequent involvement of follicular external root sheaths
- The basal keratinocytes separate from one another but remain attached to the dermis, reminiscent of a "row of tombstones"

28. Ans. (a) Pemphigus vulgaris

Please refer to above explanation

- Pemphigus vulgaris is characterized by following signs:
 1. Bulla spread sign
 2. Perilesional and distant nikolsky sign
 3. Tzanck smear: Acantholytic cell
- Histopathology shows suprabasal blister with row of tomb stone appearance of basal cells.
- Direct immunofluorescence from perilesional skin demonstrated intraepidermal IgG deposits in a *fishnet pattern*.

FIGURE: Pemphigus vulgaris, shows suprabasal cleavage with acantholysis. "Row of tomb stones appearance" can be seen in the floor of bulla

29. Ans. (d) Bullous pemphigoid

Ref: *Mayo Clinic Internal Medicine Board Review*, pg.162

- Bullous pemphigoid is the *most common autoimmune bullous disease*.
- It occurs predominantly in elderly population.
- It presents as *large, tense bullae* with a predilection for flexural areas.

- Immunofluorescence testing is important for its diagnosis.
- Almost all cases have deposition of C3 and IgG in a *linear pattern at the basement membrane zone* (as shown in the image of question).

30. Ans. (b) Dermatitis herpetiformis

Ref: *Bhutani Atlas of Dermatology*, 6th ed. pg. 179

- Dermatitis herpetiformis is a condition seen in middle aged patients with male predilection.

Clinical Features

Dermatitis herpetiformis is an immunopathologic vesiculobullous disease of skin rarely showing oral manifestations. The condition represents the *cutaneous expression of gluten enteropathy* (gliadin sensitivity). The skin lesions are *pruritic* and are located primarily on the extremities and buttocks. They are *vesicular with a tendency to rupture and desquamate*. Oral bullae may be encountered and many patients present with aphthous like ulcers. The disease is chronic, lasting for many years, yet is not life threatening.

HPE: Neutrophilic microabscess in dermal papillary tip is **characteristic**.

Direct immunofluorescence: Shows granular IgA deposition in dermal papillary area.

31. Ans. (b) Atopic dermatitis

- **Hertoghe's sign** is lateral thinning of the eyebrows. It is seen in condition like atopic dermatitis.

- **Dennie morgan fold:** A deep fold that can be found under the lower lid. Also seen in atopic dermatitis.

Dennie-Morgan Lines

32. Ans. (b) Tuberous sclerosis

Ref: *Harrison's*, 19th ed. pg. 359

- **Triad of tuberous sclerosis** is remembered with simple mnemonic **EpiLoA**: Epilepsy, Low IQ, and adenoma sebaceum.

- The patient in image presented with adenoma sebaceum and other triad of tuberous sclerosis.
- The **earliest cutaneous sign** tuberous sclerosis, is macular hypomelanosis, referred to as an *ash leaf spot*.
- Examination of the patient for additional cutaneous signs such as multiple angiofibromas of the face (*adenoma sebaceum*), ungual and gingival fibromas, fibrous plaques of the forehead, and connective tissue nevi (*shagreen patches*) is recommended.
- Internal manifestations include seizures, mental retardation, central nervous system (CNS) and retinal hamartomas, pulmonary lymphangioleiomyomatosis (women), renal angiomyolipomas, and cardiac rhabdomyomas.

33. Ans. (b) Nevus ota

Ref: Oski's Pediatrics, Principle and Practice, pg. 829

- *Nevus of Ota*, is a hamartoma of dermal melanocytes.
- It is a bluish or gray-brown patch of pigmentation that occurs on the skin of the face, usually in the distribution of the first and second branches of the trigeminal nerve. Perhaps two-thirds of affected infants have an *associated ipsilateral bluish discoloration of the sclera*.
- Histologically, a nevus of Ota is *identical to a mongolian spot* and likely results from errors in migration spot, however, the nevus of Ota does not undergo spontaneous regression. If scleral pigmentation is present, glaucoma may occur.
- Malignant degeneration occurring within a nevus of Ota is rare. Management options for the nevus include the use of a covering cosmetic or treatment with a pigmented lesion laser.

Nevus of Ito: A patch of hyperpigmentation similar to the nevus of Ota but *occurring over the shoulders*, in the supraclavicular areas, and on the sides of the neck, the upper arms, and the scapulae is known as the *nevus of Ito*. These lesions persist throughout life. Treatment options are analogous to those for the nevus of Ota.

34. Ans. (b) Ivermectin

Ref: KDT, 6th ed. pg. 864

Explanation:

- The image shows lesions in inter-digital clefts suggestive of scabies.
- Scabies is caused by an ectoparasite *sarcoptes scabiei*. It is highly contagious. The mite burrows through the epidermis, laying eggs which form papules that itch intensely.
- Most common site of entry—finger webs.
- Drugs used are:
 - **Permethrin**: Broad spectrum and potent insecticide, currently most efficacious.
 - ◆ It is preferred topical drug for scabies.
 - ◆ **MOA**: It causes neurological paralysis in insects by delaying depolarization.
 - ◆ Single application needed in most cases.
 - ◆ Very less toxicity; 100% cure rate.
 - **Lindane**: Another broad spectrum insecticide. Efficacy lower than permethrin.
 - ◆ **MOA**: Kills lice and mites by penetrating through their chitinous cover and affecting the nervous system.
 - **Benzyl benzoate**: Oily liquid with a faint aromatic smell.
 - ◆ It is applied over face and neck after a bath. A second coat is applied next day which is washed after 24 hours.
 - Crothamiton
 - Sulfur

Extra Mile

- **Ivermectin**: Highly effective in scabies pediculosis and Norwegian scabies
 - It is the only orally administered drug which is used for scabies (ectoparasitosis). Oral DOC for scabies.
 - A single dose of 0.2 mg/kg has cured almost 90–100% of population.
 - It is contraindicated in children <5 years, pregnant and lactating women.

35. Ans. (d) Antipyretics

Ref: Primary Care Dermatology, An Issue of Primary Care, pg. 526

- The shown image is a case of roseola infantum also known as 6th day disease.
- Roseola infantum, also known as 3-day fever, is characterized by high-grade fever followed by abrupt defervescence and onset of a rash. It is the most common exanthem before age 2. It is typically seen in children between the ages of 6 months and 4 years, with a peak age of acquisition between 9 and 21 months.
- It is most commonly caused by human herpes virus (HHV) –6 and less commonly by HHV-7, enterovirus, adenovirus, and parainfluenza virus.
- The modes of transmission and incubation periods vary depending on the etiologic agent. In most patients with roseola caused by HHV-6 the average incubation period is 9–10 days. Usually by the time the rash appears, viremia has already resolved.

FMGE Solutions Screening Examination

36. Ans. (c) **Tinea capitis**Ref: Harrison's, 19th ed. pg. 355

- The image shows a boggy scalp of Tinea capitis

Tinea capitis	Varies from scaling with minimal hair loss to discrete patches with "black dots" (broken infected hairs) to boggy plaque with pustules (kerion)	Invasion of hairs by dermatophytes, most commonly <i>Trichophyton tonsurans</i>	Oral griseofulvin or terbinafine plus 2.5% selenium sulfide or ketoconazole shampoo; examine family members
Traumatic alopecia	Broken hair, often of varying lengths irregular outline	Traction with curlers, chemicals (e.g., hair straighteners) Mechanical pulling (trichotillomania)	Discontinuation of offending hair style of chemical treatments; require observation of shaved hairs (for growth) or biopsy, possibly followed by psychotherapy

37. Ans. (b) **Tinea corporis**

Ref: Oski's Essential Pediatrics, pg. 155

- The annular lesion with central clearing, is most likely indicative of tinea corporis.
- The infection of nonhairy areas of the skin by dermatophytes is limited to the epidermis, only the most superficial layers of the skin are involved. The rings are generally erythematous. As the inflammation spreads, the active infection in the center of the lesions is destroyed, and this area clears, frequently resulting in the picture of an advancing border with central clearing.
- The organism responsible for most cases of tinea corporis is *Trichophyton tonsurans*. *Microsporum canis*, *Microsporum audouinii*, and *Trichophyton mentagrophytes* infections are also seen.

38. Ans. (a) **Molluscum contagiosum**Ref: Harrison's, 19th ed. pg. 220e-1

- Vesicle with central umbilication is most likely suggestive of molluscum contagiosum.
- Molluscum contagiosum is a cutaneous poxvirus infection characterized by multiple umbilicated flesh-colored or hypopigmented papules.
- Molluscum contagiosum is highly prevalent among children and is the most common human disease resulting from poxvirus infection.
- Swimming pools are a common vector for transmission.

39. Ans. (b) **Basal cell cancer**Ref: Harrison's, 19th ed. pg. 501

The image shows a lesion on face showing *raised and beaded appearance*. It is suggestive of diagnosis of BCC. The *most common site* is the face with a line drawn between angle of mouth and ear Lobule–Onghren's line.

40. Ans. (a) **Alopecia areata**Ref: Harrison's, 19th ed. pg. 355

	Clinical	Pathogenesis	Treatment
Telogen effluvium (choice C)	<ul style="list-style-type: none"> Diffuse shedding of normal hairs Follows major stress (high fever, severe infection) or change in hormone levels (postpartum) Reversible without treatment 	Stress causes more of the asynchronous growth cycles of individual hairs to become synchronous; therefore, larger numbers of growing (anagen) hairs simultaneously enter the dying (telogen) phase	Observation, discontinue any drugs that have alopecia as a side effect, must exclude underlying metabolic causes, e.g. hypothyroidism, hyperthyroidism

Contd...

	Clinical	Pathogenesis	Treatment
Androgenetic alopecia (male pattern; female pattern) (choice B)	<ul style="list-style-type: none"> Miniaturization of hairs along the midline of the scalp Recession of the anterior scalp line in men and some women 	<ul style="list-style-type: none"> Increased sensitivity of affected hairs to the effects of androgens Increased levels of circulating androgens (ovarian or adrenal source in women) 	If no evidence of hyperandrogenemia, then topical minoxidil finasteride ^a spironolactone (women); hair transplant
Alopecia areata (choice A)	<ul style="list-style-type: none"> Well-circumscribed, circular areas of hair loss, 2–5 cm in diameter In extensive cases, coalescence of lesions and/or involvement of other hair-bearing surfaces of the body Pitting or sandpapered appearance of the nails 	<p>The germinative zones of the hair follicles are surrounded by T lymphocytes</p> <p>Occasional associated disease: hyperthyroidism, hypothyroidism, vitiligo. Down syndrome</p>	Topical anthralin or tazarotene; intralesional glucocorticoids; topical contact sensitizers
Traumatic alopecia (choice D)	Broken hairs, often of varying lengths irregular outline	<ul style="list-style-type: none"> Traction with curlers, rubber bands braiding Exposure to heat or chemical (e.g. hair straighteners) Mechanical pulling (trichotillomania) 	Discontinuation of offending hair style or chemical treatments; diagnosis of trichotillomania may require observation of shaved hairs (for growth) or biopsy, possibly followed by psychotherapy

41. Ans. (b) Zinc deficiency

Ref: Harrison's, 19th ed. pg. 96e-9

Acrodermatitis enteropathica (AE)

- AE is characterized by abnormalities in zinc absorption due to defect in intestinal zinc transporter which leads to zinc deficiency.
- It is a rare autosomal recessive (AR) disorder which classically present during infancy on weaning from breast milk to formula or cereal which have lower zinc bioavailability than breast milk.
- Classical features of AE include: (Mnemonic-“DEAL”)**
 - Diarrhea, Depression
 - Eczematous erosive dermatitis
 - Alopecia (non scarring), Apathetic look
 - Lethargy, irritability, whining and crying.

42. Ans. (a) Tinea versicolor

Ref: Harrison's, 19th ed. pg. 350

- Malassezia furfur*, a normal inhabitant of the skin is a nondermatophytic, dimorphic fungus is a causative organism for *Tinea versicolor*.
- The expression of infection is promoted by heat and humidity. The typical lesions consist of oval scaly macules, papules, and patches concentrated on the chest, shoulders, and back.

- On dark skin the lesions often appear as hypopigmented areas, while on light skin they are slightly erythematous or hyperpigmented.
- A KOH preparation from scaling lesions will demonstrate a confluence of short hyphae and round spores (“spaghetti and meatballs”).

43. Ans. (d) Psoriasis

Ref: Harrison's, 19th ed. pg. 347

- The silver scaly lesion as shown in the patient in the given image is more likely a case of psoriasis.

PSORIASIS

- Psoriasis is one of the most common dermatologic diseases, affecting up to 2% of the world's population.
- Clinical feature:** Characterized by—
 - Erythematous, sharply demarcated papules and rounded plaques covered by silvery micaceous scale. The skin lesions of psoriasis are variably pruritic.
 - Koebner or isomorphic phenomenon: Traumatized areas often develop lesions of psoriasis.

44. Ans. (c) Erythema multiforme

Ref: Harrison's, 19th ed. pg. 134

- The shown target lesions on palm are diagnostic of erythema multiforme.
- The classic target lesions of *erythema multiforme* appear symmetrically on the elbows, knees, palms, soles, and face.

FMGE Solutions Screening Examination

- In severe cases, these lesions spread diffusely and involve mucosal surface.
- Choice B, Steven Johnson syndrome is ruled out due to presentation of vesico-bullous lesions

Disease	Etiology	Description	Group affected /Epidemiologic factor	Clinical syndrome
Hand-foot-and-mouth disease (Choice A)	Coxsackievirus A16 most common cause	Tender vesicles, erosions in mouth; 0.25 cm papules on hands and feet with rim of erythema	Summer and fall; primarily children <10 years old; multiple family members	Transient fever
Erythema multiforme (EM) (Choice C)	<ul style="list-style-type: none"> • Infection • Drugs • Idiopathic 	<ul style="list-style-type: none"> • Target lesions (central erythema surrounded by area of clearing and another rim of erythema) up to 2 cm, symmetric on knees, elbows, palms, soles. • When extensive and involving mucous membranes, it is termed as EM major 	Herpes simple virus or <i>Mycoplasma pneumoniae</i> infection; drug intake (i.e., sulfa, phenytoin, Penicillin)	50% of patients <20 years old; EM major, which can be confused with Stevens-Johnson syndrome (but EM major lacks prominent skin sloughing)

45. Ans. (d) Palms and soles involved

Ref: Robbins, 9th ed. pg. 358

- IP of chickenpox-10–21 days
- Infectious period is 2 days before to 5 days after the onset of rash
- **Chickenpox** is caused by VZV and reactivation of latent VZV causes shingles (also called *herpes zoster*).
- Like HSV, VZV infects mucous membranes, skin, and neurons and causes a self-limited primary infection in immunocompetent individuals.

Small pox	Chicken pox
• Face involved	• Involves trunk mainly
• Centrifugal; involves palms and soles	• Centripetal; palm and soles not involved
• Umbilicated, deep lesion	• Superficial lesion
• Same stage at one point of time	• Pleomorphic rash
• Extensor aspect involved/ axilla, mucous not involved	• Axilla, mucosa involved
• Heals slowly	• Rapid healing
• Scab formation 10–14 days	• Scab formation 4–7 days

46. Ans. (c) Lichen planus

Ref: Harrison's, 19th ed. pg. 349

■ LICHEN PLANUS

- Lichen planus (LP) is a *papulosquamous disorder* that may affect the skin, scalp, nails, and mucous membranes.
- The primary cutaneous lesions of LP are pruritic, **polygonal, flat-topped, violaceous papules**.
- **Most common site** can occur anywhere but have a predilection for the **wrists, shins**, lower back, and genitalia.

Characteristic Feature

1. **Wickham's striae**: A network of gray lines on the surface of papules.
2. **Lichen planopilaris**: Involvement of the **scalp may lead to scarring alopecia**, and nail involvement may lead to permanent deformity or loss of finger nails and toe nails.
3. Lichen planus commonly involves mucous membranes, particularly the buccal mucosa (Erosive stomatitis) which may persist for years and linked to an *increased risk of oral squamous cell carcinoma*.
4. **LP may be associated with hepatitis C infection**. The course of LP is variable, but most patients have **spontaneous remissions 6 months to 2 years** after the onset of disease.

Treatment of choice: Topical glucocorticoids.

Extra Mile

TABLE: Papulosquamous disorders

	Clinical features	Other notable features	Histologic features
Psoriasis	Sharply demarcated, erythematous plaques with <i>mica-like scale</i> ; predominantly on elbows, knees, and scalp; atypical forms may localize to intertriginous areas; eruptive forms may be associated with infection	May be aggravated by certain drugs, infection; severe forms seen in association with HIV	Acanthosis, vascular proliferation
Lichen planus	<i>Purple polygonal papules marked by severe pruritus</i> ; lacy white markings, especially associated with mucous membrane lesions	Certain drugs may induce; thiazides antimalarial drugs	Interface dermatitis

47. Ans. (c) Psoriasis

Ref: Harrison's, 19th ed. pg. 347

- The silver scaly lesion on the skin of the patient in the given image is more likely a case of psoriasis.

PSORIASIS

- Psoriasis is one of the most common dermatologic diseases, affecting up to 2% of the world's population.
- Clinical feature:** Characterized by—
 - Erythematous, sharply demarcated papules and rounded plaques covered by silvery micaceous scale. The skin lesions of psoriasis are variably pruritic.
 - Koebner** or isomorphic phenomenon: Traumatized areas often develop lesions of psoriasis.

Types of Psoriasis

- Plaque-type:** It is the **most common variety** of psoriasis.
 - Patients present with stable, slowly enlarging plaques, which remains unchanged for long periods of time.
 - The **most commonly involved areas** are the elbows, knees, gluteal cleft, and scalp. Involvement tends to be **symmetric**.
- Inverse psoriasis** affects the intertriginous regions, including the axilla, groin, submammary region, and navel.

- Guttate psoriasis (eruptive psoriasis):** This is **most common in children** and young adults.

- Patients present with many small erythematous, scaling papules, **frequently after upper respiratory tract** infection with β -hemolytic streptococci.

- Pustular psoriasis:** Usually localized to the **palms and soles**, or may be generalized. Can present with fever and or pustular eruptions.

Treatment

- Limited psoriasis:** Topical glucocorticoids, Calcipotriene (topical vitamin D analogue), retinoid (tazarotene).
- Widespread psoriasis:
 - UV light:** Ultraviolet B (UVB), narrow band UVB, and ultraviolet A (UV A) light with either oral or topical **psoralens (PUVA)** is used.
 - Methotrexate** is an effective agent, especially in patients with psoriatic arthritis.

Note: Oral glucocorticoids should not be used for the treatment of psoriasis due to the potential for development of life-threatening pustular psoriasis when therapy is discontinued.

48. Ans. (c) Tetracycline

Ref: Harrison's, 19th ed. pg. 352

ACNE VULGARIS

- It is a self-limited disorder primarily of teenagers and young adults.
- Increase in sebum production by sebaceous glands after puberty is a permissive factor for the disease expression.
- Clinical hallmark of acne vulgaris:** Comedone, which may be closed (*whitehead*) or open (*blackhead*).
- The earliest lesions seen in adolescence** are generally mildly inflamed or noninflammatory comedones on the forehead.
- Most common location for acne** is the face, but involvement of the chest and back is common.

Treatment of Acne

- Minimal to moderate pauci-inflammatory disease** respond adequately to local therapy alone: Topical agents such as retinoic acid, benzoyl peroxide, or salicylic acid.
- Given the image, it is obvious that the case is not a minimal to moderate case of acne vulgaris. It is more likely moderate to acne vulgaris with inflammatory papules, pustules and comedones.
- Harrison's states:** "Patients with moderate to severe acne with a prominent inflammatory component will benefit from the addition of systemic therapy, such as **tetracycline** in doses of 250–500 mg BD or **doxycycline** in doses of 100 mg BD"

FMGE Solutions Screening Examination

- If patients with severe nodulocystic acne are unresponsive to the therapies discussed above: Treatment with the synthetic retinoid isotretinoin is the choice. Its dose is based on the patient's weight, and it is given once daily for 5 months.
- Isotretinoin gives excellent result, but its teratogenic side effects limits its use in reproductive age group females.

49. Ans. (a) **Neurofibromatosis**Ref: *Harrisons, 19th ed. pg. 2331*

NF-1 is diagnosed when *any two of the following seven signs* are present:

1. Six or more café au-lait macules. *Café au-lait spots are the hallmark of neurofibromatosis and are present in almost 100% of patients.*
2. Axillary or inguinal freckling consisting of multiple hyperpigmented areas 2–3 mm in diameter.
3. Two or more iris Lisch nodules. Lisch nodules are hamartomas located within the iris and are best identified by a slit-lamp examination.
4. Two or more neurofibromas or one plexiform neurofibroma.
5. Osseous lesion such as sphenoid dysplasia (which may cause pulsating exophthalmos) or cortical thinning of long bones with or without pseudoarthrosis.
6. Optic gliomas are present in ~15% of patients with NF-1.
7. First Degree relative with NF-1

50. Ans. (a) **Alopecia areata**Ref: *Harrisons, 19th ed. pg. 354-55*

- Alopecia is of two types: Scarring and Nonscarring.

Scarring alopecia	Nonscarring alopecia
<ul style="list-style-type: none"> • It is associated with fibrosis, inflammation, and loss of hair follicles. • Most common causes of scarring alopecia are primary cutaneous disorder such as <i>lichen planus, folliculitis decalvans, chronic cutaneous (discoid) lupus, or linear scleroderma (morphea).</i> 	<ul style="list-style-type: none"> • In this type the hair shafts are absent or miniaturized, but the hair follicles are preserved (reversible condition) • The most common causes of nonscarring alopecia include <ol style="list-style-type: none"> 1. <i>Androgenetic alopecia</i> 2. <i>Telogen effluvium</i> 3. <i>Alopecia areata</i> 4. <i>Tinea capitis</i>, and the early 5. Phase of <i>traumatic alopecia</i>. 6. SLE

Extra Mile

- SLE has non-scarring alopecia
- This non-scarring alopecia coincides with flare up of systemic disease and presents as lupus hairs.
 - Discoid lupus erythematosus has scarring alopecia
 - Linear scleroderma [Morphea] has scarring alopecia

51. Ans. (d) **Zinc oxide**Ref: *Robbins, 9th ed. pg. 391*

- Sunscreens are rated for their photoprotective effect by their sun protection factor (SPF).
- The SPF is simply **a ratio of the time required to produce sunburn erythema with and without sunscreen application.**
- The SPF of most sunscreens reflects protection from UV-B but not from UV-A.
- US. Food and Drug Administration (FDA) has recognized category-I ingredients as safe and effective. Those ingredients are listed in the table below:

FDA CATEGORY I MONOGRAPHED SUNSCREEN INGREDIENTS

Ingredients	Maximum concentration, %
p-Aminobenzoic acid (PABA)	15
Avobenzone	3
Cinoxate	3
Dioxybenzone (benzophenone-8)	3
Ecamsule	15
Homosalate	15
Methyl anthranilate	5
Octocrylene	10
Octyl methoxycinnamate	7.5
Octyl salicylate	5
Oxybenzone (benzophenone-3)	6
Padimate O (octyl dimethyl PABA)	8
Phenylbenzimidazole sulfonic acid	4
Sulisobenzene (benzophenone-4)	10
Titanium dioxide	25
Trolamine salicylate	12
Zinc oxide	25

52. Ans. (a) **5 kg**

- Average weight of skin is ~4 kg. Skin is considered to be the largest organ of the body.
- It is 12-15% of the total body weight.
- *Given these options, 5 kg is closest and best choice.*

53. Ans. (d) **Stratum germinatum**Ref: *Fitzpatrick, 7th ed. pg. 384*

- Epidermis of the skin has 4 layers:
 1. **Stratum basale/Germinatum:** Deepest most layers having single row **columnar** epithelial cells. It is actively dividing layer.

2. **Stratum spinosum:** Also known as prickle cell layer. Polygonal in shape. *Synthesis of keratin mainly takes place here.*
 3. **Stratum granulosum:** Diamond shaped. *Microscopically there is presence of keratohyaline granules and Odland bodies (membrane coating granules)*
 4. **Stratum corneum:** Also known as horny cell layer. Most superficial layer of skin. This layer is a nuclear dead cell layer.
- **Note:** *Stratum lucidum is the 5th layer of skin found on palm and soles. It is located between stratum granulosum and corneum.*

Extra Mile

- **Stratum corneum** develops last. Therefore this layer is absent in premature babies
- **Stratum corneum is dead layer of epidermis**
- **Hyperkeratosis:** Thickening of stratum corneum.

54. Ans. (d) **Stratum spinosum**

Ref: Fitzpatrick, 7th ed. pg. 384

55. Ans. (b) **Thickening of stratum corneum**

Ref: Fitzpatrick, 7th ed. pg. 384

56. Ans. (b) **Stratum granulosum**

Ref: McGraw Hill Speciality Board Review Dermatology
2nd ed. pg. 561

57. Ans. (c) **Keratinocytes**

Ref: Fitzpatrick, 7th ed. pg. 100

CELLS OF EPIDERMIS

- **Keratinocytes:** These are considered as the principal cells of epidermis. They proliferate in basal layer and differentiation occurs in spinosum and granulosum layer which further matures fully and dies in corneum. (*keratinocytes are present in all 4 layers of epidermis*)
- **Melanocytes and Merkel cell:** Present in stratum basale.
 - **Melanocytes** synthesize melanin pigment and transfer to keratinocytes
 - **Merkel cells** for touch sensation. Also known as touch cells
- **Langerhan cell** found in stratum spinosum and act as **antigen presenting cells** (macrophages).
 - They contain **tennis racquet shaped granules** also known as **Bierbeck granules**.

58. Ans. (d) **Spinosum**

Ref: Fitzpatrick, 7th ed. pg. 384

59. Ans. (a) **Basale**

Ref: Fitzpatrick, 7th ed. pg. 62

60. Ans. (b) **Separation of keratinocytes**

Ref: Harrison, 19th ed. pg. 370

- Keratinocytes are connected to one another by intracellular desmosomal bridges.
- If there is loss of these desmosomal bridges, it will lead to **separation of keratinocytes** and the condition is known as **acantholysis**.
- If separation continues, there will be intracellular edema, and the condition is known as **Ballooning**.

Extra Mile

- Degeneration of stratum basale is seen in: Lichen planus
- **Acanthosis:** Thickening of stratum spinosum
- **Hypergranulosis:** Thickening of stratum granulosum
- **Hyperkeratosis:** Thickening of stratum corneum
- **Parakeratosis:** Persistence of nucleus in stratum corneum layer

61. Ans. (d) **Thickening of prickle cell layer**

Ref: Harrison, 19th ed. pg. 370

- **Acanthosis:** Thickening of stratum spinosum aka prickle cell layer.

62. Ans. (b) **Persistence of nucleus in stratum corneum**

- Stratum corneum is the most superficial layer of the skin and is devoid of nucleus.

FMGE Solutions Screening Examination

- Parakeratosis is retention of nucleus in stratum corneum
- If there is presence of nucleus in this layer it can be a normal case or can be associated with some pathology.
- **Normally** nucleus in cornuem persists in vagina and in mucous membrane of mouth.
- **Pathologies having nucleus in stratum corneum:** seborrheic dermatitis, squamous cell CA, Actinic keratosis, psoriasis, etc.

63. Ans. (b) 4 days

Ref: Neena Khanna: Synopses of Dermatology 4th ed. pg. 52

- Normal skin turnover from basal cell layer to corneum layer takes around **4–5 weeks**.
- **In conditions like psoriasis**, the mitotic activity is increased and the turnover time is highly reduced to 3–7 days with an **average of 4 days**.

64. Ans. (d) Gustatory sweating

Types of Sweating

- **Gustatory sweating:** Sweating on scalp, forehead and nose in response to hot and spicy meals.
- **Mental sweating:** Occurs in response to emotional stimuli like. For example, mental stress, emotional stress. Sweating usually noticed on palms, soles and axilla.
- **Thermogenic sweating:** Sweating in response to pre-optic stimulation of hypothalamus in order to maintain the body temperature.

65. Ans. (b) Lips are most common site

Ref: Harrison, 19th ed. pg. 127

- **Fordyce's spots** are ectopic sebaceous glands.
 - **MC site:** Lips > oral mucosa > Vulva and Penis (Tysons gland)
 - **MC age group:** Puberty
 - M > F
 - **Characterized as** discrete pin headed size, yellowish maculo-papular lesions in mucus membrane of lips and oral cavity.
 - **Mimicks** or are very often confused as **koplik's spot** of measles.

Extra Mile

- **Obstruction of eccrine sweat gland ducts:** Miliaria
- **Obstruction of apocrine sweat gland ducts:** Fox fordyces spot/disease aka Apocrine Miliaria
- **MC site of fox fordyces disease:** Axilla
- **MC age group of fox fordyces spot:** 13–35 years (**Females are MC affected**).

66. Ans. (a) Lips

Ref: Harrison, 19th ed. pg. 240 table 45.2/

67. Ans. (b) Flat lesion <2 cm

Ref: Harrison's, 19th ed. pg. 319

DESCRIPTION OF PRIMARY SKIN LESIONS

Macule

- A flat, colored lesion, <2 cm in diameter, not raised above the surface of the surrounding skin. A "freckle" or ephelid, is a prototypical pigmented macule.

Patch

- A large (>2 cm) flat lesion with a color different from the surrounding skin. This differs from a macule only in size.

Papule

- A small, solid lesion, <0.5 cm in diameter, raised above the surface of the surrounding skin and thus palpable (e.g. a closed comedone, or white-head in acne).

Nodule

- A larger (**0.5–5.0 cm**), firm lesion raised above the surface of the surrounding skin. This differs from a papule only in size (e.g. a large dermal nevomelanocytic nevus).

Tumor

- A solid, raised growth >5 cm in diameter.

Plaque

- A large (>1 cm), flat-topped, raised lesion; edges may either be distinct (e.g., psoriasis) or gradually blend with skin (e.g. in eczematous dermatitis).

Vesicle

- A small, fluid lesion, <0.5 cm in diameter, raised above the pane of surrounding skin. Fluid is often visible, and the lesions are translucent (e.g. vesicles in allergic contact dermatitis caused by Toxicodendron [poison ivy]).

Pustule

- A vesicle filled with leukocytes. Note: The presence of pustules does not necessarily signify the existence of an infection.

Bulla

- A fluid-filled raised often translucent lesion >0.5 cm in diameter.

Wheal

- A raised erythematous, edematous papule of plaque, usually representing short-lived vasodilatation and vasopermeability.

Telangiectasia

- A dilated, superficial blood vessel.

68. Ans. (b) <5 mm

Ref: Harrison's 19th ed. pg. 319

Please refer to above explanation

69. Ans. (a) Insect bite

- **Insect bite:** Presents as papule. It can be painful or painless
- **Angioedema:** Edema of subcutaneous and submucosal tissue can be due to allergic reaction.
- **Urticaria** is an auto-inflammatory condition. MC symptom is itching.
- **Erythema Nodosum:** Inflammation of submucosal fatty cells.

70. Ans. (d) Biliverdin

- Bruise is a skin contusion which is also known as hematoma of skin
- Capillaries and sometimes venules are damaged by trauma, allowing blood to seep, hemorrhage, or extravasate into the surrounding interstitial tissues.
- Larger bruises may change color due to the breakdown of hemoglobin from within escaped RBC in the extracellular space.
- The striking colors of a bruise are caused by the Phagocytosis and sequential degradation of hemoglobin to biliverdin to bilirubin to hemosiderin.
- The color changes noted at the site of bruise is secondary to:

- Hemoglobin itself producing a red-blue color
- Biliverdin producing a green color
- Bilirubin producing a yellow color
- Hemosiderin producing a golden-brown color

71. Ans. (c) Sulfur granules in the purulent sinuses are characteristic

Ref: Harrison, 19th ed. pg. 1090

- **Propionibacterium acne** is a Gram-positive bacterium, which is a normal flora of the skin.
- It can also cause chronic blepharitis and endophthalmitis.
- It is basically linked to the skin condition acne.
- Aside from skin it lives primarily on fatty acids in sebum secreted by sebaceous glands in the follicles.
- It may also be found throughout the gastrointestinal tract in humans.
- The antibiotics most frequently used to treat acne vulgaris are: Erythromycin, clindamycin, doxycycline and minocycline.
- *Actinomyces israelii* is an opportunistic pathogen which causes actinomycosis.
- Its lesions are often characterized as "wooden." Sulfur granules form in a central purulence surrounded by neutrophils is very characteristic of actinomycosis.

72. Ans. (d) Dermatitis herpetiformis

Ref: Harrison, 19th ed. pg. 373

Diagnosis of Dermatitis Herpetiformis is confirmed by a simple blood test for IgA antibodies, and by a skin biopsy in which the pattern of IgA deposits in the dermo-epidermal junction, revealed by direct immunofluorescence.

Extra Mile

TABLE: Differentiating Dermatitis Herpetiformis, Pemphigus and Pemphigoid Vulgaris

Feature	Dermatitis herpetiformis	Pemphigus vulgaris	Pemphigoid
Lesion	Intensely itchy vesicles, papulovesicles	Thin walled, delicate, flaccid bullae / blister that rapidly rupture & erode	Large, tense often blood stained blisters
Area of predilection	Knees, elbows, scalp, buttock, & around axilla	Upper part of body Buccal mucosa is commonly involved	Lower part of body Mucosa not involved
Associated with	G.I. absorptive defect due to gluten enteropathy	<ul style="list-style-type: none"> • Acantholysis • Nikolsky sign 	—
Lab finding	<ul style="list-style-type: none"> • Small intestine biopsy: partial villous atrophy • Lesion biopsy: Subepidermal blisters • IgA & neutrophils in papillary tips 	<ul style="list-style-type: none"> • Lesion biopsy: <ul style="list-style-type: none"> ▪ Acantholysis ▪ Intraepidermal blisters ▪ Row of tomb stone ▪ IgG, C₃ complement deposition between epidermal cells. 	<ul style="list-style-type: none"> • Lesion biopsy: <ul style="list-style-type: none"> ▪ Subepidermal blisters ▪ Subepidermal collection of IgG, C₃-complement, eosinophils, polymorphs.
Treatment	<ul style="list-style-type: none"> • Gluten free diet • Dapsone (DOC) 	<ul style="list-style-type: none"> • Systemic steroid • Immunosuppressant 	<ul style="list-style-type: none"> • Systemic steroid • Immunosuppressant

FMGE Solutions Screening Examination

73. Ans. (a) **Pemphigus vulgaris**Ref: Harrison, 19th ed. pg. 370

- The rounded keratinocytes with hyperchromatic nuclei and perinuclear halo (due to condensing of cytoplasm in periphery) are called **acantholytic cells**.
- It is seen in case of pemphigus vulgaris
- **Acantholytic cells** can be demonstrated in bed side by Tzanck test.

74. Ans. (c) **Autoimmune**Ref: Harrison, 19th ed. pg. 370■ **PEMPHIGUS**

- *Pemphigus is an autoimmune blistering disorder*
- It results from the loss of integrity of normal intercellular attachments with the epidermis.
- Commonly affects individuals of age between 40-60.
- Equal prevalence among males and females.
- There are five variants of pemphigus:
 - **Pemphigus Vulgaris**: Most common type
 - **Pemphigus Foliaceus**: Superficial pemphigus
 - **Pemphigus Vegetans**: Least common type
 - **Pemphigus Erythematous**
 - **Fogo Selvagem**: An endemic form of pemphigus foliaceus.
- Refer to above table

75. Ans. (b) **Intraepidermal**Ref: Harrison, 19th ed. pg. 371-72

- **Pemphigus has intraepidermal bullae and Pemphigoid has subepidermal bullae**

TABLE: Difference between Pemphigus and Pemphigoid Bullae

Features	Pemphigus	Pemphigoid
Row of Tomb stone	Present	Absent
Nikolsky Sign	Present	Absent
Bullae location	Intraepidermal – flaccid Bullae	Subepidermal & tense Bullae
Mucosa involvement	Present (common)	Absent or less common
Acantholysis	Present	Absent
Prognosis	Poor	Good

76. Ans. (b) **Pemphigoid bullae**Ref: Harrison, 19th ed. pg. 371-72

- Pemphigus has intraepidermal bullae
- Pemphigoid has subepidermal bullae
- Refer to the previous answer for detailed explanation.

77. Ans. (b) **Pemphigus vulgaris**

Please refer to above explanation.

78. Ans. (b) **Nikolsky sign absent**Ref: Harrison, 19th ed. pg. 370

Nikolsky sign is present in pemphigus bullae. It is absent in pemphigoid bullae.

79. Ans. (b) **Pemphigus**Ref: Neena Khanna, 3rd pg. 61-6

- In Pemphigus, there is production of **IgG auto antibodies** against polypeptide complexes present in the **intercellular substance of epidermis**.
- Lesional sites show a characteristic **Fish net like pattern of intercellular IgG** deposits in the intercellular area.

80. Ans. (a) **Dapsone**

Ref: Katzung, pg. 1468

- **Dermatitis herpetiformis** is a chronic blistering skin condition, characterized by blisters filled with a watery fluid.
- DH is neither related to nor caused by herpes virus: the name means that it is a skin inflammation having an appearance similar to herpes.
- It characterized by intensely itchy, chronic papulovesicular eruptions, usually distributed symmetrically on extensor surfaces (buttocks, back of neck, scalp, elbows, knees, back, hairline, groin, or face).
- **Diagnosis** is confirmed by a simple blood test for IgA antibodies, and by a skin biopsy in which the pattern of IgA deposits in the dermo-epidermal junction, revealed by direct immunofluorescence.
- **Treatment:** dapsone is considered as drug of choice for DH.
- In case of intolerance to dapsone, other drugs which can be used are: Colchicine, Tetracycline, Sulfapyridine.

81. Ans. (c) **Urticaria pigmentosa**Ref: Harrison, 19th ed. pg. 367

- **Urticaria pigmentosa:** Excess of mast cells in many tissues lead to numerous red-brown/pink papules over trunk & limbs. Present as red/pink nodules in infants & young children but disappear later in childhood.
- **Atopic dermatitis:** WHITE DERMATOGRAPHISM: running a blunt object as key on affected skin produces a white line.

- **Pemphigus vulgaris:** Manual pressure on the skin elicits the separation of epidermis called NIKOLSKY SIGN.
- **Bullous pemphigoid:** Urticarial/eczematous prodrome with faint dusky erythema in a figurative pattern.

82. Ans. (b) Lips

Ref: Harrison, 19th ed. pg. 363; Harwood Clinical Practice pg. 855

- Angioedema is the swelling of deep dermis, subcutaneous, or submucosal tissue due to vascular leakage.
- Acute episodes often involve the eyelids, lips, tongue, larynx, GI tract and face; however, angioedema may affect other parts of body, including respiratory and gastrointestinal (GI) mucosa.
- Most common site of angioedema lips.
- Laryngeal swelling can be life-threatening.

Extra Mile

- Angioneurotic edema (swelling of face & lips) in presence of intense pruritis and evidence of vascular collapse (hypotension) suggest a diagnosis of anaphylaxis.

83. Ans. (a) Subcutaneous tissue

Ref: Harrison, 18th ed. pg. 2711

84. Ans. (a) Due to deficiency of IgA

Ref: Harrison, 19th ed. pg. 386

- Disease entity which is caused due to deficiency to zinc is Acrodermatitis Enteropathica

XERODERMA PIGMENTOSA

- It is an *autosomal recessive skin disorder* with cellular hypersensitivity to ultraviolet radiation & certain chemical agents and cancer chemotherapeutic agents like cisplatin, carmustine etc.
- Covalent linkage between adjacent pyrimidines in DNA is damaged by UV rays & chemicals.
- In normal circumstances, damaged DNA is repaired by nucleotide excision & repair pathway (NER) but in case of Xeroderma Pigmentosa, NER is defective leading to clinical signs and symptoms.

Clinical Presentation of XP Includes

1. Skin involvement

- Hallmark of XP is *Photosensitivity* which causes acute sunburn reaction on minimal UV exposure.
- Skin is like dry parchment and pigmented, which gives the name Xeroderma Pigmentosa.

2. Ocular involvement

- Loss of lashes
- Conjunctival infection
- Keratitis

3. Neurological involvement

- Mild case: Hyporeflexia
- Severe cases: Mental retardation, sensorineural deafness, spasticity & seizures.

85. Ans. (c) Zinc

Ref: O.P. Ghai, 8th ed. pg. 121

ACRODERMATITIS ENTEROPATHICA (AE)

- AE is characterized by abnormalities in zinc absorption due to defect in intestinal zinc transporter which leads to zinc deficiency.
- It is a rare autosomal recessive (AR) disorder which classically present during infancy on weaning from breast milk to formula or cereal which have lower zinc bioavailability than breast milk.
- Classical features of AE include: (Mnemonic- "DEAL")
 - Diarrhea, Depression
 - Eczematous erosive dermatitis
 - Alopecia (non scarring), Apathetic look
 - Lethargy, irritability, whining & crying.

86. Ans. (c) Subsides over time

Ref: Manipal Manual of Surgery, 4th ed. pg. 9

- Keloids can be remembered as "scars that don't know when to stop."
- A keloid, sometimes referred to as a keloid scar, is a tough heaped-up scar that rises quite abruptly above the rest of the skin.
- It can appear few day to few weeks after surgery.
- It usually has a smooth top and a pink or purple color. Keloids are irregularly shaped and tend to enlarge progressively.
- Unlike scars, keloids do not subside over time. Instead it spreads and includes normal skin also.
- Keloid scars are made of dense collagen fibres.
- Recurrence is possible after local excision.
- It can be familial.
- Most common site of keloid: Sternum.
- It can be treated by intrakeloid injection of Triamcinolone.
- Best cure of keloid is achieved by excision and radiotherapy.

87. Ans. (d) **Nevus Anemicus**Ref: Neena Khanna Synopsis of Dermatology, 4th ed. pg. 147**NEVUS ANAEMICUS**

- Nevus is circumscribed malformation of skin.
- Nevus anemicus is a congenital anomaly that presents clinically as a hypopigmented macule or patch.
- It usually presents at birth and is unilateral.
- It does not increase in size
- Pressure with glass slide makes the lesion disappear & indistinct from surrounding skin.

Extra Mile

Nevus anemicus	Functional development defect in vascular filling, characterized by pale round flat lesions.
Becker nevus	Irregular pigmentation of shoulder, upper chest or scapular area.
Ito nevus	Pigmentation of skin innervated by lateral branches of the supraclavicular nerve.
Ota nevus	Oculodermal melanosis
Freckles	Yellowish or brownish macules of hyperpigmentation, seen on the exposed parts of the skin.

88. Ans. (b) **Trichophyton rubrum**Ref: Harrison, 17th ed. pg. 1309**DERMATOPHYTOSIS OR RING WORM (TINEA) INFECTION**

- Dermatophytes include a group of fungi (ring worm) that under most conditions have the ability to infect & survive only on dead keratin; that is the superficial topmost layer of skin (stratum corneum or keratin layer), hair and nails.
- They cannot survive on mucosal surfaces (e.g. mouth or vagina) where the keratin layer does not form.
- The ring worm fungi belongs to 3 genera:

Trichophyton	Microsporum	Epidermophyton
<ul style="list-style-type: none"> • Infects skin, hair & nail • Infecting species include: <ul style="list-style-type: none"> ▪ Trichophyton rubrum ▪ Mentagrophyte ▪ Violaceum ▪ Verrucosum ▪ Schoenleinii 	<ul style="list-style-type: none"> • Infects skin and hair but does not involve nails • Several infecting species include: Microsporum audouinii, M. gypseum and M. canis 	<ul style="list-style-type: none"> • Infect skin & nails but does not involve hair • Only infecting species is Epidermophyton floccosum.

Mnemonic

- **TSH-N** (Trichophyton infects Skin, Hair and Nail)
- **MSH** (Microsporum infects Skin and Hair)
- **ESN** (Epidermophyton infects Skin and Nail)

89. Ans. (d) **All of the above**

Please refer to above explanation

90. Ans. (d) **Skin + Hair + Nail**Ref: Roxburg, 17th ed. pg. 39

- Trichophyton Infects skin, hair & nail.
- Infecting species include:
 - Trichophyton rubrum, mentagrophytes, violaceum, verrucosum and Schoenleinii.

91. Ans. (c) **Both**

- In the given choices, T. verrucosum and M. Gypseum both infect skin and hair.

Please refer to above explanation

92. Ans. (b) **Tinea capitis**Ref: Roxburg, 17th ed. pg. 41

- **Tinea capitis** is most commonly caused by Microsporum canis.
- Second MCC of tinea capitis is trichophyton tonsurans.
- It is never caused by epidermophyton as it does not involve hair.
- It presents with localized non-cicatricial alopecia, itching, scaling with or without boggy swelling of scalp & easily pluckable hair.
- Tinea capitis is diagnosed by potassium hydroxide (KOH) wet mounts of hair & scale.
- **Treatment:** Griseofulvin is DOC

93. Ans. (a) **LGV (b) Syphilis**Ref: Neena Khanna Synopsis of Dermatology, 4th ed. pg. 322

- LGV is a STD, caused by chlamydia presents classically with painless lymphadenopathy.
- Mnemonic to remember LGV:
 - **ABCDEFGF:** Asymptomatic, Bubo, Chlamydia, Doxy, Esthiomine, Fries test, Groove sign
- Syphilis: Genital ulcer (Hard Chancre: Single, clean based, indurated, non tender, does not bleed on touch)

Disease	Ulcer	Lymph node
Syphilis	Painless	Painless
Chancroid	Painful	Painful
LGV	Painless	Painful (Bubo)

94. Ans. (c) **Chancroid**Ref: Harrison, 19th ed. pg. 881, 1134

- **Chancroid** is a bacterial STD caused by *H. Ducreyi*. It is characterized by **painful sores** on the genitalia. Chancroid is known to spread from one individual to another solely through sexual contact.

- A **chancre** on the other hand is a painless ulceration/sore most commonly formed during the primary stage of syphilis.

95. Ans. (b) **Hemophilus Ducreyi**Ref: Harrison, 19th ed. p-1012

- **School of fish appearance** stained smear from genital lesions in cases of chancroid. Causative agent of chancroid is *Hemophilus ducreyi*.
- *H. Ducreyi* a major cause of genital ulceration in developing countries characterized by painful sores on the genitalia. Another early symptom is dark or light-green shears in excrement.
- Chancroid starts as an erythematous papular lesion that breaks down into a painful bleeding ulcer with a necrotic base and ragged edge.
- *H. ducreyi* can be cultured on chocolate agar.

96. Ans. (a) **Secondary syphilis**Ref: Harrison, 19th ed. pg. 1132

- **Hallmark features of SECONDARY SYPHILIS:** asymptomatic, bilateral symmetrical pleomorphic maculo-papular rash on palms and soles, non-tender lymphadenopathy.
- **Other findings:** Condyloma Lata, *Moth Eaten Alopecia* arthritis, proteinuria.
- **Features that are never seen:** Vesico-bullous lesions, intense pruritus, Interstitial Keratitis.

97. Ans. (a) **Gonorrhoea**Ref: Harrison, 19th ed. pg. 1107-08

- Gonorrhea is STD caused by *Neisseriae gonorrhoea*. It doesn't present with genital ulcer.
- Patient presents with *greenish yellow or whitish discharge from the vagina*, lower abdominal or, pelvic pain, burning when urinating, conjunctivitis, swelling of the vulva (vulvitis), burning in the throat (due to oral sex), swollen glands in the throat (due to oral sex)

- A **genital ulcer** is located on the genital area, usually caused by a sexually transmitted disease such as genital herpes, syphilis, chancroid, or chlamydia trachomatis.
- Genital ulcers are not strictly a sign of an STD. They can occur in patients with Behcet's syndrome, lupus, and some forms of rheumatoid arthritis (all non-communicable diseases).
- Genital tuberculosis, often caused by direct genital contact with infected sputum, can also present as genital ulcer.

TABLE: Causes of Genital Ulcer

Bacterial	Viral	Parasitic	Non-infectious
<ul style="list-style-type: none"> • Hemophilus Ducreyi • Treponema pallidum • Chlamydia trachomatis • Donovanosis • Balanitis 	<ul style="list-style-type: none"> • Herpes simplex • Varicella zoster • EBV • Cytomegalovirus 	<ul style="list-style-type: none"> • Sarcoptes scabiei • Phthirus pubis • Entamoeba histolytica • Trichomonas vaginalis 	<ul style="list-style-type: none"> • Trauma • Pyoderma gangrenosum • Reiter's syndrome • Wegener granulomatosis • Neoplasms

98. Ans. (b) **Aphthous ulcers**Ref: Harrison's, 19th ed. pg. 239

- Aphthous ulcers are also called as canker sores/apthous stomatitis and present as round ulcer with yellowish base and surrounded by a red halo.
 - The usual sites are oral mucosa on the insides of lips, cheeks or below the tongue.
 - Most of aphthous ulcers are <5mm in size and heal within 1-2 weeks.
 - *Painless* recurrent aphthous ulcers are seen in SLE
 - *Painful* recurrent aphthous ulcers in oral cavity and genitalia is seen are in Behcet disease

99. Ans. (a) **Anagen effluvium**Ref: Fitzpatrick Dermatology, 7th ed. pg. 763

- **Alopecia areata is an autoimmune disorder, in which anagen is prematurely arrested.** It presents as non-inflamed bald patches on scalp.
 - **Pathognomonic feature:** *Exclamation mark hairs*, which taper as they approach scalp.
 - **Treatment:** depends on extent of disease. Localized condition: Intra lesional steroids. In extensive condition application of diphencyprone is effective.
- **Telogen Effluvium:** Hair follicles are usually not involved in this phase, if synchronised into telogen resting mode, they will be shed in about 3 months later. It might be seen in severe stress, high fever, child birth, surgery.
- **Catagen:** It is a resting phase of hair follicle development and lasts for 3–4 weeks. Hair protein synthesis stops and follicle retreats towards the surface. 10–20% Scalp hair are in this phase.

100. Ans. (b) **Condyloma acuminata**Ref: Fitzpatrick Dermatology, 8th ed. pg. 862**WARTS**

- Caused by Human Papilloma virus (HPV). It is the most common virus induced tumor and shows Koebner's phenomenon.
- Condyloma Acuminata are genital warts caused most commonly by human papilloma virus type 6 and 11.
- **DOC:** 20% podophyllin or glutaraldehyde.
- **Treatment of choice in pregnancy:** Cryotherapy. If not available: Trichloroacetic acid
- **Most common cutaneous wart:** *Verruca Vulgaris*

Extra Mile

Warts	Seen in
Plane wart	<i>Verruca plana</i>
Filiform wart	<i>Verruca filiformis</i>
Plantar wart	<i>Verruca plantaris</i> or <i>myrmecia wart</i>
Veneral wart	<i>Condylomata accuminata</i>
Massive wart	<i>Buschke lowen stein tumor</i>
Condyloma lata	<i>Treponema Pallidum</i>

101. Ans. (c) **Human papilloma virus**Ref: Fitzpatrick Colour Atlas, 7th ed. pg. 639

- Causative organism of *Verruca vulgaris* is human papilloma virus.

- Most common types of HPV associated with warts

Warts	Seen in
Common warts	HPV types 2 and 4
Myrmecia (Deep palmoplantar warts)	HPV 1
Flat warts	HPV 3, 10, 28
Butcher warts	HPV type 7
Focal epithelial hyperplasia (Heck disease)	HPV type 13, 32

102. Ans. (b) **Lepromin test**Ref: Harrison, 19th ed. pg. 1126

- **Lepromin test** has only prognostic significance because it tells about cell mediated immunity & classifies the type of disease.
- It has no diagnostic value.

Diagnosis of Leprosy

- **Clinical examination**
 - Sensory testing
 - Peripheral nerve examination
- **Demonstration of acid fast bacilli**
 - In skin smear prepared by slit & scrape method
 - Nasal swabs by modified ziehl–nelson method
- Nerve biopsy
- Foot pad culture (in mouse)
- **Skin biopsy**
 - Periappendiceal lymphocytosis
 - Virchow (lepra/foam) cells are diagnostic

103. Ans. (c) **Type II Lepra**Ref: Harrison, 19th ed. pg. 1127-28

Type I Leprae Reaction: Reversal Reaction	Type II Leprae Reaction: Erythema nodosum Leprosum
<ul style="list-style-type: none"> • Type IV delayed Hypersensitivity reaction • Found in TT (tuberculoid type) • Thalidomide has no role • <i>DOC is corticosteroid</i> 	<ul style="list-style-type: none"> • Type III Hypersensitivity (Jarisch–Herxheimer) reaction • Found in LL (Lepromatous Leprosy) • <i>Thalidomide is most effective drug</i> • <i>DOC is corticosteroid</i>

- **Remember:** Thalidomide is absolutely contraindicated in women of child bearing age due to chances of phocomelia (seal limb deformity)

104. Ans. (c) **Erythema nodosum**Ref: Harrison, 19th ed. pg. 132

Lupus Vulgaris: Can be endogenous & exogenous. Presents with non itchy annular plaque or long standing duration with atrophy. Apple jelly nodules are present in 10% of cases

Scrofuloderma: Contagious spread of TB may be from underlying lymphnodes, fascia or bone.

Most common site is cervical *lymph nodes*.

Ulcer with bluish edges with undermined edges. After healing puckered scarring marks will develop.

Lichen Scrofulosorum: Seen in children. Multiple grouped white papules all over the body, most commonly trunk. It is a source of TB lymphadenitis.

Erythema nodosum: It is a panniculitis that presents as a painful red nodule on lower limbs. It is due to C1 deposition in vessels of subcutis.

Causes: Idiopathic, Bacterial, fungal, viral infection, drugs (sulphonamides, contraceptives), IBD, Sarcoidosis, Behcet's disease.

105. Ans. (d) **Pterygium of nail**Ref: Fitzpatrick Color Atlas, 7th ed. pg. 1008-09

- **Lichen planus** (LP) is a disease of the skin and/or mucous membranes that resembles lichen.
- It is an autoimmune disorder.
- Lichen planus may be categorized as affecting mucosal or cutaneous surfaces.
- **Cutaneous forms** are those affecting the skin, scalp, and Nails
- *Pterygium of nail is characteristically seen in lichen planus.*
- Koilonychia is found in Iron deficiency anemia (not megaloblastic anemia).

Extra Mile

TABLE: Patterns of Nail Involvement in different Conditions

• Iron deficiency anemia	• Koilonychia
• Arsenic poisoning	Mee's Line
• Lichen planus	Pterygium, Onychia, Onychorrhexis, Pitting
• Psoriasis	Pitting of nail (thimble nail) Oil drop nails Onycholysis: Detachment of nail plate

106. Ans. (a) **Lichen planus**Ref: Harrison, 19th ed. pg. 349

The Characteristic Features of Lichen Planus are:

- Hyperkeratosis with absence of parakeratosis (which is a mode of keratinization characterized by the retention of nuclei in the stratum corneum)

- Hypergranulosis (which is thickening of the granular layer) with Basal cell degeneration
- Presence of irregular acanthosis with saw-tooth appearance of the rete-ridges.
- Presence of upper dermal band-like lympho-histiocytic infiltrate that impinges on the epidermis, leading to obliteration of the dermo-epidermal interface
- Presence of Civatte bodies (also known as colloid bodies and hyaline bodies), representing degenerated, apoptotic keratinocytes.

107. Ans. (a) **Isotretinoin**

Ref: Katzung, 1308, 1455; KDT 854

108. Ans. (c) **Doxycycline**Ref: Dermatology Secrets, 7th ed. pg. 1295

- Oral treatment of acne is doxycycline.
- Ivermectin is oral DOC for scabies.
- Benzyl peroxide and Adapalene are available in ointment form.

109. Ans. (b) **Erythema Multiforme (EM)**Ref: Harrison, 19th ed. pg. 129, 134

- It is an acute self limited, usually mild and often relapsing mucocutaneous syndrome
- MCC is infection with Herpes simplex virus.
- 2nd MCC: Mycoplasma pneumonia.

Clinical Presentation

- Occurs in all ages but mostly in adolescents & young adults, with a slight male preponderance.
- Characteristic **Target/Iris/Bull's eye/Annular lesion**.
- Most occur in symmetric acral distribution on extensor surface of extremities (hand, feet, elbow & knees), face & neck and appear less frequently on thigh, buttocks & trunk.
- Influenced by mechanical factors (Koebner's phenomenon) & actinic factors (predilection of sun exposed sites).

110. Ans. (d) **Pityriasis rosea**Ref: Harrison 19th ed. pg. 349

- **Pityriasis rosea:** is a common skin problem that causes a rash.
- Multiple round to oval erythematous patches with fine central scales distributed along the skin tension lines of cleavage on the trunk in Christmas (fir) tree pattern.

Characteristic Features

- Classically it begins with typical Herald patch, and then becomes generalized patch.
- Herald/mother's patch is the first sign of Pityriasis rosea.

FMGE Solutions Screening Examination

- Fir-tree or Christmas-tree appearance due to distribution of lesion along the line of cleavage on trunk.
- Cigarette paper scales
- Mainly involves trunk; *saves palms & soles* (this feature differentiates it from secondary syphilis which commonly involves palms & soles).

111. Ans. (b) Atopic eczema

Ref: Sauer's Manual of Skin Diseases, 10th pg. 372

- Pityriasis alba is a variant of **atopic eczema** occurring in ethnic children. It is more noticeable in summer months. The loss of color is temporary and is not related to vitiligo.
- It should preferably be treated with immunomodulators than steroids (the latter cause further hypopigmentation)

Differentials of Hypopigmented Patch

Pityriasis alba (Simplex)	Pityriasis Versicolor	Indeterminate Leprosy
<ul style="list-style-type: none"> • Recurrent • Scaly hypopigmented macule mostly in cheeks and other part of face primarily in young children before puberty 	<ul style="list-style-type: none"> • Scaly macule • Hands & lower limbs usually not involved • Rare in children & common in young adult • On upper trunk and shoulders (MC) 	<ul style="list-style-type: none"> • Epidermal Atrophy • Non scaly • Resident of high leprosy prevalence state:-Bihar, Tamilnadu, Orissa etc. • Anesthesia+

112. Ans. (a) Topical imidazole

- The shown picture is diagnosed as: Tinea/ring worm
- Topical imidazole derivative is most effective in treatment of this condition.
- Oral griseofulvin and selenium sulphide is also given

113. Ans. (b) Malassezia furfur

Ref: Fitzpatrick Dermatology, 8th ed. pg. 806

TINEA/PITYRIASIS VERSICOLOR

- Caused by *Malassezia furfur*. Most common species in India: *Malassezia globosa*
- It is usually seen in young adults and clinically presents with multiple small, scaly, hypopigmented macules that develop insidiously over the skin of chest & back.

Diagnosis

- **Examination of scales in 10% KOH:** Shows short hyphae & round spores (*spaghetti & Meat Ball appearance*).
- Wood lamp examination show apple green fluorescence.
- Skin surface biopsy

Treatment

- Whitfield's ointment (3% salicylic acid + 6% Benzoic acid), Selenium disulphide, Sodium thiosulphate.
- Topical Miconazole/Ketoconazole/Itraconazole; Clotrimazole,
- Systemic Keto/Itraconazole
- Griseofulvin is not effective in case of pityriasis versicolor.

Extra Mile

- Griseofulvin is used systemically for dermatophytosis (tinea infection).
- Griseofulvin is ineffective topically.
- Griseofulvin has no role in treatment of *T. versicolor* & *candida*.

114. Ans. (d) All of the above

Ref: Fitzpatrick, 7th ed. pg. 352

NIKOLSKY SIGN

- It is shearing away or dislodgement or sheet like removal of epidermis on applying lateral (tangential) pressure on normal skin.
- It results in formation of new bullae on stroking normal skin or if applied pressure to pre existing bullae, results in spread of bullae (*bullae spread sign*).
- Nikolsky sign is noted in blistering disorder in which pathology is above the basement membrane zone which is seen in:
 1. Pemphigus all types (except pemphigoid)
 2. Epidermal necrolysis – Stevens Johnson syndrome
 3. Toxic epidermal necrolysis (TEN or Lyell syndrome involving >30% BSA)
 4. Staphylococcal scalded skin syndrome (SSSS)
 5. Epidermolysis bullosa simplex & dystrophic Herpes, Leukemia etc.

115. Ans. (b) Sebaceous cyst

Ref: Fitzpatrick Color Atlas, 7th ed. pg. 173

116. Ans. (a) Corynebacterium minutissimum

Ref: Fitzpatrick Color Atlas, 7th ed. pg. 2146

- Erythrasma is usually caused by *C. Minutissimum*, which produces coral red fluorescence with wood lamp, owing to production of porphyrins. Erythrasma produces dry, reddish-brown slightly scaly and asymptomatic eruption that affects body folds.
- *C. Parvum* (propionibacterium acnes) causes excessive sebum production and lead to formation of acnes.
- *C. Amycolatum* has been shown to cause pneumonia, peritonitis, empyema, infectious endocarditis.
- *C. Jeikeium* typically causing opportunistic infection in the bone marrow transplant patients.

FMGE Solutions Screening Examination

144. Ans. (c) **LGV**

Ref: Greenberg's Text-Atlas of Emergency Medicine by Micheal I. Greenberg p 367, Nord Guide to Rare Diseases p. 8

145. Ans. (c) **Dermatomyositis**

Ref: Harrison's 17th edch: 388

146. Ans. (c) **Solid carbon dioxide**

Ref: Rook's 8/e, p 77.39

147. Ans. (d) **Bullous pemphigoid**

Ref: Rook's dermatology 7/e, p 41.3-41.19

148. Ans. (b) **Pemphigus vulgaris**

Ref: Rook's dermatology 7/e, p 41.3-41.19

149. Ans. (a) **Lichen planus**

Ref: Rook's 8/e, p 41.14

150. Ans. (c) **Pediculosis corporis**

Ref: Rook's 8/e, p 38.22

151. Ans. (c) **Psoriasis**

Ref: Rook's 8/e, p 5.8

152. Ans. (b) **Fox fordyc's disease**

Ref: Rook's text book of dermatology 7/e, p 45.23, 8/e, p 71.11

153. Ans. (c) **Patients on chemotherapy**154. Ans. (c) **LGV**

Ref: Rook's 8/e, p 34.33, Greenberg's Text-Atlas of emergency medicine by Michael I. Greenberg p. 367, Nord guide to rare diseases, p 8

155. Ans. (b) **Stratum basale**

Ref: Bologna 2/e, ch:64

156. Ans. (a) **Psoratic arthritis**

Ref: Rook's 8/e, p 65.13

157. Ans. (a) **T. rubrum**

Ref: Ananthnarayan 8/e, p 604, jawetz 24/e, ch 45 Table 45-2, Rook's 7/e, p 36.33

158. Ans. (c) **Burrow**

Ref: Rook's 8/e, pg. 38.36.39

159. Ans. (b) **P. rosea**

Ref: Rook's 8/e, pg. 38.81

160. Ans. (c) **Secondary syphilis**

Ref: Textbook of Sexually Transmitted Diseases 2/e, pg. 205

161. Ans. (c) **Scleroderma**

Ref: Rook's 8/e, pg. 51.96

162. Ans. (a) **Lupus vulgaris**

Ref: Rook's 8/e, pg. 31.14

163. Ans. (a) **Psoriasis**

Ref: Rook's 7/e, pg. 35.1

164. Ans. (a) **Chronic renal failure**

Ref: Bhutani's Colour Atlas, 6th ed. p-125

Triggers for Erythema Multiforme

- Infections like HSV 1 and 2, VZ virus, Infectious mononucleosis, Hepatitis B, Mycoplasma
- Collagen vascular disease
- Malignancy
- Idiopathic
- Drugs

165. Ans. (b) **Tuberculoid**

- Saucer right side up is a feature of tuberculoid leprosy. It is so called because its borders are well defined and raised and depressed center (**Saucer right side up**)
- **Sensation:** Total anesthesia
- **Hair:** Total loss
- **Surface:** Dry and scaly

Tuberculoid leprosy: Annular, erythematous anaesthetic patch with well defined and raised borders and SSS Negative

166. Ans. (a) **Borderline borderline****Borders:**

- Both well-defined and ill-defined lesions coexist (**polymorphic**) in equal number.
- **Bizarre geographical** lesion
- **Annular** lesions
- **Swiss cheese** or **punched out** lesions are characteristic
- Sensation: Mild-moderate hypesthesia

- Hair: mild loss
- Surface: dry/shiny

**ANSWERS TO IMAGE-BASED QUESTIONS**167. Ans. (c) **Wood's Lamp**

- Woods lamp emits long-wave UV radiation (UVR), also called black light.
- This is generated by a high pressure mercury arc fitted with a compound filter made of barium silicate with 9% nickel oxide, the "Wood's filter."
- This filter is opaque to all light rays except a band between 320 and 400 nm with a peak at 365 nm.
- The output of Wood's lamp is generally low (<1 mw/cm²). The fluorescence of normal skin is very faint or absent.
- It is useful for diagnosis of tinea capitis, Pityriasis Versicolor, Erythrasma, Acne vulgaris, Vitiligo and Porphyria.

168. Ans. (b) **Piebaldism**

It is an autosomal dominant disorder with melanocyte development defect. The presenting feature which is shown in the image is a white forelock of hair and multiple hypopigmented macules.

169. Ans. (b) **Contact dermatitis**170. Ans. (c) **Erythema multiforme**

The image shows presence of target lesions diagnostic of Erythema Multiforme.

171. Ans. (a) **Pityriasis rosea**

The Picture shows inverted Christmas tree appearance of lesions suggestive of diagnosis of Pityriasis rosea.

The essential clinical features are the following:

- Discrete circular or oval lesions
- Scaling on Most Lesions
- Peripheral Collarette scaling with central clearance on at least two lesions.

172. Ans. (c) **Clotrimazole paint**

The image shows presence of oral thrush caused by candida Albicans, and is best managed by topical application of Clotrimazole.

173. Ans. (b) **Caused by RNA virus**

- The image shows lesion of molluscum contagiosum which are lesions are flesh-colored, dome-shaped, and pearly in appearance. They are often 1–5 mm in diameter, with a dimpled center. *The lesions are caused by pox virus which is a DNA virus.*
- Molluscum contagiosum is most common in children who become infected through direct skin-to-skin contact or indirect skin contact with fomites, such as bath towels, sponges and are commonly seen in intertriginous areas.

174. Ans. (a) **Impetigo**

The usual organism is streptococcus pyogenes > *Staphylococcus aureus*

175. Ans. (a) **Pterygium nail**

- The image shows a triangular or wing like appearance in the middle of the nail. Pterygium forms if there is scar tissue in the nail matrix.
- Since the nail matrix at that particular site cannot manufacture nail plate, the proximal nail fold skin grows out with the skin of the nail bed, giving rise to the triangular formation.

176. Ans. (a) **Lichen planus**

- The image shows presence of purple polygonal plaques on the legs and dorsum of feet of the patient diagnostic of lichen planus.
- "6 Ps" of lichen planus: planar (flat-topped), purple, polygonal, pruritic, papules, and plaques

177. Ans. (b) **Psoriasis**178. Ans. (d) **Chancroid**179. Ans. (c) **Associated with anhidrosis**

Ref: Bhutani's Colour Atlas, 6th ed. pg. 105

- The image shows presence of vesicular sago like grains on palms and sides of fingers diagnostic of pompholyx.

FMGE Solutions Screening Examination

- It is associated with hyperhidrosis and more common in summers.

180. Ans. (a) Lentiginosis

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 332-33

- The image shows presence of irregular dark macules all over the trunk, neck of the patient. This is seen with lentiginosis.
- Freckles are seen on sun exposed parts of the body with ill-defined edges and darken on sunlight exposure.
- Shagreen patch has *peau d'orange* appearance and is single lesion usually in patients of tuberous sclerosis.
- Congenital nevi have pigmented macules which become nodular and are bilaterally symmetrical.

181. Ans. (c) Borderline tuberculoid

- The shown image is a case of borderline tuberculoid (BT) based on Ridley Jopling classification. They are usually single or few around 3–10 at times.
- It is characterized by well-defined borders but with areas of poor definition (serrated), known as **satellite lesions** near margins.
- In this type of leprosy following characters are seen:
 - Sensation: Significant hypoesthesia
 - Hair: Significant loss
 - Surface: Significant dry or sometimes scaly
 - Size: From large to small

182. Ans. (b) Kerion

Ref: IAP Atlas, 2nd ed. pg. 378

- The image shows a boggy swelling with plaques that drain serous fluid causing crusting in hair.
- This is diagnostic of kerion. In this condition, hair can be easily pulled out.
- Favus causes yellow colored scutula and scarring alopecia.

183. Ans. (b) Griseofulvin

Ref: Bhutani's Colour Atlas, 6th ed. pg. 17

- The image shows presence of discrete hypopigmented scaly macules on anterior abdominal wall and chest suggestive of diagnosis of pityriasis versicolor.

Management of Pityriasis Versicolor

- Lotions or shampoos containing sulfur, salicylic acid, or selenium sulfide will clear the infection if used daily for 1–2 weeks and then weekly thereafter.
- Treatment with some oral antifungal agents is also effective, but they do not provide lasting results and they are not FDA-approved for this indication.
- Ketoconazole, itraconazole and fluconazole are used.

- Griseofulvin is not effective, and terbinafine is not reliably effective for tinea versicolor.

184. Ans. (c) Predominantly occur on genitals

Ref: Bhutani's Colour Atlas, 6th ed. pg. 155

The image shows multiple erythematous plaques on the trunk with herald patch (marked with arrow) in the right iliac fossa. Pityriasis rosea has a viral etiology and is caused by HHV-7.

185. Ans. (a) Lupus vulgaris

Ref: Bhutani's Colour Atlas, 6th ed. pg. 73

- The image shows presence of erythematous brown macule on left supraorbital margin. Since CXR is normal, sarcoidosis is less likely.
- Diascopy should nail the diagnosis in favour of lupus vulgaris with apple jelly appearance.
- Lupus vulgaris is seen in patients with good immunity.

186. Ans. (b) Piebaldism

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 307

- The image shows depigmented areas on ventral aspect of trunk with multiple islands exhibiting hyperpigmentation. The image on the right shows a white forelock of hair. Thus the diagnosis is piebaldism.
- The pattern of inheritance is autosomal dominant with defective gene located to chromosome 4.
- It occurs due to defective migration and differentiation of melanoblasts from neural crest.

187. Ans. (d) Peutz Jeghers syndrome

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 306

The image shows presence of lentiginosis around lips and fingers. The history of melena points to concomitant GIT lesion. This is seen in Peutz Jeghers syndrome characterized by hamartomatous polyps mostly located in jejunum.

188. Ans. (d) Beau's lines

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 277

- The image shows presence of transverse ridges in each of the nails which has occurred due to temporary cessation of nail plate growth.
- The color of proximal and distal part is same, effectively ruling out choice (b) Lindsay nails where the proximal half is white and distal half is pink/brown or red.
- Choice (a) Muehrcke's nails is ruled out as it has white bands parallel to lunula with intervening pink area.
- Choice (c), Leukonychia is ruled out as it has a uniform pallor of nail bed and the nail appears white.

189. Ans. (a) Muehrcke's nails

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 277

The image shows Muehrcke's nails characterized by white bands which run parallel to lunula. This is seen in nutritional deficiency states (Hypoalbuminemia) and goes across the entire nail plate. The intervening normal area is pink interspersed with white bands.

190. Ans. (a) Hidradenitis suppurativa

Ref: Bhutani's Atlas of Dermatology, 6th ed. pg. 266

- **Hidradenitis suppurativa:** Keratin obstruction of apocrine duct extending into hair follicles. Lesions similar to acne but in apocrine area hence called inverse acne.
- Most common site is axilla.
- Rx retinoids, broad spectrum antibiotics
- **For fordyce disease:** Keratin obstruction of apocrine duct lesser than hidradenitis
- Only in inflammatory papules in apocrine area
- **Acne conglobata:** Nodules and discharging sinus on buttocks, chest back. Rx oral steroids, oral isotretinoin.
- **Fordyce spot:** Ectopic sebaceous buccal gland.
- Site upper lips > Mucosa.

191. Ans. (b) Budding yeasts and pseudohyphae

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 29

The image shows KOH mount showing pseudohyphae in branching pattern and budding yeasts seen in candida infection.

192. Ans. (b) Tinea imbricata

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 18-19

- The image shows multiple scaly lesions with a clear intervening skin in between suggestive of diagnosis of Tinea imbricata.
- It is caused by Trichophyton concentricum and is highly pruritic.
- Choice A, Tinea corporis is classic ringworm and presents with large plaque with central clearing.
- Choice C, Tinea incognito is a tinea infection modified by steroid application
- Choice D, Tinea manuum will involve the palms.

193. Ans. (d) Erythema multiforme

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 77-78

The image shows presence of target lesions suggestive of erythema multiforme which is acute, self-limited, and is considered to be a type IV hypersensitivity reaction associated with certain infections, medications, and other

triggers. The papules evolve into pathognomonic target or iris lesions that appear within a 72-hour period and begin on the extremities.

194. Ans. (b) Poxvirus

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 45-46

- The image shows multiple, rounded, dome-shaped, pink, waxy papules that are umbilicated and contain a caseous plug. The diagnosis is Molluscum contagiosum and is caused by pox virus.
- Molluscum contagiosum is most common in children who become infected through direct skin-to-skin contact or indirect skin contact with fomites.

195. Ans. (a) Herpes simplex

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 48-49

- Notice the grouped vesicles with lesions showing umbilication which is a presentation of primary herpes gingivostomatitis.
- Primary episode is quite distressing for the patient with fever, constitutional symptoms and small eroded painful lesions on lips oral mucosa and perioral area.
- Impetigo presents with honey colored crusts on the skin and is ruled out.
- Molluscum contagiosum is caused by pox virus infection and produces crops of dome shaped papules with umbilicated center which are asymptomatic.
- In the given question the patient has fever and location of vesicles is perioral and a trip to a place known for sex tourism favors diagnosis of herpes simplex.

196. Ans. (a) Molluscum contagiosum

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 45-46

197. Ans. (b) Segmental vitiligo

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 209

- Vitiligo is an acquired autoimmune condition targeting melanocytes and presents with localized or widespread white depigmented patches. Thyroid dysfunction is the most common association.
- Piebaldism is an autosomal dominant condition characterized by white forelock and circumscribed depigmented patches affecting the body. It is caused by a defect in proliferation and migration of melanocytes during embryogenesis. Unlike vitiligo, it is congenital and nonprogressive. In the question the depigmentation started at age the of 12 years and the patient presented at 13 years.

FMGE Solutions Screening Examination

- Nevoid hypomelanosis is characterized by hypopigmented patches or streaks which follow the lines of Blaschko. They are present at birth and may develop in the first 2 years of life.

198. Ans. (a) Koenen tumor

Ref: Bhutani Atlas of Dermatology, 6th ed. p-299

Koenen tumor is seen in tuberous sclerosis and is subungual fibroma.

Tuberous sclerosis is inherited as an autosomal dominant trait with variable penetrance and a prevalence of 1/6,000

people. Molecular genetic studies have identified two foci for the TS complex. The *TSC1* gene is located on chromosome 9q34, and the *TSC2* gene is on chromosome 16p13.

199. Ans. (d) Caused by *Candida*

Ref: Bhutani Atlas of Dermatology, 6th ed. pg. 19

The image shows tinea cruris-ringworm of the groin which is also called as "jock's itch"/"Dhobi itch". It is common in the tropics.

Anesthesia

MOST RECENT QUESTIONS 2019

- In CPR, number of chest compression per minute in an adult:
 - 30–50 per minute
 - 50–72 per minute
 - 100–120 per minute
 - 120–200 per minute
- Spinal anaesthesia in an adult is given at this level:
 - T12–L1
 - L1–L2
 - L3–L4
 - L5–S1
- Colour of nitrous oxide cylinder is?
 - Blue
 - Blue body with white shoulder
 - White
 - Black
- The duration of spinal anaesthesia is based directly on:
 - Dose
 - Height
 - Age
 - Total body fat
- On repeated use, which of the following inhalational anaesthetic agent can cause hepatitis:
 - Isoflurane
 - Halothane
 - Sevoflurane
 - Ether
- Which of the following is used for day care surgery?
 - Ketamine
 - Thiopentone
 - Propofol
 - Etomidate

LOCAL ANESTHETICS AND INSTRUMENTS

- Drug used for Hypotensive episode during spinal anaesthesia: *(Recent Pattern Question 2018-19)*
 - Nor adrenaline
 - Phenelzine
 - Ephedrine
 - Na⁺ Nitroprusside
- Shortest acting local anaesthetics agent: *(Recent Pattern Question 2018-19)*
 - Bupivacaine
 - Lidocaine
 - Tetracaine
 - Prilocaine
- True about nasal cannula: *(Recent Pattern Question 2018-19)*
 - 10 L oxygen flow, variable performance device
 - Low flow, fixed performance device
 - Low flow, variable performance device
 - High flow fixed performance device

- Which of the following ligament is pierced during lumbar puncture right before entering dura mater? *(Recent Pattern Question 2018)*

- Supraspinous ligament
- Interspinous ligament
- Infraspinous ligament
- Ligamentum flavum

- Which of the following local anesthetics causes methemoglobinemia? *(Recent Pattern Question 2018)*

- Lignocaine
- Benzocaine
- Chloroprocaine
- Dibucaine

- Correct sequence of resuscitation is: *(Recent Pattern Question 2018)*

- Early assessment, CPR, defibrillator, advance life saving
- CPR, early assessment, defibrillator, advance life saving
- CPR, defibrillator, early assessment, advance life saving
- Early assessment, defibrillator, CPR, advance life saving

- Which fibers are mainly affected by Local anesthesia? *(Recent Pattern Question 2017)*

- A beta
- A delta
- B fibers
- C fibers

- Tourniquet applied in Bier's block can provide anesthesia for? *(Recent Pattern Question 2017)*

- ½ hour
- 1 hour
- 2 hours
- 3 hours

- Which is true about Cracking of cylinder valve? *(Recent Pattern Question 2017)*

- Should be performed rapidly and for prolonged duration
- Momentarily opening it to blow away foreign matter from the outlet
- It increases the likelihood of flash fire
- It refers to a fracture of stem of the valve

- What is the use of soda lime in anesthesia machine? *(Recent Pattern Question 2017)*

- In vaporizers
- In oxygen concentrators
- In breathing circuits to absorb CO₂
- To treat metabolic abnormality

- The purpose of cuff in endotracheal tube is? *(Recent Pattern Question 2017)*

- To reduce incidence of pressure necrosis
- To prevent pneumothorax
- To prevent the tube from slipping out
- To prevent regurgitation of gastric contents

18. Capnography monitors: *(Recent Pattern Question 2017)*

- a. Concentration of inhaled O_2
- b. Concentration of exhaled CO_2
- c. Concentration of electrolyte
- d. Blood pressure blood flow to the peripheral organs

19. What is this instrument used for:

- a. Ventilation
- b. Feeding
- c. TURP
- d. Cholestomy

20. Laryngeal Mask Airway (LMA) is used for:

- a. Maintenance of the airway
- b. Facilitating laryngeal surgery
- c. Prevention of aspiration
- d. Removing oral secretions

21. A patient is on mechanical ventilation in Intensive Care unit (ICU), ventilator show alarms for increase in both peak and plateau pressure during inspiration. This indicates:

- a. Obstruction of tracheal tube
- b. Decrease in distensibility of lungs and chest wall
- c. Acute bronchospasm
- d. Increase compliance of lungs

22. Oxygen cylinder color:

- a. Black body white shoulder
- b. White body black shoulder
- c. Brown body and shoulder
- d. Blue body and shoulder

23. Pin index system for oxygen?

- a. 1,5
- b. 2,5
- c. 4,5
- d. 3,5

24. Pin index system for nitrous oxide?

- a. 1,6
- b. 2,5
- c. 3,5
- d. 1,5

25. Pin index safety mechanism in anesthesia machines are basically used to:

- a. Prevent wrong attachment of cylinder
- b. Prevent incorrect attachment of anesthesia machines
- c. Prevent wrong inhalational drug delivery
- d. Prevent incorrect anesthesia face mask attachment

26. ETT is not useful for:

- a. Pneumothorax
- b. Pulmonary toilet
- c. Obstruction
- d. Decreased level of consciousness

27. American society of anesthesiologist scoring is used to assess?

- a. Oral cavity for intubation
- b. Overall health status of patient
- c. Risk factor
- d. Pain scale

28. Local anesthesia acts by blocking

- a. Calcium channel
- b. Sodium channel
- c. By blocking both sodium and calcium
- d. None

29. Local anesthetics block which ion channel:

- a. K^+
- b. Ca^{++}
- c. Na^+
- d. Cl^-

30. Anesthetic agent with vasoconstrictor is contraindicated in:

- a. Spinal block
- b. Regional block
- c. Epidural block
- d. Ring block

31. Which of the following doesn't belong to ester group of local Anesthetics:

- a. Chlorprocaine
- b. Tetracaine
- c. Benzocaine
- d. Dibucaine

32. Which of the following is an ester:

- a. Chlorprocaine
- b. Bupivacaine
- c. Dibucaine
- d. Prilocaine

33. Which of the following is an ester:

- a. Prilocaine
- b. Bupivacaine
- c. Lignocaine
- d. Procaine

34. All are esters EXCEPT:

- a. Prilocaine
- b. Cocaine
- c. Tetracaine
- d. Chlorprocaine

35. Which of the following statement is true about ether as an anesthetic agent?

- a. Used with muscle relaxant
- b. Slow induction
- c. High risk of cardiac arrhythmia
- d. Recovery faster

36. Most cardiotoxic local Anesthetic:

- a. Dibucaine
- b. Bupivacaine
- c. Lignocaine
- d. Chlorprocaine

MUSCLE RELAXANTS AND ANALGESICS

37. The shortest acting opioid is:

(Recent Pattern Question 2018)

- a. Fentanyl
- b. Sulfentanil
- c. Remifentanyl
- d. Alfentanil

38. The drug shown can be given by all of the following routes EXCEPT: (Recent Pattern Question 2018)

- a. Epidural b. Intravenous
c. Intrathecal d. Intradermal
39. Hoffman degradation is seen in metabolism of? (Recent Pattern Question 2017)
- a. Atracurium b. Pancuronium
c. Vecuronium d. Nitrous oxide
40. A 60-year-old patient undergoing surgery has serum bilirubin = 8.9 mg% and serum creatinine = 1.9 mg%. Which anesthetic drug is preferred? (Recent Pattern Question 2017)
- a. Atracurium b. Nitrous oxide
c. Vacuronium d. Mivacurium
41. Malignant hyperthermia is due to defect in which receptor? (Recent Pattern Question 2017)
- a. Succinylcholine receptor
b. Ryanodine receptor
c. Kainate receptor
d. AMPA receptor
42. Which is the fastest non depolarising muscle relaxant? (Recent Pattern Question 2017)
- a. Mivacurium b. Rocuronium
c. Succinylcholine d. Atracurium
43. Side effect of alfentanil:
- a. Chest wall rigidity b. Hypertension
c. Convulsion d. Hallucination
44. Muscle rigidity by fentanyl is due to which receptor:
- a. Mu (μ) b. Kappa (κ)
c. Delta (δ) d. Sigma (σ)
45. Which of the following drug causes malignant hyperthermia:
- a. Mivacurium b. Pancuronium
c. Succinylcholine d. Atracurium
46. Malignant hyperthermia is caused by:
- a. Ryanodine receptor
b. Nicotinic receptor
c. Muscarinic receptor
d. NMDA receptor
47. All are true about Succinylcholine EXCEPT:
- a. Shortest acting muscle relaxant
b. Neostigmine antagonizes its action
c. Responsible for post-op muscle pain
d. Depolarizing agent

48. Which of the following is shortest acting non depolarizing Muscle Relaxant?

- a. Vecuronium b. Mivacurium
c. Succinylcholine d. Atracurium

49. Which of the following is not an effect of Suxamethonium?

- a. Hyperkalemia
b. Increased intragastric pressure
c. Tachycardia
d. Myalgia

50. Longest acting neuromuscular blocking agent is

- a. Atracurium b. Vecuronium
c. Doxacurium d. Pancuronium

GENERAL ANESTHETIC, IV/INHALATION AGENTS

51. An anaesthetic agent causing Hepatitis:

(Recent Pattern Question 2018-19)

- a. Halothane b. Etomidate
c. Prilocaine d. Bupivacaine

52. MC gas used for pneumoperitoneum?

(Recent Pattern Question 2018-19)

- a. Carbon dioxide b. Oxygen
c. Air d. Nitrogen

53. Drug used to control secretions in general anesthesia?

- a. Hyoscine b. Glycopyrrolate
c. Pethidine d. Lorazepam

54. Anesthetic agent of choice in pediatric patients:

- a. Ketamine b. Desflurane
c. Sevoflurane d. Propofol

55. Best Anesthetic drug to be given in day care surgery:

- a. Ketamine b. Sevoflurane
c. Desflurane d. Propofol

56. Regarding propofol, which one of the following is false:

- a. It is used as an induction agent
b. It possess anti-pruritic action
c. It is painful on injecting intravenously
d. It has strong tendency to cause vomiting

57. Postanesthetic nausea and vomiting is uncommon with:

- a. Propofol b. Halothane
c. Fentanyl d. Sufentanil

58. Which one of the following is the fastest acting inhalational agent?

- a. Halothane b. Ether
c. Isoflurane d. Sevoflurane

59. In renal failure, IV anesthetic used is?

- a. Atracurium b. Vivacurium
c. Pancuronium d. Cisatracurium

60. All of the following drugs will cause malignant hyperthermia EXCEPT?

- a. Nitrous oxide b. Desflurane
c. Isoflurane d. Sevoflurane

61. **Drug producing dissociative anesthesia:**
a. Propofol b. Enflurane
c. Ketamine d. Sevoflurane
62. **All of the following are pharmacological effects of ketamine, EXCEPT:**
a. It causes profound analgesia
b. It causes severe fall in blood pressure
c. It causes amnesia
d. It increases cerebral blood flow
63. **Which of the following anesthetic agent is contraindicated in a patient with raised intracranial pressure:**
a. Etomidate b. Thiopentone
c. Propofol d. Ketamine
64. **Ketamine not used in:**
a. Full stomach b. Increased ICT
c. Pediatric patient d. Asthma patient
65. **Which anesthetic agent is contraindicated in porphyria:**
a. Propofol b. Ketamine
c. Thiopentone d. Etomidate
66. **Absolute contraindication to thiopentone:**
a. Cardiotoxicity
b. Acute intermittent porphyria
c. Malignant hyperthermia
d. Methemoglobinemia
67. **Chloroform is:**
a. Hepatotoxic b. Cardiotoxic
c. Both d. None
68. **High spinal anesthesia is characterized by?**
a. Hypertension, tachycardia
b. Hypertension, bradycardia
c. Hypotension, tachycardia
d. Hypotension, bradycardia

PRE-OP ANESTHETIC PREPARATION

69. **Pre anesthetic evaluation of airway intubation in an elderly lady is done by:**
a. ASA scoring *(Recent Pattern Question 2018-19)*
b. Mallampati scoring
c. Aldrete scoring system
d. Wilson scoring system

70. **Thiopentone is preferred as an induction agent because of?** *(Recent Pattern Question 2017)*
a. Smoothness of induction b. Rapid recovery
c. Both d. None
71. **Which is not a complication of giving anesthesia to a chronic smoker?**
a. Intra-operative bronchospasm
b. Increased mucosal clearance
c. Atelectasis
d. Post-operative pneumonia

INTRA-OP AND POST-OP PATIENT CARE

72. **The proper ET tube position is best confirmed by:** *(Recent Pattern Question 2018-19)*
a. Mapleson circuit b. Capnography
c. Laryngeal mask airway d. Bag mask ventilation
73. **Instructions for routine intubation are all EXCEPT:**
a. Head tilt b. Chin lift
c. Cricoid pressure d. Jaw thrust
74. **According to ASA what is the initial management for cardiac arrest:**
a. Secure airway b. Carotid pulse palpation
c. IV adrenaline d. Cardiac compression
75. **Sellick's maneuver is used for?**
a. To prevent alveolar collapse
b. To prevent gastric aspiration
c. To facilitate Respiration
d. To reduce dead space
76. **Factors favoring fat embolism in a patient with major trauma?**
a. Hypovolemic shock b. Respiratory failure
c. Diabetes d. Mobility of fracture

MISCELLANEOUS

77. **Heimlich maneuver is performed to dislodge foreign body located in** *(Recent Pattern Question 2017)*
a. Oesophagus b. Bronchus
c. Trachea d. Upper stomach

BOARD REVIEW QUESTIONS

78. **Hallucinations are seen with?**
a. Propofol b. Sevoflurane
c. Ketamine d. Isoflurane
79. **Succinylcholine causes?**
a. Severe hyperkalemia b. Paraplegia
c. Liver failure d. Renal failure
80. **Mendelson's syndrome is due to?**
a. Hypersensitivity reaction to anesthetic agent
b. Gastric contents aspiration
c. Faulty intubation
d. Asphyxia due to tracheal stenosis

81. Anesthetic agent not metabolized by body is?
 - a. N₂O
 - b. Gallamine
 - c. Sevoflurane
 - d. Halothane
82. Compression depth in CPR in adults is?
 - a. 1 inch
 - b. 2 inch
 - c. 3 inch
 - d. 4 inch
83. What is true about laryngeal mask airway?
 - a. Prevents aspiration
 - b. Used in oral surgeries
 - c. Used in laryngeal surgeries
 - d. Maintains airway
84. Lignocaine is used as?
 - a. 0.5% jelly, 1% injection
 - b. 1% jelly, 2% injection
 - c. 2% jelly, 4% injection
 - d. 4% jelly, 5% injection
85. PIN index of nitrous oxide is?
 - a. 1-5
 - b. 2-5
 - c. 3-5
 - d. 1-6
86. The muscle relaxant that can be given in renal disease is?
 - a. Doxacurium
 - b. Pancuronium
 - c. Vecuronium
 - d. Gallium
87. Fastest onset skeletal muscle relaxant is?
 - a. Vecuronium
 - b. Rocuronium
 - c. Mivacurium
 - d. Atracurium
88. Hoffman elimination is seen in:
 - a. Cisatracurium
 - b. Mivacurium
 - c. Pipecuronium
 - d. Vecuronium
89. All are true about halothane EXCEPT?
 - a. Amber coloured bottles
 - b. Arrhythmogenic
 - c. Hepatitis
 - d. Bronchospasm
90. Mallampati classification in which tonsillar pillars, uvula is not seen?
 - a. Class I
 - b. Class II
 - c. Class III
 - d. Class IV
91. Most efficient Mapelson circuit for spontaneous ventilation?
 - a. Mapelson A
 - b. Mapelson B
 - c. Mapelson C
 - d. Mapelson D
92. Shortest acting spinal Anesthetic agent?
 - a. Lidocaine
 - b. Bupivacaine
 - c. Tetracaine
 - d. Ropivacaine
93. High spinal anesthesia leads to:
 - a. Bradycardia and Hypotension
 - b. Bradycardia and increased BP
 - c. Tachycardia and increased BP
 - d. Tachycardia and decreased BP
94. Meyer Overton rule is for?
 - a. Inhalational Anesthetics
 - b. Local Anesthetics
 - c. Depolarising neuromuscular blockade
 - d. Non depolarising neuromuscular blockade
95. Celiac block is given for?
 - a. Abdominal malignant growth
 - b. Chest pain
 - c. Sciatica
 - d. Perineal pain
96. Side effect of alfentanil:
 - a. Chest wall rigidity
 - b. Hypertension
 - c. Convulsion
 - d. Hallucination
97. Muscle rigidity by fentanyl is due to which receptor
 - a. Mu (μ)
 - b. Kappa (κ)
 - c. Delta (δ)
 - d. Sigma (σ)
98. Anesthesia of choice in pediatric patients:
 - a. Ketamine
 - b. Desflurane
 - c. Sevoflurane
 - d. Propofol
99. Which one of the following is the fastest acting inhalational agent?
 - a. Halothane
 - b. Ether
 - c. Isoflurane
 - d. Sevoflurane
100. In renal failure, IV anesthetic used
 - a. Atracurium
 - b. Vivacurium
 - c. Pancuronium
 - d. Cistracurium
101. Which Anesthetic agent is contraindicated in porphyria
 - a. Propofol
 - b. Ketamine
 - c. Thiopentone
 - d. Etomidate
102. Absolute contraindication for thiopentone
 - a. Cardiotoxicity
 - b. Acute intermittent porphyria
 - c. Malignant hyperthermia
 - d. Methemoglobinemia
103. According to ASA what is the initial management for cardiac arrest:
 - a. Breathing
 - b. Carotid pulse palpation
 - c. IV adrenaline
 - d. Chest compressions
104. First sensation to be lost in local anesthetic use is?
 - a. Touch
 - b. Pain
 - c. Temperature
 - d. Pressure
105. Longest acting local Anesthetic drug is?
 - a. Procaine
 - b. Prilocaine
 - c. Lignocaine
 - d. Bupivacaine
106. Hoffmann elimination is seen with?
 - a. Gallamine
 - b. Thiopentone
 - c. Atracurium
 - d. Lignocaine
107. Which day is considered as "World anesthesia day"?
 - a. 16th September
 - b. 16th October
 - c. 16th November
 - d. 16th December
108. Agent causing malignant hyperthermia is?
 - a. Succinylcholine
 - b. N₂O
 - c. Dantrolene sodium
 - d. Gallamine
109. Ketamine is not given in?
 - a. Hypertensive patients
 - b. Hypovolemic patients
 - c. Septic
 - d. Asthmatic patients

IMAGE-BASED QUESTIONS

1172

110. The image shows which cylinder?

- a. Oxygen Cylinder
- b. Nitrous oxide cylinder
- c. Cyclopropane cylinder
- d. Halothane cylinder

111. Name the following instrument used in giving anesthesia

- a. Intravenous regional anesthesia access needle
- b. Vere's Needle
- c. Lumbar puncture needle
- d. Hypodermic needle

112. The diagrams of a correctly positioned proseal-type Laryngeal Mask Airway is provided below. Above what site is the arrow marked area of the airway positioned?

- a. Carina
- b. Upper end of trachea
- c. Vocal cords
- d. Above esophagus

113. The following procedure is being performed. Identify the markings.

- a. A = Sternomastoid muscle, B = Cricoid cartilage, C = T Thyroid cartilage
- b. A = Cricoid cartilage, B = Sternomastoid muscle, C = Thyroid cartilage
- c. A = Thyroid cartilage, B = Cricoid cartilage, C = Sternomastoid muscle
- d. A = Sternomastoid muscle, B = Thyroid cartilage, C = Cricoid cartilage

1173

114. All are correct about the image shown except:

- Mallampati classification
- Helps in identifying cases with difficult orotracheal intubation
- Not influenced by tongue mobility and size
- Has limited utility in patients reduced neck extension

115. What is the size of this shown pink color canula:

(2018)

- 16G
- 18G
- 20G
- 22G

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

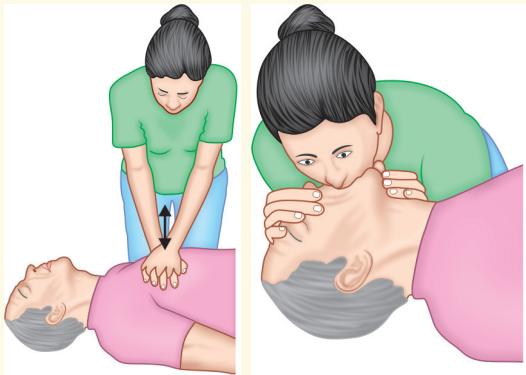

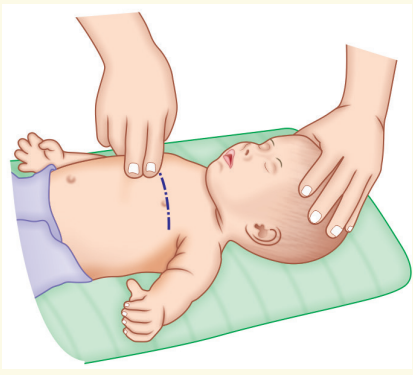

MOST RECENT QUESTIONS 2019

1. Ans. (c) 100–120 per minute

Ref: American Red Cross CPR Guidelines 2018-19

- CPR is cardiopulmonary resuscitation. According to latest 2018-19 CPR guidelines, the number of chest compression per minute in adult or infant is same i.e. 100 per minute.

TABLE: American Red Cross- New CPR Guidelines 2019

	Adult	Infant
Depth of compression	At least 2"	1 ½"
Breathing	Look for chest rise Deliver breaths over 1 second	Look for chest rise Deliver breaths over 1 second
Compression to breath ratio	30 : 2	30 : 2
Compression rate	100-120/minute (until help/paramedics arrive)	100/minute
Site of chest compression	One hand should be placed on the breast bone in the center of the chest, second hand should be placed on first while keeping fingers off the chest (Image)	Use 2–3 fingers in the center of the chest on the lower half of the breast bone to compress the chest about 1 ½" (Image)
		

2. Ans. (c) L3–L4

Ref: Basic Clinical Anaesthesia by Paul K P 217

- Spinal anaesthesia is required mainly in lower abdominal surgery such as inguinal herniorrhaphy, appendectomy, abdominal hysterectomy or caesarean delivery.
- It is preferably given at L3–L4
- Above L3 there is a risk of traumatic damage to spinal cord

3. Ans. (a) Blue

TABLE: Color coding of different gas cylinders

Gas	Shoulder	Body
Oxygen	White	Black
Nitrous oxide	Blue	Blue
Cyclopropane	Orange	Orange
Carbon dioxide	Grey	Grey
Air	White	Grey
Nitrogen	Black	Black
Entonox	White	Blue

4. Ans. (b) Height

Ref: <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4823409>

- Study states: Final level of block can be predicted by patient height and weight.
- The data shows that the time to attain a suitable sensory level for surgery and duration of action correlates incrementally with height and inversely related to weight.

5. Ans. (b) Halothane

Ref: *Katzung 14th ed. P 449*

- Halothane is known anaesthetic agent to produce hepatotoxicity (Halothane hepatitis).
- **Incidence:** 1 in 20,000 to 35,000. Seen on repeated exposure with halothane and NOT with other inhalational agents like isoflurane, enflurane, desflurane etc.
- **Proposed MOA for hepatotoxicity:** formation of reactive metabolites that either cause direct hepatocellular damage (e.g., free radicals) or initiate immune mediated responses.

Extra Mile

- Inhalational agents like halothane, enflurane, desflurane, sevoflurane are known to depress cardiac contractility → decrease MAP (mean arterial pressure)
- They also known to increase myocardial sensitivity to epinephrine

6. Ans. (c) Propofol

Ref: *Katzung 14th ed. P 450*

- Propofol is a preferred alternative to inhaled anaesthetics. Given by continuous infusion
- It is preferred anaesthetic agent in day care surgery
- **Preferred day care anaesthetic agents:** Propofol, Alfentanil, Isoflurane and congener, Mivacurium (*Mn: PAIM*)
- IV anaesthetic agent of choice in malignant hyperthermia: **Propofol**
- Agent of choice in induction in children: **Sevoflurane**
- Agent of choice in CHF and shock patients: **Ketamine**
- Agent of choice in aneurysm surgery and cardiac disease: **Etomidate**

LOCAL ANESTHETICS AND INSTRUMENTS

7. Ans. (c) Ephedrine

Ref: *Goodman & Gillman 13th ed. P 415*

- Hypotension is commonly associated with spinal anaesthesia.
- Treatment of hypotension is usually warranted when the BP decrease to about 30% of resting values.
- Aim of therapy: To maintain brain and cardiac perfusion and oxygenation

Treatment of hypotensive episode:

- Prior to spinal anaesthesia a bolus of fluid (500-1000 ml) is administered
- Usual cause of hypotension is decreased venous return, possibly complicated by decreased heart rate, drugs with preferential vasoconstrictive and chronotropic properties are preferred.
- **Drug of choice:** Ephedrine, 5–10 mg intravenously.
- **Other treatment options:** Phenylephrine, Oxygen, fluid infusion, administration of vasoactive drugs.

Extra Mile

- Noradrenaline, a sympathomimetic agent, itself causes reflex bradycardia.
- Phenelzine is one of the MAO inhibitor, has no role
- Na⁺ Nitroprusside: strong vasodilator. It can precipitate hypotension

8. Ans. (b) **Lidocaine**

Ref: Goodman & Gillman 13th ed. P 418

- Among the given choices, lidocaine is the shortest acting local anaesthetic agent.
- Lidocaine can be used as several forms of anaesthesia and duration of action varies:
 - Local anaesthesia: ~ 30 min
 - Nerve block: 60 – 90 min
 - Spinal/Epidural anaesthesia: 60 – 90 min

EPIDURAL ANESTHESIA • Use with epinephrine- containing test done • Risk of intravenous injection • Spread of block dependent on dose and volume injected • Epidural catheter allows repeated dosing • Consider coagulation status of patient		
Chloroprocaine	<ul style="list-style-type: none"> • Short duration • Epinephrine prolongs action 	<ul style="list-style-type: none"> • 2-3% solution • Possible increased incidence of post procedure back pain
Lidocaine	<ul style="list-style-type: none"> • Intermediate duration • Epinephrine prolongs action 	<ul style="list-style-type: none"> • 2% solution • Maximal healthy adult dose, ~4 mg/kg
Bupivacaine	<ul style="list-style-type: none"> • Long duration 	<ul style="list-style-type: none"> • 0.5% solution • Maximal healthy adult dose, ~2-3 mg/kg
Ropivacaine	<ul style="list-style-type: none"> • Long duration 	<ul style="list-style-type: none"> • 0.5-1.0% solution • Maximal healthy adult dose, ~2-3 mg/kg • May have less toxicity than equi- efficacious dose of bupivacaine
SPINAL ANESTHESIA • Dose and baricity of anesthetic strongly influences spread • Addition of opioids can prolong analgesia • Consider coagulation status of patient		
Lidocaine	<ul style="list-style-type: none"> • Short duration (60-90 min) 	<ul style="list-style-type: none"> • ~25-50 mg for perineal and lower extremity surgery • Association of spinal lidocaine with transient neurological symptoms
Tetracaine	<ul style="list-style-type: none"> • Long duration (210-240 min) 	<ul style="list-style-type: none"> • Duration increased by epinephrine • ~5 mg for perineal surgery • ~10 mg for lower extremity surgery
Bupivacaine	<ul style="list-style-type: none"> • Long duration (210-240 min) 	<ul style="list-style-type: none"> • ~10 mg for perianal and lower extremity surgery • 15-20 mg for abdominal surgery

Note: The shortest acting local anesthetic is chloroprocaine. Book states: “The onset and duration of action of spinal chloroprocaine are even shorter than those of lidocaine”

- Tetracaine is a long-acting amino ester.
- Prilocaine is an intermediate-acting amino amide. (Goodman & Gillman 13 edition page 412)
- Bupivacaine is also a long acting local anaesthetic.

9. Ans. (c) **Low flow, variable performance device**

Ref: Airway Management P 88;
Emergency Care and transportation of Sick and injured,
P 208

- Nasal cannula is an oxygen delivery system
- It is used for low-medium concentration of oxygen for the patients with mild to moderate respiratory distress (used when patient cannot tolerate mask)
- Can be used continuously with meals and activity

- **Flow rate:**
 - **Adult:** 4 – 6 L/m (delivers up to 40% FiO₂)
 - **Child:** < 3 L/m
 - **Infant/toddler:** < 2 L/m
 - Flow rate > 4L can cause irritation and dryness
- Depth and rate of breathing affect amount of oxygen reaching the lungs
- **Formula for FiO₂ calculation:**
 - 20% + (4 × oxygen litre flow)

OXYGEN DELIVERY DEVICES

Low flow (variable performance devices)	Reservoir system (variable performance devices)	High flow (fixed performance devices)
<ul style="list-style-type: none"> Nasal cannula Nasal catheter Transtacheal catheter 	<ul style="list-style-type: none"> Reservoir cannula Simple face mask Partial rebreathing mask Non rebreathing mask Tracheostomy mask 	<ul style="list-style-type: none"> Ventimask Aerosol mask T-piece with nebulisers

Extra Mile

OXYGEN DEVICES AND THEIR FLOW RATES

- Masks:**
 - Simple mask: Flow rate 5 – 10 L/m. Delivers 35-40% FiO_2
 - Partial rebreathing mask: Flow rate 10 – 12 L/m. Delivers 50 – 60% FiO_2
 - Non breathing mask: Flow rate 10 – 15 L/m. Delivers up to 90% FiO_2
- Enclosure systems:**
 - Hoods:** Flow rate 10 – 15 L/m. Delivers 80 – 90% FiO_2
 - Tents:** using high flow rate can deliver up to 50% FiO_2

10. Ans. (d) Ligamentum flavum

Ref: Clinical Neuroanatomy by Richard; S Snell, P 29

Structures which are pierced while doing lumbar puncture:

- Skin → Subcutaneous tissue → Supraspinous ligament → Interspinous ligament → Ligamentum flavum → Dura mater → Arachnoid membrane

Needle Used

- Dura cutting needle/Quincke's needle:** More traumatic
- Dura separating needle/Whitacre needle:** Atraumatic. Less incidence of postpuncture headache
- Size:** 25G (Preferred)

11. Ans. (b) Benzocaine

Ref: Handbook of Local Anesthetics, By Stanley F. Malamed; E-book, P 153

- Local anesthetics causing methemoglobinemia are: Benzocaine and prilocaine (prilocaine mainly in neonates).
- Dibucaine:** Longest acting, most potent and most toxic LA.
- Chloroprocaine:** Shortest acting LA.
- LA highest incidence of malignant hyperthermia:** Lignocaine
- Inhalational agent having highest incidence of malignant hyperthermia:** Halothane

12. Ans. (a) Early assessment, CPR, defibrillator, advance life saving

Ref: ABC of Resuscitation by Jasmeet Soar, Gavin D Perkins; Jerry Nolan, Ch 9

In an unresponsive patient:

- Assess pulse and breathing,** on carotid artery for less than 10 seconds, if there is absent pulse, **start CPR.**
 - Site of chest compression:** At the center of chest, lower half of sternum
 - Depth of compression:** 2 inches or 5 cm
 - Rate** 100/min
 - Number of chest compression given per cycle of CPR:** 30
 - Maintain patent airway by head tilt, chin lift, jaw thrust
- Defibrillator is used next
- Call for advance life support help.

13. Ans. (b) A delta

Susceptibility order of nerve fibers are as follows:

- Pressure:** $\text{A}\alpha > \text{A}\beta > \text{A}\gamma > \text{A}\delta > \text{B} > \text{C}$
- Local anesthetic:** $\text{A}\gamma \text{ \& A}\delta >> \text{A}\alpha \text{ \& A}\beta >> \text{B} >> \text{C}$
- Hypoxia:** $\text{B} > \text{A} > \text{C}$
- Paresthesias** (inappropriate sensations such as burning or prickling) usually seen when A-delta is involved.

14. Ans. (b) 1 hour

Ref: Morgan Clinical Anesthesia, 4th ed. pg. 341

- Bier's block can provide intense regional anesthesia for 45-60 minutes and short surgical procedures can be done on forearm, hand and leg.
- The procedure is usually done for *carpal tunnel release*.

- An intravenous Catheter is inserted on the dorsum of the hand and *double pneumatic tourniquet* is placed on the arm.
- The extremity is elevated and exsanguinated by wrapping an *esmark elastic bandage* from a distal to proximal direction.

15. Ans. (b) Momentarily opening it to blow away foreign matter from the outlet

Ref: Objective Anesthesia Review: A Comprehensive Textbook for Examinees, pg. 358

Before connecting the cylinder to the anesthesia machine the protective cap should be removed and the valve should be opened slowly and briefly. While opening the valve the port should point away from the user or other personnel. This is known as cracking the valve. *It helps to clear dust and other foreign materials from the valve outlet before it is connected to the machine.* It reduces the possibility of fires and explosions when the valve is opened after connecting it to the machine. It also prevents the dust from being blown into the machine and clogging the filters.

16. Ans. (c) In breathing circuits to absorb CO₂

Ref: Ajay Yadav's Textbook of Anesthesia, pg. 29-30

- Soda lime is mixture of
 1. Calcium hydroxide 94%
 2. Sodium hydroxide 5%
 3. Potassium hydroxide 1%.
- They react with CO₂ to form calcium carbonate.
- Soda lime also contains small amounts of silica to make the granules less likely to disintegrate into powder and a chemical dye which changes color with change in pH.
- As more CO₂ is absorbed the pH decreases and the *color of the dye changes from pink to yellow/white* (Clayton yellow-pH indicator).

17. Ans. (d) To prevent regurgitation of gastric contents

- Cuffs prevent leakage between the endotracheal tube and the trachea-both leakage of gas outwards during IPPV and of gastric contents, blood and mucus into the lungs.

18. Ans. (b) Concentration of exhaled CO₂

- Capnography—Measures end tidal CO₂ in inspired and expired gases.
- End tidal CO₂ is a reliable estimate of PaCO₂ in most settings.

19. Ans. (a) Ventilation

Ref: Miller's Anesthesia, 7th ed. pg. 2139

- AMBU Bag stands for *Ambulatory Breathing Unit*.
- It is a self-refilling bag-valve-mask unit with 1-1.5L capacity, used for ventilating and oxygenating intubated patients, allowing both spontaneous and artificial respiration.

20. Ans. (a) Maintenance of the airway

Ref: Miller's Anesthesia, 7th ed. pg. 1683

It is placed blindly in oropharynx and the cuff is inflated with large volume of air (**30 to 40 ml** for adult size). Inflated cuff seals the lateral and posterior pharyngeal walls and patient can be ventilated through ventilation ports.

Indications

1. As an alternative to intubation where difficult intubation is anticipated
2. Securing airway in emergency where intubation and mask ventilation is not possible.
3. As an elective method for minor surgeries where anaesthetist wants to avoid intubation.
4. As a conduit for bronchoscopes, small size tubes, gum elastic bougies.

Advantages

- Easy to insert (even paramedical staff can insert).
- Does not require any laryngoscope and muscle relaxants.
- Does not require any specific position of cervical spine so can be used in cervical injuries.

Disadvantages

- It does not prevent aspiration so should not be used for full stomach patients.
- High incidence of laryngospasm and bronchospasm.

Contraindications

- Full stomach patients.
- Hiatus hernia, pregnancy (where chances of aspiration are high)
- Oropharyngeal abscess or mass.

- Patients who are vulnerable to go in bronchospasm.

21. Ans. (a) Obstruction of tracheal tube

Ref: Handbook of Mechanical Ventilation, 2nd ed.

Setting-off of an alarm for peak inspiratory pressure during ventilation indicates an endotracheal tube kinking/obstruction

Complications of Intubation

Perioperative

1. Esophageal intubation: This is a hazardous complication. If not detected in time, can cause severe hypoxia and even death.
2. Ischemia, edema and necrosis at local site (especially with red rubber tubes).
3. Aspiration (if cuff is not properly inflated).
4. Bronchial intubation and collapse of other lung.
5. **Tracheal tube obstruction by secretions, kinking.**
6. Accidental extubation
7. Trauma to gums, lip, epiglottis, pharynx, larynx and nasal cavity (in nasal intubation).
8. Reflex disturbances like laryngospasm, bronchospasm, breath holding.
9. Cardiac arrhythmias, hypertension or even cardiac arrest.

22. Ans. (a) Black body white shoulder

Ref: Miller's Anesthesia, 7th ed. pg. 675

Gas	Color Code		Pin index position
	Body	Shoulder	
Oxygen	Black	White	2, 5
Nitrous oxide	Blue	Blue	3, 5
CO ₂	Gray	Gray	1, 6
Helium	Brown	Brown	2, 5
Air	Grey	White/black quartered	1, 5

23. Ans. (b) 2, 5

Ref: Miller's Anesthesia, 7th ed. pg. 675

- Pin index for oxygen is 2, 5.
- Cylinder of oxygen is black body with white shoulder.
- Please refer to previous answer for explanation.

24. Ans. (c) 3, 5

Ref: Miller's Anesthesia, 7th ed. pg. 675

Please refer to above table

25. Ans. (a) Prevent wrong attachment of cylinder

Ref: Miller's Anesthesia, 7th ed. pg. 675

- Each gas cylinder has two holes in its cylinder valve that mate with corresponding pins in the yoke of anesthesia machine.
- Each cylinder has a particular pin code and unless the correct cylinder valve is attached, the pins & holes will not coincide.
- Thus it is practically impossible to fit any cylinder to wrong yoke.
- To discourage incorrect cylinder attachment a pin index safety system has been adopted
- To prevent misconnection, gas cylinder valve blocks have holes drilled in 2 of 6 positions (a single hole in entonox)
- The pin index safety system is also ineffective if yoke pins are damaged or cylinder is filled with wrong gas or using extra sealing washers.

26. Ans. (a) Pneumothorax

Ref: Miller's Anesthesia, 7th ed. pg. 288

ETT is Endotracheal Tube Toilet

- It involves clearance of airway secretions, and is a normal process needed for the preservation of airway patency and the prevention of respiratory tract infection.
- Impaired clearance of airway secretions like in patients with depressed level of consciousness can result in atelectasis and pneumonia, and may contribute to respiratory failure.
- The primary indications for tracheal suctioning is to remove secretions in order to enhance oxygenation or to obtain samples of lower respiratory tract secretions for diagnostic tests. In the end, perform tracheal suctioning after endotracheal intubation to clear the airway of aspirated material or secretions or to enhance oxygenation in a tracheostomy patient with respiratory insufficiency.
- Perform bronchopulmonary toilet when secretions are visible in the endotracheal tube or at the orifice of the tracheostomy tube. Perform tracheal suctioning when the patient has coarse rales, rhonchi, or tubular breath sounds; acute or worsening dyspnea; or arterial oxygen desaturation.

27. Ans. (b) Overall health status of patient

Ref: Fundamentals of Anesthesia, 3rd ed. pg. 4

ASA Physical Status Scale

1180

Class	Physical status
1	Healthy patient with no organic or psychological disease process.
2	Mild disease/mild systemic illness but no functional limitation
3	Systemic illness with functional limitation
4	A patient with severe systemic disease which is a constant threat to life (e.g. unstable angina)
5	A moribund patient unlikely to survive with or without surgery.
6	Brain dead patient (for organ transplant)

28. Ans. (b) **Sodium channel**

Ref: Miller's Anesthesia, 7th ed. pg. 353

- The local anesthesia (LA) acts by blocking sodium channel. With this blockage, there is decrease in entry of Na⁺ ions during action potential (AP). As the LA concentration is increased, the rate of rise of AP and maximum depolarization decreases, causing slowing of conduction.
- A time comes when local depolarization fails to reach the threshold potential and conduction block ensues.
- Exposure to higher concentration of calcium reduces the inactivation of Na⁺ channels and lessens the degree of block.

Extra Mile

- Lignocaine is most commonly used local Anesthetic.
- It is **drug of choice** for treatment of **ventricular arrhythmias** but due to digitalis toxicity but it is ineffective **in atrial arrhythmias**.

29. Ans. (c) **Na⁺**

Ref: KDT, 6th ed. pg. 353

30. Ans. (d) **Ring block**

Ref: Morgan, clinical Anesthesiology, 4th ed. pg. 34

- Vasoconstrictor should not be added for ring block of hand, finger, toes, penis, pinna as all these organs are supplied by end arteries and ischemic damage may occur
- Adrenaline is most commonly used vasoconstrictor.
- Felypressin is preferred in cardiovascular disease patient.

31. Ans. (d) **Dibucaine**

Ref: KDT, 6th ed. pg. 352

- Dibucaine is amide group of local anesthetics.

TABLE: Ester and amides

Ester (one 'I' in name)	Amides (2 'I' in name)
<ul style="list-style-type: none"> • Cocaine • Benzocaine • Chlorprocaine • Tetracaine 	<ul style="list-style-type: none"> • Lignocaine • Bupivacaine • Prilocaine • Dibucaine • Etidocaine

- All LA causes causes vasodilation and hypotension, except Cocaine. It causes vasoconstriction and significant rise in BP.

32. Ans. (a) **Chlorprocaine**

Please refer to previous question for explanation.

33. Ans. (d) **Procaine**

Ref: KDT, 6th ed. pg. 352

Please refer to above explanation

34. Ans. (a) **Prilocaine**

Ref: KDT, 6th ed. pg. 352

35. Ans. (b) **Slow induction**

Ref: KDT, 6th ed. pg. 371

- Blood gas coefficient of ether is 12 which means ether has **slow induction & slow recovery**.
- Irritant vapour, which can readily induce laryngeal spasm and make induction even slower and stimulates salivary and bronchial secretions, So *atropine as pre medication is required*.
- Ether is highly inflammable and causes explosion with cautery. It should not be used when diathermy is needed in the airways because of risk of fire or explosion. *Muscle relaxants need not be used as ether itself produces excellent relaxation*.
- Ether liberates catecholamines and tends to maintain blood pressure. *Cardiac arrhythmias occur rarely with ether and there is no sensitization of myocardium to circulating catecholamines*.
- Adrenaline is relatively safe with ether. Bronchial smooth muscle is relaxed.

36. Ans. (b) **Bupivacaine**

Ref: KDT, 6th ed. pg. 357

- Bupivacaine is a local anesthetic agent from Amide group.
- It is most cardiotoxic LA.
- Shortest acting LA: Chlorprocaine
- Longest acting LA: Dibucaine
- Most commonly used LA: Lignocaine
- Local anesthetic which causes methhemoglobinemia: Prilocaine

MUSCLE RELAXANTS AND ANALGESICS

37. Ans. (c) Remifentanyl

Ref: Smith and Aitken's Textbook of Anesthesia; E-book, P 460

- Remifentanyl is shortest acting opioid due to its metabolism by plasma esterase. Dose reduction is not necessary in hepatic or renal disease.
- **Most potent opioid:** Sulfentanyl.
- Alfentanil is opioid of choice for day care surgery.
- **Opioid causing neuroleptic analgesia:** Fentanyl + droperidol
- **Opioid causing neuroleptic anesthesia:** Fentanyl + droperidol + N_2O .

38. Ans. (d) Intradermal

Ref: Pain Assessment and Pharmacological Management; E-book, P 369

- Fentanyl can be given by intravenous, intrathecal, epidural and transdermal patch.
- Side effects of fentanyl are muscle rigidity, respiratory depression and bradycardia.

39. Ans. (a) Atracurium

Ref: Essentials of Clinical Anesthesia, pg. 139

- Hoffman degradation is simply spontaneous breakdown of the molecule at physiologic pH and temperature. This process occurs despite renal or hepatic failure, and therefore the duration of action of atracurium and cisatracurium is essentially unchanged inpatient with renal or hepatic impairment.
- Therefore, Atracurium and Cisatracurium can be given in renal failure and hepatic failure.

40. Ans. (a) Atracurium

Ref: Broody's Human Pharmacology, pg. 144

- Since in this case, there is both renal and hepatic impairment, the anesthetic agents have to be given very carefully. Agent of choice in such cases is atracurium.
- Prolonged neuromuscular block has been reported in these patients with pancuronium, vecuronium, rocuronium, and tubocurarine. These drugs are all H_2O -soluble compounds that depend on glomerular filtration, tubular excretion, and tubular reabsorption for clearance. The large volume of distribution in an edematous renal patient, a reduced renal clearance, and decreased plasma protein binding can cause prolonged elimination. The drug of choice in patients with renal disease is atracurium because of its unique degradation that is unaffected by renal or hepatic dysfunction.

- Hepatic disease also prolongs the duration of neuromuscular blockade. The liver is especially important in the metabolism of steroid-type relaxants such as vecuronium and rocuronium. In patient with cholestasis or cirrhosis, uptake of drug into the liver is decreased; thus plasma clearance is also decreased, leading to a prolonged effect. Because butyrylcholinesterase is produced in the liver, in patients with hepatic disease a decrease in enzyme production may prolong the effect of succinylcholine. Again, because the liver is not involved in the elimination of atracurium, it is the drug of choice in patient with hepatic failure.

41. Ans. (b) Ryanodine receptor

Ref: Miller's Anesthesia, 2015 ed. pg. 1314

- Malignant hyperthermia is a condition that is usually triggered by exposure to certain drugs used for general anesthesia, specifically the volatile anesthetic agents and the neuromuscular blocking agent succinylcholine.
- **Succinylcholine** is depolarizing/non competitive M.R. with shortest duration of action (3-5 minutes) due to rapid hydrolysis by pseudo cholinesterase.
- It causes dual/biphasic block. It causes hyperkalemia, increased intraocular & intragastric pressure and temperature which leads to **malignant Hyperthermia**.
- Susceptibility to MH is often inherited as an **autosomal dominant disorder**, for which there are at least 6 genetic loci of interest, most prominently the **Ryanodine receptor gene (RYR1)**.
- **DOC for malignant hyperthermia:** Dantrolene
- Propofol is the intravenous Anesthetic of choice in the patients with **malignant hyperthermia**.

Extra Mile

- Glutamate-activated ion channels have been classified, based on selective agonists, into three categories: AMPA receptors, Kainate receptors, and NMDA receptors. AMPA and Kainate receptors are relatively nonselective monovalent cation channels involved in fast excitatory synaptic transmission, whereas NMDA channels conduct not only Na^+ and K^+ but also Ca^{++} and are involved in long-term modulation of synaptic responses (long-term potentiation).

42. Ans. (b) Rocuronium

- Fastest acting NDMR- **Rocuronium**
- Longest acting NDMR- **Pancuronium**
- Shortest acting NDMR (*Non-depolarizing muscle relaxant*)-MIVACURIUM.
- Shortest acting depolarizing muscle relaxant: Sch
- *Overall shortest acting* muscle relaxant: Sch.

43. Ans. (a) **Chest wall rigidity**

Ref: *Miller's Anesthesia*, 7th ed. pg. 806

- **Alfentanil** is a short-acting synthetic opioid analgesic drug, used for anesthesia in surgery. It is an analogue of fentanyl, with lower potency.
- **Adverse side effect of alfentanil:** Chest wall rigidity, followed by others like respiratory depression, arrhythmia, Bradycardia, hypertension, blurred vision etc.

Extra Mile

- *Remifentanyl, Alfentanyl & Sufentanyl* have short duration of action so can be used as outpatient anesthetic agents
- *Best anesthetic agent for OPD patients: Alfentanyl*

44. Ans. (a) **Mu (μ)**

Ref: *Miller's Anesthesia*, 7th ed. pg. 914

Opioid receptors are of four variety – mu (μ), Kappa (κ), delta (δ) & sigma (σ)

Receptor	Clinical effect	Agonist
(μ_1) Mu (μ) (μ_2)	Muscle rigidity Physical dependence Supraspinal analgesia Respiratory depression	Fentanyl Morphine β – Endorphin
Kappa (κ)	Sedation Spinal analgesia	Morphine Nalbuphine Dynorphin (endogenous opioid) Butorphanol oxycodone
Delta (δ)	Analgesia Behavioral Epileptogenic	Leu – Enkephalin β – Endorphin
Sigma (σ)	Dysphoria Hallucination Respiratory stimulation	Pentazocine Nalorphine Ketamine

45. Ans. (c) **Succinylcholine**

Ref: *Miller's Anesthesia*, 7th ed. pg. 866

- Malignant hyperthermia is a condition that is usually triggered by exposure to certain drugs used for general anesthesia, specifically the volatile anesthetic agents and the neuromuscular blocking agent succinylcholine.
- **Succinylcholine** is depolarizing/non competitive M.R. with shortest duration of action (3-5 minutes) due to rapid hydrolysis by pseudo cholinesterase.
- It causes dual/biphasic block. It causes hyperkalemia, increased intraocular & intragastric pressure and temperature which leads to **malignant Hyperthermia**.

- Susceptibility to MH is often inherited as an autosomal dominant disorder, for which there are at least 6 genetic loci of interest, most prominently the **Ryanodine receptor gene (RYR1)**.
- **DOC for malignant hyperthermia:** Dantrolene

46. Ans. (a) **Ryanodine receptor**

Please refer to above explanation

47. Ans. (b) **Neostigmine antagonizes its action**

Ref: *KDT*, 6th ed. pg. 344

Reversal of Muscle Relaxation

- Depolarizing (Non Competitive) muscle relaxants are not antagonized.
- Nondepolarizing (competitive) muscle relaxants are antagonized by Acetyl choline or Anticholinesterase: Neostigmine, Pyridostigmine, Edrophonium
- In order to prevent muscarinic effects atropine is given in combination.

48. Ans. (b) **Mivacurium**

Ref: *KDT*, 6th ed. pg. 343

- Shortest acting non-depolarizing muscle relaxant: Mivacurium.
- **Duration of action** 15–20 minutes
- Shortest acting depolarizing muscle relaxant: Sch
- Overall shortest acting muscle relaxant: Sch.
- Shortest acting local Anesthetic: chlorprocaine
- Sch duration of action 6–10 minutes

Classification of Muscle Relaxants

Neuro Muscular Blocking agent

Depolarizing (Non-competitive) muscle relaxant	Non-depolarizing (Competitive) muscle relaxant
1. Suxamethonium 2. Succinyl choline 3. Scoline Decamethonium	1. Gallamine, 2. D-tubocurarine, Atracurium, 3. Mevacurium 4. Vecuronium 5. Pancuronium 6. Rocuronium

49. Ans. (c) **Tachycardia**

Ref: *KDT*, 6th ed. pg. 342

Summary of Effect of Sch

CARDIOVASCULAR SYSTEM

- It produces muscarinic effects similar to acetylcholine. It can cause profound *bradycardia*, so atropine should be given prior to use of succinylcholine (especially in children).

HYPERKALEMIA

- This is due to excessive muscle *fasciculations*. Ventricular arrhythmias can occur due to hyperkalemia. In a normal subject serum potassium increases by 0.5 mEq/L.
- It also causes muscle pain/soreness

CNS

- Sch *increases intracranial tension* due to contraction of neck muscles and blocking venous outflow (jugular veins) from cranium. This rise in ICT can be prevented by precurarization.

EYE

- Ocular muscles which are multiple, undergo tonic contraction after administration of succinylcholine *increasing the intraocular tension (IOT)*. This increase in intraocular tension can not be avoided by precurarization (precurarization is the technique in which one tenth dose of nondepolarizing muscle relaxant is given 3 minutes prior to succinylcholine).

GIT

- *Intragastric pressure is increased* due to contraction of abdominal muscles and this increases intragastric pressure which *can cause aspiration* in vulnerable individuals. Normally intragastric pressure of > 28 cm of H₂O is required to overcome the competency of gastroesophageal junction but in conditions like pregnancy, hiatus hernia, ascites, pressure >15 cm of H₂O can cause aspiration. So precurarization is necessary in these conditions.
- Increased salivation.
- Increased gastric secretions.
- Increased peristalsis.

Remember

- **Malignant hyperthermia:** SCh is the most commonly implicated drug.
- **Anaphylaxis:** Severe hypersensitivity reaction can occur with succinylcholine.
- **Masseter spasm:** SCh can cause masseter spasm especially in children and patient's susceptible to malignant hyperthermia.

50. Ans. (c) Doxacuronium

Ref: KDT, 6th ed. pg. 343

- Doxacuronium is the longest acting neuromuscular blocking agent. Duration of action of doxacuronium is 120 minutes.

- Atracurium duration of action- 45 minutes
- Vecuronium duration of action- 25–40 minutes
- Pancuronium duration of action 85–100 minutes

Extra Mile

- Most potent skeletal muscle relaxant: **Doxacuronium**
- Least potent skeletal muscle relaxant: **Succinylcholine**
- Least potent non-depolarizing muscle relaxant: **Rocuronium**
- Most commonly used muscle relaxant for routine surgery: **Vecuronium**

GENERAL ANESTHETICS, IV/INHALATIONAL AGENTS

51. Ans. (a) Halothane

Ref: Goodman & Gillman 13th ed. P 395

- Halothane is one of the light sensitive anaesthetic agent, marketed in amber color bottles
- **Side effect:** Fulminant hepatic necrosis (halothane hepatitis).
- **Incidence:** ~1 in 10,000 patients receiving halothane
- **Fatality:** 50%
- Halothane hepatitis is a syndrome which is characterized by fever, anorexia, nausea, vomiting and can be accompanied by a rash and peripheral eosinophilia.
- Halothane hepatitis may be the result of an immune response to hepatic proteins that become trifluoroacetylated as a consequence of halothane metabolism.

Extra Mile

Important side effects

- **Lidocaine:** Methemoglobinemia, cauda equine syndrome
- **Prilocaine:** Methemoglobinemia
- **Etomidate:** Adrenal suppression
- **Bupivacaine:** Most cardiotoxic LA, ventricular arrhythmia
- **Ketamine:** Dissociative anaesthesia, hypertension and tachycardia
- **Nitrous oxide:** Bone marrow depression, diffusion hypoxia

52. Ans. (a) Carbon dioxide

Ref: Page 582: Morgan Clinical Anaesthesia

Laparoscopic surgery involves insufflation of carbon dioxide into the peritoneal cavity producing a pneumoperitoneum. This causes an increase in intra-abdominal pressure (IAP). Carbon dioxide is insufflated into the peritoneal cavity at a rate of 4–6 litre min⁻¹ to a pressure of 10–20 mm Hg. The pneumoperitoneum is maintained by a constant gas flow of 200–400 ml min⁻¹.

53. Ans. (b) **Glycopyrrolate**Ref: Ajay Yadav's Anesthesia, 4th ed. pg. 48

- To control secretions, anti-cholinergics are used: Glycopyrrolate, Atropine and Scopolamine.
- Glycopyrrolate is preferred over atropine and scopolamine because it doesn't cross blood brain barrier. Therefore it is devoid of central side effects.

Drugs Used for Premedication:

- **Sedative/Anti-anxiety:**
 - Lorazepam MC used
 - Midazolam in day care surgery
- **Anti-emetics:** Hyoscine (*Most potent*), Ondansetron, Metoclopramide
- **To decrease pain:** Morphine and Pethidine

54. Ans. (c) **Sevoflurane**Ref: KDT, 6th ed. pg. 373-374**SEVOFLURANE**

- Induction and emergence of anesthesia is rapid with sevoflurane.
- Absence of pungent smell makes it pleasant and administrable through face mask and is **considered as anesthesia of choice in pediatric patient**.
- Side effect: Respiratory depression and Arrhythmia.

DESFLURANE

- Desflurane is one of the inhalation (volatile liquid) anesthetic agents.
- It is fastest acting but less soluble than isoflurane.
- It has the most pungent odor, which make it unsuitable for induction.
- It irritates air passage, which may induce coughing, laryngeal spasm.

PROPOFOL

- Anesthesia of choice for **day care surgery**.
- Short acting, action diminishes the same day.
- Advantage: has anti emetic property. It is safe in porphyria.
- **Disadvantages:** Causes myocardial depression and hypotension.

KETAMINE

- Has maximum analgesic property.
- Produces **dissociative anesthesia**.
- Induction agent of choice in asthma patient.

55. Ans. (d) **Propofol**Ref: KDT, 6th ed. pg. 373-374**PROPOFOL**

- Anesthesia of choice for **day care surgery**.
- Short acting, action diminishes the same day.
- **Advantage:** Has anti emetic property. *It is safe in porphyria*.
- **Disadvantages:** Causes myocardial depression and hypotension.

56. Ans. (d) **It has strong tendency to cause vomiting**Ref: KDT, 6th ed. pg. 375**Salient Features of Propofol**

- It is a **milky white powder** that is **preservative free**. Therefore, it must be used within 6 hours.
- It is an **oil based preparation**, therefore injection is *painful*.
- Onset of action: 15 seconds
- Duration of action: 5-10 min. (due to redistribution)
- Due to rapid action, post anesthetic nausea and vomiting is uncommon with propofol
- It possesses very **strong antiemetic and antipruritic action**.
- It *decreases blood pressure* and impairs baroreceptor reflexes.
- It produces more severe and prolonged *respiratory depression* than thiopentone.
- It has no *muscle relaxant property*.
- It has cerebroprotective activity but does not possess anticonvulsant activity. Rather, **myoclonic jerking and muscle twitching** can be seen with the use of propofol.
- It is the intravenous Anesthetic of choice for **day care surgery**.
- It is also the intravenous Anesthetic of *choice for sedation in ICU*.
- Propofol is the intravenous Anesthetic of choice in the patients with **malignant hyperthermia**.
- Along with opioids (alfentanil or fentanyl) *propofol is the agent of choice for total intravenous anesthesia (TIVA)*.
- Propofol infusion syndrome (on long term use as a continuous infusion >48 hours) leads to acute cardiac failure, hepatomegaly, lipemia, rhabdomyolysis.

57. Ans. (a) **Propofol***Please refer to above explanation*58. Ans. (d) **Sevoflurane**Ref: KDT, 6th ed. pg. 373-74

- Non pungency & rapid increase in alveolar anesthetic concentration, makes sevoflurane an excellent choice for smooth & rapid inhalational induction in pediatrics & adult population.

- Induction and recovery are very fast in desflurane. Due to its short action it is commonly used as *anesthesia for OPD*.
- Blood gas partition coefficient of sevoflurane is lesser than halothane and isoflurane (*halothane-2.3, isoflurane-1.4, sevoflurane-0.69, desflurane 0.42*), which makes it *fastest acting inhalational agent among the choices*.

59. Ans. (a) Atracurium

Ref: KDT, 6th ed. pg. 345

- Atracurium and Cisatracurium undergoes spontaneous degradation by Hoffmann elimination. So its pharmacokinetics are independent of renal and hepatic functions. Therefore, it can be given in renal failure.
- Muscle relaxant of choice in renal failure: **Atracurium**
- Muscle relaxant of choice in renal and, or hepatic failure: **Cis-atracurium**
- Muscle relaxant in which Hoffman elimination is seen: **Atracurium, Cis-atracurium**

60. Ans. (a) Nitrous oxide

Ref: KDT, 6th ed. pg. 370-71

- Malignant hyperthermia (MH) is a life-threatening clinical syndrome of hypermetabolism involving the skeletal muscle.
- It is triggered in susceptible individuals primarily by the volatile inhalational anesthetic agents and the muscle relaxant succinylcholine.
- The most common triggering agents are volatile anesthetic agents such as: Halothane, Sevoflurane, Desflurane, Isoflurane, Enflurane or the depolarizing muscle relaxants suxamethonium and dexamethonium.
- Anesthetic agents which are considered safe include local anesthetics:
 - Lidocaine, bupivacaine, mepivacaine, opiates (morphine, fentanyl), ketamine, barbiturates, *nitrous oxide*, propofol, etomidate and benzodiazepines.
- Non-depolarizing muscle relaxants which are safe:
 - Pancuronium, cisatracurium, atracurium, mivacurium, vecuronium and rocuronium also do not cause malignant hyperthermia.

61. Ans. (c) Ketamine

Ref: Katzung, 9th ed. pg. 1604; KDT, 6th ed. pg. 376

- Ketamine is the only intravenous anesthetic that possesses analgesic properties and produces cardiovascular stimulation.
- It causes "**dissociative anesthesia**" which is characterized by profound analgesia, immobility, amnesia and feeling of dissociation from one's own body and the surrounding.
- In addition it also causes:
 - Hallucination

- Delusion and illusion.
- Profound analgesia
- Ketamine increases all pressures like:
 - BP (hypertension)
 - Intracranial tension (ICT)
 - Intraocular pressure (IOP)
- It is **contraindicated** in intracerebral mass/hemorrhage.

Extra Mile

About Ketamine: (Remembered as:)

K	Kids: can be given to kids
E	Emergence reaction: s/e occurring during recovery
T	Thalamo-cortical junction affected: Dissociative Anesthesia
A	Analgesia strongest
M	Meal: can be given with full stomach
I	Increase: BP/IOP/ICT
N	NMDA receptor blocker
E	Excellent bronchodilator: inducing agent of choice in asthma patient.

Extra Mile

- **PROPOFOL** causes myocardial depression and fall in BP.

62. Ans. (b) It causes severe fall in blood pressure

Ref: KDT, 6th ed. pg. 376

Ketamine causes increase in blood pressure.

Please refer to above explanation

63. Ans. (d) Ketamine

Ref: KDT, 6th ed. pg. 376

- Please refer to above explanation.
- Ketamine causes increase in all pressure i.e. intracranial, intraocular, intragastric and intravascular pressure.
- Therefore, it is not used in raised ICT/IOT & hypertension as it may increase the pressure to morbid levels.
- Anesthetic agents of choice in head injury/increased ICP are:
 - Thiopentone (*cerebro protective*)
 - Propofol
 - Etomidate (*protection against circulatory depression*)
 - Isoflurane

64. Ans. (b) Increased ICT

Ref: Katzung, 9th ed. 1604; KDT, 6th ed. pg. 376

65. Ans. (c) **Thiopentone**

Ref: KDT, 6th ed. pg. 374

- Thiopentone is an ultrashort acting thiobarbiturate because of rapid redistribution.
- It has poor analgesic property.
- I/v injection is very painful. Therefore it is contraindicated unless opioids or N₂O has been given.
- Contraindicated in porphyria patients

Extra Mile

- Etomidate is contraindicated in adrenal insufficiency.
- Anesthetic drug safe in patients with porphyria: Propofol

66. Ans. (b) **Acute intermittent porphyria**

Extra Mile

- Thiopentone is C/I in acute intermittent porphyria.
- Etomidate is C/I in adrenal insufficiency.
- LA which causes meth-hemoglobinemia: Prilocaine
- Malignant hyperthermia is caused by: Succinylcholine
- DOC for malignant hyperthermia: Dantrolene

67. Ans. (c) **Both**

Ref: Principles of Anesthesia, 4th ed. pg. 73

Chloroform is both hepatotoxic and cardiotoxic.

68. Ans. (d) **Hypotension, bradycardia**

Ref: KDT, 6th ed. pg. 360

Systemic Effects (Physiological Alterations) of Central Neuraxial Blocks

CARDIOVASCULAR SYSTEM

The most prominent effect is hypotension which is because of the following factors:

- Venodilatation which is because of sympathetic block which maintains the venous tone.
- Dilatation of post arteriolar capillaries which is again because of loss of sympathetic tone.
- **Decreased cardiac output which is because of:**
 - **Decreased venous return:** Due to blood pooling in veins of lower limb and lower abdomen.
 - **Bradycardia:** Bradycardia can occur as a result of:
 - ♦ Decreased atrial pressure because of decrease venous return (Bainbridge reflex) and
 - ♦ Direct inhibition of cardioaccelerator fibers (T1 to T4).
- Paralysis of nerve supply to adrenal glands with consequently decreased catecholamine release.
- Direct absorption of drug into systemic circulation.
- Compression of inferior vena cava and aorta by pregnant uterus, abdominal tumors (supine hypotension syndrome).

NERVOUS SYSTEM

- Autonomic fibers (mediated by C fibers) are most sensitive and they are blocked earliest followed by sensory and then motor fibers. So, sequence of block is Autonomic - Sensory - Motor. The recovery occurs in reverse order although number of studies have suggested return of autonomic activity before sensory.

PRE-OP ANESTHETIC PREPARATION

69. Ans. (b) **Mallampati scoring**

Ref: Airway management, An Issue in Anaesthesiology clinic, P 284

- Mallampati scoring is used to predict the ease of endotracheal intubation

- Class I : Uvula, fauces, soft palate, pillars visible
- Class II : Uvula, soft palate, fauces visible
- Class III : Base of uvula visible, soft palate
- Class IV : Only hard palate visible

ASA SCORING

- **American Society of Anesthesiologist** classification system developed to categorize patient's physiological status that helps in predicting the operative risk.

ASA Classification	Description	Example	Perioperative mortality risk
1	A normal healthy patient		0.1%
2	Patient with mild systemic disease	Controlled epileptic patient	0.2%
3	Patient with severe systemic disease	Poorly controlled diabetes mellitus	1.8%
4	Patient with severe systemic disease that is constant threat to life	Dyspnoeic patient	7.8%
5	A moribund patient who is not expected to survive without operation	Hypovolemic shock	9.4%
6	Declared brain dead, whose organs are being removed for donation		

Extra Mile

- **Aldrete/Modified aldrete scoring system:** For determination of discharge of patient from anaesthesia care unit
- **Wilson scoring system:** For ease of laryngoscopy (score < 5= easy laryngoscopy; Score > 7= Severe difficulty in laryngoscopy)
- **P-POSSUM scoring system:** For predicting the mortality of neurosurgical patients

70. Ans. (c) **Both**

Thiopentone is preferred as an induction agent because of:

- Ease and rapidity of induction
- Absence of stage of delirium
- Rapid recovery
- Ability to increase depth rapidly

71. Ans. (b) **Increased mucosal clearance**

Ref: Handbook of Clinical Anesthesiology 3rd ed. by Brian Pollard 120

- From an anesthesiologist's perspective, smoking increases the relative risk of postoperative pulmonary complications by up to six times.
- A common concern is the increased risk of laryngospasm and bronchospasm.
- Smoking increases airway mucous production and impairs ciliary function resulting in poor sputum clearance. This in combination with smoke-induced impairment of immune function, increases the likelihood of developing postoperative pneumonia.
- **The pre-operative effect of smoking on respiratory system are:**
 - Hyper-reactive airways especially small airways
 - Reduced muco-ciliary clearance
 - Increased mucus secretion
 - Altered surfactant and permeability
 - V/Q mismatch

INTRA-OP AND POST-OP PATIENT CARE

72. Ans. (b) **Capnography**

Ref: www.capnography.com

CAPNOGRAPHY

- Best/confirmatory sign of endotracheal intubation
- Measures end tidal CO₂ in inspired and expired gases
- It is the most reliable tool to confirm placement of an advanced airway, both for endotracheal (ET) tubes and supraglottic-airway devices.
- When a device is placed correctly, a waveform and end-tidal CO₂ (ETCO₂) reading appear within seconds after the first ventilation is delivered to the patient.
- **Characteristics of normal capnogram:**
 - Rapid increase from B to C
 - Horizontal (rising) plateau from C to D
 - Rapid decrease from D to E

FMGE Solutions Screening Examination

1188

Phases of capnograph:

- **Phase I:** Inspiratory baseline (beginning of expiration)
- **Phase II:** Expiratory upstroke (mixing of alveolar gas with dead space)
- **Phase III:** Alveolar plateau
- **Phase IV:** Inspiratory down stroke

TYPES OF CAPNOGRAM

- A Near flat-line of apnea to normal rounded rectangle
- B Irregular top indicating problem with airway placement
- C Near-normal shape indicates successful airway placement
- D Sudden drop indicating displacement of airway or cardiac arrest

Extra Mile

Some typical capnograph appearances

- **Shark fin appearance:** Bronchospasm/COPD
- **Biphasic/Dual waveform aka curare cleft:** Endobronchial intubation
- **Tooth like hump at the end of expiratory phase aka cardiogenic oscillation:** Heart beating against lungs
- **Steeple sign capnogram:** Due to loose connection between sampling tube and monitor
- **Tail/Pig tail capnogram:** Slit in sampling tube

73. Ans. (c) Cricoids pressure

Ref: *Miller's Anesthesia*, 7th ed. pg. 2430

- Cricoid pressure is called Sellick's maneuver
- It is a method of preventing regurgitation in an anesthetized patient during rapid endotracheal intubation by applying pressure to the cricoid cartilage.
- It is indicated *only for high risk cases* where patient is not fasting example: Upper GI surgery, obstetric anesthesia.
- Studies have not shown any mortality reduction.

74. Ans. (d) Cardiac compression

Ref: *Harrison*, 19th ed. pg. 1768

- Since cardiac arrest is already, mentioned in the question, initiate chest compressions.
- If a clinical question of a patient collapsing suddenly is given, then check carotid A pulsation and respiratory efforts in 6 second interval. If both are absent it implies cardio-respiratory arrest. Then perform CPR.

75. Ans. (b) To prevent gastric aspiration

Ref: *Miller's Anesthesia*, 7th ed. pg. 2430

- Sellick's maneuver is a method of preventing regurgitation of an anesthetized patient during endotracheal intubation by applying pressure to the cricoid cartilage.
- Or in other words, Sellick's maneuver is application of *backward pressure on cricoid cartilage to prevent gastric aspiration (Mendelson's syndrome)*.

76. Ans. (d) Mobility of fracture

Ref: *Textbook of Neurosurgery*, 3th ed. pg. 2713

Factors Favoring Fat Embolism

Traumatic	Non- traumatic
<ul style="list-style-type: none"> • Fracture of long bones eg. Femur • Reaming • Mobility of fracture 	<ul style="list-style-type: none"> • Diabetes • Fatty liver • Pancreatitis • Sickle cell anemia • Decompression sickness • Extensive burns • Inflammation of bone & soft tissue • Oil or fat introduced to body

MISCELLANEOUS

77. Ans. (c) Trachea

Ref: *Emergency Procedure and Techniques*, pg. 48

HEIMLICH MANEUVER

The primary indication for use of the Heimlich maneuver is *upper airway obstruction due to a bolus of food* or any aspirated foreign material unrelieved by coughing and traditional means that now is causing complete airway obstruction and threatening asphyxiation.

ANSWERS TO BOARD REVIEW QUESTIONS

78. Ans. (c) **Ketamine**

Ref: Anesthesia for Medical Students by Sullivan 1999 ed. pg. 83

79. Ans. (a) **Severe hyperkalemia**

Ref: Miller 4th ed. Ch: 9

80. Ans. (b) **Gastric aspiration**

Ref: Fundamentals of Anesthesia by Tim Smith 3rd edn. pg. 5

81. Ans. (a) **N2O**

Ref: Miller's 7th ed. ch: 24

82. Ans. (b) **2 inch**

Ref: 2015 AHA Guidelines

83. Ans. (d) **Maintains airway**

Ref: Ajay Yadav, 2nd ed. p-36

84. Ans. (c) **2% jelly, 4% injection**

Ref: Morgan's 4th ed. p-270, KDT 6th ed. p-357

85. Ans. (c) **3-5**

Ref: Morgan 4th ed. p-2

86. Ans. (c) **Vecuronium**

Ref: Fundamentals of anesthesia by Tim Smith p-618

Vecuronium is primarily eliminated by hepatic mechanisms. Since 30% of dose is excreted unchanged in urine, the elimination half life of drug is increased.

87. Ans. (b) **Rocuronium**

Ref: Lee 13th ed. p-188, Miller's 6th ed. p-492-535

88. Ans. (a) **Cisatracurium**

89. Ans. (d) **Bronchospasm**

90. Ans. (c) **Class III**

91. Ans. (a) **Mapleson A**

92. Ans. (a) **Lidocaine**

93. Ans. (a) **Bradycardia and hypotension**

94. Ans. (a) **Inhalational Anesthetics**

95. Ans. (a) **Abdominal malignant growth**

96. Ans. (a) **Chest wall rigidity**

97. Ans. (a) **Mu (μ)**

98. Ans. (c) **Sevoflurane**

99. Ans. (d) **Sevoflurane**

100. Ans. (a) **Atracurium**

101. Ans. (c) **Thiopentone**

102. Ans. (b) **Acute intermittent porphyria**

103. Ans. (d) **Cardiac compression**

104. Ans. (b) **Pain**

Ref: Oral and Maxillofacial Surgery, 3rd ed. Elsevier pg. 77

The classical order of sensation loss during local anesthesia is:

1. Pain
2. Temperature
3. Touch
4. Deep pressure
5. Motor (Recovery is in reverse order)

The order of sensation loss in spinal anesthesia is cold/warm followed by pin-prick, pain.

105. Ans. (d) **Bupivacaine**

Ref: Morgan's Anaesthesiology 4/e, p 269

106. Ans. (c) **Atracurium**

Ref: Lee Synopsis of Anesthesia 12/e, p 215

107. Ans. (b) **16th October**

Ref: Miller's 7/e, ch-1

108. Ans. (a) **Succinylcholine**

Ref: Goodman and Gillman p 152, 11/e, 352-54

109. Ans. (a) **Hypertensive patients**

Ref: Miller's 7/e, Ch 26

ANSWERS TO IMAGE-BASED QUESTIONS

110. Ans. (a) **Oxygen cylinder**

	Body color	Shoulder color
Oxygen	Black	White
Nitrous oxide	Blue	Blue
Carbon dioxide	Grey	Grey
Air	Grey	White/black quarters
Entonox	Blue	Alternate blue and white quarter shoulder
Helium	Brown	Brown

111. Ans. (b) **Veres needle**

It is used to create pneumoperitoneum before laparoscopic surgery for insufflation of carbon Dioxide.

112. Ans. (d) **Above esophagus**

113. Ans. (a) **Sternomastoid muscle, B = Cricoid cartilage, C = Thyroid cartilage**

114. Ans. (c) **Not influenced by tongue mobility and size**

115. Ans. (c) **20G**

- The shown pink canula is 20G in size with flow rate of 55–60 mL/min.
- The canula is ~1mm in diameter and 32 in length.

Theoretical Maximum flow rates		
Colour	Gauge	Flow
Yellow	24G	13 ml/min
Blue	22G	30 ml/min
Pink	20G	55 ml/min
Green	18G	80-100 ml/min
White	17G	135 ml/min
Grey	16G	180 ml/min
Orange or Brown	14G	270 ml/min

Psychiatry

MOST RECENT QUESTION 2019

1. A 24-year-old lady presented with sudden onset chest pain like heart attack, palpitations lasting for about 20 minutes. There has been previous recurrent episode of same. She says there were 3 similar episodes last month:
 - a. Acute psychosis
 - b. Panic attack
 - c. Post-traumatic stress disorder
 - d. Mania

SCHIZOPHRENIA AND PSYCHOSIS

2. Management of violent patient in psychiatry is treated with all EXCEPT: *(Recent Pattern Question 2018-19)*
 - a. BZD
 - b. CBT
 - c. ECT
 - d. Haloperidol
3. Negative symptoms of schizophrenia are all EXCEPT: *(Recent Pattern Question 2018-19)*
 - a. Overactivity
 - b. Anhedonia
 - c. Alogia
 - d. Apathy
4. Capgras syndrome is? *(Recent Pattern Question 2017)*
 - a. Familiar person replaced by impostor
 - b. Nonfamiliar person appears to be familiar
 - c. Wife cheating with another man
 - d. Famous person is in love with patient
5. Fregoli syndrome is: *(Recent Pattern Question 2017)*
 - a. Familiar person replaced by impostor
 - b. Nonfamiliar person appears to be familiar
 - c. Wife cheating with another man
 - d. Famous person is in love with patient
6. Which of the following atypical antipsychotic agents is associated with the most weight gain? *(Recent Pattern Question 2017)*
 - a. Olanzapine
 - b. Ziprasidone
 - c. Aripiprazole
 - d. Quetiapine
7. Which of the following is seen in Catatonia *(Recent Pattern Question 2016)*
 - a. Cataplexy
 - b. Echolalia
 - c. Positivism
 - d. Disobedience
8. An old patient was brought to the hospital with the history of auditory hallucinations. He states that, some unknown peoples are conspiring against him. He hears them talking on his every actions continuously. What could be the most likely diagnosis?
 - a. Dementia
 - b. Delusional disorders
 - c. Schizophrenia
 - d. Acute psychosis
9. A patient is brought to your clinic with complaint of unrealistic behavior from last 5-6 months. Family members mentioned about loss of his wife few years back. They also mentioned about his talking behavior in absence of everyone and sometimes muttering to himself loudly inside his room. The most likely diagnosis is
 - a. Major depression
 - b. Schizophrenia
 - c. Conversion disorder
 - d. Delusion
10. A schizophrenia patient refuses to take drugs, because he complains that he is persistently hearing people talking in spite of taking the medications. Which drug will be most suitable for his condition?
 - a. Chlorpromazine
 - b. Clozapine
 - c. Risperidone
 - d. Fluphenazine
11. A 43-year-old male is diagnosed with Schizophrenia but he refused to take treatment. Which of the following antipsychotic drug is the treatment of choice for this patient?
 - a. Clozapine
 - b. Risperidone
 - c. Olanzapine
 - d. Fluphenazine
12. Clinical manifestation of Schizophrenia are all of the following EXCEPT:
 - a. Delusion
 - b. Altered sensorium
 - c. Auditory hallucinations
 - d. Catatonia
13. Which of the following is not a characteristic symptom/ sign of schizophrenia:
 - a. Inappropriate affect
 - b. Disturbance of thought process
 - c. Visual hallucinations
 - d. Auditory hallucinations
14. Prognosis in Schizophrenia is less favorable if:
 - a. Occurs in women
 - b. History of depression
 - c. Gradual onset
 - d. Acute onset

15. Schizophrenia with worst prognosis:
a. Paranoid b. Catatonic
c. Hebephrenic d. Simple
16. A patient was caught by police for fighting with classmates because he thought they were planning to kill him. He states that his dead grandfather talks to him every now and then for last one month. He is delusional from past few weeks also. What will be the most likely diagnosis:
a. Delusional disorder
b. Post traumatic stress disorder
c. Mania
d. Schizophrenia
17. A 13 year young boy is brought by his parents with history of frequent fighting at school, disciplinary problems, stealing money, assaulting his batch mates and being weak in studies. What is the most appropriate diagnosis for this child:
a. Attention deficit hyperactivity disorder
b. Conduct disorder
c. Autism
d. Nothing abnormal (teenage phenomenon)
18. Which of the following is *not* Bleuler's 4 A's of Schizophrenia:
a. Association b. Inappropriate Affect
c. Automatism d. Ambivalence
19. All of the following are Schneider's first rank symptoms EXCEPT:
a. Running commentary b. Primary delusion
c. Thought insertion d. Delusion of guilt
20. Antipsychotic drugs relieve positive symptoms of schizophrenia by targeting which of the following neurotransmitters:
a. Acetylcholine b. GABA
c. Dopamine d. Serotonin

DEPRESSION, SUICIDE AND ADJUSTMENT DISORDER

21. Double depression is: (Recent Pattern Question 2018-19)
a. Major depressive disorder from 2 years
b. Major depression with OCD
c. Depression with dysthymia
d. Depression with anxiety attack
22. Indoor management of anorexia nervosa is done on priority in patients with: (Recent Pattern Question 2018)
a. Forced eating symptoms
b. Weight loss >75%
c. Amenorrhea
d. Depression

23. Copycat suicide is seen at age of: (Recent Pattern Question 2018)
a. Adolescence b. Child age
c. Adult age d. Old age
24. What would be the choice of initial treatment when a 65-year-old man with carotid artery stenosis develops severe depression and hypersomnia: (Recent Pattern Question 2017)
a. Amitriptyline b. Doxepin
c. Nortriptyline d. Phenelzine
25. The most common psychiatric disorder associated with stroke is: (Recent Pattern Question 2017)
a. Psychosis b. Bipolar disorder
c. Depression d. Mania
26. Dysthymia is seen in (Recent Pattern Question 2016)
a. Bipolar Mood disorder
b. Major depressive disorder
c. Minor depressive disorder
d. Persistent depressive disorder
27. Which of the following is true about depression:
a. Increased Serotonin and Norepinephrine
b. Increased serotonin decreased Norepinephrine
c. Decreased serotonin and Norepinephrine
d. Decreased serotonin increased Norepinephrine
28. Neurotransmitters mainly involved in depression are:
a. Serotonin and Dopamine
b. Serotonin and GABA
c. Dopamine and GABA
d. Serotonin and Norepinephrine
29. All of the following are the feature of masked depression EXCEPT
a. Body aches and pains b. Gastrointestinal symptoms
c. Functional impairment d. Depressed mood
30. What is the most common cause of DALY'S in world?
a. Schizophrenic b. Mania
c. Depressive Disorder d. Alzheimer's
31. In clinical practice, most common psychiatric illness seen is:
a. Maniac disorder b. Schizophrenia
c. Depressive disorder d. Bipolar disorder
32. A 40 year man is diagnosed with terminally ill cancer. He is not able to digest the fact. He previously indulged with his children like playing with his daughter, dropping her at school, but now he is not pleasurable in such events. He even stopped meeting friends and has difficulty in sleeping also. What could be the possible diagnosis:
a. Post traumatic stress disorder
b. Adjustment disorder
c. Major depression
d. Sleep disorder

33. A patient who after getting fired from her job prefers to stay isolated, has anhedonia and also lost weight. She thinks that because of her worthlessness she got fired. What could be the possible diagnosis:

- a. Adjustment disorder
- b. Major depressive disorder
- c. Post traumatic stress disorder
- d. Sleep disorder

34. The son of a construction worker died at his work place. After that he is neither going out, nor eating food properly. His wife consulted a physician and stated that he has been doing this for over 2 months. What is the most likely diagnosis:

- a. Adjustment disorder
- b. PTSD
- c. Severe depression
- d. Bipolar

35. Suicide is least commonly seen in:

- a. Female
- b. Old age
- c. Living alone
- d. Depression

36. Most common cause of impotency in male:

- a. Generalized disorder
- b. Local disorder
- c. Psychogenic
- d. Somatic disorder

PERSONALITY DISORDER/OCD

37. In nondiabetic nonhypertensive patient having some extra beats in pulse. Doctor informed it is benign. But patient is still going for investigations from doctor to doctor. This is a type of: *(Recent Pattern Question 2018)*

- a. Conversion disorder
- b. Hypochondriac disorder
- c. Somatoform pain
- d. Depression

38. A 6-year-old child with no interest in daily activity and not engaging with other children of his age group is likely to be suffering from:

(Recent Pattern Question 2018)

- a. Autism
- b. ADHD
- c. Depression
- d. Bipolar disorder

39. What is the drug of choice for OCD:

(Recent Pattern Question 2017)

- a. Buspirone
- b. Risperidone
- c. Fluoxetine
- d. Clomipramine

40. Goal directed repetitive behaviour is seen in

(Recent Pattern Question 2017)

- a. Depression
- b. OCD
- c. Mania
- d. Schizophrenia

41. Psychological separation of a mental function from the rest of the personality is called as?

(Recent Pattern Question 2017)

- a. Isolation
- b. Dissociation
- c. Acting out
- d. Paranoia

42. Skinnerian conditioning is:

(Recent Pattern Question 2016)

- a. Pavlov method
- b. Classical conditioning
- c. Operant conditioning
- d. Stimulus response

43. A 25-year-old man has presented to you with sexual indulgence and increased alcohol consumption, irritability and decreased sleep, from last 10 days. The family members stated that he was career oriented remained wide awake and had prolonged periods of activity without getting fatigued. What would be the most likely diagnosis:

- a. Schizophrenia
- b. Mania
- c. Impulsive control disorder
- d. Alcohol dependence

44. Which one of the following is not a characteristic feature of mania?

- a. Elated mood
- b. Increased energy
- c. Heightened concentration
- d. Impaired judgment

45. True about obsession:

- a. Ego dystonic
- b. Ego syntonic
- c. Feel pleasure and enjoy
- d. Must be followed by compulsion

46. Which of the following is part of the treatment for OCD:

- a. MAO inhibitor
- b. Exposure and response prevention
- c. Diazepam
- d. Neurosurgery

47. Treatment of choice for phobia:

- a. Behavior therapy
- b. Psychotherapy
- c. Relaxation therapy
- d. Covert sensitization

48. Which of the following best explains behavioral therapy in phobia?

- a. Exposure and response prevention followed by flooding
- b. Systemic desensitization followed by exposure and response prevention
- c. Exposure and response prevention followed by systemic desensitization
- d. Flooding followed by systemic desensitization

49. All of the following is good prognostic factor for bipolar disorder EXCEPT:

- a. Acute onset
- b. Early age of onset
- c. Early responsive treatment
- d. Associated with depression

50. Lithium most commonly used in:

- a. Bipolar disorder
- b. Depressive disorder
- c. Personality disorder
- d. Headache

51. Which one of the following is *not* used in therapy of bipolar affective disorders:

- a. Lithium carbonate b. Sodium valproate
- c. Phenytoin sodium d. Olanzapine

52. A sensitive person, gets affected easily and has difficulty in controlling anger and doesn't meet people. What is the personality defect:

- a. Maniac
- b. Schizoid personality
- c. Borderline
- d. Paranoid personality

53. Anorexia nervosa is an eating disorder characterized by all EXCEPT:

- a. Menorrhagia
- b. Salivary gland enlargement
- c. Acrocyanosis
- d. Bradycardia

54. A 20-year-old man was found in a city far away from his home town, working in a factory. He was unable to tell about his previous life. Which of the following is the likely diagnosis:

- a. Post traumatic stress disorder
- b. Body dysmorphic disorder
- c. Dissociative fugue
- d. Dissociative identity disorder

55. A 21-year-old girl is disturbed that her nose is too big. She is convinced that it is disfiguring though no one else can see that way. What is the likely diagnosis:

- a. Delusional disorder
- b. Obsessive compulsive disorder
- c. Body dysmorphic disorder
- d. Specific phobia

DELIRIUM, DEMENTIA AND ALZHEIMER'S DISEASE

56. Most commonly psychiatric illness seen in medico-surgical patient: *(Recent Pattern Question 2018-19)*

- a. Depression b. Schizophrenia
- c. Delirium d. Dementia

57. Most common acute organic mental disorder:

(Recent Pattern Question 2018-19)

- a. Delirium b. Dementia
- c. Amnesia d. Anxiety disorder

58. Clouding of consciousness is seen in:

- a. Dementia b. Delirium
- c. Schizophrenia a. Depression

59. Which of the following present with loss of consciousness:

- a. Schizophrenia b. Dementia
- c. Mania d. Organic brain syndrome

60. All are true about Dementia EXCEPT:

- a. Impaired memory
- b. Loss of consciousness
- c. Normal wake-sleep cycle
- d. Deterioration of personality

61. Dementia pugilistica occurs due to?

- a. Old age b. Trauma
- c. Antiepileptic drugs d. Hydrocephalus

62. Drug used in alzheimer's disease are all EXCEPT:

- a. Biperidin b. Donepezil
- c. Rivastigmine d. Memantine

63. Reversible dementia is seen in all EXCEPT:

- a. Wernicke's encephalopathy
- b. Alzheimer's
- c. Hypothyroidism
- d. Head trauma

SUBSTANCE ABUSE

64. Drug of choice for alcohol poisoning:

(Recent Pattern Question 2018)

- a. Disulfiram b. Methycobalamin
- c. Fomepizole d. Benzodiazepine

65. Disulfiram is a type of: *(Recent Pattern Question 2018)*

- a. Aversion therapy
- b. Anticraving therapy
- c. Maintenance therapy
- d. Alcohol withdrawal therapy

66. Date rape drug *(Recent Pattern Question 2016)*

- a. Diazepam b. Lorazepam
- c. Temazepam d. Flunitrazepam

67. Grass/Weed/pot slang is used for

(Recent Pattern Question 2016)

- a. Cocaine b. Cannabis
- c. LSD d. Opioid

68. Trip word in LSD is defined as

(Recent Pattern Question 2016)

- a. Occasional use with long abstinence
- b. Frequent use with short abstinence
- c. Single use for lifetime
- d. Occasional use with short abstinence

69. Alcohol withdrawal presents with all EXCEPT:

- a. Hallucinations
- b. Tremors
- c. Bradycardia
- d. Sweating

70. After cessation of drinking in a person dependent on alcohol, when does the risk of alcoholic seizures peak

- a. 6-8 hours after cessation of alcohol
- b. 8-12 hours after cessation of alcohol
- c. 12-24 hours after cessation of alcohol
- d. 24-48 hours after cessation of alcohol

71. The treatment of acute alcohol intoxication is based on which of the following?
- Severity of respiratory and CNS depression
 - Age and sex of the patient
 - Medical fitness of the patient
 - Amount of breath odour
72. Which of the following is *not* a form of cannabis?
- Bhang
 - Charas
 - Cocaine
 - Ganja
73. Early and rapid addiction is seen with:
- Smoking
 - Chewing betel seeds
 - Alcohol
 - Narcotics
74. "Bad-trip" is associated with:
- Bhang
 - Ganja
 - Cocaine
 - LSD
75. IQ range of Severe Mental Retardation:
- Below 20
 - 21-34
 - 21-40
 - 35-49

BOARD REVIEW QUESTIONS

76. A lady washes her hands 40 times per day for no apparent reason. Cognitive behavior therapy for her treatment should include?
- Response prevention
 - Aversion
 - Thought stopping
 - Desensitization
77. All are first rank symptoms of schizophrenia EXCEPT?
- Voices commenting
 - Thought broadcasting
 - Delusion of persecution
 - Somatic passivity
78. Which of the following is not a component of 4A's of schizophrenia?
- Autism
 - Affect
 - Auditory hallucination
 - Ambivalence
79. Term "Dementia precox" was coined by?
- Sigmund Freud
 - Bleuler
 - Kraepelin
 - Schneider
80. Kleptomania is?
- Fear of heights
 - Impulse control disorder
 - Compulsive eating disorder
 - None of the above
81. Outside environment seems strange in?
- Déjà vu phenomenon
 - Derealisation
 - Jamais vu phenomenon
 - Mania
82. Dialectical behaviour therapy is used for?
- Personality disorder
 - Somatoform disorder
 - Schizophreniform disorder
 - Schizophrenia
83. Akathasia is?
- Increase sense of Restlessness and anxiety
 - Buco-linguo-masticatory triad
 - Involuntary distal movement
 - Increase sensation of worthlessness and anxiety
84. CAGE questionnaire is used for?
- Sex addiction
 - Alzheimer's disease
 - Alcohol addiction
 - Opioid addiction
85. Fear of being alone in a crowd or fear of travelling alone in a bus?
- Agoraphobia
 - Generalised anxiety disorder
 - Dissociative fugue
 - Obsessive compulsive disorder
86. Most common symptom of psychiatric illness?
- Anxiety
 - Depression
 - Schizophrenia
 - Somatoform illness
87. Not a negative symptom in schizophrenia
- Anhedonia
 - Decreased emotional expression
 - Diminished social engagement
 - Delusions
88. Not a feature of side effects of lithium?
- Neutrophilia
 - Hypothyroidism
 - Polyuria
 - Steven Johnson syndrome
89. Prognosis in Schizophrenia is less favorable if:
- Occurs in women
 - History of depression
 - Gradual onset
 - Acute onset
90. Which of the following is *not* Bleuler's 4 A's of Schizophrenia:
- Association
 - Inappropriate affect
 - Automatism
 - Ambivalence
91. Son of a construction worker died at his work place. After that he is not going out, not eating food properly. His wife consulted physician and states that he has been doing this over 2 months. What is the most likely diagnosis:
- Adjustment disorder
 - PTSD
 - Severe depression
 - Bipolar
92. Suicide least commonly seen in:
- Female
 - Old age
 - Living alone
 - Depression

- 93. True about obsession?**
a. Ego dystonic
b. Ego syntonic
c. Feel pleasure and enjoy
d. Must be followed by compulsion
- 94. Clouding of consciousness seen in:**
a. Dementia
b. Delirium
c. Schizophrenia
d. Depression
- 95. Which of the following presents with loss of consciousness:**
a. Schizophrenia
b. Dementia
c. Mania
d. Organic brain syndrome
- 96. In case of Alzheimer's disease Dementia pugilistica occurs due to:**
a. Old age
b. Trauma
c. Antiepileptic drugs
d. Hydrocephalus
- 97. Alcohol withdrawal presents with all EXCEPT:**
a. Hallucinations
b. Tremors
c. Bradycardia
d. Sweating
- 98. "Bad-trip" is associated with:**
a. Bhang
b. Ganja
c. Cocaine
d. LSD
- 99. IQ range of moderate mental retardation:**
a. Below 20
b. 21-34
c. 21-40
d. 35-49
- 100. Bright light therapy is used for?**
a. Seasonal affective disorder
b. Schizophrenia
c. Adjustment disorder
d. Anxiety
- 101. Treatment of depression with suicidal tendencies is?**
a. Clozapine
b. Mirtazapine
c. ECT
d. Olanzapine
- 102. DALY lost due to mental diseases is?**
a. 10%
b. 14%
c. 18%
d. 28%
- 103. Ganser syndrome is related to?**
a. Approximate answer
b. Ataxia
c. Confusion
d. Repeated answers
- 104. Treatment of a child suffering from ADHD with Tourette's syndrome is?**
a. Atomoxetine
b. Methylphenidate
c. Amphetamine
d. Guanfacine
- 105. About narcolepsy all are true EXCEPT?**
a. Associated with cataplexy
b. Equal in male and female
c. NREM disorder
d. Hypnagogic hallucinations
- 106. True about good sleep hygiene is?**
a. Same time for sleeping and waking up daily
b. Heavy exercise in evening
c. Heavy dinner at night
d. Small naps in day
- 107. Which of the following is not a perceptual disorder?**
a. Imagery
b. Illusion
c. Hallucinations
d. Synaesthesia
- 108. Cause of death in retts syndrome is?**
a. Hypoglycemia
b. Cardiac arrhythmia
c. Seizures
d. Respiratory failure
- 109. An IQ of 50-60 is which type of mental retardation?**
a. Mild
b. Moderate
c. Severe
d. Very severe
- 110. Which defense mechanism is seen in panic disorder?**
a. Personalisation
b. Reaction formation
c. Catastrophisation
d. Derealization
- 111. If both parents are suffering from schizophrenia then what chance does the offspring have of being schizophrenic?**
a. 4%
b. 14%
c. 40%
d. 50%
- 112. Aversion therapy is used for?**
a. Depression
b. Mania
c. Paraphilia
d. Suicidal tendencies
- 113. Minimum time period to diagnose depression with daily manifestation is?**
a. 1 weeks
b. 2 weeks
c. 4 weeks
d. 8 weeks
- 114. Delusion is a disorder of?**
a. Thought
b. Personality
c. Memory
d. Cognition
- 115. Which of the following is a symptom of opioid withdrawal?**
a. Pupillary constriction
b. Piloerection
c. Hypotension
d. Constipation
- 116. Pseudodementia is seen in?**
a. Depression
b. Schizophrenia
c. Parkinson's disease
d. Dissociative disorder
- 117. A child with schizophrenia was on medications. Suddenly he developed neck stiffness and spasm. Best treatment of such a case is?**
a. Benztropine
b. Lorazepam
c. Diphenhydramine
d. Propranolol
- 118. Delusion that an identical looking individual has been replaced by imposter is?**
a. De clerbault's syndrome
b. Capgras syndrome
c. Cotard's syndrome
d. Ekbom's syndrome
- 119. Which of the following is classified as mood stabilizing drug?**
a. Valproate
b. Clonazepam
c. Desvenlafaxine
d. Amitriptyline
- 120. Squeeze technique is used for:**
a. Premature ejaculation
b. Azoospermia
c. Depression
d. Anxiety

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTION 2019

1. Ans. (b) Panic attack

Ref: Harrison's 19th ed. P 3262

- Panic disorder is defined by the presence of recurrent and unpredictable panic attacks, which are distinct episodes of intense fear and discomfort associated with a variety of physical symptoms like chest pain, fear of impending doom, palpitation, sweating, trembling, paresthesias, GI distress etc,
- **Diagnostic criteria:** 1 month of concern or worry about the attack or behavioural change related to them
- Lifetime prevalence of panic disorder is 2–3%
- Symptoms are always sudden onset, in an unexpected fashion, developing within 10 minutes and usually resolving within an hour.
- Frequency of panic attack varies: ranging from once a week to clusters to attacks separated by months of well being

SCHIZOPHRENIA

2. Ans. (b) CBT

Ref: Kaplan's Textbook of Psychiatry Ch 29.2

- Violence is one of the common psychiatric emergencies. It is characterized by physical aggression of one person on another.
- It is most commonly associated with psychotic disorder and personality disorders.

Management

- Physical restraint (*only if necessary*).
- Give injection of Haloperidol (5 mg IM/IV) with or without lorazepam (2 mg IV). Repeat every 2 hours if necessary.
- Hospitalization → Referral to psychiatric services for further management
- In acute cases ECT can also be used.
- **Note:** CBT is not done in any of the acute psychiatric illness including depression.

3. Ans. (a) Overactivity

Ref: Kaplan's Textbook of Psychiatry Ch 12.8

NEGATIVE SYMPTOMS OF SCHIZOPHRENIA

- Affect flattening/blunting
- Alogia (poverty of speech/content)
- Avolition/apathy (lack of interest/motivation)
- Anhedonia (a sociality)
- Lack of attention

NOTE

- Over activity is NOT a negative symptom of schizophrenia.
- Example of positive symptoms: Conceptual disorganization, delusions, auditory hallucination or hallucinations
- Negative symptoms are associated with poor prognosis, while positive symptoms are associated with good prognosis.

4. Ans. (a) Familiar person replaced by impostor

Ref: Patient based approach to cognitive neurosciences pg. 155

Capgras syndrome: Chronic paranoid psychosis who is convinced that multiple persons, including members of family, had been replaced by imposters.

5. Ans. (b) Nonfamiliar person appears to be familiar

Ref: Patient based approach to cognitive neurosciences pg. 155

- **Fregoli syndrome** involves the belief that a person who appears to be well known to the patient is really impersonating.
- Christodoulou suggested that capgras syndrome is characterized by a “hypoidentification” of a person known by the patient, who is felt to be an imposter, while Fregoli syndrome was the manifestation of “hyperidentification” in which a known person could be seen in the disguise of others.

6. Ans. (a) Olanzapine

- Most common atypical antipsychotics associated with weight gain is: **Clozapine, Olanzapine**
- Other drugs associated with weight gain are Quetiapine, Risperidone and Asenapine, sertindole.

7. Ans. (b) Echolalia

Ref: Harrison's, 19th ed.

FMGE Solutions Screening Examination

- Catatonia is a syndrome. It is a state of neurogenic motor immobility and behavioral abnormality manifested by stupor.
- It can be a part of medical illness or a psychiatric illness.
- **Signs and symptoms:**
 - **Echolalia:** Repetition of words or sentences heard by patient. Ex: what is this color? Patient replies: what is this color.
 - **Echopraxia:** Repetition of action
 - **Rigidity**
 - **Negativism:** Opposition or no response to instructions or external stimuli
 - **Automotive obedience:** Excessive obeying of command without thinking of its consequence
 - **Catalepsy:** Waxy flexibility
 - **Posturing:** Spontaneous and active maintenance of a posture against gravity
 - **Mitgehen:** Excessive movement with slight pressure
 - **Gegenhalten:** Resistance of movement with proportional force
 - **Staring:** Persistent glaring/staring at one place

DIAGNOSIS

- **According to ICD 10:** Any one symptom if present is diagnostic
- **DSM 5 says:** Any 3 symptoms present is diagnostic

Treatment: IV Lorazepam

Note: *Cataplexy* is symptom of *narcolepsy*, while *catalepsy* is a feature of catatonia.

8. Ans. (c) Schizophrenia

Ref: Harrison, 19th ed. pg. 2720

- Hallucinatory voice commenting (keeping up a running commentary) on one's behavior, thought or action in the third person (*third person hallucination*) is a classical presentation of schizophrenia.
- The patient presented here presents with 3rd party auditory hallucination, which is a very characteristic finding of Schizophrenia.

TABLE: Diagnostic criteria for schizophrenia according to DSM-IV and ICD 10

	DSM-IV	ICD-10
≥ 1 criteria for 1 month	<ul style="list-style-type: none"> • Bizarre delusions • Hallucinations consist of: <ul style="list-style-type: none"> ■ Hallucinatory voice commenting (keeping up a running commentary) on one's behavior, thought or action in the third person (<i>third person hallucination</i>) ■ Voices discussing or arguing i.e. hallucinations of two or more voices discussing or conversing with each other 	<ul style="list-style-type: none"> • Thought echo/ insertion/withdrawal/ broadcasting • Delusion of control • Hallucinatory voices • Persistent delusions
	DSM-IV	ICD-10
Or ≥ 2 Criteria	<ul style="list-style-type: none"> • Delusions • Hallucinations • Negative symptoms i.e. affective flattening, alogia or avolition • Grossly disorganized or catatonic behavior • Disorganized speech (eg frequent incoherence or derailment) 	<ul style="list-style-type: none"> • Thought block/ disorder • Persistent hallucinations • Negative symptoms • Catatonia
Time course	• Symptom for 1 month + 6 months social/occupational disturbance	• 1 month (most of the time)
Exclusions	<ul style="list-style-type: none"> • Brief mood disturbance or schizoaffective disorder • Direct effect of drug abuse/ medication/medical condition 	<ul style="list-style-type: none"> • Schizoaffective disorder or extensive depressive/manic symptoms • Drug intoxication/withdrawal, overt brain disease.

- Negative symptoms respond poor to treatment (*poor prognosis*) while positive symptoms are well responsive to treatment (*better prognosis*).

Positive Symptoms	Negative Symptoms
<ul style="list-style-type: none"> • Hallucination • Delusion • Illusion • Thought disorder • Aggressive behavior • Irrational conclusion 	<ul style="list-style-type: none"> • Anhedonia: loss of interest in things which were interesting before. • Avolition: lack of desire to achieve goal • Alogia: poverty of speech • Attention deficit and cognition deficit • Social withdrawal/poor socialization skill • Emotional blunting

9. Ans. (b) **Schizophrenia**

Please refer to above explanation

10. Ans. (b) **Clozapine**

Ref: Harrison, 19th ed. pg. 2271, 2617

- The patient here is a case of resistant schizophrenia as the auditory hallucination is not responding to treatment. As we know that:
 - Auditory hallucinations are first symptom to go with treatment and also 1st symptoms to reappear after drug resistance.
- Clozapine is:**
 - A reserve drug for resistant schizophrenia
 - Drug with least extra pyramidal side effects (extradyskinesia)
 - Major side effect of clozapine is agranulocytosis, sedation, sialorrhea, weight gain

Extra Mile

Antipsychotic

Longest acting	Fluphenazine (2-4 weeks)
With antidepressant action	Flupenthixol
Least extrapyramidal side effect	Risperidone
Least potent	Chlorpromazine (CPZ)
Least Hypotensive & Least Antiemetic	Molindone

11. Ans. (d) **Fluphenazine**

Ref: Harrison, 19th ed. pg. 2722

Fluphenazine can be given as monthly intramuscular depot preparation. Thus it is preferred in non-compliant patients.

Important Points Regarding Anti-Psychotic Agents

- Fluphenazine (enanthate and decanoate) and haloperidol (decanoate) are long-acting injectable (s.c. or i.m.) forms of typical antipsychotics.
- Risperidone** is the first atypical antipsychotic available in long-acting injectable form.
- Most commonly used antipsychotic by intravenous route is **haloperidol**
- Ziprasidone, aripiprazole, asenapine and iloperidone** has negligible risk to cause metabolic adverse effects (weight gain, hyperlipidemia and new onset diabetes mellitus)
- Asenapine, paliperidone and ziprasidone** has greatest potential to prolong QT interval.
- Asenapine → available as sublingual

12. Ans. (b) **Altered sensorium**

Ref: Harrison, 19th ed. pg. 2270-71

- Schizophrenia is a formal thought disorder, characterized by third person hallucination & inappropriate emotion (affect)
- Altered consciousness (sensorium) is a characteristic feature seen in delirium (*not in schizophrenia*)

Characteristics

- Only 3rd person hallucinations are characteristic of schizophrenia.
- Third person hallucination means: Two or more voices talking to one another, discussing about the patient; and giving a running commentary on his actions or thoughts.
- Auditory hallucination is most characteristic of Schizophrenia.

13. Ans. (c) **Visual hallucinations**

Ref: Harrison, 19th ed. pg. 2270-71

14. Ans. (c) **Gradual onset**

Ref: Harrison, 19th ed. pg. 2271

Prognostic Factor of Schizophrenia

Good prognostic factor	Bad prognostic factor
<ul style="list-style-type: none"> Female sex Acute onset (late onset) No family history of schizophrenia History of depressive order Premorbid personality Positive symptoms 	<ul style="list-style-type: none"> Male sex Gradual onset (early onset) Family history of schizophrenia Emotional blunting Negative symptoms

15. Ans. (c) **Hebephrenic**

Ref: Harrison, 19th ed. pg. 2271

- Surprisingly, the name simple doesn't fit with the better prognosis. It has the worst prognosis among the types of schizophrenia.

TABLE: Types of Schizophrenia

Paranoid <ul style="list-style-type: none"> Most common type. Late onset. It has more positive and less negative symptom Has better prognosis 	Hebephrenic <ul style="list-style-type: none"> Early onset Personality and emotions get affected Worst prognosis 	Simple <ul style="list-style-type: none"> No positive symptom at all Only negative symptoms Poor prognosis
	Catatonic <p>Due to imbalance of NT, there is hyperactivity and hypoactivity. BEST prognosis</p>	Undifferentiated <ul style="list-style-type: none"> Can't be categorized in one particular category. Has >1 category.

FMGE Solutions Screening Examination

1200

16. Ans. (d) **Schizophrenia**Ref: Harrison, 19th ed. pg. 2270-71

- Patient in the given case is delusional and has disorganized behavior with his classmates.
- He even hears his dead grandfather talking to him (auditory hallucination), which is a very characteristic finding of schizophrenia.
- In case of delusional disorder, hallucinations are rare, and in case they are present, they are usually tactile or olfactory

TABLE: Differentiating Delusions of Different Causes

Delusion due to Delusional disorder	Delusion due to Schizophrenia
<ul style="list-style-type: none"> • Delusions are non bizarre (ie involving situations that occur in life as being followed, deceived, infected, loved etc) • Behaviour & personality is normal except in the delusional area • Hallucinations are very rare & if occur are of tactile or olfactory variety 	<ul style="list-style-type: none"> • Bizarre delusions • Behaviour & personality is deteriorated in almost all areas • Hallucinations are very common • Auditory variety is most common • 3rd person hallucination is characteristic

17. Ans (b) **Conduct disorder**Ref: Ahuja 5th ed. pg. 173, Kaplan, 9th ed. pg. 1234-6

The child is not normal and suffers from conduct disorder.

TABLE: Differentiation between different disorders mentioned in the question

Autism	Attention Deficit Disorder	Conduct Disorder
<p>There is marked impairment of reciprocal social and interpersonal interaction:</p> <p>Absence of social smile</p> <ul style="list-style-type: none"> • Absence of fear • Lack of attachment to parents and absence of separation anxiety • Lack of friends 	<p>More common in males, the onset occurs before the age of 7 years, characterized, by:</p> <ul style="list-style-type: none"> • <i>Poor attention span with distractibility</i> • <i>Hyperactivity</i> • <i>Impulsivity</i> • <i>Moving about here and there</i> 	<p>There is violation of rights and rules like:</p> <ul style="list-style-type: none"> • Frequent lying • Stealing or robbery • Running away from home & school • Physical violence • Cruelty • Poor at studies

18. Ans. (c) **Automatism**Ref: Kaplan & Saddock, 10th ed. pg. 468

- Autism, NOT automatism is part of Bleuler's four A's
- Eugene Bleuler's Fundamental symptoms of schizophrenia (4 A's of Bleuler):
 - **Ambivalence**—Inability to decide for or against (confusion)
 - **Autism**—Withdrawal into self
 - **Association disturbance**—Loosening of association, thought disorder
 - **Affect disturbance**—Inappropriate affect

19. Ans. (d) **Delusion of guilt**Ref: Harrison, 19th ed. pg. 2271

- **Schneider's first rank symptoms of schizophrenia include:** Hallucination, Delusion (*primary delusion*, *NOT delusion of guilt*), Passivity (made) phenomenon, and thought alienation phenomenon.
- *Presence of one symptom is diagnostic of schizophrenia.*

Hallucination

- Hearing Audible thought
- Voice heard arguing or discussing or both
- Voice commenting on one's action
- Hallucinations in form of commentary
- 3rd person hallucination
- Somatic hallucination

Thought alienation phenomenon

- Thought withdrawal
- Thought insertion
- Thought broadcasting

Passivity

- Made feeling (affect)
- Made impulse
- Made volition
- Somatic passivity

Delusional perception

- Primary delusion

20. Ans. (c) **Dopamine**Ref: Harrison, 19th ed. pg. 215

- Antipsychotics targeting positive symptoms probably act by *blocking the postsynaptic dopamine (D₂) receptors in the mesolimbic system*. Other receptors such as 5-HT, muscarinic receptors and GABA are also probably important. Atypical antipsychotics are also called as Serotonin Dopamine Antagonists (SDAs) due of their action on both dopamine and 5-HT.

- Overactivity of DA receptor causes positive symptoms
- Their blockage of D2 antagonist relieves from positive symptoms
- Underactivity of NMDA receptor is responsible for negative symptoms.

DEPRESSION, SUICIDE AND ADJUSTMENT DISORDER

21. Ans. (c) Depression with dysthymia

Ref: Harrison's 20th ed. P 3269

- Prolong/persistent disorder is known as dysthymia. Therefore dysthymia is also known as persistent depressive disorder.
- It consist of a pattern of chronic (at least 2 years), ongoing depressive symptoms that are usually less severe than we seen in major depression.
- Often times the conditions like depression and dysthymia occur together and is difficult to separate.
- This persistence of depression with dysthymia is known as double depression.

22. Ans. (b) Weight loss >75%

Ref: Treatment manual for anorexia nervosa; 2^{ed}. P 277-278

- Anorexia nervosa (AN) is a type of eating disorder marked by an inability to maintain a normal healthy body weight, often dropping below 85% of ideal body weight (IBW).
- Bulimia nervosa (BN) is characterized by recurrent episodes of binge eating in combination with some form of inappropriate compensatory behavior.
- Indian patients chiefly present with refusal to eat, persistent vomiting, marked weight loss, amenorrhea and other somatic symptoms, but do not show over activity or disturbances in body image seen characteristically in anorexia nervosa.
- Nutritional rehabilitation along with some form of re-educative psychotherapy remains the mainstay of management of anorexia nervosa.
- In bulimia nervosa, both fluoxetine and cognitive behavior therapy have been found to be effective.

23. Ans. (b) Child age

Ref: Dying, Death and Bereavement; P 323

- A **copycat suicide** is defined as an emulation of another suicide that the person attempting suicide knows about either from local knowledge or due to accounts or depictions of the original suicide on television and in other media.
- It is commonly seen among teenagers.

24. Ans. (c) Nortriptyline

- Elderly patients are often sensitive to the hypotensive, sedative and anticholinergic effects of antidepressants, and this patient is at special risk for hypotension because of his carotid artery stenosis. Nortriptyline is *least likely* to cause these side effects.

25. Ans. (c) Depression

Ref: Comprehensive Clinical Psychiatry, Theodore, 2nd ed. pg. 221

- Depression is more commonly associated with frontal lobe lesions
- Left frontal lobe lesions are more commonly associated than the right frontal lobe.
- Depression occurs in 30 to 50% of stroke patients within two years of the event.
- Mania is less common and it occurs almost exclusively with right hemisphere lesions. Many of the patients who develop mania have a family history of affective disorders.

26. Ans. (d) Persistent depressive disorder

Ref: Harrison's, 19th ed. pg. 2706

- Persistent depressive disorder, also called dysthymia is a continuous long-term (chronic) form of depression.
- **Dysthymia** is, sometimes called **neurotic depression**, **dysthymic disorder**, or **chronic depression**, is a mood disorder consisting of the same cognitive and physical problems as in depression, with **less severe but longer-lasting symptoms**.

27. Ans. (c) Decreased serotonin and Norepinephrine

Ref: Harrison 19th ed./2714-2715

- Depression is one of the mood disorders
- It is considered as second most common psychiatric disorder.
- Most commonly seen in middle age females. M:F ratio= 1:2
- **Neurotransmitters involved are serotonin a NE and DA. All 3 are decreased.**

**Diagnostic Criteria of Depression**

Major Criteria	Minor Criteria
Persistent sadness of mood	Loss of appetite
Loss of pleasure in activities	Sleep disturbance
Easy fatigability	Decreased libido
	Decreased concentration
	Ideas of guilt, worthlessness, hopelessness
	Suicidal ideas

Depression Category on Basis of Severity

- Mild Depression : 2 major + 2 minor
- Moderate Depression : 2 major + 3 minor
- Severe Depression : 2 major + 4 minor

Extra Mile

Disease	Related Neurotransmitter
Alzheimer's disease	Acetyl choline decreased
Depression	Norepinephrine, Serotonin (5-HT) & dopamine are DECREASED
OCD	Serotonin (5 HT) decreased
Schizophrenia	Dopamine, Serotonin increased Glutamate decreased

28. Ans. (d) Serotonin and Norepinephrine

Please refer to the previous answer for explanation.

29. Ans. (d) Depressed mood

Ref: Ahuja, 5th ed. pg. 81,109-110

- Masked depression means hidden depression which practically means that the patient is having a depression which manifests in somatic symptoms like vague body aches, bowel complaints and inability to carry out normal activities. However, the mood is not seems to be depressed.

30. Ans. (c) Depressive Disorder

- DALY's is Disability Adjusted Life years.
- It is a measure of the burden of disease in a population and the effectiveness of the intervention.
- DALYs express years of life lost to premature death and years lives with disability adjusted for the severity of the disability.
- One DALY is "one lost year of healthy life"
- According to Park 23rd ed. Most common cause of DALY's is depressive disorder.

31. Ans. (c) Depressive disorder

Ref: Kaplan Synopsis 10th ed. pg. 528-30

- Most common psychiatric disorder and worldwide: **Anxiety disorders > depression**
- Female is most commonly affected as compared to males
- Depression is the most common psychiatric disorder associated with severe medical illness like hypothyroidism, cancer, AIDS, post MI, stroke etc.

32. Ans. (c) Major depression

Ref: Harrison, 19th ed. pg. 2714

- Major depression is the second most common psychiatric disorder world wide & in India with highest life time prevalence (17%), **most commonly involving middle (old) age females**. Independent of culture or country, is **two fold greater prevalent in females than in males**.
- It is the most common psychiatric disorder associated with severe medical illness as myxedema (hypothyroidism, cancer, AIDS, post partum, post MI and post surgery etc.)
- In depression monoamine neurotransmitters (monoaminergic NTs) NE and serotonin (and dopamine also) are reduced.
- **For diagnosing Major depression**
 - **> 1 essential criteria**
 - ◆ Depressed /low mood
 - ◆ Loss of interest or pleasure
 - **> 4 of the following for > same 2 weeks**
 - ◆ Appetite or weight loss
 - ◆ Sleep loss
 - ◆ Psychomotor activity (not meeting friends)
 - ◆ Concentration loss
 - ◆ Low energy (feeling of fatigue, weakness)
 - ◆ Feeling of worthlessness or guilt
 - ◆ Suicidal thoughts
- Patient given in the question fits in the criteria:
- **1st criteria:** He has depressed mood and loss of interest or pleasure in dropping his daughter at school
- **In 2nd criteria:** Difficulty in sleeping, Not meeting with friends, decrease in energy.

Extra Mile

MC psychiatric disorder is Anxiety spectrum disorders > depression
Ref: Harrison 19th ed. pg. 2708

33. Ans. (b) Major depressive disorder

Ref: Harrison, 19th ed. pg. 2714-15

Please refer to above explanation.

34. Ans. (a) Adjustment disorder

Ref: Kaplan & Sadock, 10th ed. pg. 790

- Adjustment disorder is a short-term condition that occurs when a person is *unable to cope with, or adjust to, a particular source of stress*, such as a major life change, loss, or event.

Diagnostic Criteria

- Development of emotional or behavior symptoms *in response to identifiable stressor (not of an unusual or catastrophic type), occurring within 3 months of onset of stressor* & does not persist for > 6 months if stressor is terminated.
 - Marked distress that is in excess of what would be expected
 - Significant impairment in social or occupational life
- In this question, the examiner wanted us to mis-diagnose as severe depression, but the arousal of symptoms, i.e. within 3 months of stressor favours diagnosis of adjustment.*
- The type of stress that can trigger adjustment disorder varies depending on the person, but can include:
 - Ending of a relationship or marriage
 - Losing or changing job
 - Death of a loved one** (*as seen in this case*)
 - Developing a serious illness (yourself or a loved one)
 - Being a victim of a crime
 - Having an accident
 - Undergoing a major life change (*such as getting married, having a baby, or retiring from a job*)
 - Living through a disaster, such as a fire, flood, or hurricane.
- A person with adjustment disorder develops emotional and/or behavioral symptoms as a reaction to a stressful event. *These symptoms generally begin within three months of the event and rarely last for longer than six months after the event or situation.*
- Adjustment disorder is not the same as post-traumatic stress disorder (PTSD). *PTSD generally occurs as a reaction to a life-threatening event and tends to last longer.* Adjustment disorder, on the other hand, is *short-term*, rarely lasting longer than six months.

35. Ans. (a) Female

Ref: Kaplan & Sadock, 10th ed. pg. 428

- Mood disorders (major depression) and alcohol dependence are two most common causes of suicide.
- Men **COMMIT** suicide four times as often as women. Women **ATTEMPT** suicide four times as often as men. Women usually take psychoactive substance while men use firearms.

- Suicidal risk is much more in presence of following risk factors:**

- Early in illness* (than later), **more commonly in men (than women) of middle or old age (>40 years).**
- Single, separated, divorced, widowed, or recently bereaved, social isolation, unemployed.
- At the onset or end of depressive episode (i.e. depression in involution).* Early treatment particularly with SSRIs may increase suicidal feelings & attempts. As with other psychiatric patients, the months after discharge from a hospital are time of high risk. Subtherapeutic doses may increase risk.
- Presence of marked *haplessness*.
- At the peak of depression, the patient is either too retarded or depressed to commit suicide. So, *early stages of depression, during recovery (involution) from depression and 3 months period from recovery is high risk period for suicide.*

Suicide

Biological factors <ul style="list-style-type: none"> Decreased <i>central serotonin (5 HT)</i> plays an important role in suicide Decreased concentrations of serotonin metabolite <i>5-HIAA in CSF</i> 	Most important risk factors <ul style="list-style-type: none"> Psychosis Substance abuse Personality disorder Hypochondriac
Most important causes: <ul style="list-style-type: none"> <i>Major depression</i> <i>Substance abuse</i> <i>Schizophrenia</i> 	

36. Ans. (c) Psychogenic

Ref: Kaplan & Sadock 10th ed. pg. 693

- Most common cause of impotency in male is psychogenic.

PERSONALITY DISORDER/OCD

37. Ans. (b) Hypochondriac disorder

Ref: Handbook of outpatient treatment of adults: *Non psychotic mental disorder; P 300*

- Hypochondriasis** is a condition in which a person is inordinately worried about having a serious illness. The person is preoccupied with thoughts of a serious life threatening diagnosis or medical illness.
- Somatoform pain:** Only pain of one location of long standing duration.
- Conversion disorder:** Anxiety due to conflict.

38. Ans. (a) **Autism**

Ref: Textbook of autism spectrum disorders, edited by Eric Hollander e.g.al; P 99-102

- **Autism:** Impairment in social communication and interaction, language development delay, restrictive repetitive stereotyped behavior.
- **ADHD:** Child is hyperactive, impulsive, attention deficit.

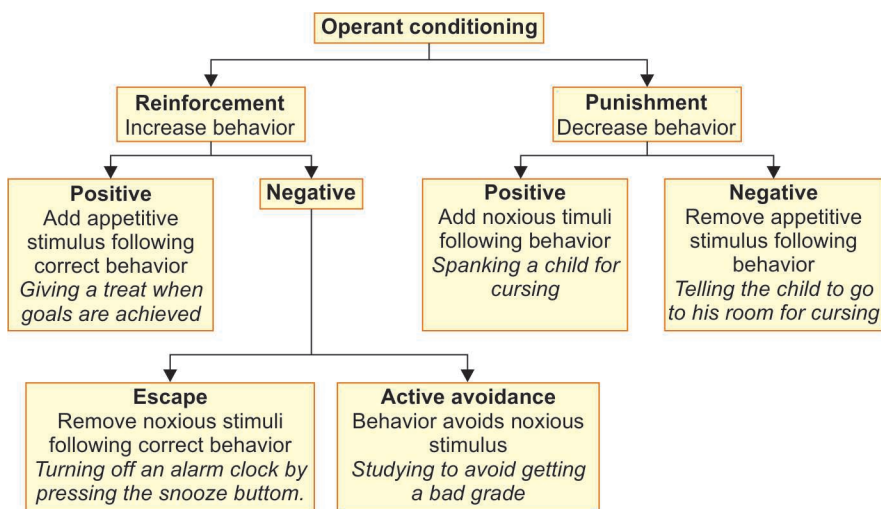

39. Ans. (c) **Fluoxetine**

- The drugs of choice for OCD are SSRI or clomipramine (2nd drug of choice)
 - **SSRIs:** Fluoxetine, Fluvoxamine, Paroxetine, Sertraline, Citalopram, Escitalopram
- Exposure and Response Prevention is a part of cognitive and behavior therapy for OCD.

42. Ans. (c) **Operant conditioning**

Ref: PubMed

- B.F. Skinner (1904–1990) is often referred to as the **father of operant conditioning**. This conditioning is based on behavioural change with reinforcement or punishment.

Note: Classical conditioning differs from operant or instrumental conditioning: in classical conditioning, behavioral responses are elicited by antecedent stimuli (e.g: chocolate wrapper stimulate salivation), whereas in operant conditioning behaviors are strengthened or weakened by their consequences (i.e., reward or punishment).

43. Ans. (b) **Mania**

Ref: Kaplan & Sadock, 10th ed. pg. 2717

DSM- IV Diagnostic Criteria of Mania

- Abnormally & persistently elevated, expansive, or irritable mood lasting for at least 1 week or any duration, if requires hospitalization.

- Combination of behavior therapy & drug therapy gives best results for treatment of OCD.

40. Ans. (b) **OCD**

- O.C.D does not arise from any cognition bias but a goal directed dysfunction that interacts with anxiety and irrational belief. They cannot exert necessary control over their actions to realize this goal.

41. Ans. (b) **Dissociation**

Ref: Ahuja 5th ed. pg. 213

- Dissociation is a neurotic/immature defence mechanism characterized by involuntary splitting or suppression of a mental function or a group of mental function from rest of the personality in a manner that allows expression of forbidden unconscious impulses without having any sense of responsibility for actions.

- Distractibility (i.e. attention to easily drawn to unimportant or irrelevant external stimuli)
- Increase in goal-directed activity (social spiritual religious, sexual) or psychomotor agitation
- Excessive involvement in pleasurable activities (eg. *unrestrained buying sprees, foolish business investments, donations or sexual indiscretions*) that have a high potential for painful consequences.

Why Mania: This patients satisfies the criteria and his conditions fits into it.

- The patient is irritable for 10 days (i.e. criteria A-abnormally & persistently elevated mood for at least 1 week). There are ≥ 3 criteria B features: increased sexual indulgence & alcohol consumption (*excessive involvement in pleasureable activity*), decreased need for sleep and career oriented prolonged work without getting tired.

44. Ans. (c) Heightened concentration

Please refer to above explanation

45. Ans. (a) Ego dystonic

Ref: Kaplan & Sadock 10th ed./279

- The idea in OCD is Egodystonic or ego-alien (foreign to one's own personality), NOT ego syntonic.
- Persons with OCD are stubborn, rigid, overconscious, scrupulous & inflexible about matters of morality & ethics (not indecisive).
- **Shows perfection that interferes with task completion**
- Is excessively devoted to work and productivity to the exclusion of leisure activities & friendships. Is reluctant to delegated task or work to others. Adopts a miserly spending style.

Obsession	Compulsion
<ul style="list-style-type: none"> • Fear something terrible may happen (fire, death, or illness of loved one, self or others) • Concern or need for symmetry, order or exactness • Concern or disgust with bodily wastes or secretion (urine, stool, saliva), dirt, germs, environmental toxins • Scrupulosity (excessive praying or religious concerns out of keeping with patients background) • Forbidden or perverse sexual thoughts, images or impulses • Believes in Luck & unlucky numbers. • Intrusive nonsense sounds, words or music 	<ul style="list-style-type: none"> • Excessive hand washing, checking, cleaning, ordering, arranging, counting etc.

46. Ans. (b) Exposure and response prevention

Ref: Harrison, 19th ed. pg. 2713

Exposure and Response Prevention is a part of cognitive and behavior therapy for OCD.

MANAGEMENT OF OBSESSIVE COMPULSIVE DISORDER

Behaviour Therapy (BT)

- **It is treatment of choice for OCD**
- Exposure & response prevention is the preferred & principal approach. It is most effective in obsessional rituals (i.e. compulsions)
- In this form of therapy, the patient is asked to endure, in a graduated manner, the anxiety that a specific obsessional fear provokes while refraining from compulsions that allay (reduce) that anxiety. The principle behind success of treatment are based on habituation based on response prevention.

Pharmacotherapy

- The drug of choice for OCD are SSRI or clomipramine (2nd drug of choice)
 - **SSRI's**
 - ♦ **FLUXOETINE, FLUVOXAMINE, PAROXETINE, SERTRALINE, CITALOPRAM, ESCITALOPRAM**
- Combination of behavior therapy & drug therapy gives best results for treatment of OCD.
- **Clomipramine:** It is the most selective for serotonin reuptake versus norepinephrine re-uptake & exceeds in the respect only by SSRI's.
- **2nd line drugs:** If treatment with SSRIs or clomipramine is unsuccessful, valproate lithium or carbamazepine are used.

Psychotherapy

- To treat OCD, Psychoanalytic prolonged insight oriented or exploratory & interpretative psychotherapy is used in educated & psychologically oriented patients.
 - **ECT:** is used in severe depression with OCD
 - **Psychosurgery:** It is indicated only for most chronic, treatment resistant cases that have resisted (IPD or OPD) treatment (including drug of behavior therapy) for at least a year.

47. Ans. (a) Behavior therapy

Ref: Kaplan & Sadock, 10th ed. pg. 605

BEHAVIOUR THERAPY

It is the treatment of choice in phobia, which may of following types

- *Exposure & Response prevention is 1st line of behavior therapy*
- Flooding (implosion or intensive exposure)

FMGE Solutions Screening Examination

- Systemic desensitization: Progressive exposure to anxiety evoking stimulus.
- Relaxation techniques

Medications

- Anxiolytic drugs
- Tricyclic antidepressant
- SSRI
- MAO inhibitors

COVERT SENSITIZATION

- It is an aversion therapy, used for the treatment of conditions which are pleasant but undesirable. Eg. Alcohol dependence, and sexual deviations like homosexuality & transvestism etc.
- The main aim of aversion therapy is pairing of pleasant stimulus with an unpleasant response so that pleasant stimulus becomes unpleasant by association.

48. Ans. (c) **Exposure and response prevention followed by systemic desensitization**

Ref: Harrison, 19th ed. pg. 2712-13

BEHAVIOUR THERAPY

- It is the treatment of choice in phobic disorders and several other psychiatric illness. Exposure and response prevention followed by systemic desensitization behavior therapy is the treatment of choice in phobia. It can be of following types:
- Exposure & Response prevention is **1st line of behavior therapy**
- Systemic desensitization: progressive exposure to anxiety evoking stimulus (**2nd line**)
- Flooding (implosion or intensive exposure)
- Relaxation techniques

49. Ans. (b) **Early age of onset**

Good Prognostic Factors	Poor Prognostic Factors
<ul style="list-style-type: none"> • Acute or abrupt onset • Typical clinical features • Severe depression • Well-adjusted premorbid personality • Good response to treatment 	<ul style="list-style-type: none"> • Co-morbid medical disorder, personality disorder or alcohol dependence • Double depression (acute depressive episode superimposed on chronic depression or dysthymia) • Catastrophic stress or chronic ongoing stress • Unfavourable early environment and <i>early age of onset</i> • Marked hypochondriacal features, or mood incongruent psychotic features • Poor drug compliance

50. Ans. (a) **Bipolar disorder**

Ref: Harrison, 19th ed. pg. 2717

- **DOC for prophylaxis of bipolar disorder- Lithium**
- DOC for acute mania: Benzodiazepines + atypical antipsychotic
- Lithium can also be used in treatment of neutropenia, Cluster headache and major depression episodes.
- **Therapeutic level of lithium: 0.8 – 1.2 mEq/L**
- **Toxicity seen after >1.5 mEq/L**
- Most common side effect of lithium: Coarse tremor
- **Side effects of lithium (Mn: LITTH)**
 - Leukocytosis
 - Insipidus (DI)
 - Tremor, teratogenic (MC-Ebstein anomaly)
 - Hypothyroidism
- Lithium is contraindicated in 1st trimester of pregnancy. It can cause congenital heart defect- **Ebstein anomaly**.

51. Ans. (c) **Phenytoin sodium**

Ref: Harrison, 19th ed. pg. 2718, 4665e-2

- Lithium has traditionally been the drug of choice for the treatment of manic episode (acute phase) as well as for prevention of further episodes in bipolar mood disorder. It has also been used in treatment of depression with less success.
- Antipsychotics are an important adjunct in the treatment of mood disorder. The commonly used drugs include risperidone, olanzapine, quetiapine, haloperidol, and aripiprazole.

The other mood stabilizers which are used in the treatment of bipolar mood disorders include;

- Sodium valproate
- Carbamazepine and Oxcarbazepine
- Benzodiazepines Lorazepam (IV and orally) and clonazepam
- Lamotrigine

52. Ans. (c) **Borderline**

Ref: Harrison, 19th ed. pg. 2720

Personality disorders and their clinical manifestation:

- **Borderline:** Pervasive pattern of unstable and intense interpersonal relationship, difficulty in controlling anger hence avoids meeting people.
- **Paranoid:** Generalized mistrust and suspiciousness
- **Schizoid:** Markedly detached from others. Excessive preoccupation with fantasy and introspection and emotional coldness.

53. Ans. (a) **Menorrhagia**

Ref: Harrison, 17th ed. pg. 471-7

Amenorrhea (and not menorrhagia) is seen in 100% patients of anorexia nervosa. It is a mandatory finding diagnostic criterion to be fulfilled for anorexia nervosa.

	Anorexia nervosa	Bulimia nervosa
Feature	Refusal to maintain body weight above a minimal normal	Irresistible craving for food with episodes of over eating in less time (Binge eating)
Method of weight control		Attempts to counteract the effects of over eating by self-induced vomiting: <ul style="list-style-type: none"> • Purgative abuse, • Periods of starvations • Appetite suppressants
Ritualised exercise	Common	Rare
Amenorrhea	100%	50%
Decreased Vitals ↓ BP, ↓ Pulse	Common	Uncommon
Hypothermia	Common	Rare
Skin changes (Hirsutism)	Common	Rare
Medical Complications	Hypokalemia Cardiac arrhythmias	Hypokalemia Cardiac arrhythmias

54. Ans. (c) Dissociative fugue

DISSOCIATIVE FUGUE

- Dissociative fugue is characterized by *episodes of wandering away (usually away from home)*. During the episode, the person usually *adopts a new identity* with *complete amnesia for the earlier life*. The onset is usually sudden, often in the presence of severe stress. The termination too is abrupt and is followed by amnesia for the episode, but with recovery of memories of earlier life.

MULTIPLE PERSONALITY (DISSOCIATIVE IDENTITY) DISORDER

- In this dissociative disorder, the person is dominated by two or more personalities, of which only one is being manifest at a time. These personalities are usually different, at times even opposing.

POST-TRAUMATIC STRESS DISORDER

- Arises as a delayed and/protracted response to an exceptionally stressful or catastrophic life event or

situation, which is likely to cause pervasive distress in 'almost any person' (e.g. disasters, war, rape or torture, serious accident). The symptoms of PTSD may develop, after a period of latency, within six months after the stress or maybe delayed beyond this period

- PTSD is characterized by recurrent and intrusive recollections of the stressful event either in flashbacks or in dreams.

55. Ans. (c) Body dysmorphic disorder

- Body dysmorphic disorder is a somatoform disorder, wherein the affected person is concerned with body image
- It manifests as excessive concern about and preoccupation with a perceived defect of their physical features.
- The person is under an impression that they have a defect in either one feature or several features of their body, which causes psychological distress that causes clinically significant distress or impairs occupational or social functioning.
- *This condition co-exists with emotional depression and anxiety, social withdrawal or social isolation.*

DELIRIUM, DEMENTIA AND ALZHEIMER'S DISEASE

56. Ans. (c) Delirium

Ref: Kaplan's Textbook of Psychiatry Ch 10.2

- Delirium is the most common psychiatric condition seen in medico-surgical patient.

TABLE: Delirium incidence and prevalence in different scenarios

Population	Prevalence Range (%)	Incidence Range (%)
General medical inpatients	10-30	3-16
Medical and surgical inpatients	5-15	10-55
General surgical inpatients	N/A	9-15 postoperatively
Critical care unit patients	16	16-83
Cardiac surgery inpatients	16-34	7-34
Orthopedic surgery patients	33	18-50
Emergency department	7-10	N/A
Terminally ill cancer patients	23-28	83
Institutionalized elderly	44	33

**57. Ans. (a) Delirium***Ref: Kaplan's Textbook of Psychiatry Ch 12.2*

- Delirium is also known as organic brain syndrome/acute brain failure/cerebral insufficiency.
- Delirium is occasionally termed to denote the acute form organic mental syndrome. It is most common organic mental disorder seen in clinical practice.

58. Ans. (b) Delirium*Ref: Harrison, 19th ed. pg. 166***DELIRIUM**

- It is characterized by global impairment of consciousness (*clouding of consciousness*), resulting in reduced levels of alertness, attention & perception of environment along with acute onset of fluctuating cognitive impairment.
- It is the commonest organic mental disorder

Clinical Features & Diagnosis

- Global impairment of consciousness & attention is the hallmark/cardinal feature of Delirium. It manifests as:
 - Diminished ability to focus, sustain or shift attention.
 - Reduced levels of alertness, attention, and perception of environment.
 - Drowsiness (mental slowness), distractibility & disorientation.
- Global impairment of cognition is manifested as:
 - Disorientation (in time, place and person)
 - *Disturbance of immediate & recent memory*
 - *Remote memory is intact.*

59. Ans. (d) Organic brain syndrome**ORGANIC BRAIN SYNDROME**

- It is also known as organic brain disease which is decreased mental function due to a medical disease, other than a psychiatric illness.
- Cognitive or higher mental functions (*i.e. consciousness, orientation & abstract thinking*) are impaired in organic brain syndrome.

60. Ans. (b) Loss of consciousness*Ref: Harrison, 19th ed. pg. 170, 173*

- Impairment of higher mental function is noted in case of dementia, but there is NO impairment of consciousness.
- Impairments in dementia (*Mn: A Thinking Memorable Intelligent Judge Can't be Impulsive*)
 - Abstract thinking
 - Memory (*recent > remote*)
 - Intellectual function
 - Judgment

- Continence (fecal & urinary)
- Impulse control (catastrophic reaction)
- Personality & personal care
- Memory impairment (ex. Forgetfulness) is typically an early & prominent feature in dementia
- No matter how severe the dementia, patients show no impairment in their level of consciousness.
- Hallucinations & Delusion can occur in 20-40% of patients with dementia.

Feature of Cortical & Subcortical Dementia

Features	Cortical Dementia	Subcortical Dementia
Site	Cortex (frontal, parietal, temporal, occipital, hippocampus)	Subcortical grey matter
Memory impairment	<ul style="list-style-type: none">• Severe, early• Recall helped very little by cues	<ul style="list-style-type: none">• Mild to moderate• Recall helped partially by cues & recognition tasks
Mathematical skills	<ul style="list-style-type: none">• Impaired early (Acalculia)	<ul style="list-style-type: none">• Preserved
Language	<ul style="list-style-type: none">• Early, Dysphasia (Aphasia)	<ul style="list-style-type: none">• Normal & Anomia (in severe cases)
Speech	<ul style="list-style-type: none">• Articulate until late	<ul style="list-style-type: none">• Dysarthria
Personality	<ul style="list-style-type: none">• Indifferent	<ul style="list-style-type: none">• Apathetic, inert

Etiology of Dementia

1. Decreased level of NE in locus cereuleus
2. Decreased level of Acetylcholine in Nucleus basalis of Meynert
3. In moderate to severe dementia: *Increased* level of Glutamate.

61. Ans. (b) Trauma*Ref: Harrison, 19th ed. pg. 173*

- Dementia Pugilistica is also known as punch drunk syndrome. It is a form of dementia usually secondary to some trauma to head.

ALZHEIMER'S DISEASE

- Alzheimer's disease, the most common cause of dementia.
- It initially presents with minor forgetfulness & gradually progressive short term memory loss
- The memory is lost for recent events first with a delayed loss of long term memory mainly affecting episodic memory.

• **Feature of Alzheimer dementia are**

- Memory impairment without impairment of consciousness
- Aphasia: Language disturbance
- Apraxia: Impaired ability to carry out motor activities despite intact motor function
- Agnosia: Failure to recognize or identify objects despite intact sensory function
- Agnosia: Failure to recognize or identify objects despite intact sensory function
- Anosognosia (*Unware of his problem*), Prosopagnosia (*difficulty in identifying known faces*)
- Disturbance in executive functioning (i.e planning organizing, sequencing, abstracting)
- Focal neurological signs (ex asymmetrical hyper-reflexia or weakness)

Extra Mile

Neuropathological findings of Alzheimer's disease

Gross

- Diffuse atrophy with flattened cortical sulci & enlarged cerebral ventricles

Microscopic

- Senile (Amyloid) plaques
- Neurofibrillary tangles
- Neuronal – loss (especially in cortex & hippocampus)
- Synaptic loss
- Granulovascular degeneration of the neurons

Remember

Neurofibrillary tangles are not unique to Alzheimer's disease but also occur in Down's syndrome, Dementia pugilistica (punch-drunk syndrome), Parkinson dementia complex.

62. Ans. (a) Biperidin

Ref: Harrison, 19th ed./2601-02

- Alzheimer's disease is most common cause of dementia.
- Cause → Decreased level of Ach in nucleus basalis of Meynert

Drugs Used in the Treatment of Alzheimer's are:

- Acetylcholine esterase inhibitors: (It increases Ach level)
 - Donepezil
 - Tacrine (Hepatotoxic; not used)
 - Galantamine
- **Rivastigmine:** Carbamate derivative of physostigmine
- **Memantine:** NMDA glutamatergic antagonist
- Biperidin is an anti cholinergic drug used to treat parkinsonism.

63. Ans. (b) Alzheimer's

Ref: Harrison's 18th ed. 3300-07

- Alzheimer's disease is most common cause of irreversible dementia.

TABLE: Reversible vs Irreversible dementia

Reversible	Irreversible
<ul style="list-style-type: none"> • Vitamin deficiency <ul style="list-style-type: none"> ▪ B1- Wernicke's ▪ B12- SCID ▪ Nicotinic acid- Pellagra 	Alzheimer's
Endocrine (Hypothyroidism, adrenal insufficiency, Cushing's)	Vascular dementia (Multi-infarct)
<ul style="list-style-type: none"> • Head trauma and diffuse brain damage • Haemorrhage-subdural, epidural, normal pressure hydrocephalus 	Leucoencephalopathy
Primary metastatic brain tumor	Metabolic disorder (<i>Wilson's disease, Leigh disease, Leucodystrophy</i>)
<ul style="list-style-type: none"> • Toxic dementia (MCC of reversible dementia) 	Degenerative disorder <ol style="list-style-type: none"> 1. Parkinsonism 2. Pick's disease 3. Prion's disease, 4. Multiple sclerosis 5. Huntington's disease 6. Diffuse Lewy body dementia

SUBSTANCE ABUSE

64. Ans. (c) Fomepizole

Ref: Safe and effective medication use in emergency department, By Victor Cohen; P 120

- The primary antidotal treatment of methanol or ethylene glycol involves blocking alcohol dehydrogenase, this enzyme is inhibited by fomepizole or ethanol.

65. Ans. (a) Aversion therapy

Ref: Principles of addiction medicine; P 843

- Disulfiram acts by inhibiting aldehyde dehydrogenase, which causes accumulation of acetaldehyde.

- This accumulation of acetaldehyde leading to distressing symptoms like hot flushes, pulsatile headache, respiratory difficulty, nausea, vomiting, sweating, orthostatic syncope, chest pain, hypotension, confusion and blurred vision.
- This particular reaction produces aversion from intake of alcohol.

Anticraving medication: Naltrexone, acamprosate, baclofen, fluoxetine, topiramate.

66. Ans. (d) Flunitrazepam

Ref: Harrison's, 19th ed. pg. 469e1; PubMed

- **Flunitrazepam (Rohypnol)** is a tasteless, odorless benzodiazepine derivative primarily used to treat insomnia, but it has significant abuse potential because of its strong hypnotic, anxiolytic, and amnesia-producing effects. It is a club drug commonly referred to as a “date-rape drug” or “roofies.”
- Earlier, it was used in some countries to treat severe insomnia and in fewer, early in anesthesia.
- **Mechanism of action:** The drug enhances GABA_A receptor activity.
- **Toxicity/overdose:** Treated with **flumazenil**, a benzodiazepine receptor antagonist.

Extra Mile

- Commonly abused club drugs include flunitrazepam, GHB (Gamma Hydroxybutyrate), and ketamine
- GHB and ketamine can be identified in blood.
- Flunitrazepam can be identified in urine and hair samples.

67. Ans. (b) Cannabis

Ref: Pub Med

TABLE: Common abused substances and their slang names

Abused substance	Slang names
Cannabis/Marijuana	Aunt mary/Dope/Ganja/Grass/Green/Joint/Pot/weed
Cocaine	Coke/snow/toot/coca
Heroin	Brown sugar/china white/Dope/Junk/Hell dust/Smack
LSD	Acid/Blotters/Blue heaven/micro dots/yellow sunshine
Hashish	Boom/Gangster/Hash/hemp
Phencyclidine (PCP)	Angel dust/Boat/Peace pill/Sherm

68. Ans. (a) Occasional use with long abstinence

Ref: Neeraj Ahuja, 7th ed. pg. 49

- The textbook quotes: “Although tolerance as well as psychological dependence can occur with LSD use, no

physical dependence or withdrawal syndrome is reported. A common pattern of LSD use is a trip (**occasional use followed by a long term period of abstinence**)”.

69. Ans. (c) Bradycardia

Ref: Harrison, 19th ed. pg. 2727

- The symptoms which arises when an alcoholic reduces or stops alcohol consumption after prolonged periods of excessive alcohol intake.
- *In case of alcohol withdrawal there is hallucinations, tremors, sweating and tachycardia, NOT bradycardia.*
- **Clinical presentation**
 - Hangover next morning: *Most common withdrawal syndrome*
 - Mild tremors (*Most Common symptom*)
 - Nausea, vomiting
 - Weakness, insomnia, anxiety
 - Delirium tremens: *Most severe withdrawal syndrome*
 - Alcoholic seizures (Rum fits)
 - Alcoholic hallucinosis

TABLE: Appearance of Alcohol withdrawal symptoms

Time	Symptoms
6-12 hours	Minor withdrawal symptoms: Insomnia, tremulousness, anxiety, GIT upset, headache, diaphoresis, palpitations, anorexia
12-24 hours	Alcoholic hallucinosis; visual, auditory, or tactile hallucination
24-48 hours	<i>Withdrawal seizures:</i> Generalized tonic-clonic seizures
48-72 hours	Delirium tremens; visual hallucinations, disorientation, <i>tachycardia</i> , hypertension, low-grade fever, agitation, diaphoresis

70. Ans. (d) 24–48 hours after cessation of alcohol

Ref: Harrison, 19th ed. pg. 2727

71. Ans. (a) Severity of respiratory and CNS depression

Ref: Harrison, 19th ed. pg. 2727

- CNS depression predisposes to chances of aspiration due to suppression of airway defence mechanisms. Hence it is the most important parameter determining hospitalization in acute intoxication of any etiology.

Acute Alcohol intoxication:

- After a brief period excitation, there is a generalized central nervous system depression with alcohol use.
- With increasing intoxication, there is increased reaction time, slowed thinking, distractibility and poor motor control.
- Later, dysarthria, ataxia and incoordination can occur. There is progressive loss of self control with frank disinhibited behavior.

- The duration of intoxication depends on the amount and the rapidity of ingestion of alcohol. Usually the signs of intoxication are obvious with blood levels of 150–200 mg %. With blood alcohol levels of 300–450 mg % increasing drowsiness followed by coma and respiratory depression develop.

72. Ans. (c) Cocaine

Ref: Harrison, 19th ed. pg. 469e-1

- Cannabis and its products contain (-) D-9 TetraHydro Coannabinol (Δ^9 -THC).
- It is obtained from Indian hemp plant known as cannabis Sativa.
- Different parts of plants have different product:
 - Dried leaves: *Bhang*
 - Dried female inflorescence: *Ganja*
 - Resinous extract from flowering tops: *Charas / Hashish*
 - *Marijuana/Marihuana: other name for cannabis*
- In case of cannabis abuse there is an episode of acute violent behavior for which the person claims amnesia. This is known as **Run Amok**.

Extra Mile

Substance	Characteristic clinical feature
• Cocaine	Magnus symptoms (cocaine bugs or Tactile hallucination)
• Cannabis	<ul style="list-style-type: none"> • Run Amok • Amotivation syndrome • Flashbacks
• Alcohol	<ul style="list-style-type: none"> • Mc-Evan's sign • Morbid jealousy
• LSD	<ul style="list-style-type: none"> • Bad Trips • Flash backs
• Amphetamine	Paranoid Halucinatory syndrome (like paranoid schizophrenia)
• Phencyclidine (Angel dust)	Dissociative anesthesia

73. Ans. (a) Smoking

Ref: Harrison, 19th ed. pg. 17, 266e-4

- Alcohol is the most common substance abused in India and worldwide.
- Early and rapid addiction has been seen with SMOKING
- Most common illicit drug/substance abused: Cannabis > Amphetamine (2nd MC).
- Nicotine (tobacco/smoking): Highly addictive and heavily used drug/substance

74. Ans. (d) LSD

Ref: Harrison, 19th ed. pg. 469e-4

- LSD intoxication causes *bad trips*, which is acute panic reaction in which the individual experience a loss of control over his self.
- Spontaneous recurrence of LSD, or sometimes cannabis use experience even during a withdrawal state is known as *Flash back*.

75. Ans. (b) 21–34

Ref: O.P. Ghai 8th ed./584-85

Categories of mental retardation based on IQ levels

Mental retardation	IQ range
Mild MR	50-69
Moderate MR	35-49
Severe MR	21-34
Profound MR	20 or below

ANSWERS TO BOARD REVIEW QUESTIONS

76. Ans. (a) Response prevention

Ref: Kaplan and Sadocks 10th ed p 953

77. Ans. (c) Delusion of persecution

Ref: Kaplan 10th ed p 468

78. Ans. (c) Auditory hallucination

Ref: Kaplan and Sadocks Synopsis of Psychiatry, 10th ed ch-13

79. Ans. (c) Kraepelin

Ref: Kaplan 10th ed p 467

80. Ans. (b) **Impulse control disorder**

Ref: Kaplan and Sadocks 10th ed p 25

81. Ans. (b) **Derealisation**

Ref: Kaplan and Sadocks 10th ed ch-20, Oxford Handbook of Psychiatry by david Semple, Roger Smyth, Jonathan Burns p 372

82. Ans. (a) **Personality disorder**

83. Ans. (a) **Increase sense of Restlessness and anxiety**

84. Ans. (c) **Alcohol addiction**

85. Ans. (a) **Agoraphobia**

86. Ans. (a) **Anxiety**

87. Ans. (d) **Delusions**

88. Ans. (d) **Steven Johnson syndrome**

Squeeze technique is used in premature ejaculation

Radiology

MOST RECENT QUESTIONS 2019

1. Comment on the diagnosis of CT chest shown below.

- a. Aortic dissection
- b. Pulmonary embolism
- c. Cardiac myxoma
- d. Aortic aneurysm

2. Which is used for calculation of ejection fraction?

- a. MUGA
- b. SPECT using thallium 201
- c. PET myocardial perfusion imaging
- d. Sestamibi scan with pharmacological stress

3. The shown radiograph is a case of:

- a. Diaphragmatic hernia
- b. Intestinal obstruction
- c. Pleural effusion
- d. Pneumonia

4. Maximum radiation exposure:

- a. X-ray abdomen
- b. HSG
- c. IV Angiography
- d. Barium enema

5. All of the following areas are scanned in FAST except:

- a. Pericardium
- b. Pleural cavity
- c. Spleen
- d. Liver

6. In the shown lateral view of chest X-ray, what is the structure marked with X or white arrow head?

- a. Esophagus
- b. Pulmonary artery
- c. Trachea
- d. Left atrium

7. A patient presented with complaints of low grade fever with dyspnoea. The shown X-ray is suggestive of:

- a. Consolidation
- b. Exudative pleural effusion
- c. Pneumothorax
- d. Hydropneumothorax

BASIC RADIOLOGY PRINCIPLES AND RADIOTHERAPY

8. Which of the following investigations work on the same principle? *(Recent Pattern Question 2018-19)*

- a. CT and MRI b. CT and X-ray
c. USG and HIDA scan d. MRI and PET scan

9. Which of the following investigation must be performed before giving contrast to the patient? *(Recent Pattern Question 2018)*

- a. K.F.T b. L.F.T
c. Urine specific gravity d. Serum electrolytes

10. What is the gold standard investigation of choice for deep vein thrombosis? *(Recent Pattern Question 2017)*

- a. Double contrast duplex b. Venography
c. CT scan d. MRI

11. The shown image modality is: *(Recent Pattern Question 2017)*

- a. PET- CT scan b. PET-MRI
c. CECT d. X-ray

12. What is this image called *(Recent Pattern Question 2016)*

- a. Orthopantogram b. Lateral cephalogram
c. Towns view d. Stenver view

13. Loss of proton and electron both when rays travel through the body:

- a. Compton effect
b. Loss of linear energy
c. Loss of biological dose
d. Photoelectric effect

14. Maximum penetrating rays:

- a. Alpha b. Beta
c. Gamma d. Delta

15. Unit of radiation exposure:

- a. Rad b. Gray
c. Sievert d. Roentgen

16. Iridium 192 half life is?

- a. 2.7 days b. 8 days
c. 74 days d. 16 hours

17. Radioiodine 131 half life is?

- a. 8 days b. 15.7 days
c. 74.3 days d. 13 hours

18. Half- life of cobalt-60 is?

- a. 53 years b. 5.3 years
c. 0.53 years d. 7.8 years

19. Half- life of radium 226 is?

- a. 15.9 years b. 159 years
c. 1620 years d. 15900 years

20. Radioisotope used for thyroid treatment of metastasis/ablation

- a. I-123 b. I -131
c. I-83 d. I-90

21. The radioisotope used for ablation of thyroid gland is

- a. Iodine 123
b. Iodine 125
c. Iodine 131
d. Technetium 99 pertechnetate

22. Which of the following is not used as a Radioisotope:

- a. Iodine-131 b. Caesium-137
c. Iridium-192 d. Iodine-135

23. Who discovered gamma knife?

- a. Rutherford b. Roentgen
c. Leksell d. John R Adler

24. PET scan isotope is:

- a. Phosphorus-32 b. 18-fluoro-deoxyglucose
c. Iridium-77 d. Radium-226

25. Ionizing radiation with maximum penetration is:

- a. Alpha particles b. Beta particles
c. Gamma rays d. Microwaves

26. Purely beta emission comes from:

- a. P 32 b. I 131
c. Cobalt 60 d. Ra 226

27. Occupational radiation exposure allowed per year to Indian population?

- a. 2 mSv b. 5 mSv
c. 10 mSv d. 20 mSv

28. Which of the following is a functional investigation:

- a. CT scan b. MRI
c. USG d. PET scan

29. Gadolinium is a contrast agent used for:

- a. CT - angiography b. Bronchography
c. MRI - Imaging d. Contrast Sonography

30. Absolute contraindication for MRI:

- a. Pacemaker b. Claustrophobia
c. Penile prosthesis d. Joint replacement

31. Correct regarding B-scan on ultrasound is
 - a. 2D image
 - b. 3D image
 - c. Visualizing blood flow
 - d. All of above
32. Which phase of the cell cycle is most sensitive to radiotherapy:
 - a. G₂M phase
 - b. S phase
 - c. M phase
 - d. G₁ phase
33. Most common complication of radiotherapy of head and neck cancer?
 - a. Dryness of mouth
 - b. Jawbone necrosis
 - c. Odynophagia
 - d. Bleeding
34. The most radio sensitive tumor among the following is:
 - a. Small cell lung cancer
 - b. Seminoma
 - c. Soft tissue sarcoma
 - d. Osteosarcoma
35. Maximum radiation exposure occurs in:
 - a. Bone scan
 - b. MRI
 - c. CT scan
 - d. X-ray
36. Which of the following is a non-iodinated contrast?
 - a. Gadolinium
 - b. Visipaque
 - c. Iopamidol
 - d. Ditrizoate
37. All of the following about MRI are correct EXCEPT:
 - a. MRI is useful for localizing small lesions in the brain
 - b. MRI is useful for evaluating bone marrow
 - c. MRI is better for calcified lesions
 - d. MRI is contraindicated in patients with pacemakers

UROLOGY AND BONE IMAGING

38. Which of the following is a gold standard investigation for diagnosis of renal stone? *(Recent Pattern Question 2018)*
 - a. USG
 - b. Helical CT with Non-contrast
 - c. Helical CT with Contrast
 - d. MRI
39. Identify the bone marked with arrow: *(Recent Pattern Question 2017)*

- a. Radius
- b. Ulna
- c. Humerus
- d. Clavicle

40. On IVP this image was obtained. What is the diagnosis? *(Recent Pattern Question 2017)*

- a. Horse shoe kidney
 - b. Duplex collecting system
 - c. Cross fused ectopic kidney
 - d. Polycystic kidney
41. MRI spine shows following finding. What is the diagnosis? *(Recent Pattern Question 2017)*

- a. Osteoporosis
 - b. Metastasis
 - c. TB spine
 - d. Osteopetrosis
42. X-ray pelvis image is shown. What is the structure marked with arrow? *(Recent Pattern Question 2017)*

- a. Acetabulum
 - b. Obturator foramen
 - c. Ischial foramen
 - d. Symphysis pubis
43. Ring sign is seen on urography. What is the diagnosis of the patient is? *(Recent Pattern Question 2017)*
 - a. Hydronephrosis
 - b. Polycystic kidney
 - c. Papillary necrosis
 - d. Renal cell carcinoma

44. Which of the following condition is most predisposed for contrast nephropathy:

- a. Diabetes
- b. Hypertension
- c. Malignant hypertension
- d. Hypertensive glomerulosclerosis

45. Which of the following cancer is LEAST LIKELY to occur secondary to radiation exposure:

- a. Hepatocellular CA
- b. Renal cell CA
- c. Stomach CA
- d. Colon CA

46. Ring sign is seen on Urography film in a diabetic is due to?

- a. Hydronephrosis
- b. Polycystic kidney
- c. Papillary necrosis
- d. Emphysematous pyelonephritis

47. Spider leg sign on IVP suggests:

- a. Renal stone
- b. Polycystic kidney
- c. Hypernephroma
- d. Hydronephrosis

48. Spider-leg deformity of pelvicalyceal system on intravenous urography (IVU) is a constant feature of:

- a. Tuberculosis
- b. Renal cell carcinoma
- c. Polycystic disease
- d. Wilm's tumor

49. Adder head on I.V.P. is seen in:

- a. Ureterocoele
- b. Cystocele
- c. Enterocoele
- d. Omentocoele

50. Which of the following investigation is preferred for diagnosis of vesicoureteric reflux:

- a. Intravenous urography
- b. Micturating cystourethrogram
- c. Retrograde pyelography
- d. Ultrasonography

51. Crew cut appearance on X ray skull is seen in:

- a. Thalassemia
- b. Megaloblastic anemia
- c. Autoimmune hemolytic anemia
- d. Dimorphic anemia

52. Bone within a Bone appearance is seen in:

- a. Osteo-necrosis
- b. Osteoporosis
- c. Osteopetrosis
- d. Osteomyelitis

53. 'Hair on end' appearance in skull X-ray is characteristic of:

- a. G6PD deficiency
- b. Sickle cell anemia
- c. Rickets
- d. Scurvy

54. Martel sign is seen in

- a. Gout
- b. Ankylosing spondylitis
- c. Osteoarthritis
- d. Rheumatoid arthritis

55. Nuchal thickness is evaluated in:

- a. Ante natal USG first trimester
- b. Prenatal USG screening
- c. Antenatal USG second trimester
- d. Antenatal USG third trimester

ABDOMEN IMAGING

56. Investigation of choice for acute cholecystitis is:

(Recent Pattern Question 2018-19)

- a. H.I.D.A scan
- b. USG
- c. CT scan
- d. Biopsy

57. Investigation of choice for GERD:

(Recent Pattern Question 2018-19)

- a. USG
- b. HIDA
- c. Manometry
- d. 24-hour pH monitoring

58. Comment on the diagnosis of the image shown below

(Recent Pattern Question 2018)

- a. Apple core appearance
- b. Claw sign
- c. Coffee bean appearance
- d. String sign of Kantor

59. Name the structure marked with arrow:

(Recent Pattern Question 2017)

- a. Right kidney
- b. Left kidney
- c. Spleen
- d. Stomach

60. A 7-year-old child presented with abdominal pain, fever and jaundice. CT abdomen is given below. What is the most likely diagnosis? (Recent Pattern Question 2017)

- a. Amebiasis
- b. Hemangioma
- c. Hepatoma
- d. Hydatid cyst

61. Identify the organ shown with an arrow

(Recent Pattern Question 2016)

- a. Spleen
- b. Kidney
- c. Stomach
- d. Liver

62. Most useful investigation of choice for liver abscess is

- a. Exploratory laparotomy
- b. Ultrasound
- c. Liver enzymes
- d. Parasite in the stool

63. Normal thickness of gallbladder wall:

- a. 1 mm
- b. 1 cm
- c. 3 mm
- d. 5 cm

64. Thumb print on barium is seen in:

- a. Volvulus
- b. Ischemic colitis
- c. Crohn's disease
- d. Intussusception

65. Diagnosis of the given X-ray of abdomen:

- a. Small intestine obstruction
- b. Pneumointestinalis
- c. Sigmoid volvulus
- d. Intussusception

66. Double bubble sign is seen in:

- a. Duodenal atresia
- b. Jejunal atresia
- c. Ileal atresia
- d. Hypertrophic pyloric stenosis

67. Double barrel sign is seen in?

- a. Primary Sclerosing cholangitis
- b. Primary Biliary cirrhosis
- c. Obstructive jaundice
- d. Duodenal atresia

68. Cobble stoning of intestine with string of kantor is seen in :

- a. Crohn's disease
- b. Ulcerative colitis
- c. Ischemic colitis
- d. Amoebic colitis

69. Pipe stem colon on barium enema is seen with:

- a. Crohn's disease
- b. Ulcerative colitis
- c. Ischemic colitis
- d. Irritable bowel syndrome

70. Target sign is seen in:

- a. Ischemic colitis
- b. Meckel's Diverticulum
- c. Intussusception
- d. Volvulus

71. Cork screw appearance on barium swallow is seen in:

- a. Achalasia cardia
- b. Diffuse esophageal spasm
- c. Zenker's diverticulum
- d. Scleroderma

72. IOC for neonatal hypertrophic pyloric stenosis:

- a. X-ray
- b. CT scan
- c. MRI
- d. Ultrasound

73. Saw tooth appearance is seen in:

- a. Diverticulosis
- b. Cholecystitis
- c. Appendicitis
- d. Hiatus hernia

74. Apple core appearance on barium enema is seen in?

- a. Carcinoma colon
- b. TB caecum
- c. Crohns disease
- d. Ulcerative colitis

75. IOC acute pancreatitis:

- a. Contrast CT
- b. USG
- c. Serum lipase
- d. Serum amylase

76. Sentinel loop on X-ray:

- a. Meckel's diverticulum
- b. Acute cholecystitis
- c. Acute mesenteric adenitis
- d. Acute pancreatitis

77. A patient presents with right hypochondrium pain. Which of the following investigations should be done:

- a. CT
- b. MRI
- c. USG
- d. Cholecystogram

78. RTA brought in casualty. On examination liver rupture is suspected. Which of the following investigation is to be done first?

- a. CT
- b. MRI
- c. USG
- d. Peritoneal lavage

79. Identify the image:

- a. Digital X-Ray
- b. CT
- c. PET scan
- d. USG

THORAX IMAGING

80. Identify the pathology in the given X-ray:

(Recent Pattern Question 2018-19)

- a. Pneumothorax
- b. Pneumoperitoneum
- c. Hydrothorax
- d. Normal X-ray

81. The following image shows:

(Recent Pattern Question 2018-19)

- a. Achalasia cardia
- b. Diffuse oesophageal spasm
- c. Carcinoma Oesophagus
- d. Schatzki's Ring

82. The Lateral view X-ray lung shows:

(Recent Pattern Question 2018)

- a. Major fissure
- b. Minor fissure
- c. Azygos fissure
- d. Transverse fissure

83. Comment on the diagnosis:

(Recent Pattern Question 2017)

- a. Hydrothorax
- b. Pneumothorax
- c. Pleural effusion
- d. Hydropneumothorax

84. CT chest is as shown below. What is the diagnosis?

(Recent Pattern Question 2017)

- a. Bronchiectasis
- b. Pneumonia
- c. Pulmonary TB
- d. COPD

85. The shown investigation is:

(Recent Pattern Question 2017)

- a. Barium enema
- b. Barium swallow
- c. Plain X-ray
- d. Fluoroscopy

86. Identify the pathology in the given chest X-ray:

(Recent Pattern Question 2017)

- a. Tetralogy of Fallot
- b. Transposition of great arteries
- c. Pericardial effusion
- d. Total anomalous pulmonary venous return

87. In the CECT shown below what is the structure marked with arrow?

(Recent Pattern Question 2017)

- a. Aorta
- b. Trachea
- c. Descending aorta
- d. Main pulmonary artery

88. The arrow at CXR points to?

(Recent Pattern Question 2017)

- a. Left atrium
- b. Left atrial appendage
- c. Lingular lobe lung
- d. Aortic knuckle

89. The following image shows

(Recent Pattern Question 2016)

- a. Pulmonary edema
- b. CT ratio being measured
- c. Atelectasis
- d. Bronchiectasis

90. In a patient with bronchopneumonia lung, finding on CXR

(Recent Pattern Question 2016)

- a. Patchy consolidation
- b. Diffuse consolidation
- c. Mediastinal shift
- d. Massive pleural effusion

91. All of the following are true in chest X-ray PA view EXCEPT:

- a. Right ventricle forms the right heart border
- b. Left ventricle forms the left heart border
- c. Cardiothoracic ratio in adults is normally 50% or less than that
- d. Right atrium forms the right heart border

92. Trans-esophageal echocardiography is better than trans-thoracic Echocardiography because of better evaluation of?

- a. Diastolic dysfunction
- b. Left ventricular hypertrophy
- c. Systolic function
- d. Left atrial appendage clots

93. Most common congenital cardiac anomaly diagnosed in adulthood:

- a. ASD
- b. VSD
- c. PDA
- d. TAPVR

94. Box shaped heart is seen in which of the following condition:

- a. Coarctation of aorta
- b. Pericardial effusion
- c. Tetralogy of fallot
- d. Ebstein anomaly

95. Curschmann spirals and flattening of diaphragm is seen in:

- a. Asthma
- b. COPD
- c. Silicosis
- d. Pulmonary embolism

96. Flexible Bronchoscope contains holes for all of these functions EXCEPT?

- a. Ventilation
- b. Drainage of secretion
- c. For biopsy
- d. To remove foreign body

97. Hampton hump is seen in:

- a. Pulmonary TB
- b. Bronchogenic carcinoma
- c. Pulmonary embolism
- d. Pulmonary hemorrhage

98. Westermarck's sign is seen in:

- a. Pulmonary embolism
- b. Pulmonary sequestration
- c. Pulmonary alveolar proteinosis
- d. A.B.P.A (Allergic Broncho-pulmonary Aspergillosis)

99. Continuous diaphragm sign is seen on X-ray. Diagnosis is?

- a. Pneumopericardium
- b. Pneumomediastinum
- c. Pneumothorax
- d. Pericardial abscess

100. Air Bronchogram is seen in:

- a. Pneumonia
- b. Pleural effusion
- c. Pneumothorax
- d. Pneumo-peritoneum

101. IDENTIFY: (X-ray chest showing big mass on left upper lobe, touching sternum)

- a. Lung carcinoma
- b. Hydatid cyst
- c. Lung Abscess
- d. Aspergilloma

102. Golden S sign is seen in:

- a. Bronchogenic carcinoma with collapse of lung
- b. Traction Bronchiectasis with apical scarring
- c. Emphysema with increased lucency and flattened diaphragm
- d. Pulmonary edema

103. Pop-corn calcification is seen with?

- a. Pulmonary tuberculosis
- b. Pulmonary hamartoma
- c. Klebsiella infection
- d. Foreign body

NEUROLOGY IMAGING

104. Identify the pathology in the shown CT:

(Recent Pattern Question 2018-19)

- a. Intraventricular bleed
- b. Massive Epidural hemorrhage
- c. Subdural hemorrhage
- d. Subarachnoid haemorrhage

105. Identify the image given below

(Recent Pattern Question 2018)

- a. Lateral ventricle
- b. Corpus callosum
- c. 3rd ventricle
- d. 4th ventricle

106. Angiography of brain blood vessels of brain as is shown in image. Identify the artery marked with arrow?

(Recent Pattern Question 2017)

- a. Anterior communicating artery
- b. Posterior cerebral artery
- c. Middle cerebral artery
- d. Internal carotid artery

107. In the given imaging, what is the structure marked with arrow?

(Recent Pattern Question 2017)

- a. Midbrain
- b. Pons
- c. Medulla
- d. Cerebellum

108. Most common investigation done in brain tumor

(Recent Pattern Question 2016)

- a. CT
- b. MRI
- c. Digital X-ray
- d. USG

109. IOC for sub-arachnoid hemorrhage

- a. CT scan
- b. MRI
- c. Lumbar puncture
- d. MRA

110. Extradural hemorrhage is seen as:

- a. Hypodense bi concave
- b. Hypodense bi convex
- c. Hyperdense bi concave
- d. Hyperdense bi convex

111. Intracranial calcification is best diagnosed by:

- a. Plain X-ray skull
- b. CT scan
- c. FDG-PFT scan
- d. MRI

112. The investigation of choice for meningeal carcinomatosis in CNS is:

- a. Enhanced MRI
- b. SPECT
- c. PET
- d. NCCT

MAMMOGRAPHY

113. The most appropriate technique for mammography is:

- a. Spot Compression view
- b. Medial lateral oblique view
- c. Lateral view
- d. Bird's eye view

114. Which one of the following statements regarding mammography is FALSE:

- a. It can detect 95 % of early breast cancers
- b. Normal mammogram rules out breast cancer
- c. The sensitivity of this investigation increases with age as the breast becomes less dense.
- d. Mammography is a safe investigation even after radiation exposure.

OBSTETRICAL IMAGING

115. Father of obstetrical ultrasound:

- a. Ion Donald
- b. John Wild
- c. Doppler John
- d. Hounsfield

116. By ultrasonography, the earliest sign of conception is:

- a. Small white gestational ring
- b. Presence of foetal pole
- c. Presence of yolk sac
- d. Presence of cardiac pulsations

BOARD REVIEW QUESTIONS

1223

- 117. Half-life of tritium is?**
 a. 6 hours b. 3 days
 c. 10 months d. 12 years
- 118. Colon cut off sign is seen in?**
 a. Carcinoma colon b. Pancreatitis
 c. Sigmoid valvulus d. Diverticulosis
- 119. Chain of lakes appearance is seen in?**
 a. Chronic pancreatitis
 b. Acute pancreatitis
 c. Gall stone ileus
 d. Sub-acute intestinal obstruction
- 120. Double atria shadow is a feature of enlargement of?**
 a. Left atria enlargement b. Right atrial enlargement
 c. Right ventricular enlargement
 d. Left ventricular enlargement
- 121. Palla sign is?**
 a. Enlarged right descending pulmonary artery
 b. Enlarged left descending pulmonary artery
 c. Bilateral wedge shaped lung infarction
 d. Elevated hemi-diaphragm
- 122. Bulging fissure sign is seen in**
 a. Friedlander's pneumonia b. Pneumonia alba
 c. Psittacosis
 d. Broncho-alveolar carcinoma
- 123. Earliest radiological feature of raised ICT in children?**
 a. Sutural diastasis
 b. Posterior clinoid erosion
 c. Silver beaten appearance
 d. Sella erosion
- 124. MRI finding of face of panda appearance is seen in**
 a. Wilson disease b. Menke disease
 c. Huntington chorea d. Parkinsonism
- 125. Snow storm appearance on antenatal USG is seen in**
 a. Hydatiform mole
 b. Miliary TB
 c. Arnold chiari malformation
 d. Beckwith Wiedemann syndrome
- 126. Investigation of choice for diagnosis of dysphagia lusoria**
 a. CT angiography
 b. Barium swallow
 c. Esophageal manometry
 d. Barium meal follow through
- 127. String of beads sign is seen in**
 a. Crohn's disease b. Fibromuscular dysplasia
 c. Chronic pancreatitis d. Intestinal ileus
- 128. Bat wing appearance on CT scan is seen in**
 a. Joubert syndrome
 b. Pulmonary edema
 c. Pulmonary artery syndrome
 d. SVC syndrome
- 129. All are true about MRI EXCEPT?**
 a. Complex interaction of protons with magnetic fields
 b. Preferred contrast agent is gadolinium
 c. Cerebral edema is better seen on T2W
 d. FLAIR sequence shows low brain intensity
- 130. PET scan uses**
 a. 18-Fluorodeoxy-glucose b. 18-Fluorinated Glucose
 c. Iodinated contrast d. Gadolinium contrast
- 131. M.U.G.A scan is used for diagnosis of?**
 a. Ejection fraction b. GFR
 c. Cerebral oxygen uptake d. Pulmonary function test
- 132. Investigation of choice for Zollinger Ellison syndrome?**
 a. Endoscopic ultrasound b. Secretin study
 c. Basal acid output d. Upper GI endoscopy
- 133. Double barrel sign is seen due to?**
 a. Dilated CBD b. Dilated Portal vein
 c. Dilated Common Hepatic duct
 d. Dilated left hepatic duct
- 134. In the X-ray image,**
 a. Fat is darker than water
 b. Calcium is darker than air
 c. Bone is darkest
 d. Heart is darker than vertebra
- 135. The degree of blackness of a film is called**
 a. Spatial resolution b. Contrast
 c. Density d. Sharpness
- 136. Continuous diaphragm sign is seen in**
 a. Pneumothorax b. Pneumo-mediastinum
 c. Pneumo-peritoneum d. Subcutaneous emphysema
- 137. Stratosphere sign is seen in:**
 a. Pneumothorax b. Pleural effusion
 c. Pneumonia d. Consolidation
- 138. Reigler sign is seen in**
 a. Pneumoperitoneum
 b. Pneumothorax
 c. Renal abscess
 d. Retroperitoneal haemorrhage
- 139. Water lily sign in lung is seen with?**
 a. Echinococcus b. Paragonimus
 c. Ankylostoma d. Angiostrongyloides
- 140. Egg on side appearance of heart is seen in the radiograph of?**
 a. TAPVC b. TGA
 c. ASD d. VSD
- 141. Radionuclide scan done for Parathroid adenoma is?**
 a. Sesta MIBI scan b. Iodine-123 scan
 c. 99mTc-sulphur colloid d. Gallium scan
- 142. Millitary shadow in chest X ray is seen in all EXCEPT:**
 a. Millitary tuberculosis b. Tropical eosinophillia
 c. Asbestosis d. Metastasis

143. Radioisotope used in PET scan is?

- a. Technetium 99m b. Iodine 123
- c. Iodine 131 d. Fluoride-18

144. How much area is covered by spiral CT in 30 seconds?

- a. Entire organ b. Entire abdomen
- c. Entire trunk d. Whole body

145. Best investigation for diagnosing abdominal aortic aneurysm is?

- a. USG b. CT angiography
- c. Classical radiography d. Non contrast CT scan

146. Which of the following is the investigation of choice for dissecting aortic aneurysm?

- a. CECT b. PET
- c. MRI d. TEE

147. Dawson finger in brain seen in which condition?

- a. Cortical vein thrombosis b. Multiple sclerosis
- c. Lacunar infarcts d. Alzheimer's disease

148. Kerley B lines are seen in which part of chest X-ray?

- a. Upper portion
- b. Mid portion
- c. Peripheral lower
- d. Upper peripheral zone

149. Figure of 8 sign on X-ray is seen in?

- a. TAPVC b. TGA
- c. TOF d. Ebstein's anomaly

150. Investigation of choice for subdural hemorrhage is?

- a. Angiography b. NCCT
- c. CECT d. MRI

IMAGE-BASED QUESTIONS

151. Comment on the diagnosis.

(Most Recent Question 2019)

- a. Intussusception
- b. Malrotation
- c. Duodenal atresia
- d. Ileal atresia

154. The following CT shows:

- a. Liver laceration
- b. Kidney cyst
- c. Pancreas contusion
- d. Perforation peritonitis

152. Identify the lesion shown in the CT head of an unconscious unresponsive patient with GCS of 5.

- a. SAH and IVH
- b. Brain tumor
- c. Hydrocephalus
- d. Extradural and subdural hemorrhage

155. CT head shows?

- a. Brain tumor
- b. Brain infarction
- c. S.A.H
- d. I.V.H

153. Identify the lesion shown in the CT head of an unconscious unresponsive patient with GCS of 5.

- a. Extradural hemorrhage
- b. Subdural hemorrhage
- c. Subarachnoid hemorrhage
- d. Intraventricular hemorrhage

156. The following IVP shows presence of?

- a. Drooping lily sign
- b. Horseshoe kidney
- c. Duplication of kidney
- d. Normal scan

157. The cholangiogram shows?

- a. Klatskin tumor
- b. Gall stones
- c. Choledocholithiasis
- d. Porcelain gallbladder

158. A 3-year-old non-vaccinated child presented with fever and fast breathing. His mother told that he has recently developed measles rash. CXR shown below is indicative of which infection?

- a. Staphylococcus aureus
- b. Staphylococcus albus
- c. Streptococcal pneumoniae
- d. Streptococcal viridans

159. A neonate with Down syndrome is having bilious vomiting

- a. Duodenal atresia
- b. Congenital hypertrophic pyloric stenosis
- c. Ileal atresia
- d. Anorectal malformation

160. A 40-year-old intravenous drug abuser presents with Vomiting, Jaundice and Right Hypochondrium pain. USG abdomen shows presence of?

- a. Amoebic liver abscess
- b. Acute viral hepatitis
- c. Acute cholecystitis
- d. Hepatocellular carcinoma

161. Neonate with respiratory distress 6 hours after birth. CXR was performed. Diagnosis is?

- a. Meconium aspiration syndrome
- b. Congenital Pneumonia
- c. Bochdalek Hernia
- d. Transient Tachypnea of Newborn

162. A 3 days old neonate with abdominal distention and non-passage of stool. The X-ray done shown below is called?

- a. Invertogram
- b. Infantogram
- c. Babygram
- d. Double contrast barium study

163. Neonate with anoxic spells and single S2. CXR shows all EXCEPT?

- a. Boot shaped heart
- b. Pulmonary plethora
- c. Right sided aortic arch
- d. Right ventricular hypertrophy

165. The marked structure in chest X-ray is: (2018)

- a. Inferior vena cava
- b. Right atrium
- c. Right ventricle
- d. Superior vena cava

164. In the shown image, what is the marked line with B is which fissure: (2018)

- a. Minor fissure
- b. Major fissure
- c. Transverse fissure
- d. Azygous fissure

166. In the shown X-ray what is the name of structure marked: (2018)

- a. Aortic knob
- b. Left atrium
- c. SVC
- d. Pulmonary trunk

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) Aortic dissection

Ref: Harrison 20th ed. pg. 1921

The given image is of a CT chest showing intimal flap of aortic dissection and involves both ascending and descending aorta.

2. Ans. (a) MUGA

Ref: Harrison 20th ed. pg. 675

MUGA or Multiple Uptake Gated Acquisition Angiography and is used to assess LV function and Volume. Choices B, C and D are used for angiographically significant Coronary artery disease.

3. Ans. (a) Diaphragmatic hernia

- The shown image is suggestive of diaphragmatic hernia.
- Intestinal loop in thoracic cavity and absence of bowel loops in abdomen is highly suggestive of diaphragmatic hernia.

4. Ans. (d) Barium enema

Ref: Radiation dose in X-ray and CT exams; <https://www.radiologyinfo.org/en/pdf/safety-xray>

TABLE: Radiation exposure in different investigations

Procedure	Mean effective dose (mSv)
• Chest X-ray (PA View)	0.02
• Chest X-ray (PA + Lateral view)	0.1
• Mammogram	0.4
• Abdomen X-ray	0.7
• HSG	0.9 – 1.3
• CT Brain	2.2
• IVP	3
• ERCP	4
• Coronary angiography	7 (2–16)
• Barium enema	8 (2–18)

Contd...

Procedure	Mean effective dose (mSv)
• CT Colonography	6
• CT Abdomen and Pelvis	10
• Thallium scan	16.9

5. Ans. (b) Pleural cavity

Ref: Principle and Practice of Trauma Care by SK Kochar, P 51

- FAST scan is Focused Assessment with Sonography for Trauma
- It is a rapid, decision making scan done on the patients immediately at the time of trauma. It has sensitivity of ~90% and specificity of ~95%.
- Aim of this scan is to identify intraperitoneal free fluid (to rule out hemoperitoneum), which helps in precise decision making on immediate transfer of patient to operation theatre.
- Four regions that are mainly assessed by FAST scan are:
 - Pericardial/Subxiphoid view:** To rule out pericardial effusion
 - Right upper quadrant view/Perihepatic view/Morison pouch view:** to rule out fluid in the hepatorenal interface (morison pouch) due to hepatorenal trauma
 - Left upper quadrant/Perisplenic view:** To rule out fluid in perisplenic space due to spleen trauma
 - Pelvic/Suprapubic view:** This space (pouch of Douglas) is most dependent peritoneal space. It rules out bladder or other pelvic organ damage.
- Extension of FAST is eFAST, which includes scanning of pleural space also, to rule out any injury to lungs or pleural effusion.

6. Ans. (c) Trachea

- The structure in CXR lateral view is trachea. Refer to the image below

7. Ans. (b) Exudative pleural effusion

- The given X-ray shows massive pleural effusion. Since there is history of low grade fever and dyspnea, this can be secondary to some underlying pathology, producing exudative effusion.

BASIC RADIOLOGY PRINCIPLES AND RADIOTHERAPY

8. Ans. (b) CT and X-ray

- Out of given choices, CT and X-ray work on the same principle.
 - X-rays passed through the body are either absorbed or attenuated (weakened) at different levels
 - The image contains shadow of the dense tissues of body
 - If 3D image required, as in CT, a detector is placed opposite to radiation source → take pictures from different angles → reconstruction of image by computer.

Extra Mile

- **Working principle of other radiological procedures:**
 - **Ultrasound:** Uses sound waves (Piezoelectric effect)
 - **MRI:** Uses magnetic fields/radio-frequency waves
 - **Nuclear medicine:** Uses gamma rays
 - **PET scan:** Uses short-lived positron emitting isotopes (each positron gives two gamma rays)

9. Ans. (a) K.F.T

Ref: Harrison: 19th ed, P 1803

The contrast can lead to development of renal shutdown due to contrast nephropathy. Serum creatinine should be checked before any contrast study is performed. Adequate hydration of the patient can prevent such a mishap. Drug of choice for management of contrast nephropathy is N-acetyl Cysteine.

10. Ans. (b) Venography

- Duplex ultrasound is the **initial investigation of choice** in nearly all patients with suspected DVT.
- Its reliability is dependent upon the skill of the user.
- Major axial veins of the lower limb are well displayed.
- It has a sensitivity of 98.7% and specificity of 100% for above-knee DVT and a sensitivity of 85.2% and specificity of 98.2% for below-knee DVT.
- **Gold standard/Best test** for venous occlusion is **invasive venography**.

11. Ans. (a) PET-CT scan

- The shown image is of PET-CT.

- Shown below are three images. First image is of CT scan, second image PET scan. When these two images are superimposed, the image is said to be PET-CT.

12. Ans. (a) Orthopantogram

- An **orthopantogram** is a **panoramic or wide view X-ray of the lower face**, which displays all the teeth of the upper and lower jaw on a single film. It demonstrates the number, position and growth of all the teeth including those that have not yet surfaced or erupted.
- A **lateral cephalogram** is a **lateral or side view X-ray of the face**, which demonstrates the bones and facial contours in profile on a single film (image).

Figure: Lateral cephalogram

- **Town's view and stenoer view** is used to visualize the petrous part of the pyramids, the dorsum sellae and the posterior clinoid processes, which are visible in the shadow of the foramen magnum.

13. Ans. (a) Compton effect

Ref: Comprehensive Biophysics, 2014 ed. pg. 1

When X-rays travel through the body it can cause 2 effects:

- **Photoelectric effect and Compton effect.**
- The **photoelectric effect** is the observation that many metals emit electrons when light shines upon them.

FMGE Solutions Screening Examination

Compton Effect

- *Compton scattering* is the inelastic scattering of a photon by a charged particle, usually an electron. It results in a decrease in energy (increase in wavelength) of the photon (which may be an X-ray or gamma ray photon), called the *Compton effect*.
- This is the reason, it is advised to wear lead apron (*thickness- 0.5 mm*) in the procedure room.

14. Ans. (c) Gamma

Ref: Essentials of Radiological Science, 2nd ed. pg. 10

- *Maximum penetrating is gamma rays, therefore least dangerous. Hence gamma camera is used therapeutically for myocardial perfusion imaging.*
- *Least penetrating is alpha rays, therefore most dangerous*

15. Ans. (d) Roentgen

Ref: Essentials of Radiological Science, 2nd ed. pg. 3

- Unit of radiation exposure- **Roentgen** (SI = Coloumb/kg)
- Unit of absorbed radiation **RAD** (SI = GRAY)
- Unit of biologic effect of radiation **Rem** (SI = Sievert)

16. Ans. (c) 74 days

Ref: Basic Radiological Physics, 2nd ed. pg. 180

- Iridium-192, emits gamma rays. It has energy of 0.4 MeV.
- T_{1/2} of iridium 192: 74 days

Important Half Life of Radionuclides

- **Gold-198:** 2.7 days
- **Iodine-123:** 13.3 hours
- **Iodine-131:** 8 days
- **Phosphorus-32:** 14.3 days
- **Yttrium 90:** 64 hours
- **Cobalt-60:** 5.26 years
- **Caesium-137:** 30 years
- **Radium-226:** 1620 years

17. Ans. (a) 8 days

Ref: Basics Radiological Physics, 2nd ed. pg. 180

Please refer to above explanation

18. Ans. (b) 5.3 years

Ref: Basics Radiological Physics, 2nd ed. pg. 180

Please refer to above explanation

19. Ans. (c) 1620 years

Ref: Basics Radiological Physics, 2nd ed. pg. 180

Please refer to above explanation

20. Ans. (b) I-131

Ref: Sutton, 7th ed. pg. 1504

- **Iodine-131** has a radioactive decay half-life of about eight days.
- Iodine-131 exhibits a beta mode of decay, and leads to death in cells that it penetrates up to several millimeters and hence is useful for thyroid ablation.
- **I-123** has a half-life of 13.22 hours and is a radioactive isotope of iodine used in nuclear medicine imaging, including single photon emission computed tomography.

21. Ans. (c) Iodine 131

Ref: Sutton, 7th ed. pg. 1504

22. Ans. (d) Iodine-135

Ref: Essentials of Radiological Science, 2nd ed. pg. 15

- **Iodine-131** is used to treat the thyroid for cancers and other abnormal conditions such as hyperthyroidism
- **Iridium-192** can be implanted into cancers of the tongue.
- **Iodine-135** is an isotope of iodine which is an important isotope from the viewpoint of nuclear reactor physics. It is produced in relatively large amounts as a fission product, and decays to xenon-135, *which is a nuclear poison*.
- **Caesium-137** is another example of an implantable radioactive isotope used in the treatment of uterine or vaginal cancers.
- **Radium-223:** This is a new radioisotope used in treatment for secondary cancer in the bones.
- **Strontium-89 and samarium-153:** Used for treatment of secondary bone CA.

23. Ans. (c) Leksell

- The *Gamma Knife* is an advanced radiation treatment for adults and children with small to medium brain tumors. This surgery sometimes referred to as **stereotactic radio surgery** (SRS), is a non-invasive method for treating brain disorders. It is the delivery of a single, high dose of irradiation to a small and critically located intra-cranial volume through the intact skull.
- **Prof Rutherford-** Father of nuclear physics
- John R. Adler- Cyberknife therapy
- Wilhelm Röntgen- discovered X-rays.

24. Ans. (b) 18-Fluoro-deoxyglucose

Ref: Harrison, 19th ed. pg. 102e-12

- Radionuclides used in PET scanning are typically isotopes with short half-lives such as carbon-11 (~20 min), nitrogen-13 (~10 min), oxygen-15 (~2 min), fluorine-18 (~110 min), or rubidium-82 (~1.27 min).
- These radionuclides are incorporated either into compounds normally used by the body such as glucose (or glucose analogues), water, or ammonia, or into molecules that bind to receptors or other sites of drug action. Such labelled compounds are known as radiotracer.
- *At present, however, by far the most commonly used radiotracer in clinical PET scanning is fluorodeoxyglucose (also called FDG or fludeoxy-glucose), an analogue of glucose that is labeled with fluorine-18.*
- This radiotracer is used in essentially all scans for oncology and most scans in neurology, and thus makes up the large majority of all of the radiotracer (>95%) used in PET and PET/CT scanning.

25. Ans. (c) Gamma rays

Ref: Essentials of Radiological Science, 2nd ed. pg. 10

- **Alpha** particles are emitted from the nuclei of radioactive atoms and have high speeds and high energy and are the least penetrating. Their maximum range in air is about 10 cm and can be stopped by the outer layer of skin. If they enter the body, alpha emitters are hazardous to human health. As they disintegrate, they can damage tissue. The normal route of entry by alpha particles are inhalation, digestion and through wounds.
- **Beta** particles are also emitted from the nuclei of radioactive atoms, but they are much smaller in mass than alpha particles and have considerably more penetrating power. Beta emitters are capable of penetrating wood to 4 cm and the human body to 1 cm. Like alpha emitters, they are internal radiation hazards and have the same routes of body entry. They can be stopped by ordinary wall or a 1.3-cm thick sheet of aluminum.
- **Gamma** radiation originates in the nucleus of an atom. It can penetrate deeply into tissue, and may produce burns similar to deep sunburn, alter genes to cause mutations, and reduce the white blood cell count and encourage infections.
- **X-rays** cause cancer by inducing mutations. X-rays are a form of electromagnetic radiation that is produced when high-speed electrons strike the target material inside the X-ray tube. The quality of the X-ray, which is the power to penetrate through matter, depends upon the wavelength and the material being irradiated. Hard X-rays with short wavelengths will penetrate thick steel plate. Soft X-rays with long wavelengths are less penetrating.

- **Neutrons** are particles released upon the disintegration of radioactive isotopes. Neutron particles are highly penetrating and require heavy shielding. They are capable of penetrating the human body to several centimeters. Within the body the neutrons release excess energy which can cause tissue damage. Secondary releases of energy may also occur from alpha, beta, and gamma emitters released from the neutrons.

26. Ans. (a) P 32

- **Radioactive phosphorus:** Pure beta emission
 - Used in Bone tumor and polycythemia
- **Cobalt 60-** emits gamma rays
- **Radium-226-** Emits α , β , γ

27. Ans. (d) 20 mSv

Natural Radiation exposure	2.5 mSv
Yearly dose limit for public	1.0 mSv
Yearly dose limit for occupational workers	20 mSv
Dose level at which chromosomal aberrations can be measured	100 mSv
Dose at which nausea, vomiting may start	Approx 1000 mSv (1 Sv)
Dose level for 50% death of exposed population in 60 days	Approx 4,000 mSv (4Sv)

- The U.S. Nuclear Regulatory Commission (NRC) guidelines mandate-
 - To limit human-made radiation exposure for individual members of the public to 100 mrem (1 mSv) per year
 - To limit occupational radiation exposure to adults working with radioactive material to 5,000 mrem (50 mSv) per year
- The radiation exposure of occupationally exposed individuals is carefully monitored with the use of pocket-sized instruments called dosimeters.

28. Ans. (d) PET scan

- Positron emission tomography (PET) is a nuclear medical imaging modality that produces a three-dimensional image of functional processes in the body.
- The most common indication for a PET scan is to detect cancer metastasis.
- The technique operates on the principle of detecting gamma rays emitted indirectly by a positron-emitting radionuclide (tracer).
- Three dimensional imaging is done with the aid of a CT X-ray scan performed on the patient during the same session.

FMGE Solutions Screening Examination

- The biologically active molecule chosen for PET is FDG (18-Fluoro deoxy glucose), an analogue of glucose, the concentrations of tracer imaged will indicate tissue metabolic activity by virtue of the regional glucose uptake.
- **Also remember:** Functional magnetic resonance imaging or functional MRI (fMRI) is an imaging procedure that measures brain activity by detecting associated changes in blood flow. This technique relies on the fact that cerebral blood flow and neuronal activation are coupled. It is used for diagnosis of alzheimer's disease

29. Ans. (c) MRI-Imaging

Ref: Harrison, 19th ed. pg. 440

- **The most commonly used compounds for contrast enhancement are gadolinium-based** and they improve the visibility of internal body structures in magnetic resonance imaging.
- *MRI contrast agents alter the relaxation times of atoms within body tissues where they are present after oral or intravenous administration.*
- This relaxation emits energy which is detected by the scanner and is mathematically converted into an image.

- *Gadolinium containing MRI contrast agents are used for enhancement of vessels in MR angiography or for brain tumor diagnosis which is associated with the degradation of the blood-brain barrier.*

30. Ans. (a) Pacemaker

Ref: Harrison, 19th ed. pg. 440e-t

Contraindications of MRI

Absolute contraindication	Relative contraindication
<ul style="list-style-type: none">• Pacemaker• Metallic foreign body in the eye• Deep brain stimulator• Swan-Ganz catheter• Bullets or gunshot pellets• Cerebral aneurysm clips• Cochlear implant• Magnetic dental implants	<ul style="list-style-type: none">• AAA stent• Stapes implant• Implanted drug infusion device• Neuro or bone growth stimulator• Surgical clips, wire sutures, screws or mesh• Ocular prosthesis• Penile prosthesis• Joint replacement or prosthesis• Other implants, in particular mechanical devices

31. Ans. (a) 2D image

Modes of Ultrasound used in Medical Imaging

Mode	Principle	Application in practice
A-mode: (amplitude mode)	Simplest type of ultrasound. Single transducer scans a line through the body with the echoes plotted on screen as a function of depth	Therapeutic ultrasound aimed at a specific tumor or calculus to allow for pinpoint accurate focus of the destructive wave energy
B-mode (brightness mode)	Horizontal array of transducers scan a plane through the body that can be viewed as a two-dimensional image on screen.	Commonly known as 2D mode now
C-mode	C-mode image is formed in a plane normal to a B-mode image	Selects data from a specific depth from an A-mode line is used; then the transducer is moved in the 2D plane to sample the entire region at this fixed depth.
M-mode (motion mode) ultrasound	Pulses are emitted in quick succession and either an A-mode or B-mode image is taken.	Used to determine the velocity of specific organ structures like in valvular heart disease.
Doppler mode	Makes use of the Doppler effect in measuring and visualizing blood flow	Used in evaluation of buergers disease and valvular heart disease.

Also remember

Types of Doppler

- **Color Doppler:** Velocity information is presented as a color-coded overlay B-mode image
- **Pulsed wave (PW) Doppler:** Doppler information is sampled from only a small sample volume (defined in 2D image), and presented on a timeline.
- **Duplex:** a common name for the simultaneous presentation of 2D and (usually) PW Doppler information.

32. Ans. (a) G2M phase

- Dividing cells are most sensitive to radiotherapy. The phase that is most sensitive to radiation is G2M.

Remember the Sensitivity in this Order

G2M > G2 > M > G1 > early S > Late S

33. Ans. (a) Dryness of mouth

DRYNESS OF MOUTH is the most common complication noted in patients undergoing radiotherapy of head and neck CA.

Extra Mile

- Most radiosensitive tissue: **Bone Marrow**
- Least radiosensitive: **Nervous tissue**
- Most radiosensitive cell: **Lymphocyte**
- Least radiosensitive cell: **Platelets**
- Most sensitive phase of cell cycle: **G2-M phase**
- Least radiosensitive: **Late S2**
- Most radiosensitive cancer of head and neck: **Nasopharyngeal carcinoma**

34. Ans. (b) **Seminoma**Ref: Devita, 7th ed. p-1907

- **Most radiosensitive tumor:** HL > Ewing's
- **Most radiosensitive tumor of head and Neck:** Nasopharyngeal CA > Glottic CA

Radiosensitivity of tumors

Highly sensitive	Moderate sensitive	Relatively Resistant	Highly Resistant
<ul style="list-style-type: none"> • Ewing's sarcoma • Lymphoma • Wilms tumor • Multiple Myeloma • Seminoma 	<ul style="list-style-type: none"> • Nasopharyngeal CA • Dysgerminoma • Medulloblastoma • Small Cell Cancer lung • Breast Cancer • Ovarian Cancer • Basal cell cancer • Nasopharyngeal Cancer • Dysgerminoma • Small Cell Cancer lung • Breast Cancer • Ovarian Cancer • Basal cell cancer 	<ul style="list-style-type: none"> • Renal cell CA • Rectal/ colon cancer • Bladder Carcinoma • Soft tissue sarcoma • Squamous cell carcinoma of lung • Cervix cancer 	<ul style="list-style-type: none"> • Hepatoma • Melanoma • Pancreatic cancer • Osteosarcoma

35. Ans. (a) **Bone scan**Ref: Review of Radiology by Sumer Sethi, 5th ed. pg. 23.

- Radiation exposure for **CT Head** is equivalent to 115 CXR.
- CT whole Body is **around** 400 CXRs.
- Radiation exposure of **Bone Scan** is equivalent to 200 CXR.

36. Ans. (a) **Gadolinium**

- Gadolinium is a lanthanide.
- Gd-DTPA is classed as an acyclic, ionic gadolinium contrast medium.
- Its paramagnetic property reduces the T1 relaxation time.
- Gadolinium based agents may cause a toxic reaction known as *nephrogenic systemic fibrosis (NSF)* in patients with severe kidney problems.
- Rest all are iodinated contrast agents.

37. Ans. (c) **MRI is better for calcified lesions****MRI Versus CT**

- CT is superior to MRI for calcification and acute intracranial haemorrhage.
- Cortical bone is better evaluated by CT.

- **MRI is better for brain**, spine pathologies other than head injury, stroke, calcification, brain haemorrhage.
- MRI is better for bone marrow.
- **MRI is contraindicated in pacemakers**, cochlear implants, and metallic foreign bodies in sensitive locations.

UROLOGY AND BONE IMAGING38. Ans. (b) **Helical CT with Non-contrast**Ref: SRB Manual of Surgery, 5th ed. P 1190, 1107

- The best investigation for kidney stone and ureteric stone is non-contrast helical CT abdomen.
- The limitation of USG is that it is less sensitive and can scan only the kidney and proximal ureter.
- Helical CT can detect stones as small as 1 mm which can be missed by other modalities.

Extra Mile

IOC for Ureteric Stones is helical Non-contrast CT abdomen
 IOC for Polycystic kidneys is non-contrast CT/ MRI. Contrast may be used depending on level of renal function.
 Always check serum creatinine before giving contrast

39. Ans. (c) **Humerus**

- The structure shown in the image is humerus
- A very common tumor of humerus upper end is unicameral bone cyst/simple bone cyst, which is characterized radiologically by *trap door sign* or *falling leaf sign*

40. Ans. (b) **Duplex collecting system**

- The shown IVP finding in image is known as drooping lily sign, which is a characteristic finding of duplex ureter.

- The **drooping lily sign** is a radiological sign in patients with a duplicated collecting system. It refers to the inferolateral displacement of the opacified lower pole. The size of calyces in kidney is also smaller.

41. Ans. (c) **TB spine**

- Notice the vertebral body collapse, which is diagnostic of pott spine.
- IOC for Pott's spine: MRI
- The **earliest sign** of infection are local **osteoporosis of two adjacent vertebra and narrowing of intervertebral disc space**, with fizziness of end plates.
- Progressive disease is associated with signs of bone destruction and collapse of adjacent vertebral bodies into each other.

42. Ans. (b) **Obturator foramen**

(Revise the pelvic anatomy as shown on X-ray from this image given below)

43. Ans. (c) **Papillary necrosis**

- *Ring sign appearance by CT urography* or IVP shows radio-contrast outlines of sloughed renal papillae in *papillary necrosis*, which often have a triangular shape. Also remember:
- **Cortical ring sign:** A circular shadow cast by a rotated scaphoid in scapho-lunate subluxation which is due to scaphoid's abnormal orientation.

44. Ans. (a) **Diabetes**

Ref: Harrison, 19th ed. pg. 270e-9

- Contrast nephropathy is defined as a condition arising after an investigation using contrast agent.
- *A rise in serum creatinine level above 25% from baseline within 48-72 hours of procedure indicates contrast nephropathy.*
- Out of the given condition diabetes is most predisposed for contrast induced nephropathy.

45. Ans. (b) **Renal cell CA**

Ref: Harrison, 19th ed. pg. 263e-7

Cancers associated with high dose exposure include leukemia, breast, bladder, colon, liver, lung, esophagus, ovarian, multiple myeloma, and stomach cancers.

46. Ans. (c) **Papillary necrosis**

Ref: Harrison, 19th ed. pg. 1860

Refer to above explanation

47. Ans. (b) **Polycystic kidney**

Ref: Radiological and Imaging Secrets, 2nd ed. pg. 79

- Polycystic kidney autosomal dominant and recessive forms multiple cysts that deform the pelvi-calyceal system resulting in spider leg sign.
- MC extra-renal malformation in polycystic kidney disease = Hepatic cysts
- MC Cardiac malformation in polycystic kidney disease = Mitral valve prolapse
- MC GIT malformation in polycystic kidney disease = colonic diverticulosis

Extra Mile

Remember these Important Radiological Signs in Urology

- Spider leg appearance—polycystic kidney
- Cobra head appearance—ureterocele
- Flower vase appearance of ureters—horse shoe kidney
- Sandy patches—schistosomiasis of bladder
- Soap bubble appearance—hydronephrosis

48. Ans. (c) **Polycystic disease**

49. Ans. (a) **Ureterocele**

Ref: SRB Manual of Surgery, 4th ed. pg. 1279

The **adder head/cobra head sign** refers to dilatation of the distal ureter, surrounded by a thin lucent line, which is seen in patients with an adult-type **ureterocele**. The presence of this cobra head appearance is an indicator of ureterocele.

A ureterocele is a submucosal cystic dilation of the terminal segment of the ureter.

50. Ans. (b) **Micturating cystourethrogram**

Ref: SRB Manual of Surgery, 4th ed. pg. 1118

Steps in MCU

- Catheterization to fill the bladder with a radio-contrast agent, typically cystografin.
- Under fluoroscopy, we can see the contrast entering the bladder.
- If the contrast moves into the ureters and back into the kidneys, the radiologist makes the diagnosis of vesicoureteral reflux.

Indication of MCU

1. All males with recurrent UTIs, or abnormality on ultrasound if first UTI urinary tract infection
2. First episode UTI in females <3 years of age
3. Febrile UTIs in females <5 years of age
4. Older females with pyelonephritis or recurrent UTIs
5. Suspected obstruction (e.g. Bilateral hydronephrosis)
6. Suspected bladder trauma or rupture
7. Stress incontinence (urine)

51. Ans. (a) **Thalassemia**

Ref: Harrison, 19th ed. pg. 637

- Crew cut appearance in thalassemia occurs due to expansion of the marrow on account of extra-medullary hematopoiesis.
- **The widened diploic spaces on X-ray skull lateral view appears as Crew cut or hair on end appearance.**

52. Ans. (c) **Osteopetrosis**

Ref: Harrison, 19th ed. pg. 426e-4

- **Bone within a bone** describes the bones that appear to have another bone within them.

Causes: P.O.S.T-C.G.D

- Paget's disease of bone
- Osteopetrosis
- Sickle cell disease

- Thalassemia
- Caffey's disease
- Gaucher's disease
- Growth recovery lines (after infancy)
- Hypervitaminosis D

53. Ans. (b) **Sickle cell anemia**

- Hair on end appearance of the skull is a characteristic feature of chronic haemolysis usually seen in patients with thalassemia and sickle cell anaemia. It results from accentuated vertical trabeculae between the inner and outer tables of the skull because of excessive bone marrow hyperplasia.

Conditions where 'Hair on End Appearance' is seen:

Mnemonic: HI NEST

- Hereditary spherocytosis
- Neuroblastoma
- Enzyme deficiency (e.g. G-6-P deficiency causing haemolytic anaemia)
- Sickle cell disease
- Thalassemia major

54. Ans. (a) **Gout**

Ref: Harrison Rheumatology, 2006 ed. pg. 261

- **Martel sign or rat bite sign-** Sharply margined, bony erosions from a long-standing soft-tissue tophus, seen in X-Ray in a patients with gout.

55. Ans. (c) **Ante-natal USG second trimester**

- The **nuchal thickness** is a parameter that is measured in a second trimester scan (18–22 weeks) and it is not to be mixed with nuchal translucency (which is measured in the first trimester at 11-14 weeks).
- The **nuchal thickness** is measured in a second trimester scan.
- Nuchal translucency scan is performed between 11 and 14 weeks of gestation, because the accuracy is best in this period.

FMGE Solutions Screening Examination

- The scan is obtained with the fetus in sagittal section and a neutral position of the fetal head
- The head of the fetus should neither be hyper-flexed nor extended, either of which can influence the nuchal translucency thickness.
- Both are used for diagnosis of Trisomy 21 prenatally.

ABDOMEN IMAGING

56. Ans. (b) USG

- **USG is IOC for:**
 - Acute cholecystitis
 - Cholelithiasis, Renal stone
 - Intrauterine pathology
 - Intrauterine assessment of foetus
 - To see minimal pleural fluid/ascitic fluid
 - Hydrocephalus in infants
 - Congenital hypertrophic pyloric stenosis (CHOPS)
- Most sensitive and specific test for cholecystitis: HIDA scan

57. (d) 24-hour pH monitoring

- **IOC for GERD:** 24-hour pH monitoring
- It is the **most accurate/most sensitive/Gold standard** test for measuring pattern, frequency and duration of reflux episodes.
- It quantifies the actual time the esophageal mucosa is exposed to gastric juice

Extra Mile

- **Manometry:** IOC for motility disorders of esophagus (Ex: Achalasia cardia, diffuse esophageal spasm, corkscrew esophagus).
- **Uses of HIDA scan:**
 - Biliary atresia
 - Neonatal hepatitis (parenchymal liver disease)
 - Abnormal biliary leakage
 - Acute/Chronic cholecystitis

58. Ans. (a) Apple core appearance

Ref: SRB Manual of Surgery: 5th ed, P 905

- The image shows an appearance of an annular *constricting* carcinoma of the bowel, usually the colon form the circumferential involvement of lumen.
- The string sign of Kantor is seen in Crohn's disease at the junction of ileum entering into the caecum. In this image small intestine is not visualized.
- Claw sign is seen on barium enema in intussusception.
- Coffee bean sign is seen on X-ray abdomen in case of sigmoid volvulus.

59. Ans. (c) Spleen

Check out the structures on CT scan and their names in given image.

60. Ans. (d) Hydatid cyst

- **Hepatic hydatid disease** is a parasitic zoonosis caused by the *Echinococcus* tape worm. In the liver, two agents are recognised as causing disease in the human:
 - *Echinococcus granulosus*
 - *Echinococcus multilocularis*
- In the human manifestation the disease caused by echinococcus is most commonly localized to liver (in 75% of cases), followed by lungs (in 5–15% of cases) and other organs in the body such as the spleen, brain, heart, and kidneys (in 10–20% of cases).
- If the patient has cysts in the liver, symptoms abdominal discomfort, hepatomegaly with an abdominal mass, jaundice, fever and/or anaphylactic reaction.

Radiographic features:

- **Plain radiograph:** Shows a curvilinear or ring calcific shadow overlying the liver due to calcification of the pericyst.
- **Ultrasound:** Multiseptate cyst with “daughter” cysts and echogenic material between cysts.
- **CT scan:** Septation and daughter cysts may be visualised. The **water-lily sign** indicates a cyst with floating, undulating membrane, caused by a detached endocyst. It may also show hyperdense internal septa representing a **spoke wheel pattern** within a cyst.

Extra Mile

- Definitive host of echinococcus granulosus: Dog
- Intermediate host of echinococcus granulosus: Sheep
- **Accidental host for echinococcus granulosus is Man.**
- MCC of amoebic liver abscess is **Entamoeba histolytica**. This condition is mostly associated with alcoholic liver diseases (in ~ 80% of cases). M:F = 10:1
- MCC of pyogenic liver abscess in *E. coli*. associated with alcoholic liver disease in 20–30% cases. M:F = 1.5:1

61. Ans. (c) **Stomach**

For explanation, read the CT image

- Multiple questions have been framed on this image in last many exams.

62. Ans. (b) **Ultrasound**

Ref: Bailey & Love, 25th ed. pg. 69

- On ultrasound, an abscess cavity in the liver is seen as a hypoechoic or anechoic lesion with ill-defined borders; internal echoes suggest necrotic material or debris. The investigation is very accurate and is used for aspiration, both diagnostic and therapeutic.
- Where there is doubt about the diagnosis, a computerized tomography (CT) scan may be helpful.

Extra Mile

Diagnostic pointers for infection with *Entamoeba histolytica*

- Bloody mucoid diarrhoea in a patient from an endemic area or following a recent visit to such a place
- Upper abdominal pain, fever, cough, malaise
- In chronic cases, a mass in the right iliac fossa = **amoeboma**
- Sigmoidoscopy shows typical ulcers—biopsy and scrapings may be diagnostic
- Serological tests are highly sensitive and specific outside endemic areas
- **Ultrasound and CT scans are the imaging methods of choice.**

63. Ans. (c) **3 mm**

Ref: Clinical Sonography, 4th ed. pg. 88

- GB wall thickness Measured in the side in contact with the liver with the help of ultrasonography.
- Normally it is up to 3 mm.
- From 3–5 mm: suspicion of wall thickness
- More than 5 mm >>> It is a thick wall gall bladder which is seen in:

1. Cholecystitis (acute-chronic)
2. Ascites
- 3 Hepatitis (viral)
4. Schistosomiasis

Extra Mile

Size of GB

- Long axis 6–12 cm, short axis 3–5 cm
- Contracted < 5 cm
- Distended > 12 cm

64. Ans. (b) **Ischaemic colitis**

Ref: Harrison, 19th ed. pg. 267, 1857

- **Ischaemic colitis** occurs due to inflammation of the colon secondary to vascular insufficiency and ischaemia. Abdominal radiographic findings are include-
 - 'Thumb-printing' sign is due to mucosal edema and hemorrhage
 - Ileal Distention
 - Localized intramural gas

TABLE: Radiological findings and their respective pathology

Barium enema findings	Associated pathology
Apple core deformity	Colon CA
Irregular filling defect	
Bird beak sign, Ace of spades	Volvulus

Contd...

Barium enema findings	Associated pathology
Bird beak appearance	Achalasia cardia
Claw sign	Intussusception
Coiled spring sign	
Coffee bean sign	Sigmoid volvulus
Corkscrew appearance	Diffuse esophageal spasm
Nut cracker esophagus	
Curling esophagus	
Dilated proximal zone with narrow distal zone of coning	Hirschsprung disease
Inverted 3 sign of Frosberg	Pancreas head CA
Widening of C loop of duodenum/Antral pad sign.	
Lead pipe appearance	Ulcerative colitis
Loss of haustrations	
Rat tail appearance	Esophageal CA
String sign of Kantor	Crohn's disease
Raspberry thorn ulcers	
Smooth irregular filling defects	Colonic polyps
Saw tooth appearance	Diverticulosis of colon
Champagne glass sign	
String sign	Congenital hypertrophic pyloric stenosis
Thumb print sign	Ischemic colitis

65. Ans. (c) **Sigmoid volvulus**

Ref: *SRB Manual of Surgery, 4th ed. pg. 1329*

- The given image shows coffee bean sign, which is seen in sigmoid volvulus.

- It is a cause of large bowel obstruction and occurs when the sigmoid colon twists on the sigmoid mesocolon.

Clinical Presentation

- Constipation
- Abdominal bloating
- Nausea and/or vomiting

Causes

- Chronic constipation and/or laxative abuse
- Fibre-rich diet (especially in Africa)
- Chagas disease (especially in South America)

Treatment

- Rectal tube insertion is successful in treating 90% of cases.
- The most serious complication is bowel ischaemia.

66. Ans. (a) **Duodenal atresia**

Ref: *SRB manual of Surgery, 4th ed. pg. 1280*

- The diagnosis of duodenal atresia on X ray abdomen shows two large air filled spaces, called "**double bubble**" sign.
- The air is trapped in the stomach and proximal duodenum, which are separated by the pyloric sphincter, creating the appearance of two bubbles visible on X-ray.
- Since the closure of the duodenum is complete in duodenal atresia, no air is seen in the distal duodenum.

67. Ans. (c) **Obstructive jaundice**

Ref: *Abdominal Ultrasound, 3rd ed. pg. 82*

- Biliary dilatation is also easily seen on ultrasound, appearing as an extra tube running alongside the intrahepatic portal veins and hence gives an appearance of a double barrel gun aka **double-barrel sign**.

Extra Mile

Some important radiological signs

- Double bubble sign** is seen in (LAD): Ladd band/malrotation, Annular pancreas, Duodenal atresia
- Single bubble appearance:** pyloric stenosis
- Thumb print sign:** ischemic colitis
- Multiple air fluid level:** Ileal/Jejunal obstruction

68. Ans. (a) **Crohn's disease**

- Cobble stone mucosa** is appearance of the intestinal mucosa in Crohn's disease *to the endoscopist*. **Cobblestoning refers to the uniform nodules—due to the sub-mucosal fibrosis.**
- String sign of Kantor** is due to involvement of the terminal ileum in Crohn's disease.
- It is caused by severe spasm due to irritability of the loop producing the appearance of a frayed cotton string.
- Subsequently the wall of the ileum may become fibrotic and the lumen fixed in diameter.

69. Ans. (b) **Ulcerative colitis**

Barium Enema Findings in Ulcerative Colitis

- Earliest finding on air-contrast Barium enema is loss of and fine mucosal granularity.*

- *Pseudo-polyps* which are scattered islands of edematous mucosa in vast expanse of ulcerated mucosa
- Double-tracking- long, longitudinal ulcers in submucosa
- Bowel margins appear spicule like from tiny, multiple ulcerations
- Collar button ulcers-from undermining
- Shortening of the colon-may be from spasm of longitudinal muscles or from irreversible fibrosis (lead-pipe colon/ pipe stem colon)
- Loss of haustrations on left side of colon.

70. Ans. (c) Intussusception

Ref: SRB Manual of Surgery, 4th ed. pg. 996

- Target sign is seen in intussusception.
- Other signs which is seen in case of Intussusception are: Coiled spring appearance, claw sign.
- The appearance is generated by concentric alternating echogenic and hypo-echogenic bands. The echogenic bands are formed by mucosa and muscularis whereas the submucosa is responsible for the hypo-echoic bands.

Also Remember

- The **pseudo kidney** of intussusception refers to the longitudinal ultrasound appearance of the intussuscepted segment of bowel.
- **Coffee bean sign**: Sigmoid volvulus
- **Whirlpool sign on USG**: Midgut volvulus
- **Thumb print sign**: Ischemic colitis
- **Saw tooth appearance on barium enema**: Diverticula of colon
- **Seagull/Mercedes Benz/Crow Feet Sign**: Radiolucent gall stone with gas
- **Bird's beak appearance on barium swallow**: Achalasia cardia
- **Bird's beak appearance on barium enema**: Volvulus
- **Corkscrew appearance on barium swallow**: Diffuse esophageal spasm.
- **Beak sign; Double track or Tram track sign; Shoulder sign; String sign**: Hypertrophic pyloric stenosis.

71. Ans. (b) Diffuse esophageal spasm

Ref: SRB Manual of Surgery, 4th ed. pg. 1323

- **Cork screw appearance** on barium swallow is seen with diffuse esophageal spasm.
- **Bird beak appearance** is seen with achalasia cardia.
- **Rat tail appearance** as per Bailey and Love is seen with carcinoma esophagus.

72. Ans. (d) Ultrasound

Ref: SRB Manual of Surgery, 4th ed. pg. 877

- Ultrasound abdomen is the investigation of choice for diagnosing hypertrophic pyloric stenosis.

- It is reliable, highly sensitive, highly specific, and easily performed.
- The mandatory measurements include pyloric muscle thickness and pyloric channel length.
- *Muscle wall thickness 3 mm or greater and pyloric channel length 14 mm or greater are considered abnormal in infants younger than 30 days.*

73. Ans. (a) Diverticulosis

Ref: SRB Manual of Surgery, 4th ed. pg. 952

- Most common site of diverticulosis is the sigmoid colon in as many as 95% of patients with cecum being involved in 5% of patients.
- Reasons for sigmoid colon being the main site of diverticulosis and leading to saw tooth appearance-
 - Sigmoid colon is the narrowest portion of the colon, and generates the highest intra-segmental pressures
 - Combination of numerous haustra and dehydrated stool in the sigmoid colon leads to segmentation, in which the sigmoid colon functions as multiple small compartments.

Also Remember

TABLE: Pathologies and their radiological findings

Diverticulosis	Saw tooth appearance on barium enema
Intussusception	Claw sign on barium sign
Volvulus	Coffee bean sign /bird of prey sign
Ischemic colitis	Thumb printing sign

74. Ans. (a) Carcinoma Colon

Ref: Bailey, 26th ed. pg. 70

- On double contrast barium enema of the rectum and distal sigmoid colon demonstrates a typical annular constricting carcinoma of the colon with overhanging edges on both the proximal and distal margins forming a so called "apple-core" lesion.

75. Ans. (a) Contrast CT

Ref: Bailey, 26th ed. pg. 192, 1121

- CECT can be used to assess the severity of acute pancreatitis and to estimate the prognosis. Balthazar et al developed a grading system in which patients with acute pancreatitis are classified into one of the following 5 grades:
 - **Grade A** - Normal-appearing pancreas
 - **Grade B** - Focal or diffuse enlargement of the pancreas
 - **Grade C** - Pancreatic gland abnormalities associated with peri-pancreatic fat infiltration
 - **Grade D** - A single fluid collection
 - **Grade E** - Two or more fluid collections

76. Ans. (d) **Acute pancreatitis**

Ref: Bailey, 26th ed. pg. 1128-29

- The most commonly recognized radiologic signs associated with acute pancreatitis include the following:
 - Air in the duodenal C-loop
 - The sentinel loop sign**, which represents a focal dilated proximal jejunal loop in the left upper quadrant.
 - The colon cut-off sign**, which represents distention of the colon to the transverse colon with a paucity of gas distal to the splenic flexure.

77. Ans. (c) **USG**

Ref: Bailey, 26th ed. pg. 1100

78. Ans. (c) **USG**

Ref: Bailey, 26th ed. pg. 109

- In any case of blunt abdominal trauma, first investigation to be performed is ultrasonography.
- In emergency situation, USG technique used is FAST (Focussed Assessment with Sonography for Trauma).
- In FAST, the radiologist, immediately performs the USG abdomen keeping in mind to assess the four major areas to see any collection of fluid due to abdominal organ rupture.
- Four areas assessed in FAST:** Perihepatic area, Perisplenic area, Pericardial area, Pelvis
- Updated modality of FAST is eFAST (Extended FAST):** Pleural areas are also assessed along with superior mediastinal area.

79. Ans. (b) **CT**

THORAX IMAGING

80. Ans. (b) **Pneumoperitoneum**

- IOC for pneumoperitoneum:** Chest X-ray PA view in erect position (including diaphragm)

RADIOLOGICAL SIGNS OF PNEUMOPERITONEUM

- Gas under diaphragm sign:** Accumulation of gas under right side hemidiaphragm
- Mustache sign/Cupola sign/Saddle bag sign**
- Rigler sign:** Air outlining both internal and external intestinal wall
- Urachus sign:** Air outlining middle umbilical ligament
- Inverted V sign:** Air outlining both umbilical ligaments
- Falciform ligament sign:** Air surrounding falciform ligament (becomes prominent).

81. Ans. (b) **Diffuse oesophageal spasm**

- The finding shown in image is corkscrew esophagus, which is seen in patients with diffuse esophageal spasm (due to uncoordinated activity of esophageal smooth muscles).
 - This is possible due to fragmental degeneration of vagal nerve fibres

- Simultaneous and repetitive contraction in esophagus body with normal lower esophageal sphincter.

• **Clinical feature:**

- Chest pain, Non-progressive dysphagia with solids and liquids and non exertional chest pain, which responds to nitro-glycerine.

• **IOC for DES:** Manometry

• **Upon barium swallow:** Corkscrew appearance

- Similar to DES, there is **nutcracker esophagus** where there is high-amplitude peristalsis (>80 mm Hg) for increased duration.

Extra Mile

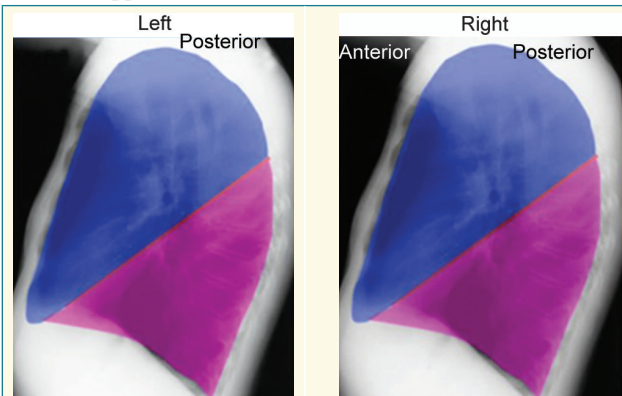

Other radiological findings of esophageal pathology

- Barium swallow:** Bird beak/Pencil tip: Achalasia cardia
- Barium swallow-rat tail appearance (with filling defect):** Achalasia cardia
- Barium swallow:** Worm eaten appearance: Esophageal varices

82. Ans. (a) **Major fissure**

Ref: Fundamentals of Radiology by Squire, P 136

The image shows left lung with **major fissure** separating the left upper lobe from the lower lobe.

Notice the major fissure in left lung segregating the upper and lower lobes. Compare with the image given below.

Notice the major fissure and minor fissures in right lung. Compare with the image given below.

Azygos fissure is seen as a curvilinear density in upper right lung, convex towards the chest wall. Azygos lobe is found as an anatomic variant in 1% of population.

Extra Mile

- Shift in the position of fissures is seen in segmental atelectasis
- **Comet tail sign:** Rounded atelectasis
- **S sign of golden:** Upper lobe atelectasis

83. Ans. (b) **Pneumothorax**

- The shown CT scan clearly shows air in the pleural cavity (arrow) around left lung. This condition is pneumothorax.
- In case of pleural effusion, the water will appear relatively white and at lower aspect on CT (*due to gravity*).

84. Ans. (a) **Bronchiectasis**

- The shown image of CT, is suggestive of bronchiectasis, characterized by tram *track sign of airways*.
- Bronchiectasis is an abnormal dilatation of airway.
- **Radiological findings:**
 - Tram track sign
 - Cluster of grape appearance
 - Signet ring sign

85. Ans. (b) **Barium swallow**

- The given imaging here is barium swallow, showing achalasia cardia.
- Barium swallow is done for esophageal pathology.
- Barium meal is for stomach and first part of duodenum.
- Barium meal follow through is for small intestine.
- Barium enema is for colon.

86. Ans. (a) **Tetralogy of Fallot**

- The given image shows boot shaped heart, which is a characteristic finding seen in Tetralogy of Fallot.

Also Remember**Radiological findings of congenital heart disease:**

- Figure of '8' appearance or Snowman appearance: TAPVR (type I)
- "Egg on its side" or "Apple on a stem" appearance: TGA (transposition of great arteries)
- **"Boot-shaped Heart"** /Classic coeur en sabot: TOF
- Box/Balloon shaped heart: Ebstein Anomaly
- '3 sign' and inferior rib notching on CXR: Coarctation of Aorta

87. Ans. (d) **Main pulmonary artery**

(Revise the chest CT anatomy from the image given below)

88. Ans. (d) **Aortic knuckle**

- Right border of heart is formed by—
 - Superior vena cava
 - The right atrium
 - Small part of inferior vena cava
- Left heart border is formed by—
 - Aortic nuckle
 - The pulmonary bay
 - The auricle of left atrium
 - The left ventricle.

89. Ans. (b) **CT ratio being measured****Cardiothoracic ratio**

- It is a estimation of cardiac size
- Vertical line is drawn through the midsternal line
- Maximal distances of the right and left heart borders from the midsternal line are added
- Greatest transverse diameter of thorax is obtained
- Normal value = $\leq 50\%$

FIGURE: Cardiothoracic ratio

90. Ans. (a) Patchy consolidation

- In bronchopneumonia there is patchy consolidation, no mediastinal shift.
- In lobar pneumonia there is diffuse consolidation.
- In collapse, there is mediastinal shift on the same side.
- In pleural effusion, there is contralateral mediastinal shift.

A

B

C

FIGURE: (A) Bronchopneumonia; (B) Lobar pneumonia; (C) Interstitial pneumonia

91. Ans. (a) Right ventricle forms the right heart border

Ref: Essential Radiology, 2nd ed. pg. 22

- Right ventricle is not a border forming structure in PA view. However, it forms anterior border in lateral view of Chest X-ray.

Right Heart Border

Superior vena cava
Right atrium
Inferior vena cava

Left Heart Border

Aortic knob
Main pulmonary trunk
Left ventricle

FIGURE: Heart border forming structures

92. Ans. (d) Left atrial appendage clots

Ref: Harrison, 19th ed. pg. 270e-2

T.E.E. is preferred over the routine Trans-thoracic echocardiography for the following situations:

1. Internal heart structures and path of blood flow in congenital heart disease is better evaluated.
2. To evaluate the effects of surgical intervention to the heart, such as repair of congenital heart defects.
3. When T.T.E is indicated, but circumstances (i.e., pulmonary disease like emphysema) that may interfere with the ability to obtain adequate images.
4. Mitral valve disease
5. Blood clots or masses inside the heart
6. Aortic Dissection
7. Implanted prosthetic heart valves
8. To evaluate for blood clots in the heart prior to cardioversion or ablation procedures.

93. Ans. (a) ASD

Ref: Harrison, 19th ed. pg. 1520

■ ATRIAL SEPTAL DEFECT (ASD)

- In atrial septal defect there is congenital defect in the interatrial septum.
- It is Most common CHD diagnosed in adulthood

TYPES Based on Defects with Different Locations Functionally the same

- *Primum*- lower part of the septum
- *Secundum*- located near the foramen ovale or fossa ovalis
- *Sinus venosus*- caval location
- *Coronary sinus*- least common → near SVC entry

Also Remember

- Most common CHD diagnosed in infancy- VSD
- 2nd OVERALL MOST COMMON CONGENITAL CARDIAC ANOMALY- VSD
- In VSD all chambers are enlarged EXCEPT: **Right Atrium**
- MC cyanotic congenital heart disease: **Tetralogy of Fallot (TOF)**
- 2nd most common cyanotic CHD after TOF- TGA
- Most common cause of cyanosis in neonate: **Transposition of Great arteries**
- Most common cause of congenital heart disease beyond the neonatal period: **Tetralogy of Fallot**

Radiological Features:

- All chambers are enlarged in ASD EXCEPT Left ventricle.
- **Increased vascularity:** Pulmonary artery over loading.
- Enlarged main (dilated MPA) and central pulmonary arteries

94. Ans. (d) Ebstein anomaly

Ref: *Pediatric Radiology, 1st ed. 57*

- **Ebstein anomaly** is a congenital heart defect in which the septal and posterior leaflets of the tricuspid valve are displaced towards the apex of the right ventricle of the heart.
- It causes atrialization of right ventricle.

Radiographic Features In Different Congenital Heart Diseases:

- Figure of '8' appearance or Snowman appearance: TAPVR (type I)
- Egg on its side" or "Apple on a stem" appearance: TGA
- **Boot-shaped Heart** /Classic coarctation: TOF
- **Box/Balloon shaped heart:** Ebstein Anomaly
- '3 sign' on CXR: Coarctation of Aorta

95. Ans. (a) Asthma

Ref: *Harrison, 19th ed. pg. 1675*

- Flattening of diaphragm is seen with obstructive airway diseases due to the process of air trapping.

- The point that clinches the diagnosis in favor of asthma is the curschmann spirals which represent the cast of the airways formed by mucus plugs in small airways in these patients.

96. Ans. (d) To remove foreign body

Ref: *Harrison, 19th ed. pg. 1667*

Foreign body is removed by rigid bronchoscopy.

Indications for Rigid Bronchoscopy

- Bleeding or hemorrhage
- Foreign body extraction
- Deeper biopsy specimen when fiber-optic specimen is inadequate
- Dilation of tracheal or bronchial strictures, relief of airway obstruction, insertion of stents, and pediatric bronchoscopy.
- It is also used for tracheobronchial laser therapy or other mechanical tumor ablation.

97. Ans. (c) Pulmonary embolism

Ref: *Harrison, 19th ed. pg. 1633*

HAMPTON HUMP is a radiologic sign which consists of a shallow wedge-shaped opacity in the periphery of the lung with its base against the pleural surface.

98. Ans. (a) Pulmonary embolism

Ref: *Harrison, 19th ed. pg. 1633*

Westermark sign is due to focus of oligemia in pulmonary embolism (PE). The sign develops due to following reasons:

- Dilation of the pulmonary arteries proximal to the embolus
- Collapse of the distal vasculature creating the appearance of a sharp cut off on chest X ray

The chest X-ray is normal in the majority of PE cases, the Westermark sign is seen in 2% of patients

99. Ans. (b) Pneumomediastinum

Ref: *Harrison, 19th ed. pg. 1720*

- Normally the central portion of the diaphragm is not discretely visualised on chest X-ray as it merges with the cardiac borders.
- However if the diaphragm can be seen continuously across the midline then this is diagnostic of free gas within the mediastinum, pericardium or peritoneal cavity.
- **Continuous diaphragm sign** is seen in pneumomediastinum.

100. Ans. (a) Pneumonia

Ref: *Harrison, 19th ed. pg. 806*

- **Air bronchogram** refers to the phenomenon of air-filled bronchi (*dark*) being made visible by the opacification of surrounding alveoli (*grey - white*).

- It is almost always caused by a pathologic airspace (alveolar) process, in which something other than air fills the alveoli.
- Air bronchograms will not be visible if the bronchi themselves are opacified (e.g. by fluid).
- Air bronchograms can be seen with several processes, including the following:
 - Pulmonary consolidation (pneumonia)
 - Pulmonary oedema
 - Non-obstructive atelectasis
 - Severe interstitial lung disease

101. Ans. (a) Lung carcinoma

Ref: Harrison, 19th ed. pg. 511

Findings in Chest X-ray Suggestive of Lung Cancer-

- Central lesions appear as a bulky hilum, representing the tumor and local nodal involvement.
- In contrast a more peripheral location may appear as a rounded or spiculated mass.
- Cavitation may be seen as an air-fluid level.
- Destruction of the adjacent rib or evidence of soft tissue growing into the soft tissues superficial to the ribs as seen in the above case where lung CA is in the right upper lobe.

HYDATID CYSTS

It result from infection by the *Echinococcus* worm, and can result in cyst formation anywhere in the body.

- **Most common organ involved:** Liver > Lung

There are several clinical signs in hydatid disease:

- **Cumbo sign:** Air is seen between the pericyst and the laminated membrane of the cyst.
- **Serpent sign:** Internal rupture of the cyst with collapse of membranes of parasite into the cyst.
- **Spin sign/whirl sign:** Detached membranes with small pleural reaction seen in hydatid cyst of lung.
- **Empty cyst sign:** May be seen after complete evacuation of parasitic membranes.

LUNG ABSCESS

- A **lung abscess** is a circumscribed collection of pus within the lung.

- Most commonly seen in superior segment of lower lobes or posterior segments of lower lobes.
- **X-ray:** The classical appearance of a pulmonary abscess is a cavity containing an air-fluid level.
- **IOC for abscess:** Contrast CT.

ASPERGILLOMA

- **Aspergillomas** are mass-like fungus balls that are typically composed of *Aspergillus fumigatus* and is a non-invasive form of pulmonary aspergillosis
- **CXR:** Aspergillomas typically appear as rounded or ovoid soft tissue attenuating masses located in a surrounding cavity and outlined by a crescent of air.
- **CT:** Appearances are those of a well formed cavity with a central soft tissue attenuating rounded mass surrounded by an *air crescent sign* or a *Monad sign*.

102. Ans. (a) Bronchogenic carcinoma with collapse of lung

- The Golden S sign (reverse S sign of Golden.) is seen in PA chest radiographs with right upper lobe collapse.
- It is caused by a central mass obstructing the upper lobe bronchus and should raise suspicion of a primary bronchogenic carcinoma.
- The right upper lobe appears dense and shifts medially and upwards with a central mass expanding the hilum. The combination of two changes together form a reverse S shape.

103. Ans. (b) Pulmonary hamartoma

Ref Robbins, 8th ed. pg. 1433

- Lung hamartoma is a lesion seen as rounded focus of radio-opacity called as coin lesion or as popcorn lesion on X-ray.
- It is a benign neoplasm rather than a lung malformation and the finding of chromosomal aberration 6p21 or 12q14, indicates a **clonal origin**.
- **Note:** Popcorn calcification on mammography: FIBRO-ADENOMA

FIGURE: Popcorn calcification in lung-pulmonary hamartoma

FIGURE: Popcorn calcification in breast-fibroadenoma

NEUROLOGY IMAGING

104. Ans. (b) Massive Epidural hemorrhage

TABLE: Difference between different kinds of intracranial bleed

	Epidural hemorrhage	Subdural hemorrhage	Subarachnoid hemorrhage
Site	Above dura (between brain and skull)	Below dura (between dura and arachnoid mater)	Below arachnoid (between arachnoid and Pia mater)
Source of bleed	Middle meningeal artery	Cortical bridging vein tear	Circle of Willis
CT appearance	Biconvex white/Lenticular	Concavo-convex/Moon crescent	Star shaped opacity
Image			

105. Ans. (d) 4th ventricle

Ref: Fundamentals of Radiology by Squire, P 532

- The image shows the arrow pointed at fourth ventricle just posterior to brainstem and anterior to cerebellum.
- CSF flows via cerebral aqueduct (between third and fourth ventricles) into the fourth ventricle.
- It then leaves the ventricular system via two foramina of *luschka* at sides of inferior aspect of cerebellum and foramen of *magendie* at the back of inferior cerebellum.
- CSF then flows above the cerebral hemispheres within the subarachnoid space and is *absorbed by arachnoid granulations* at superior sagittal sinus.

106. Ans. (d) Internal carotid artery

- The shown image is angiographic image of Circle of Willis.
 - The artery marked with arrow is internal carotid artery.
- (**Keywords in image:** PCA, posterior cerebral artery; PCoA, posterior communicating artery; ACA, anterior cerebral artery; ACoA, anterior communicating artery; MCA, middle cerebral artery; ICA, internal carotid artery).

107. Ans. (a) **Midbrain**

(Revise the brainstem anatomy from the image shown below.)

108. Ans. (b) **MRI**

IOC for certain conditions:

Conditions	Investigation of choice
Interstitial lung disease, bronchiectasis, fibrosis	HRCT
Gall stone, pleural effusion	USG
Spinal cord Neural tissue Chronic subarachnoid haemorrhage Stress fracture Femur neck fracture Bone marrow study	MRI
Cortical bone Calcification Acute head Injury Skull fracture Pelvic fracture	CT scan
Characterization of renal stone calculi	Dual source CT
Chronic pancreatitis	MRCP

109. Ans. (a) **CT scan**

Ref: Harrison, 19th ed. pg. 1786

- The diagnosis of subarachnoid hemorrhage (SAH) usually depends on a high index of clinical suspicion combined with radiologic confirmation via urgent computed tomography (CT) scan without contrast.
- Traditionally, a negative CT scan is followed with lumbar puncture (LP). However, non-contrast CT followed by CT angiography (CTA) of the brain can rule out SAH with greater than 99% sensitivity.

110. Ans. (d) **Hyperdense bi convex**

Ref: Harrison, 19th ed. pg. 457e-2

- In extradural hematoma or epidural hematoma, the tightly attached dura is stripped from the inner table of the skull, producing a characteristic **lenticular shaped hemorrhage** on noncontrast CT scan.
- **Epidural hematomas are usually caused by tearing of the middle meningeal artery** following fracture of the temporal bone.
- And the acute hematomas are hyperdense on NCCT and are hypodense only when they are chronic and becomes difficult to differentiate the chronic epidural hematoma (B/L and U/L) from hygromas which are collection of CSF from the rent of sub arachnoid space.

111. Ans. (b) **CT scan**

Ref: Harrison, 19th ed. pg. 426e-7

- When the Hounsfield units (Hu) exceed an established threshold (100 Hu), the source is believed to be calcification. **CT imaging is the gold standard in detecting calcification.**
- Calcifications of the pineal gland, choroid plexus, basal ganglia and dura mater are commonly seen with aging and are usually not associated with pathological clinical phenomena. However calcium deposits can be associated with several intracranial pathologies including tumors, cerebrovascular diseases, congenital conditions, trauma and endocrine/metabolic disorders.

112. Ans. (a) **Enhanced MRI**

Ref: Multiple Journals

- Leptomeningeal carcinomatosis (LC) refers to *diffuse seeding of the leptomeninges by tumor metastases.*
- LC occurs in an estimated 20% of patients diagnosed with cancer and is most commonly found in breast carcinoma, lung carcinoma, and melanoma in adults and hematogenous malignancies and primitive neuroectodermal tumor (PNET) in children.
- **Contrast-enhanced MRI of the brain and spine is the imaging modality of choice** because of its safety, excellent contrast resolution, and multiplanar abilities.

MAMMOGRAPHY

113. Ans. (b) Medial lateral oblique view

Ref: Harrison, 19th ed. pg. 525

There are numerous mammography views that can broadly be split into two groups

- **Standard views**- Medio-Lateral, Medio-lateral oblique, Craniocaudal
- **Supplementary views** - Additional information or problem solving
 - The **mediolateral oblique (MLO) view** is one of standard mammographic views. It is the most important projection as it allows to depict most breast tissue.
 - The **Mediolateral view** loses significant tissue volume in the upper outer quadrant of the breast where statistically the most breast cancers are found. By doing an MLO view you get extra tissue without extra exposure.

114. Ans. (b) Normal mammogram rules out breast cancer

Ref: Bailey & Love, 25th ed. pg. 828

- Soft tissue radiographs are taken by placing the breast in direct contact with ultrasensitive film and exposing it to low-voltage, high amperage X-rays.
- *The dose of radiation is approximately 0.1 cGy and, therefore, mammography is a very safe investigation.*
- *The sensitivity of this investigation increases with age as the breast becomes less dense.*
- In total, 5% of breast cancers are missed by population-based mammographic screening programmes; even in retrospect, such carcinomas are not apparent. Thus, a **normal mammogram DOES NOT exclude the presence of carcinoma.**
- Digital mammography allows manipulation of the images and computer aided diagnosis.
- **Tomo-mammography** is also being assessed as a **more sensitive** diagnostic modality

OBSTETRICAL IMAGING

115. Ans. (a) Ion Donald

- Father of USG: **JOHN WILD**
- Father of Obstetrical USG: **ION DONALD**
- Father of Doppler: **Doppler John**
- Father of CT Scan: Godfrey Hounsfield
- Father of X-Ray: Roentgen
- Father of MRI: **Lauterbur and Mansfield**

116. Ans. (a) Small white gestational ring

Ref: Rosen's Emergency Medicine, 7th ed. pg. 175

- Although the blastocyst begins to implant in the endometrium at 3 weeks menstrual age (1 week after conception), **the first definitive ultrasound sign of pregnancy is the "gestational sac."** This is a sonographic not an anatomic term.
- Before the appearance of the gestational sac, the endometrium is markedly echogenic and the arcuate vessels are somewhat prominent. This, however, is non-diagnostic and can often be seen in the normal late secretory phase. In ultrasound images, the gestational sac appears as a thick echogenic ring surrounding a sonolucent center.
- Sonographically, the chorionic sac (gestational sac) is embedded in the depth of the thick endometrium (decidua) and appears on one side of the cavity line, not in the middle of it. This sonolucent center is actually the fluid-filled chorionic sac.
- **The sac grows @1 mm/day in mean diameter during early pregnancy.** With further growth, first the yolk sac and later the embryo become visible sonographically inside the chorionic cavity. The yolk sac has a very bright echogenic rim around a sonolucent center. When it first appears at <5 weeks, it may only be **1 to 3 mm** in diameter
- Discriminatory size of the gestational sac for transvaginal visualization of the yolk sac is reported from 5 to

ANSWERS TO BOARD REVIEW QUESTIONS

117. Ans. (d) 12 years

Ref: Wolfgang, 5th ed. pg. 1065

ANSWERS TO IMAGE-BASED QUESTIONS

151. Ans. (a) **Intussusception**
- Ref: Nelson 20th ed. pg. 1813*
- The image shows presence of "coiled spring" sign which is seen when an intussusception has occurred. These ring shadows represent contrast reflux within the lumen between the walls of the intussusceptum and intussusciptions.
152. Ans. (a) **SAH and IVH**
- The NCCT shows presence of hyperdensity in the area of sylvian fissure (right side black arrow) indicating

Subarachnoid hemorrhage. The presence of hyperdensity in ventricles indicated concomitant intraventricular hemorrhage (left side white arrow).

153. Ans. (b) **Subdural hemorrhage**
- The concavo convex bleed is marked by three arrows indicating, subdural hemorrhage.
154. Ans. (a) **Liver laceration**
- The image shows a hematoma seen in the posterior part of liver (black area).

155. Ans. (a) Brain tumor

The image shows a brain tumor obliterating the ventricular system.

156. Ans. (b) Horseshoe kidney

157. Ans. (a) Klatskin tumor

The image shows the endoscope in the middle and the biliary tree. You can notice the contrast in gall bladder (9 o'clock) and cystic duct where it is meeting the common hepatic duct. However the left and right hepatic ducts are not visible indicating a tumor causing obstruction to flow of contrast.

FMGE Solutions Screening Examination

1250

158. Ans. (a) *Staphylococcus aureus*

The Chest X-ray shows a cystic cavity in right upper zone indicative of infection with a virulent organism. In setting of recovery from measles the organism responsible is *Staphylococcus aureus*.

159. Ans. (a) *Duodenal atresia*

The image shows presence of double bubble appearance suggestive of diagnosis of duodenal atresia. About 8% of children with Down syndrome are born with duodenal atresia which presents with bilious vomiting.

160. Ans. (b) *Acute viral hepatitis*

USG Abdomen shows presence of starry sky pattern of the liver, diagnostic of acute viral hepatitis

161. Ans. (c) *Bochdalek hernia*

The chest X-ray shows loops of bowel on left side of chest indicating congenital diaphragmatic hernia/Bochdalek hernia.

162. Ans. (a) *Invertogram*

The image shows an invertogram which is an X-ray of neonate taken upside down with a coin placed at the anus of the child as a radiological marker. This is done to evaluate a child with anorectal malformations.

163. Ans. (b) *Pulmonary plethora*

The CXR shows an enlarged heart with boot shaped configuration and reduced vascularity of lungs. The clinical diagnosis is Tetralogy of Fallot, and due to subpulmonic stenosis it presents with pulmonic oligemia.

164. Ans. (b) *Major fissure*

- The shown image shows major fissure or oblique fissure.

B: Major fissure L Lung

A: Minor Fissure R Lung
B: Major fissure L Lung

165. Ans. (b) *Right atrium*

- The structure marked in the given chest XRay is right atrium
- Note down the markings in image

166. Ans. (a) *Aortic knob*

- The arrow in this X-Ray points at aortic knob
- Follow the X-Ray markings shown below

Key Points

Anatomy

- Upper lateral cutaneous nerve is a branch of: **Axillary nerve**
- An injury to anatomical snuff box causes fracture of this bone: **Scaphoid**
- Muscle of arm causing flexion, adduction and medial rotation: **Pectoralis Major**
- Testicular artery is a branch of: **Abdominal aorta**
- Inferior scapular angle lies at which level: **T8**
- Muscle causing adduction at hip joint: **Gluteus medius**
- Deep inguinal ring is formed in: **Transversalis fascia**
- Nerve damage that can cause hypothenar muscle wasting and loss of sensation of medial one and half digits: **Ulnar nerve**
- Failure of closure of rostral neuropore at 25th day leads to: **Anencephaly**
- Parotid gland is supplied by this nerve: **Glossopharyngeal nerve**
- Killian's Dehiscence is formed due to: **Inferior constrictor muscle**
- Muscle biceps brachii inserts into: **Radial tuberosity**
- Nerve supplying area between great toe and 2nd toe: **Deep Peroneal nerve**
- Dermatome supplying area of nipples: **T4**
- Dermatome Supplying area of umbilicus: **T10**
- Retraction of scapula is done by: **Middle fibers of trapezius muscle**
- Nerve supplying cornea: **Trigeminal nerve**
- Longest extraocular muscle: **Superior Oblique (7.7 cm)**
- Shortest extraocular muscle: **Medial rectus (5.5 cm)**

TABLE: Important bone and their nutrient arteries

Bone	Nutrient artery
Femur	Branch of Femoral artery → Profunda femoris artery
Tibia	Posterior tibial artery
Fibula	Branch of posterior tibial artery → Peroneal artery
Clavicle	Subscapular artery
Radius and Ulna	Anterior interosseous artery
Humerus	Profunda brachii artery

TABLE: Branches of subclavian artery

1st part	VIT-CD <ul style="list-style-type: none"> • Vertebral artery • Internal mammary artery • Thyrocervical trunk
2nd part	Costocervical trunk
3rd part	Dorsal scapular artery

TABLE: Weight of some important organs

Organ	Weight
• Pituitary	0.5–0.6 gram (500–600 mg)
• Brain	Males: 1.4 kg Females: 1.27 kg
• Thyroid gland	20–40 gram
• Kidney	130–160 gram
• Adrenal gland	5–6 gram
• Prostate gland	15–20 gram

TABLE: Length of important anatomical structure

Organ	Length
• Fallopian tube	10–12 cm
• Bile duct	8 cm
• Appendix	Mn: BAG
• Gallbladder	

Contd...

FMGE Solutions Screening Examination

Organ	Length
<ul style="list-style-type: none"> Spinal cord Thoracic duct Transverse colon Umbilical cord Femur Deferens (Vas Deferens) 	45 cm Mn: STTUFED
<ul style="list-style-type: none"> Sigmoid colon Esophagus Duodenum Descending colon Ureter Urethra (male) 	25 cm Mn: SEDDUU
<ul style="list-style-type: none"> Inguinal canal Optic nerve Urethra (Female) 	4 cm Mn: IOVe U

TABLE: Glands of face and their duct

Gland	Duct	Nerve	Development	Acini histology
Parotid gland	Stensen duct (opens opposite to upper 2 nd molar)	CN V (auriculotemporal branch)	Ectodermal	Serous acini
Submandibular gland	Wharton's duct (open on sides of frenulum at the floor of mouth)	CN VII (chorda tympani branch)	Endodermal	Mixed (serous > Mucinous)
Sublingual gland	Bartholin's and Rivinus duct (open at floor of mouth)	CN VII (chorda tympani branch)	Endodermal	Mixed (Mucinous > serous)

OFTEN ASKED ONES

• Most frequently fractured bone of body	Clavicle
• First bone to ossify	Clavicle
• Only long bone which has no medullary cavity	Clavicle
• All long bone ossify in cartilage EXCEPT clavicle. It ossifies in membrane	Clavicle
• Most frequently dislocated carpal bone	Lunate
• Most frequently fractured carpal bone	Scaphoid

Contd...

• Nerve supply of deltoid	Axillary nerve
• MC fractured carpal bone	Scaphoid (boat shaped)- 2nd MC site of avascular necrosis
• Ape thumb deformity	Median nerve (opponens pollicis muscle paralyzed)
• Musician's nerve	Ulnar nerve (root value C8, T1)
• Labourer's nerve/ eye of the hand	Median nerve
• Root value of radial nerve	C5 to T1 (C5, C6, C7, C8, T1)
• Winging of scapula	Long thoracic nerve (serratus anterior muscle paralyzed)
• Police man tip hand/porter's tip hand	Erb's paralysis
• Klumpke's paralysis	Damage to C8 and T1
• Strongest ligament of body	Iliofemoral ligament
• Longest muscle of body	Sartorius (aka tailor's muscle)
• Nerve supply of gluteus maximus	INFERIOR gluteal N. (L5, S1, S2) Mn: 512
• Nerve supply of gluteus medius and minimus	SUPERIOR gluteal N. (L4, L5, S1) Mn: 451
• Vessel used in coronary artery bypass graft (CABG)	Internal Mammary Artery
• Muscle which is known as peripheral heart	Soleus
• Locking of the knee by	Quadriceps femoris muscle (occurs at last stage of extension)
• Unlocking of the knee by	Popliteus muscle (occurs at first stage of flexion)
• Sternal angle and bifurcation of trachea at	T4 level
• Arch of aorta begins and terminates at	T4 level
• Police man of abdominal cavity	Greater omentum
• Muscle of horror	Platysma
• Nerve supply of upper eyelid and TIP of nose	V1 (ophthalmic branch of trigeminal)
• Most commonly nerve paralyzed	Facial N (longest intraosseous course)
• Emergency tracheostomy at	Tracheal ring 2-3

Contd...

• Ova released in form of	Secondary oocyte
• Blastocyst formation	5th day after fertilization
• Implantation occurs	6th day after fertilization, completes on 10th day.
• Liver has 8 segments.	Caudate lobe-segment 1; Quadrate lobe-segment 4
• Narrowest part of esophagus	Cricopharynx at the root of neck
• Test which is done to check gluteus medius and minimus	Trendelenburg test
• Trigone of bladder develops	From mesonephric duct (mesodermal in origin)
• Pouch of Douglas	Between rectum and uterus
• Parotid gland duct	Stensen's duct
• Submandibular gland duct	Wharton's duct
• Muscle which opens Eustachian tube while yawning	Tensor veli palatini and levator veli palatini
• Ovarian artery/testicular artery is a branch of	Abdominal aorta
• Most common fracture of humerus	Supracondylar fracture
• Muscle not attached to apex of orbit	Inferior oblique
• Which bone does not contribute to Medial wall of orbit	Zygoma
• Which layer of scalp is vascular	Subcutaneous tissue
• Magendie foramen drains CSF from:	4th ventricle
• Closure of neural tube begins at	Cervical end (if choice given is "multiple sites" then it is the best answer)
• Junction of anterior and posterior horn of lateral ventricle is called:	Trigone and lateral ventricle
• Infection of CNS spreads in inner ear through	Cochlear Aqueduct
• Posterior communicating artery is a branch of	Middle Cerebral Artery
• The chorda tympani nerve arises from	Facial nerve
• Broca's area is located in	Inferior frontal gyrus
• Lower angle of scapula lies at	Level of T 7
• Nerve injured with fracture of surgical neck of humerus	Axillary

Contd...

• Nerve injured with fracture of shaft of humerus	Radial
• Nerve injured with fracture of medial humeral epicondyle	Ulnar
• Muscle that initiates abduction of arm	Supraspinatus
• Most commonly torn tendon of rotator cuff	Supraspinatus
• "Claw" hand is due to paralysis of which muscle group	Lumbricals
• Innervation to nail bed of ring finger	Ulnar and median
• Innervation to nail bed of middle finger	Median nerve
• Dermatome of thumb	C6
• Spinal levels of axillary nerve	C5 and C6

• Sprengel's deformity is associated with this bone: Scapula (failure of normal scapular descent during development)
• Largest branch of brachial plexus: Radial nerve
• Largest branch of lumbar plexus: Femoral nerve
• Erb's point anatomical location at junction of: C5, C6
• Klumpke's paralysis involves: C8, T1
• This nerve injury can cause wasting of intrinsic muscles of hand: Ulnar nerve
• Guyon's canal is in relation to this nerve: Ulnar nerve
• Paralysis of this muscle can cause "Dropped shoulder": Trapezius
• Power grip of hand is mainly due to: Long Flexors
• Cephalic veins drain into: Axillary vein
• Upper outer quadrant of breast is drained by this lymphatic: Anterior axillary
• Main blood supply of the femoral head: Medial circumflex femoral artery
• Nutrient artery of the femur: Profunda femoris artery
• Nutrient artery of tibia: Posterior tibial artery
• Nutrient artery to fibula: Peroneal artery
• Ligament which supports talus: Spring ligament
• Strongest flexors of the hip: Psoas major and iliacus muscle (iliopsoas muscle)
• Chief nerve of medial compartment of thigh: Obturator nerve
• Nerve root value of sciatic nerve: L4, 5, S1, 2, 3
• Nerve root of posterior cutaneous nerve of thigh: S1, 2, 3
• Nerve root value of pudendal nerve: S2, 3, 4
• Nerve root value of medial cutaneous nerve of thigh: L2, L3

Contd...

FMGE Solutions Screening Examination

1254

ANATOMY

- Hunterian perforators also known as adductor canal perforators are seen in: **Mid-thigh**
- Triceps surae nerve is: **Gastroc-soleus**
- Pressure change in calf compartment during heel touch phase of walking: **Remains same (no change in pressure)**
- Motor nerve supply of diaphragm: **Phrenic nerve**
- **Sensory nerve supply of diaphragm:**
 - Central part: Phrenic nerve
 - Peripheral part: Lower 6 intercostal nerves
- Most common site of morgagni hernia: **Posterolateral part of diaphragm (Right anterior being the most common site)**
- Intercostobrachial nerve is a branch of: **2nd intercostal nerve**
- Azygos lobe is a part of this organ: **Lung**
- **Trautmann's triangle** (transmits infection from temporal bone to cerebellum):
 - Bony labyrinth (anteriorly)
 - Sigmoid sinus (posteriorly)
 - Superior petrosal sinus (above)
- **Triangle of safety** (an important landmark of chest tube insertion)
 - Anterior border of latissimus dorsi
 - Lateral border of pectoralis major
 - Imaginary horizontal level of the nipple
- Triangle of Doom
 - Medially: Vas Deferens
 - Laterally: Gonadal vessels
 - Posteriorly: Peritoneal edge
- **Triangle of Doom contains:** External iliac vessels, Deep circumflex iliac vein, femoral nerve and genital branch of genitofemoral nerve
- **Triangle of pain** (contain femoral branch of genitofemoral nerve, lateral cutaneous nerve of thigh)
 - Medially: Gonadal vessels
 - Laterally: Iliopubic tract
- **Passaro (Gastrinoma) triangle:** Seen at upper abdomen
 - Apex: Junction of cystic duct and CBD
 - Inferior part: Junction of D2 and D3
 - Left lateral point: Pancreatic neck & Body junction
- **Koch's triangle** is formed by:
 - Superiorly: Tendon of todaro
 - Inferiorly: Tricuspid valve septal leaflet
 - Basally: Coronary sinus orifice
- Koch's triangle is a part of: **AV node**
- Blood supply of the Koch's triangle: **Right coronary artery**
- Blood supply of SA node: **Right coronary artery**
- Valve guarding coronary sinus: **Thebesian valve**
- Thoracic duct is also known as: **Van horne canal, Pecquet duct**
- Transtuberular plane lies at which level: **L5**

Contd...

- Length of inguinal canal: **4 cm**
 - Cisterna chyli is situated in: **Abdomen**
 - Labia majora is developed from: **Genital swelling**
 - Helicine artery is a branch of: **Deep artery of penis**
 - Nerve supply of perineum is: **Pudendal nerve**
 - Anatomical support of prostrate is: **Pubococcygeus**
 - Blood supply of liver: **80% portal vein, 20% hepatic artery**
 - Stave cells are seen in: **Spleen**
 - Most common congenital anomaly of pancreas: **Pancreas divisum**
 - Ligament which contains splenic artery: **Splenorenal ligament**
 - Angle of mandible is supplied by: **Greater auricular nerve**
 - Tip of nose is supplied by: **Ophthalmic nerve (external nasal branch)**
 - Metopic suture: **Separates two half of the frontal bone**
 - Metopic suture closes at: **6 years**
 - Muscle of grinning: **Risorius muscle**
 - Common carotid artery bifurcates at: **C4 level (at upper border of thyroid cartilage)**
 - Middle meningeal artery is a branch of: **Maxillary artery (1st part of maxillary artery)**
 - Anterior choroidal artery is a branch of: **Internal carotid artery**
 - Chassaignac tubercle is: **Carotid tubercle on C6 vertebra**
 - Ligament of berry function: **Connects thyroid lobe to cricoid lobe**
 - Herring bodies are seen in: **Posterior pituitary (ADH and oxytocin both stored here)**
 - Otic ganglion supplies this gland: **Parotid gland**
 - Gerlach tonsil is also named as: **Tubal tonsil**
 - Passavant's ridge is formed by: **Palatopharyngeus and superior constrictor muscle**
 - Gillette space corresponds to: **Retropharyngeal space**
 - Smallest cranial nerve: **Trochlear nerve**
 - Broca's area located at: **Posterior end of superior temporal gyrus (Area 44, 45)**
 - Wernicke's area is located at: **Superior temporal gyrus (Area 22)**
 - Organs devoid of lymphatics: **Brain, choroid, internal ear, glottis**
- Most prominent spinous process in the spine? **Vertebra prominens (C7)**
 - Muscles comprise the erector spinae? **Iliocostalis, Longissimus, Spinalis**

Contd...

- Pairs of spinal nerves exit from the spinal cord? **31 pairs**
- Region where the manubrium and the body of the sternum articulate? **Sternal angle of Louis.**
- Muscles are innervated by the axillary nerve? **Deltoid and teres minor**
- Foot drop is caused by damage to which nerve? **Common peroneal nerve**
- Artery of the anterior compartment of the leg? **Anterior tibial artery**
- Nerve supplying the lateral compartment of the leg? **Superficial peroneal nerve**
- What is the prominent “bump” on the lateral aspect of the knee? **Head of the fibula**
- What is the part of the lung that extends above the level of the first rib? **The cupula**
- Right lung has how many lobes? **Three**
- Left lung has how many lobes. **Two**
- What is the only valve in the heart that has two cusps? **Mitral (bicuspid) valve**
- Which vein travels with the right coronary artery? **Small cardiac vein**
- What attaches the cusps of the valves to the papillary muscles in the heart? **Chordae tendineae**
- First branch off the abdominal artery? **Inferior phrenic artery**
- At what vertebral level is the hyoid bone found? **C3**
- Ophthalmic artery is a branch of? **Internal carotid artery**
- Where does the inferior mesenteric vein drain? **The splenic vein**
- The folds of the mucosa of the stomach are known as? **Rugae**
- Mucosal folds of small intestine starting 2nd part of duodenum: **Valvulae conniventes also known as Kerckring folds**
- Artery of the embryonic foregut? **Celiac artery**
- **Portal triad** comprised of? **1. Common bile duct 2. Hepatic artery 3. Portal vein**
- Structure which separate the anatomic right and left lobes of the liver? **Ligamentum teres and ligamentum venosum**
- Rectouterine pouch is also known as? **Pouch of Douglas**
- Broad ligament of the uterus is comprised of? **1. Mesosalpinx 2. Mesovarium 3. Mesometrium**
- What two muscles are tested to see if CN XI is intact? **Trapezius and sternocleidomastoid**
- Only organ in the body supplied by preganglionic sympathetic fibers? **Adrenal medulla**

Contd...

- Location of seminal vesicle? **On the posterior aspect of the urinary bladder**
- Opening of parotid (Stenson's) duct in the oral cavity? **Opposite the second upper molar tooth**
- Function of the arachnoid granulations in brain? **Resorb CSF into the blood**
- Only muscle of the tongue not innervated by the hypoglossal nerve? **Palatoglossus**
- Fundus of stomach is supplied mainly by: **Splenic artery**
- Content of anatomical snuff box: **Radial artery**
- Ovarian artery is a branch of: **Abdominal aorta**
- **Ventral Branches of Abdominal Aorta:**
 - Celiac trunk
 - Superior mesenteric artery
 - Inferior mesenteric artery
- Direct branch of Inferior mesenteric artery: **Superior rectal artery**
- Left adrenal gland is **crescentic/semilunar**
- Right adrenal gland is **pyramidal** in shape
- The average weight of adrenal gland: **4–6 g**
- **Structures and level of piercing in diaphragm: (Mn: I ate, 10 Eggs, At 12)**
 - IVC: T8
 - Esophagus: T10
 - Aorta: T12
- Base of the heart is formed by: **Left atrium**
- Nerve supplying serratus anterior muscle: **Long thoracic nerve**
- Inferior vena cava formed at: **L5 level**
- Muller muscle supplied by which nerve: **Sympathetic nerve**
- Arnold nerve is a branch of: **Vagus Nerve**
- Left gonadal vein drain into: **IVC**
- Muscle of upper limb which cover both elbow and shoulder joint: **Long head of triceps brachii**
- **Supination and pronation** of upper limb is due to: **Radioulnar joint**
- Efferent cremasteric reflex is carried by: **Genitofemoral nerve**
- Collecting duct is derived from: **Ureteric bud**
- Most common fracture of humerus- **Supracondylar fracture**
- **Police man** of abdominal cavity- **Greater omentum**
- Nerve supply of upper eyelid and TIP of nose- **V1 (ophthalmic branch of trigeminal).**
- Disc are NOT found between: **C1 and C2; Sacrum-Coccyx**
- Critical vascular zone of spinal cord: **T4–T9**
- Extension of artery of Adamkiewicz is between: **T9–T11**
- Filum terminale is derived from: **Pia mater**

FMGE Solutions Screening Examination

1256

TABLE: Cranial nerves in a nutshell

• Largest cranial nerve	Trigeminal Nerve (CN V)
• Smallest cranial nerve	Trochlear nerve (CN IV)
• Longest intracranial course	Trochlear nerve (CN IV)
• The only cranial nerve to emerge from the dorsal surface of the Brain stem	Trochlear N
• Cranial N. with longest intraosseous course	Facial nerve (CN VII)
• Most common cranial nerve involved in Raised ICT	Abducens N (CN VI)

TABLE: Important vertebral levels (also mentioned inside in explanations section)

• Bifurcation of common carotid artery	C3
• Thyroid Cartilage	C5
• Cricoid Cartilage	C6
• Arch of Aorta	T4
• Tracheal bifurcation (standing)	T6
• Xiphoid process	T9
• Transpyloric plane	L1
• Origin of renal artery	L2
• Subcostal plane	L3
• Bifurcation of abdominal aorta	L4
• Transtuberular plane	L5
• Formation of IVC	L5

TABLE: Ribs at a glance

Rib nomenclature	Rib number
• False ribs	8–12
• True ribs also known as vertebrosteral ribs	1–7 th ribs
• Floating ribs	11 th and 12 th
• Typical ribs	3 rd to 9 th (<i>individual identification is not possible</i>)
• Atypical ribs	1 st , 2 nd , 10 th , 11 th , 12 th (<i>can be identified individually</i>)
• Longest rib	7 th rib
Strongest rib	1 st rib
Shortest rib	
Widest rib	
Most oblique rib	9 th rib

TABLE: Deep tendon reflexes and their spinal cord level

Reflex/Jerk	Spinal level	Nerve Involved
Biceps Jerk	C5-6	Musculocutaneous
Brachioradialis	C5-6	Radial
Supinator	C5-6	Radial
Triceps	C7-8	Radial
Knee/patella jerk	L3-4	Femoral
Ankle jerk	S1-2	Tibial

TABLE: Normal prostate anatomy: Has 5 lobes

Lobe	Importance
Anterior	–
Posterior	MC site of prostate CA
Median	MC site for BPH
Lateral- 2	Site for prostatic adenoma in elderly

STRUCTURE WITH NO LYMPHATICS (BASEC)

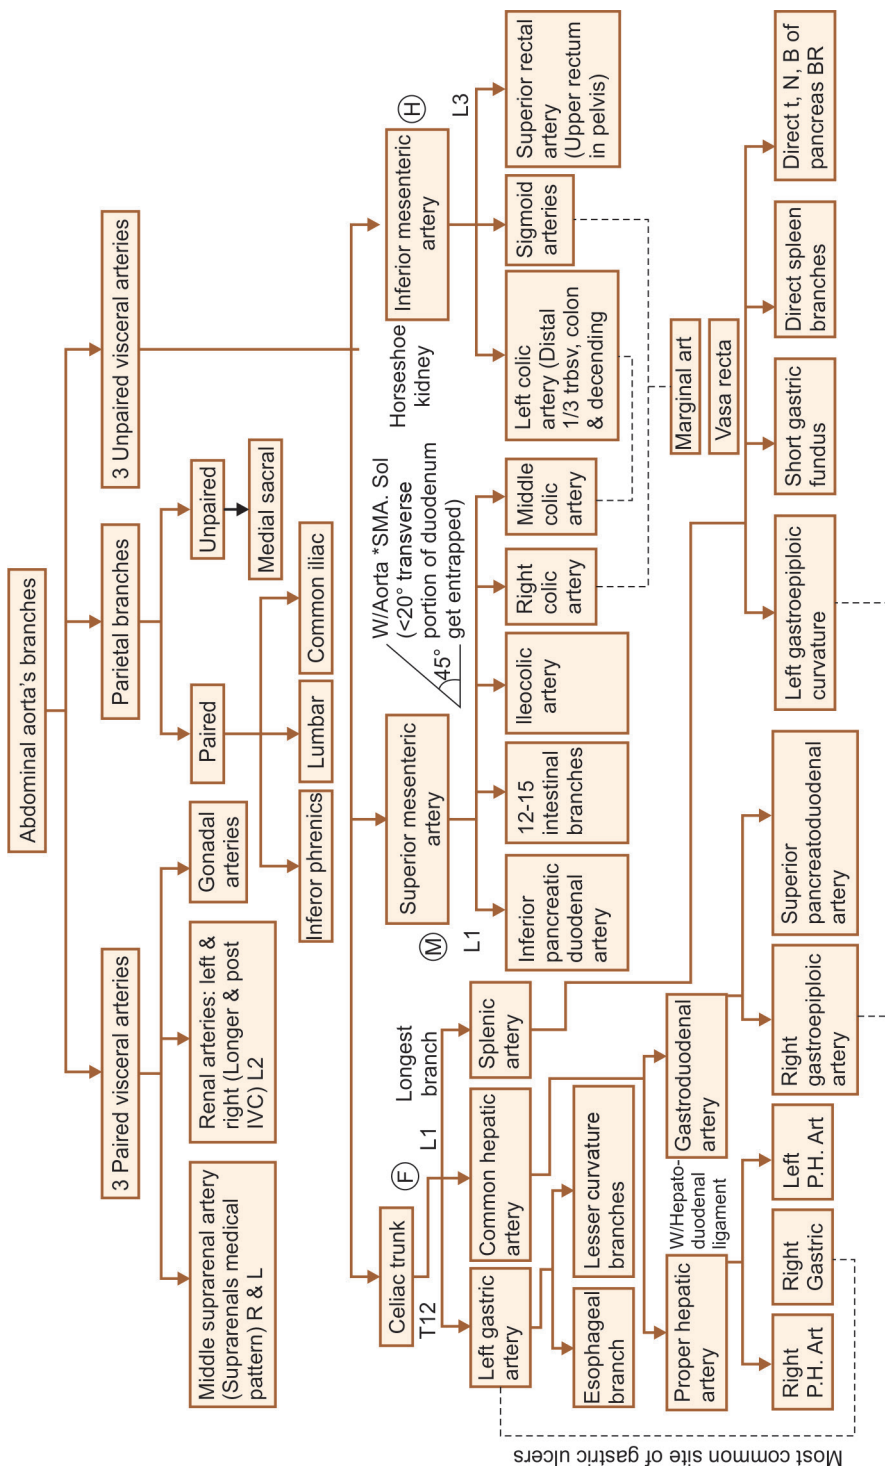

- Brain & spinal cord
- Articular cartilage
- Splenic pulp, bone marrow
- Epidermis, Hairs, Nails
- Cornea

FASCIA

- Membranous layer of superficial fascia of perineum: **COLLES FASCIA**
- Deep fascia of thighs: **FASCIA LATA**
- Deep fascia of penis: **BUCK'S FASCIA**
- separates post surface of prostate from rectum: **FASCIA OF DENOVIILLIER**
- Condensation of pelvic fascia behind rectum: **FASCIA OF WALDAYER**
- Below umbilicus superf. Fatty layer.: **FASCIA OF CAMPER**
- Below umbilicus deep membranous layer: **FASCIA OF SCARPA**

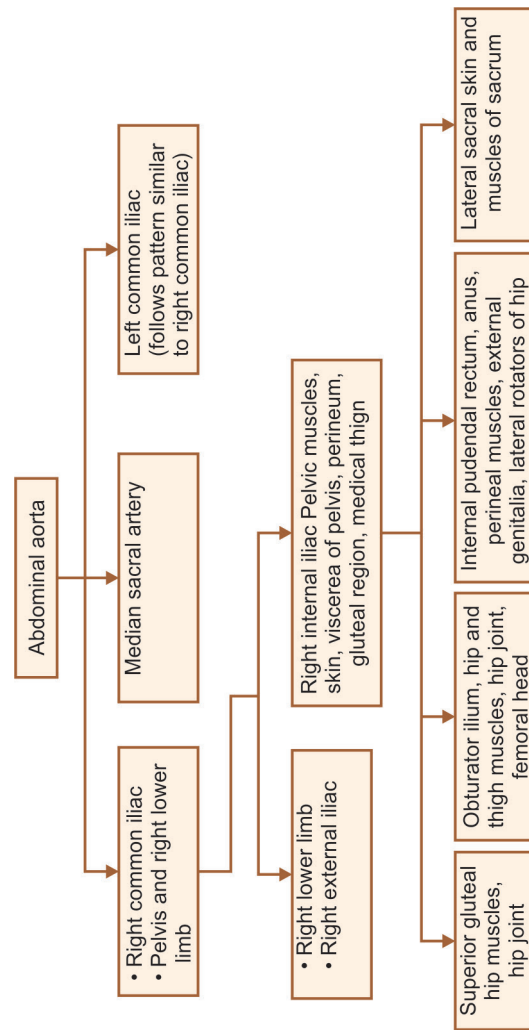

"Since there are multiple questions on aortic and iliac branches, here's the summarized table for the ease of creating an image".

1258

Physiology

IMPORTANT RECENT ONES

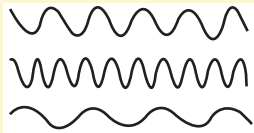

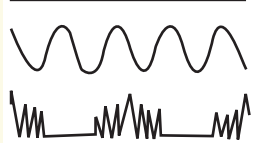

Histamine is produced by	Mast cell
Prolactin is inhibited by	Dopamine
Highest percent of blood is present in this vessel	Veins
Maximum surface area for this vessel	Capillaries
Maximum resistance for this vessel	Arterioles

SENSORY SPINAL TRACTS

Tract	Sensation carried
• Ventral/anterior STT	• Crude touch/itching, tickle pressure, sexual sensation, Detection of pressure (Barognosis)
• Lateral STT	• Pin prick/pain, temp
• Fasciculus gracilis (medial) sacral, lumbar region	• Fine touch, vibration, fine pressure, conscious proprioception, stereognosis, 2-point discrimina
• Fasciculus cuneatus (lateral) (thoracic, cervical region)	• Vibration joint/position sense
• CST	• Smoothness and coordination of movt (Skilled movements)

1259

TABLE: Breathing Patterns

	Condition	Description	Causes
	Eupnea	Normal breathing rate and pattern	Fever, anxiety, exercise, shock
	Tachypnea Bradypnea	Increased respiratory rate Decreased respiratory rate	Sleep, drugs, metabolic disorder, head injury, stroke
	Apnea Hyperpnea	Absence of breathing Normal rate, but deep respirations	Deceased patient, head injury, stroke Emotional stress, diabetic ketoacidosis
	Cheyne-Stokes	Gradual increases and decreases in respirations with periods of apnea	Increasing intracranial pressure, brain stem injury
	Biot's	Rapid, deep respirations (gasps) with short pauses between sets	Spinal meningitis, many CNS causes, head injury
	Kussmaul's	Tachypnea and hyperpnea	Renal failure, metabolic acidosis, diabetic ketoacidosis
	Apneustic	Prolonged inspiratory phase with shortened expiratory phase	Lesion in brain stem

CUTANEOUS MECHANORECEPTORS

Four types of mechanoreceptors for sensing touch and pressure

- **Meissner's corpuscles:** Texture and slow vibrations (5-40 Hz)
- **Merkel's cell (slow adapting):** Sustained pressure and touch
- **Ruffini corpuscles (slow adapting):** Sustained pressure
- **Pacinian corpuscles (rapidly adapting):** Deep pressure and fast vibrations (60–300 Hz)

Mechanoreceptors/Exteroceptors

Type of receptor	Location	Sensory modality	Nerve fibres
Non-encapsulated receptors			
Free nerve ending	Epidermis, cornea, gut, dermis, ligaments, joint capsules, bone, dental pulp	Pain, crude touch, pressure, heat/cold	AδC
Merkel disc	Hairless skin	Touch	Aβ
Hair follicle receptors	Hairy skin	Light movement on skin (Touch)	Aβ
Meissner's corpuscles	Dermal papillae in finger tips (skin of palm/sole), Basis of BRAILLE, Topognosis, Texture	Fine well localized touch, tactile, Vibration <80Hz	Aβ
Pacinian corpuscles	Dermis ligaments, joint capsules, peritoneum, ext. genitalia	Fast Vibration, Deep pressure	Aβ
Ruffini ending	Dermis of hairy skin	Stretch (sustained pressure)	Aβ
NM spindles	Skeletal muscle	Stretch—muscle length	Aα Aβ
Neurotendinous spindles	Tendons	Compression—muscle tension	Aα

NOCICEPTORS

- **Mechanical nociceptors:** Respond to strong pressure from a sharp object
- **Thermal nociceptors:** Activated by skin temperature above 42°C or severe cold
- **Chemical nociceptors:** Responds to various chemical such as bradykinin, Histamine, high acidity
- **Polymodal nociceptors:** Responds to combination of these stimuli

PAIN FIBERS

Impulses from nociceptors transmitted via two fibers:

- **A delta fibers—thin myelinated (2–5 um in diameter):** Release glutamate and is responsible for **First pain/Fast pain/Epicritic pain. Localized, superficial pain.**
- **C fibers— Unmyelinated (0.4–1.2 um in diameter):** Release a combination of glutamate and substance P and is responsible for **second pain/slow pain/Protopathic pain. Dull, poorly localized, Visceral pain.**

SOMATOSENSORY PATHWAYS AND THEIR PRIMARY FUNCTION

- **Dorsal column pathway:** Fine touch, vibration and proprioception, two point discrimination
- **Ventrolateral spinothalamic tract:** Pain and temperature, Crude touch, Detection of pressure (**Barognosis**)
- **Spinocerebellar tract:** Skilled movement
- **Corticospinal tract:** Tone and pressure (anterior CST), fine skill movement, precision (lateral CST)

TABLE: Cell cycle

- **Order of cell cycle:** G1 → S → G2 → M → G1 → G0
- DNA and centromere doubling seen in this phase of cell cycle: **S phase**
- Cell division/doubling of cell seen in this phase of cell cycle: **M phase**
- **Cell hypertrophy is due to:** Arrest of cell cycle before G2 phase (S–G2 phase)
- **Cell hyperplasia is due to:** Arrest of cell cycle before going into quiescent phase (G0) → Increase in number of cells
- Most sensitive phase of cell cycle for radiation injury: **G2-M phase**

TABLE: Cell and cell membrane

- Thickness: **7–10 nm**
- Main constituent is the **protein**.
- Protein: **50–60%**
- Lipid: **30–40%**
- Protein: **Lipid ratio is 2:1**
- Lipids** are regular but asymetrically arranged.
- Membrane lipids are **amphiphatic**.
- They are arranged as a **bilayer**.
- Signal transduction and enzyme activation are the functions of **Phospholipid part**.
- The Fluidity of the cell membrane is increased by **Poly unsaturated fatty acids**.

Contd...

RBC membrane is especially having spectrin (maintains integrity) and glycophorin .
Lipid bilayer acts as a gel .
Resting membrane potential is due to: K^+
Resting membrane potential is close to isoelectric potential of: Cl^- (i.e. - 70 mV)
IPSP is due to Cl^- influx or K^+ efflux or both
EPSP is due to Na^+ influx
For action potential; threshold stimulus is required
Nerve conduction follows All or None phenomenon.
Action Potential
Axon hillock and initial axon segment has the lowest threshold potential in a nerve fiber .
Nerve impulse travels in the direction only at synapse.
RMP is due to - Potassium
IPSP is due to Chloride/K^+
Amplitude is due to Na^+
Equilibrium potential of an ion is calculated by: Nernst equation
Nernst potential across cell membrane For K^+ ion: - 90 mV For Na^+ ion: + 60 mV For Cl^- ion: - 70 mV

TABLE: Cell organelles

Nissl bodies: Group of ribosomes in neurons which are utilized for protein synthesis
Synthesis of lipids occurs in Agranular Endoplasmic Reticulum .
Synthesis of proteins occurs in Rough ER .
Intracellular sorting and packing is done in Golgi complex .
Cell shape and motility are a function of Microtubules .
Catabolism of H_2O_2 is a function of Peroxisomes .
Site of ATP synthesis is Mitochondria .

GOLDEN POINTS (INCLUDES RECENT PATTERN QUESTIONS)

- Pacinian corpuscles consist of unmyelinated endings with a sensory nerve fiber of 2 μm in diameter
- Surfactant is produced by: **Type II cells (Granular pneumocytes)**
- Alveoli are mainly lined by: **Type I cells (95% surface area)**
- Type II alveolar cells make up only 5% of surface area, they represent approximately 60% of epithelial cells in alveoli
- Brunner gland secretes: **Alkaline mucus**

Contd...

- Pyloric gland secretes: **Thin viscid Mucus (protects stomach wall from digestion by gastric enzymes)**
- Part of intestine secreting enteropeptidase: **Duodenum (activates trypsinogen)**
- Most abundant form of vitamin D in plasma: **25-Hydroxyvitamin D [25(OH)D]**
- Vitamin D form found in skin: **7-Dehydrocholesterol**
- Upon exposure to UV light 7-dehydrocholesterol is converted to Vitamin D3 (Cholecalciferol)
- Most common form of supplemental vitamin A used: **All-trans retinyl acetate**
- Largest protein in body: **Titin**
- Volume remained in lung after normal expiration: **Functional residual capacity**
- Volatile acids in plasma is buffered by: **Hemoglobin**
- Vibration sense is carried by: **Pacinian corpuscles**
- Bohr's effect: **OHDC is inversely proportional to both acidity and to concentration of CO_2**
- Haldane effect: **Oxygenation of blood in the lungs displaces carbon dioxide from hemoglobin which increases the removal of carbon dioxide**
- Heart rate if Purkinje fibers became the pacemaker of the heart: **15–40 bpm**
- If SA node discharges at 0.00s, when will it normally arrive at the AV bundle (bundle of His): **0.12 second (0.03 from atria + 0.09 from AV node)**
- Structure with the slowest rate of conduction of the cardiac action potential: **AV bundle**
- Frank starling law of the heart: **Increase in venous return causes increased cardiac output**
- Mean systemic filling pressure: **7 mm Hg**
- Nephrons reaches to adult value at: **36 weeks gestation**
- Below this age BP of 120/80 is considered as hypertension: **<12 years**
- In newborn, renal tubular concentrating capacity reaches adult value at: **1 year**
- Normal GFR as adult value is reached at: **2 years**
- Best method of estimating creatinine assay: **Enzyme assay**
- Total body water is 60–70% of total body weight**
- **$\frac{2}{3}^{rd}$ of fluid is Intra Cellular Fluid; $\frac{1}{3}^{rd}$ is Extra Cellular Fluid.**
- Evans blue dye is used to measure: **Plasma volume**
- Normal pH of blood: **7.35–7.45**
- Normal plasma protein ratio: **1.7:1**
- Life span of normal RBC: **120 days**
- Platelets are stored at: **Room temperature**
- Mentzer index: **Used to differentiate iron deficiency anemia from beta thalassemia**

TABLE: Measurement of body fluid

Total body water <i>Mn: DATA</i>	D ₂ O (Deuterium oxide/heavy water)- MC used Aminopyrene, Tritium oxide, Antipyrine,
ECF volume <i>Mn: No SIM</i>	Sucrose Insulin (most accurate) Mannitol Na ⁺ Thiosulfate
ICF volume	Indirect method: ICF = TBW – ECF (<i>best done by D₂O – Inulin</i>)
Interstitial fluid	Indirect method: ISF = ECF – Plasma volume
Plasma volume <i>Mn: AB-P</i>	Albumin (Radiolabeled I ¹²⁵), Evans Blue
Total blood volume	Plasma volume x 100/100-Hct

TABLE: Na⁺ K⁺ ATPase pump

<ul style="list-style-type: none"> Na K ATPase pump is an active, electrogenic pump moves 3 Na⁺ ions outside and in place 2 K⁺ ions inside utilizing ATP. It helps in intrusion of K⁺. It accounts for 20% of energy utilized by cells. Thus its coupling ratio is 3:2 Extracellular binding site is Ouabain binding site Its activity is inhibited by ouabain and related cardiac glycosides (digitalis) It is a P type ATPase (super family of cation transporters) Also called E1/E2 type ATPase responsible for carrying ions across cell membranes. Type: Heterodimer heterogeneous (α & β subunit)
It is an example of active transport
<ul style="list-style-type: none"> Generation of Action Potential by Nerve cells not neuroglia Muscles Contractile tissue Glands

TABLE: Important RMP

RBC	– 12 mV
Rods & cones	– 40 mV
SA node	– 55 mV
Smooth muscle	– 50 to –60 mV
Cardiac muscle (Single Fiber)	– 85 to – 95 mV
Skeletal muscle	– 90 mV
Nerve fibre	– 90 mV
Inner hair cells	– 150 mV

NEUROTRANSMITTERS

Purines

- Adenosine
- ATP

Lipids and Gases

- Nitric oxide (NO)
- Carbon monoxide
- Cannabinoids

Biogenic Amines

- Catecholamines: Dopamine, norepinephrine and epinephrine
- Indolamines
- Serotonin and Histamine

Amino Acids

- GABA
- Glycine
- Aspartate
- Glutamate

Neuropeptides

- Substance P
- Endorphins and Enkephalins
- Somatostatin, gastrin, cholecystokinin, oxytocin, vasopressin, luteinizing hormone releasing hormone (LHRH)

TABLE: Blood brain barrier (BBB)

<ul style="list-style-type: none"> Membranes are generally asymmetrical Plasma membranes is composed mainly of proteins Protein content: 55% Phospholipid: 25% × 42%, 3% carbohydrate Function of phospholipid is transduction of signals and enzyme activation. Lipids and Proteins in cell membrane interact by Hydrogen bonds. Fluidity of membranes depends in lipid content. Saturated fatty acids increase transition temperature and decrease fluidity Unsaturated Fatty acids decrease transition temperature and increase fluidity Cerebral blood vessels are unique in that the junctions between vascular endothelial cells are nearly fused. The paucity of pores is responsible for what is termed the Blood Brain Barrier The lipid barrier allows the passage of lipid soluble substances but restrict movements of those that are ionized or have large molecular weight. CO₂, O₂ and lipid soluble substances (such as most anesthetics) freely enter the brain, whereas most ions, proteins and large substances such as mannitol penetrate poorly.

Contd...

- Water moves freely across the BBB.
- **Mannitol** an osmotically active substance that does not normally cross the BBB, cause a sustained decrease in brain water content and is often used to decrease brain volume.
- BBB may be disrupted by severe Hypertension, tumors, trauma, stroke, infection, marked hypercapnia, hypoxia and sustained seizure activity.

TABLE: Important tests

Decline in serum Ca^{2+} levels show signs of increasing neuromuscular hyperexcitability followed by hypocalcemic tetany.

Lab values: Decreased serum Ca^{2+}
Increased serum phosphate
Decreased urinary Phosphate excretion

Clinical tests for endocrine abnormalities:

Radioimmunoassays for T4, T3, TSH, cortisol, Ca^{2+} , etc.

Glucose Tolerance test: Check a fasting blood sugar level, then have patient drink a 75 g glucose solution. Re-draw blood at 30 min, 1 hr., and 2 hrs. If blood glucose level is >200 mg/dL at 2 hours, then highly suggestive of diabetes.

Dexamethasone suppression test: Dexamethasone, a synthetic steroid, is given to the patient at 11 p.m. The following day blood samples are collected at 4 p.m. and 11 p.m. The normal response is a decrease in circulating adrenal steroid hormones. Those with Cushing's will have continued elevated levels.

Radioiodine injection: Hyperthyroidism will show an increase uptake.

TABLE: Cells of stomach and their function

- G cells secretes - **Gastrin**
- I cells secretes - **CCK**
- S cells secretes - **Secretin**
- D cells secretes - **Somatostatin**
- Parietal cells secretes - **Intrinsic factor**
- Chief cells secretes - **Pepsin**

IMPORTANT PHYSIOLOGICAL FACTS

In nephron most of the reabsorption occurs at which portion: **PCT (~75%)**

Length of proximal convoluted tubule: **15 mm**

Length of distal convoluted tubule: **5 mm**

Length of collecting duct: **20 mm**

Location of macula densa: **DCT**

ADH produced by- **Supraoptic nucleus of hypothalamus**

Contd...

Oxytocin produced by: Paraventricular nucleus of hypothalamus

Teeth grinding is seen in which stage of sleep: **NREM II**

Night terror is seen in which stage of NREM: **Stage III & IV**

Sleep walking is seen in which stage of NREM: **Stage III & IV**

Other name of alpha wave: **Berger wave (discovered by Hans Berger)**

Best test for sleep disorder: **Polysomnography**

Bohr's effect: Fall in pH due to increase pCO_2 , decreases oxygen affinity of Hb

Haldane effect: Binding of O_2 to Hb reduces affinity of Hb to CO_2 .

Most important stimulus for central chemoreceptor: $\uparrow \text{PaCO}_2$ (**Inc CO_2 , Dec O_2**)

Most important stimulus for peripheral chemoreceptor: $\downarrow \text{PO}_2$, $\uparrow \text{CO}_2$

The partial pressure of O_2 (PaO_2) at sea level: **160 mm Hg.**

The partial pressure of CO_2 (pCO_2) at sea level: **0.23 mm Hg.**

Mean pulmonary arterial pressure: **16 mm Hg**

Mean pulmonary capillary pressure averages about: **7 mm Hg.**

Mean pressure in the aorta: **100 mm Hg.**

GLUT receptor located on sperm: **GLUT 5**

Alpha cells of pancreas secretes: **Glucagon**

Beta cells of pancreas secretes: **Insulin and amylin**

Delta cells of pancreas secretes: **Somatostatin**

Starch is hydrolyzed in mouth by: **Ptylin**

TABLE: Sleep waves

Wave (Mn: D-TAB)	Condition	Frequency
• Delta wave	Deep sleep	0.5 – 3 Hz
• Theta wave	Light sleep	4 – 7 Hz
• Alpha wave	Relaxed, awake	8 – 13 Hz
• Beta wave	Excited, active	14 – 30 Hz

TABLE: Sleep stages

Stage	EEG waves	Eye movement
Awake/alert	Beta (eye open) Alpha (eye closed)	Irregular
I-NREM	Alpha + Theta waves	Burst of rolling
II-NREM	Theta waves Sleep spindles K- complex	Alpha like burst
III-NREM	Theta, Delta synchronization	Fixed
IV-NREM	Delta (slowest wave)	Fixed
REM (paradoxical sleep)	Mixed frequency, Low voltage (theta, alpha > Beta)	Darting movements Active dreaming (+) Nightmares

TABLE: Important reflexes

Reflex	Stimulus	Response
Cushing reflex	Inc ICT (> 33 mm Hg)	Inc BP, Bradypnea, Bradycardia
Bainbridge reflex	Atrial distention due to rapid infusion of blood/Saline	Reflex tachycardia
Bezold-Jarisch coronary chemoreflex	5HT injection, Nicotine in coronary artery	Apnea, ↓BP, ↓HR
Hering-Breuer inflation reflex	Steady lung inflation	↑ Expiration
Hering-Breuer deflation reflex	Marked deflation of lung	↓ Expiration

TABLE: Muscle fiber types

Type I	Type II
Oxidative, slow fibers	Glycolytic, fast fibers
Easily excited	Difficult to excite
Less fatigability	More fatigability
Slow glycogen depletion	Fast glycogen depletion
Used in marathon runner	Used in sprinter (100 meter) runner
Major fuel: ATP	Major fuel: Phosphate

Biochemistry

AMINO ACID CLASSIFICATION

• Simple	Glycine, Alanine
• Branched chain	Leucine, Isoleucine, Valine
• Sulphur containing	Cysteine, Methionine
• Hydroxyl containing	Serine, Threonine
• Amide	Glutamine, Asparagine
• Acidic AA	Aspartic acid, Glutamic acid
• Basic AA	Histidine, Arginine, Lysine
• -OH containing	Serine, Threonine, Tyrosine
• Serine analog drugs	Cycloserine, Azaserine

Wernicke encephalopathy is due to deficiency of	• Thiamine
Strenuous exercise is not done in this glycogen storage disease	• Mc Ardle disease
Vitamin which is most potent anti-oxidant	• Vitamin E
Vitamin which helps in iron absorption	• Vitamin C
AA that accelerate ageing	• Homocysteine
AA that decreases ageing	• Cysteine, Taurine
Bend in DNA structure	• Glycine
AA which absorbs UV light	• Tryptophan (Max), Tyrosine, Phenylalanine
MC type of albinism	• OCA 2 (Oculocutaneous Albinism type II)
• Keshan disease is due to deficiency of: Selenium	
• Kashin-Beck disease: Due to excess of selenium	
• Menkes disease: Due to deficiency of copper	
• Acrodermatitis enteropathica: Due to deficiency of zinc (AR condition)	
• Vitamin having only animal source: Vitamin B12	
• Vitamin having antioxidant property: Vitamin E	
• Physiological uncoupler: Thyroid hormones, unconjugated bilirubin, long chain fatty acid	
• Sickle cell anemia is caused by point mutation in β globin chain	
• At 6 th position the hydrophilic glutamic acid gets replaced with valine (Hydrophobic)	
• Hyperammonemia type 1 is due to deficiency of this enzyme: Carbamoyl Phosphate Synthase I	
• Tomcat urine smell is seen in: Multiple carboxylase deficiency	
• Boiled cabbage urine smell is seen in: Hypermethioninemia	
• Smallest and simplest amino acid: Glycine	
• Storage form of folate: N-methyl folate	
• Energy for the urea cycle come from: Fat metabolism	
• Precursor of all sphingolipids: Ceramide	
• Type of bilirubin is found in neonatal jaundice: Indirect or unconjugated	
• This amino acid is a phenol: Tyrosine	
• This vitamin is an important component of rhodopsin: Vitamin A	
• Part of the 30s ribosome binds to the Shine-Dalgarno sequence: 16s subunit	
• This test is used to determine whether a gene is expressed: Northern blotting	

Contd...

- This complex of the ETC contains Cu^+ : **Complex 4**
- Inhibitors of complex IV of the ETC: **1. Cyanide, 2. CO, 3. Azide**
- Gluconeogenesis is inhibited by: **Insulin**
- **Gluconeogenesis** occurs in both cytoplasm and mitochondria
- Mercaptopurine is – **Nucleotide analogue**
- Source of ATP in RBC cell: **EMP pathway**

- Net ATP produced in anaerobic glycolysis: **2 ATP**
- Net ATP produced in aerobic glycolysis: **7 ATP**
- Cancer cells derive nutrition from **glycolysis**.
- Allosteric inhibition is seen in: **G-6-P, F-6-P**
- Erythrocytes lack **mitochondria** (all the cell organelles)
- Fluoroacetate inhibits aconitase enzyme: **Non-competitive reaction**
- Arsenite inhibits alpha-**Ketoglutarate dehydrogenase** enzyme–**Noncompetitive reaction**.
- Malonate inhibits succinate dehydrogenase enzyme–**Competitive reaction**
- Internal respiration is **exergonic** and **catabolic** and it uses **cytochromes b, c1, c, a, a3**
- Von Gierke's disease is due to **G-6-P Deficiency**
- Pompe's disease lysosomal α 1-4, α 1-6 glucosidase acid maltase deficiency.
- **Mc Ardle's disease** is muscle phosphorylase deficiency.
- **Acetyl CoA** is not a substrate for gluconeogenesis and cannot be converted back to glucose directly.
- **Gaucher disease** is due to Beta Glucocerebrosidase deficiency.
- Foam cells and sphingomyelinase deficiency is seen in **Niemann-Pick disease**
- Type 1 familial hypolipoproteinemia is due to deficiency of **lipoprotein lipase deficiency**.
- Palmitoleic acid is derivative of which family: **ω 7 family**
- Lipoprotein which transport cholesterol from liver to plasma: **VLDL**
- Most important apoprotein in HDL: **Apo A-I**
- Most important apoprotein in chylomicrons: **Apo B-48**
- De novo synthesis of fatty acids occurs in the **cytosol**
- Malic enzyme forms malic acid from pyruvic acid in the presence of **CO_2 & NADPH**.
- Long chain fatty acid penetrate the inner mitochondrial membrane only in combination with **carnitine**.
- Beta-oxidation of odd chain fatty acid produces **acetyl CoA propionyl CoA**.

Contd...

- Refsum's disease occurs due to deficiency of **phytanic alpha oxidase**.
- Alkaptonuria deficiency is: **Homogentisate oxidase**
- **Liver** is the only organ which produces ketone bodies (but never utilizes it)
- **Gout** is metabolic disorder of purine metabolism.
- Mutation in sickle cell disease: **Base pair substitution**
- **LDL** has maximum cholesterol content
- Conversion of norepinephrine to epinephrine: **Demethylation**
- Enzyme required for demethylation: **Phenylethanolamine-N-methyltransferase**
- Enzyme is used to convert phenylalanine to tyrosine: **Phenylalanine hydroxylase**
- Beta oxidation of odd chain fatty acid produces: **Acetyl CoA and Propionyl CoA**
- Complete HGPRT deficiency cause **Lesch-Nyhan syndrome**
- Partial HGPRT deficiency causes **Kelley-Seegmiller syndrome**
- Normal growth require **proto-oncogenes** not oncogenes
- DNA ligase and primase are used in **DNA replication**
- The **sigma sub unit** enables RNA polymerase to recognize promoter regions on DNA.
- **Template** is required for protein and nucleic acid synthesis
- Alzheimer's, cystic fibrosis and prion diseases occur due to **protein misfolding**
- **Microsatellites** are tandem repeats of one to six nucleotide scattered throughout the genome.
- After digestion by restriction endonucleases the DNA ends can be ligated by **DNA-ligase**.
- **DNA microarrays** is used for detection in DNA sequences and Gene expression.
- Proline and glycine have the least tendency to form **Alpha-helix**.
- Structural proteins are usually fibrous proteins, transport and functional protein are usually **globular**
- Simple globular proteins are **albumin and globulin**.
- Adenyl cyclase, guanylate cyclase and glycogen synthase enzymes are activated by **calcium and calmodulin**.
- **Phenylketonuria** is caused by deficiency of phenylalanine hydroxylase & dihydrobiopterin reductase.
- **Alkaptonuria** is due to defective homogentisate 1, 2-dioxygenase.
- Maple syrup urine disease is deficiency of branched chain **alpha keto acid dehydrogenase**.
- **Succinyl CoA** is formed by valine, isoleucine, methionine.

Contd...

FMGE Solutions Screening Examination

<ul style="list-style-type: none"> • Niacin in biologically active form of NAD⁺ & NADP⁺. • Vit A intoxication leads to demineralization of bone, hypercalcemia, hyperostosis. • ATP is used in a set of reactions that converts chemical energy into light energy. • Cobalt containing vit B12 is found only in food of animal origin and is absorbed from distal ileum. • Vitamin B12 & folic acid supplements treat pernicious anemia by increasing DNA synthesis in bone marrow • Niacin sparing amino acid: Tryptophan • Which bases are purine? Adenine and Guanine • Which bases are pyrimidines? Cytosine, Uracil, Thymine • What enzyme is deficient in Severe Combined Immunodeficiency Disease (SCID)? • Adenosine Deaminase • The start codon AUG codes for which amino acid? Methionine • Which RNA is the most abundant? rRNA – (Mn: r = rampant) • Which RNA is the longest? mRNA – (Mn: M = massive) • Which RNA is the smallest? tRNA – (Mn: t = tiny) • Which organelle is the site for labeling specific proteins for the lysosome? Golgi apparatus • What type of collagen makes the basement membrane? Type IV • Collagen is loaded with tons of which amino acids? Proline and Lysine • What enzyme is deficient in Fructose Intolerance? Aldolase B • What enzyme is deficient in Essential Fructosuria? Fructokinase • Tyrosinemia types and Enzyme defect <ul style="list-style-type: none"> ▪ I: Fumarylacetoacetate hydroxylase (<i>hepatorenal</i>) ▪ II: tyrosine transaminase (<i>oculocutaneous</i>) ▪ III: PHPP hydroxylase (<i>neonatal</i>) • Nitrofurantoin acts by inhibiting this enzyme • Tyrosine → PHPP → Homogentisic acid • Folate trap is due to deficiency of • Folate trap increases the risk of this disease • Calcium acts as cofactor for which enzymes • Copper acts as cofactor for this enzyme • Iron acts as cofactor for this enzyme • Zinc acts as cofactor for these enzymes 	<p>Parahydroxyphenyl Pyruvate Hydroxylase To treat hereditary tyrosinemia type I, Alkaptonuria</p> <p>B12</p> <p>Acute coronary syndrome</p> <p>Lipase, Lecithinase</p> <p>Cyt C oxidase, Lysil oxidase, AA oxidase, SOD, Tyrosinase</p> <p>Succinate DeH</p> <p>ALD, ALP, ALA dehydratase, carbonic anhydrase, LDH</p>
--	---

TABLE: Special group attached with amino acids

Amino Acid	Special group
Arginine	Guanidinium
Phenylalanine	Benzene
Tyrosine	Phenol
Histidine	Imidazole
Proline	Pyrrolidine
Methionine	Thioether linkage
Tryptophan	Indole
Cysteine	Thioalcohol (-SH)

TABLE: Pathways and their rate limiting enzymes

Pathway	Rate limiting enzyme
• Glycolysis	<i>Phosphofructokinase</i>
• Glycogenesis	<i>Glycogen synthase</i>
• Glycogenolysis	<i>Phosphorylase</i>
• Cholesterol synthesis	<i>HMG - COA Reductase</i>
• Ketone body formation	<i>HMG - COA synthase</i>
• Bile acid synthesis	<i>7-α-hydroxylase</i>
• Fatty acid synthesis	<i>Acetyl COA carboxylase</i>
• Uric acid synthesis	<i>Xanthine oxidase</i>
• Urea cycle	<i>CPS I</i>
• Pyrimidine synthesis	<i>CPS II</i>

TABLE: Cycles and their location

Mitochondria Mn: KEBOK	Cytoplasm	Both mitochondria and cytoplasm
Krebs cycle	Glycolysis	Gluconeogenesis
ETC	Glycogenesis	Urea synthesis
Bet oxidation of FA	Glycogenolysis	Heme synthesis
Oxidative phosphorylation	HMP Shunt	
Ketogenesis	FA synthesis	
	Cholesterol synthesis	
	Bile acid/Salt synthesis	

TABLE: GLUT receptors, their location and function

Receptor	Location on tissue	Function
GLUT 1	Brain, kidney, colon, placenta, RBC	Glucose uptake
GLUT 2	Liver, pancreatic beta cell, small intestine, Kidney	Rapid uptake or release of glucose

Contd...

Receptor	Location on tissue	Function
GLUT 3	Brain, kidney and placenta	Glucose uptake
GLUT 4	Heart, skeletal muscles, adipose tissue	Insulin-stimulated glucose uptake
GLUT 5	Small intestine	Absorption of glucose

TABLE: Lysosomal storage disease and deficient enzymes

• Hurler's syndrome: Alpha-L-iduronidase deficiency
• Hunter's syndrome: Iduronate-2-sulfatase deficiency
• Gaucher's: Glucocerebrosidase deficiency
• Farber's disease: Ceramidase deficiency
• Fabry disease: Alpha Galactosidase-A
• Tay-sachs: Hexosaminidase A deficiency
• Sandhoff disease: β-Hexosaminidase A and B
• Metachromatic leukodystrophy: Arylsulfatase A enzyme deficiency
• Krabbe disease: Galactocerebrosidase

MAJOR APOLIPOPROTEINS

- **Chylomicron:** A, B48, CII, E (*least protein, max size, max density*)
- **VLDL:** Apo B100, CII, E
- **LDL:** Apo B100
- **HDL:** Apo A1

TABLE: Source of energy during starvation

STAGE	I	II	III
Duration	1st 2–3 days	Up to 2 weeks (longest)	<1 week
Energy source	Carbohydrate	Fats	Proteins
Metabolism	Initially Glycogenolysis then gluconeogenesis	Lipolysis and ketone body formation	Breakdown of protein

TABLE: Amino acid at a glance: total AA = 20 in number

Essential AA (8): <i>Can't be synthesized. (Mn: TV TILL 8 PM)</i>	Semi-essential AA: <i>Can be synthesized under normal condition as per demand.</i>	Non-Essential AA: <i>synthesized in body readily</i>
Threonine, Valine, Tryptophan, Isoleucine, Lysine, Leucine, Phenylalanine, Methionine	Histidine Arginine	The remaining 10 AA are Non-essential.

TABLE: Vitamin B, their other names and disease entities due to deficiency

Vitamin	Other name	Deficiency causes
Vit B1	Thiamine	Beriberi , <i>Wernicke's encephalopathy</i>
Vit B2	Riboflavin	Angular stomatitis, cheilosis, dermatitis, Glossitis
Vit B3	Niacin	Pellagra (4D's- Dementia, Diarrhea, Dermatitis, Death)
Vit B5	Pantothenic acid	Burning foot syndrome, Leiner disease
Vit B6	Pyridoxine	Peripheral neuropathy, Sideroblastic anemia, Pellagra, Homocystinuria, Hartnup disease
Vit B7	Biotin	Multiple carboxylase deficiency
Vit B9	Folic acid	Megaloblastic anemia, Neural tube defect
Vit B12	Cyano-cobalamin	Megaloblastic anemia, subacute combined degeneration (SACD)

TABLE: Forms of Vitamin K

Feature	Vitamin K1	Vitamin K2	Vitamin K3
Aka	Phylloquinone	Menaquinone	Menadione
Source	Several green vegetables and prepared synthetically	Synthesized by GI bacteria, supplies 50% human requirement	Synthetic, Analog of 1, 4-naphthoquinone
Solubility	Fat soluble	Fat soluble	Diphosphate salt is Water soluble

TABLE: Urea cycle and their associated enzyme defect

Disease condition	Enzyme defect
• Hyperammonemia I	CPS I defect
• Hyperammonemia II	OTC defect
• Citrullinemia I	Argininosuccinate synthase
• Argininosuccinic aciduria	Argininosuccinate lyase
• Hyperargininemia	Arginase
• HHH Syndrome	Ornithine transporter defect

TABLE: Inborn error of metabolism and urine odor

IEM	Urine odor
• Swimming pool	Hawkinsinuria
• PKU	Mousy/musty

Contd...

IEM	Urine odor
• Glutaric acidemia	Sweaty feet, acrid
• Isovaleric acidemia	Sweaty feet, acrid
• MSUD	Maple syrup
• Hypermethioninemia	Boiled cabbage
• Trimethylaminuria	Rotting fish
• Tyrosinemia	Boiled cabbage, rancid butter

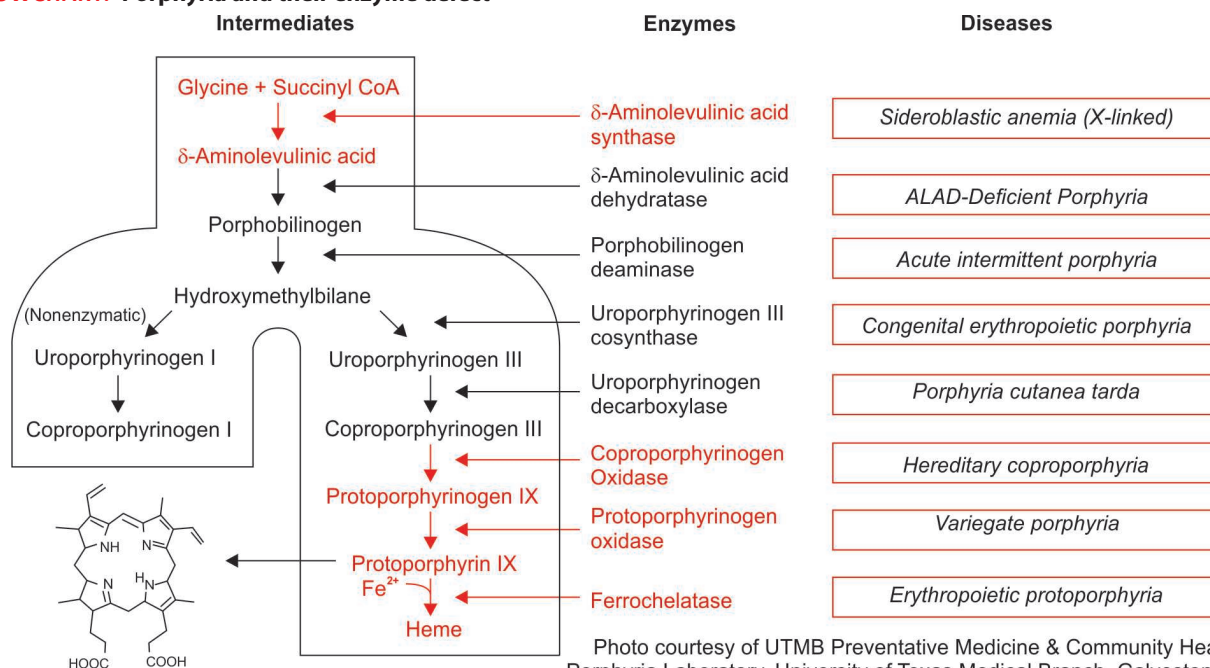

TABLE: Maple syrup urine disease types and their associated enzyme defect

Gene	Component	MSUD types
E1a	Branched chain alpha keto acid decarboxylase	Type Ia MSUD
E1b	Branched chain alpha keto acid decarboxylase	Type Ib MSUD
E2	Dihydrolipoyl transacylase	Type II MSUD
E3	Dihydrolipoamide dehydrogenase	Type III MSUD

TABLE: Inhibitors of electron transport chain

Complex	Inhibitors
• Complex I	Rotenone, Piericidin A, Amobarbital
• Complex II	Malonate, TTFA
• Complex III	BAL, Antimycin A, Naphthoquinone
• Complex IV	Na azide, HCN, CO
• Complex V	Atractyloside, Oligomycin

FLOWCHART: Porphyrria and their enzyme defect

IMPORTANT TESTS AND THEIR APPLICATION

- **Murexide test:** Uric acid
- **Rothera test:** Ketone body
- **Biuret test:** Detect maximum 2 peptide bond
- **Hopkins cole test:** Tryptophan
- **Millions test:** Tyrosine
- **Gerhardt test:** Acetoacetic acid
- **Hay test:** Bile salt
- **Fouchet's test:** Bile pigment
- **Ehrlich test:** Urobilinogen
- **Molisch test:** for CHO
- **Guthrie FeCl₃ test:** PKU
- **Ames test:** Carcinogenicity due to salmonella typhimurium

TABLE: Must know points about porphyria

- MC type of porphyria: **Porphyria cutanea tarda**
- MC acute porphyria: **Acute intermittent porphyria**
- MC porphyria in child: **Erythropoietic protoporphyria**
- Erythropoietic porphyria: **Usual clinical presentation photosensitivity**
- Hepatic porphyria with cutaneous manifestation: **PCT**

Pharmacology

PHARMACOLOGY—AT A GLANCE

- Phase of clinical trial which recruits healthy human volunteers: **Phase 0**
- Clinical trial to assess safety and non-toxicity: **Phase I**
- Number of patients in Phase II clinical trial: **20–200**
- Ethical clearance is not required for which phase of clinical trial: **Phase 4**
- Drugs are tested on healthy human volunteers in which phase of clinical trial: **Phase 1 and Phase 0**
- Phase which is dealing with microdosing: **Phase 0**
- Phase V clinical trial is: **Pharmacoepidemiology**
- **Maximum** parasympathetic outflow by which cranial nerve: **CN-X**
- 100% Bioavailability is seen with this route: **I.V. route**
- **Area under curve** denotes: **Bioavailability**
- **Bioavailability** is the fraction of administered drug that reaches the systemic circulation in the unchanged form.
- **Absorption and first pass mechanism** are two important Determinants of bioavailability.
- Shortest acting steroid: **Hydrocortisone**
- Formoterol and Indacaterol: **Long acting Beta 2 agonist (Bronchodilator)**
- Antiepileptic with highest teratogenic potential: **Sodium Valproate**
- Drug of choice for cardiogenic shock: **Dobutamine**
- DOC for neurogenic diabetes insipidus: **Desmopressin**
- Shortest acting mydriatic agent: **Tropicamide (t_{1/2}: 6 hrs)**
- Cycloplegic agent of choice in child: **Atropine 1% ointment**
- Fastest acting insulin: Insulin **Aspart**
- Peakless insulin: **Glargine**
- Physiological antagonism of Histamine: **Adrenaline**
- Preferred agent for treatment of ventricular arrhythmia: **Lignocaine**
- DOC for diabetic diarrhea: **Clonidine**
- DOC for brucellosis: **Doxycycline**
- DOC for Schistosomiasis: **Praziquantel**

Contd...

- DOC for nasal carriers of MRSA: **Mupirocin**
- DOC for motion sickness: **Hyoscine**
- Side effect of aminoglycoside: **Nephrotoxicity and Ototoxicity**
- DOC for malignant hyperthermia: **Dantrolene**
- Cardiotoxic anesthetic agent: **Etomidate**
- Cevimeline is used for: **Xerostomia in Sjögren's syndrome**
- Urine should be alkalinized for acid drug poisoning and acidified for **alkaline poisoning**.
- Drugs having **steep DRC** have narrow therapeutic index
- **Pharmacovigilance** is the science and activities relating to the detection, assessment, understanding and prevention of adverse effect of any other possible drug related problems.
- **Ach** is the principle neurotransmitter at neuromuscular junctions as well as pre-ganglionic fibers.
- Rate limiting step in the **biosynthesis of ach**: **Uptake of choline**
- Most common class of drug for causing first dose effect: **selective alpha-1 blocker (e.g.: Prazosin)**
- Irreversible alpha-1 adrenoceptor antagonist: **Phenoxybenzamine (DOC for pheochromocytoma)**
- Retrograde ejaculation is a known side effect of: **Alpha 1 blockers (Prazosin, Phentolamine)**
- Vasomotor reversal of dale is seen due to: **Alpha blocker followed by Epinephrine**
- Beta blocker which releases Nitric oxide: **Celiprolol, Nebivolol, Nipradilol (CNN)**
- DOC for beta blocker poisoning: **Glucagon**
- DOC for organophosphate poisoning: **Atropine**
- DOC for atropine poisoning: **Physostigmine**
- Pin-point pupil is seen in poisoning with: **(Mn: POMP)**
- Pontine hemorrhage, Organophosphate, Morphine and Phenol poisoning
- **Streptomycin** is contraindicated throughout pregnancy
- Side effect of Streptomycin: Nephrotoxic, Ototoxic, Neuromuscular Junction Blocker
- Low molecular weight heparin affects which factor: **Factor Xa >> IIa**
- All ACE inhibitors are prodrug EXCEPT **Captopril and Lisinopril**
- **Febuxostat**: Anti-gout and Xanthine Oxidase inhibitor
- **Drugs causing disulfiram like reaction**:
 - Griseofulvin, Metronidazole, Chlorpropamide, Cefoperazone, Cefotetan, Trimethoprim
- **Atropine** is the antidote for–Organophosphate and carbamate poisoning.

Contd...

FMGE Solutions Screening Examination

1270

- **Oximes** are used for Organophosphate poisoning
- Cystoid macular edema in aphakic is caused by **Dipivefrine**.
- New drug approved for over active bladder stimulating β_3 receptors – **Mirabegron**.
- DOC for narcolepsy – **Modafinil**
- Antidepressant used for smoking cessation: **Bupropion**
- Treatment of alopecia in males – **Minoxidil**
- Vasopressor of choice in pregnancy – **Ephedrine**
- Most cardio selective Beta blocker – **Nebivolol**
- Longest acting Beta blocker – **Nadolol**
- Maximum membrane stabilizing activity Beta blocker – **Propranolol**
- Earliest appearing adverse effect of digitalis – **Nausea and vomiting**
- Only oral inotropic drug- **Digoxin**
- Most widely used Beta blocker for Congestive heart failure – **Carvedilol**
- **Beta Blockers With Partial Agonistic Activity** (Remembered as Contain Partial Agonistic Activity): Celiprolol, Oxprenolol, Pindolol, Alprenolol, Acebutolol
- MOA of hyoscine – **M3 blocker**
- **Mannitol** – Indicated in cerebral edema and is contraindicated in cerebral hemorrhage
- Oral mannitol side effect – **Osmotic diarrhea**
- Zileuton – **LOX inhibitor**
- Selective COX-2 inhibitor: **Etoricoxib**
- **Sodium Cromoglycate** – Mast cell stabilizer
- Most common adverse effect of beta 2 agonist (eg: Salbutamol) – **Tremors**
- **Abciximab** – GpIIb/IIIa blocker
- DOC for GIST & CML– **Imatinib**
- DOC Benign Prostatic hypertrophy: **Tamsulosin**
- MOA finasteride – **5 alpha reductase inhibitor**
- Long acting somatostatin analogue – **Octreotide**
- Funny current blocker drug: **Ivabradine**
- Phosphodiesterase 3 inhibitor used in heart failure: **Amrinone, Milrinone**
- Recently approved PDE3 inhibitor which is also a myocardial Calcium sensitizer: **Levosimendan**
- Cerebroselective calcium channel blocker: **Nimodipine**
- Ranolazine is recently approved for: **Angina**
- Mechanism of action of **Fasudil**: **Rho kinase inhibitor**
- **Edaravone** is recently approved drug for: **Amyotrophic lateral sclerosis**

- **Acetyl-N carnitine** is recently approved for: **Alzheimer's disease**
- **Livedo reticularis** is side effect of antiparkinsonian drug: **Amantadine**
- Gender specific side effect of valproate: **PCOS**

TABLE: Drugs metabolized by acetylation → Causes SLE

These drugs are remembered as CHIPS-ABC drugs:

- Clonazepam
- Hydralazine
- Isoniazid
- Procainamide
- Sulfonamides
- Acebutolol, Amrinone, ASA
- Benzocaine
- Caffeine

TABLE: Drugs which are enzyme inducers and enzyme inhibitors

Enzyme inducers	Enzyme inhibitors
<ul style="list-style-type: none">• Griseofulvin• Phenytoin• Rifampicin• Smoking• Carbamazepine• Phenobarbitone• Barbiturate• DDT	<ul style="list-style-type: none">• Phenylbutazone• Erythromycin• Allopurinol, Amiodarone• Ciprofloxacin• Omeprazole• Cimetidine• Ketoconazole• Valproate
Remembered as: GPRS Cell Phone Battery Dead	Mn: PEACOCK Vala

TABLE: Anti-muscarinic drugs used in ophthalmology

Drug	Duration of effect (days)
Atropine	7–10
Scopolamine	3–7
Homatropine	1–3
Cyclopentolate	1
Tropicamide	0.25 days (6 hrs)

TABLE: Side effect of antiepileptic drugs

Drug	Side effect
• Na + Valproate	Hepatotoxicity, Reversible Alopecia, Weight Gain, Tremor, PCOS, Most teratogenic (neural tube defect)
• Phenytoin	Gum hypertrophy, Fetal hydantoin syndrome, megaloblastic anemia

Contd...

Contd...

Drug	Side effect
• Carbamazepine	Bone marrow suppression, agranulocytosis, SJS
• Topiramate	Renal stone, Weight loss
• Zonisamide	Renal stone, Weight loss
• Vigabatrin	Visual field defect, Weight gain

TABLE: Drugs of choice for some commonly asked malignancies: (Harrison 19th ed.)

Malignancy	First line drugs
Chronic Lymphatic leukaemia	Fludarabine
Chronic Myeloid leukaemia	Imatinib
Hairy cell leukemia	Cladribine
Multiple myeloma	Bortezomib
Choriocarcinoma	Methotrexate
Prostate carcinoma	Bicalutamide/Flutamide

TABLE: Some common side effects of anti-CA drugs

• Busulfan & Bleomycin – Pulmonary Fibrosis
• Doxorubicin & Daunorubicin: Cardiotoxicity
• Cisplatin – Ototoxic, Nephrotoxic, Vomiting
• Vincristine & Vinblastine – Peripheral Neuropathy
• Ifosfamide, Cyclophosphamide: Hemorrhagic cystitis
• 6 Mercaptopurine: Hepatotoxicity

SOME IMPORTANT DRUG OF CHOICE

DOC for acute severe asthma	Salbutamol
DOC for nephrogenic diabetes insipidus	Thiazides
DOC for central diabetes insipidus	Desmopressin
DOC for morning sickness	Doxylamine
DOC for cisplatin induced vomiting	Ondansetron
DOC for delayed vomiting due to cisplatin	Aprepitant
DOC for motion sickness	Hyoscine
DOC for levodopa induced vomiting	Domperidone
DOC for hypertensive emergencies	Nicardipine
DOC for hypertensive emergency in pregnancy	Labetalol
DOC for anaphylactic shock	Adrenaline
DOC for cardiogenic shock with oliguric renal failure	Dopamine
DOC for carcinoma pancreas	Gemcitabine

Contd...

DOC for hairy cell leukemia	Cladribine
DOC for CLL	Fludarabine
DOC choriocarcinoma	Methotrexate
Drug of choice for cyclophosphamide induced hemorrhagic cystitis	Mesna
DOC for glioma	Nitrosourea
DOC colorectal cancer	5 FU
Disulfiram like reaction anti- cancer drug	Procarbazine
Hodgkin's new Regimen (ABVD)	Adriamycin Bleomycin Vinblastine Dacarbazine
Non-Hodgkin's Lymphoma Regimen (R-CHOP)	+/- Rituximab Cyclophosphamide Hydroxydaunorubicin (doxorubicin) Oncovin (Vincristine) Prednisolone
DOC for liver fluke	Triclabendazole
DOC for Dog tape worm/ Echi. Granulosus	Albendazole
DOC for Filarial worm	Diethylcarbamazine (DEC)
DOC for strongyloides and onchocerca	Ivermectin
Oral DOC for scabies	Ivermectin
DOC for scabies	5% Permethrin
DOC for Platyhelminthes	Praziquantel or Niclosamide
Oral DOC for kala-azar	Miltefosine
DOC for Chagas disease	Benznidazole
DOC for dermatophytosis	Systemic Griseofulvin + Topical azole
DOC for candida	Fluconazole
DOC for Aspergillosis	Voriconazole
DOC for P. vivax	Chloroquine
DOC for P. falciparum	ACT
DOC for cerebral malaria	Artesunate
DOC for cerebral malaria during pregnancy	Quinine
DOC in Alzheimer's disease	Donepezil
Drug used in for Alzheimer's disorder	Galantamine/ Rivastigmine/ Donepezil/Memantine

Contd...

DOC for OCD	Fluoxetine
Newly diagnosed Parkinson disease patient should be started first on:	Rasagiline (due to its neuroprotective action-Studies)
DOC for parkinsonism in young	Ropinirole and Pramipexole
DOC for drug induced parkinsonism	Benzhexol
DOC for paroxysmal supra ventricular tachycardia	Adenosine
DOC for Supraventricular Tachycardia	Verapamil
DOC for Atrial Fibrillation	Esmolol
DOC for digitalis induced ventricular arrhythmia	Lignocaine
DOC for torsades de pointes	Mg⁺
DOC for morphine poisoning	Naloxone
DOC for alcohol withdrawal syndrome	Benzodiazepines (Chlordiazepoxide)
DOC for mania	Lithium

TABLE: Drug of choice for different seizures

Absence seizures (petit mal)	Na ⁺ valproate
GTCS (Grand mal)	Lamotrigine > Na ⁺ Valproate
Focal seizure	Carbamazepine
Myoclonic seizures	Na ⁺ Valproate > Lamotrigine
Infantile/salaam seizure	ACTH
Infantile spasm with tuberous sclerosis	Vigabatrin
Febrile seizures	Diazepam (per rectal)
Status epilepticus	Lorazepam (IV)
Eclamptic seizure	Magnesium sulfate
Seizure during pregnancy	Lamotrigine
Neonatal seizure	Phenobarbitone

TABLE: Diuretics their MOA and site of action

Diuretic class	Drugs	MOA	Site of action
Osmotic diuretic	Mannitol	Inhibit water and solute reabsorption	All part of tubule, but mainly proximal tubule
Loop diuretics	Furosemide Torsemide	Inhibit Na ⁺ -K ⁺ -2 Cl co-transport	Thick ascending loop of Henle

Contd...

Diuretic class	Drugs	MOA	Site of action
Thiazide diuretic	Hydrochlorothiazide Benzthiazide Chlorthalidone Indapamide	Inhibit Na ⁺ -Cl ⁻ co-transport	Distal tubule
K ⁺ sparing diuretic	Spironolactone Triamterene Amiloride	Decrease Na ⁺ reabsorption Decrease K ⁺ secretion	Collecting tubule
Carbonic anhydrase inhibitor	Acetazolamide	Inhibit H ⁺ secretion and HCO ₃ reabsorption, which reduces Na ⁺ reabsorption	Proximal tubule

TABLE: Typical antipsychotics and its action on its D receptor

Typical antipsychotics	
Strong D2 blocker	Haloperidol-has maximum risk of EPS Droperidol
Weak D2 blocker	Chlorpromazine Thioridazine – has minimum risk of EPS
Intermediate D2 blocker	Fluphenazine Prochlorperazine

TABLE: Antimicrobials with their mechanism of action

Drugs which inhibit cell wall formation	Drugs which inhibit protein synthesis
Cycloserine Vancomycin Fosfomycin Bacitracin Beta lactam	Tetracycline Chloramphenicol Macrolides (Erythro, Clarithro, Azithro) Clindamycin Streptogramins (Quinupristin + dalbapristin)
Remembered as: <u>C</u> ell <u>V</u> all o <u>F</u> <u>B</u> acteria	<u>T</u> he <u>C</u> hild <u>M</u> ay <u>C</u> limb <u>S</u> tairs

TABLE: Antimicrobials and their side effects

Antimicrobial drugs	Side effects
Chloramphenicol	<ul style="list-style-type: none"> Bone marrow suppression Grey baby syndrome
Tetracycline	<ul style="list-style-type: none"> Teeth discoloration and bone growth suppression Phototoxicity Fanconi syndrome (in case of expired tetracycline) Vestibular dysfunction

Contd...

Antimicrobial drugs	Side effects
Vancomycin	<ul style="list-style-type: none"> Red man syndrome Nephrotoxic and ototoxic
Clindamycin	<ul style="list-style-type: none"> Pseudomembranous colitis
Erythromycin estolate	<ul style="list-style-type: none"> Cholestasis
Aminoglycosides	<ul style="list-style-type: none"> Nephrotoxicity and Ototoxicity

TABLE: Choice of drugs for common problems during pregnancy/safe and unsafe drugs during pregnancy

Drug class (condition)	Unsafe drugs	Safer alternative
Antibacterials	Fluoroquinolones Tetracycline Doxycycline Chloramphenicol Streptomycin Kanamycin Tobramycin	Penicillin G; Ampicillin Amoxicillin-Clavulanate Cloxacillin, Piperacillin Cephalosporins Erythromycin
Antitubercular	Pyrazinamide, Ethambutol Streptomycin	Isoniazid Rifampicin
Anti hypertensives	ACE inhibitors Angiotensin (R) blocker Diuretics Propranolol and nitroprusside	Methyldopa Hydralazine Atenolol, Metoprolol, Pindolol Nifedipine
Antithyroid drugs	Carbimazole Radioactive iodine Iodide	Propylthiouracil (PTU)

TABLE: Recommended doses of antitubercular drug

Drug	Daily dose		3 x per week dose	
	mg/kg	For >50 kg	mg/kg	For >50 kg
Isoniazid (H)	5 (4-6)	300 mg	10 (8-12)	600 mg
Rifampin €	10 (8-12)	600 mg	10 (8-12)	600 mg
Pyrazinamide (Z)	25 (20-30)	1500 mg	35 (30-40)	2000 mg
Ethambutol (E)	15 (15-20)	1000 mg	30 (25-35)	1600 mg

TABLE: Important side effects of antitubercular drugs

Peripheral neuropathy (due to vit B6 deficiency): Isoniazid
Orange color urine- Rifampicin

Contd...

Flu-like symptoms- Rifampicin
Hyperuricemia/gout- Pyrazinamide
Optic neuritis/Red green color blindness- Ethambutol
Nephrotoxic, Ototoxic, Neuromuscular Junction Blocker- Streptomycin
Most hepatotoxic ATT: Pyrazinamide
Hypothyroidism: Ethionamide and PAS
Psychotic symptoms: Cycloserine

TABLE: Antiplatelet drugs and their target of inhibition

Antiplatelet drugs	Target of inhibition
Aspirin	Inhibit TXA ₂ (Thromboxane A ₂) release
Terutroban	TXA ₂ receptor blocker
Clopidogrel and Ticlopidine	Inhibit ADP receptor P2Y ₁₂ irreversibly
Cangrelor, Ticagrelor	Reversible inhibitor of P ₂ Y ₁₂
Abciximab Tirofiban Eptifibatide	Inhibit GP IIb/IIIa
Atopaxar, Vorapaxar	Thrombin Inhibitor
Heparin	AT3 mediated IIa and Xa inhibition
Low molecular weight heparin (Enoxaparin, Dalteparin, Tinzaparin)	AT3 mediated Xa >> IIa inhibition
Fondaparinux	AT3 mediated Xa inhibition
Hirudin, Lepirudin	Direct thrombin inhibitor

TABLE: Oral hypoglycemic agents

Drugs		Remark
Oral glucose-lowering agents		
Biguanides (Metformin)	<ul style="list-style-type: none">• Therapy of type 2 diabetes• Usually initial agent in type 2 diabetes	<ul style="list-style-type: none">• Reduce hepatic glucose production• Weight neutral• Do not cause hypoglycemia• Adverse events include diarrhea, nausea, lactic acidosis (black-box warning)• Use cautiously in renal insufficiency,• Avoid use in patents with hepatic dysfunction

Contd...

Drugs		Remark
α-Glucosidase inhibitors Acarbose, miglitol, voglibose	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Reduce carbohydrate breakdown in GI tractAdverse effects: GI flatulence, elevated liver function testsCan be combined with other agentsRelatively modest glucose lowering
Dipeptidyl peptidase 4 inhibitors Sitagliptin, Saxagliptin, Linagliptin, Alogliptin, Vildagliptin	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Prolong action of GLP-1; Promotes insulin secretionCan be combined with other agentsRelatively modest glucose lowering
Insulin secretagogues: Sulfonylureas Second generation: Glyburide, Glibenclamide, Glipizide, and other	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Stimulate insulin secretionMajor adverse events is hypoglycemiaAdjustments needed in renal/liver disease2nd gen are more potent, may have better safety profile than first-generation agents.Can be combined with other agentsModest weight gain
Insulin secretagogues-nonsulfonylureas Repaglinide, nateglinide	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Increase insulin secretion, quicker onset and shorter duration than sulfonylureasMajor adverse event: Hypoglycemia
SLGT2 inhibitors Canagliflozin, Dapagliflozin, Empagliflozin	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Prevent glucose reabsorption and promote renal glucose excretionMild weight loss and BP reductionDo not cause hypoglycemiaMay increase rate of lower urinary tract and genital mycotic infections, hypotension, and DKA

Contd...

Drugs		Remark
Thiazolidinediones Rosiglitazone, Pioglitazone	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Increase insulin sensitivityAdverse effects: Peripheral edema, CHF, weight gain, fractures, macular edemaUse with caution in CHF, liver disease
GLP-1 agonists Albiglutide, dulaglutide, exenatide, liraglutide	<ul style="list-style-type: none">Therapy of type 2 diabetes	<ul style="list-style-type: none">Increase Insulin secretion, Decrease gastric emptying, Decrease glucagonInjected subcutaneouslyOften associated with weight lossAdverse events include nauseaDo not use with agents that decrease GI motilityRisk of hypoglycemia with insulin
Amylin analogue Pramlintide	<ul style="list-style-type: none">Adjunctive therapy with insulin in type 1 and type 2 diabetes	<ul style="list-style-type: none">Slows gastric emptying, decreases glucagonInjected subcutaneouslyDecrease postprandial glycemiaOften associated with weight lossRisk of hypoglycemia with insulin

TABLE: Hypolipidemic drugs

Drug	Mechanism of action
Statins (simvastatin, rosuvastatin)	HMG-CoA reductase inhibitor
Fibrates (clofibrate, fenofibrate, gemfibrozil)	PPAR-alpha agonist
Cholestyramine, colestipol, colesevelam	Bile acid sequestrant
Ezetimibe	Inhibit cholesterol absorption

Contd...

Drug	Mechanism of action
Alirocumab, evolocumab	PCK-K9 inhibitor
Lomitapide	Microsomal TG transfer protein inhibitor
Torcetrapib, anacetrapib	Cholesteryl Ester Transfer Protein inhibitor
Mipomersen	Apolipoprotein B 100 synthesis inhibitor
Volanesorsen	Apolipoprotein C-III synthesis inhibitor

TARGETED ANTI-CA THERAPY

Class	Drugs	Use
Proteasome inhibitor	BORTEZOMIB, CARFILZOMIB, IXAZOMIB it inhibits NF-KB which does the cell division	MM
PARP inhibitor	OLAPARIB, RUCAPARIB, NIRAPARIB	BRCA # Ovarian CA
CDK inhibitor	Inhibits CDK 4 and 6 both	Breast CA
Tyrosine kinase inhibitor	Imatinib	DOC for CML & GIST
	Lapatinib	Breast CA
	Sorafenib	Hepatocellular CA
	Sunitinib	Renal cell CA
	Vandetanib	Medullary CA thyroid

IMPORTANT MAB AND THEIR USE

• Palivizumab	RSV
• Eculizumab	PNH
• Omalizumab, Mepolizumab, Reslizumab	Bronchial asthma
• Daratumumab	MM
• Cetuximab	Recurrent head & neck CA
• Rituximab	CLL and NHL

DRUG USED IN MEDICALECTOMIES

• Labyrinthectomy	Gentamicin
• Adrenalectomy	Mitotane, Metirapone, Aminoglutethimide, Ketocon
• Prostatectomy (Androgen Ablation)	Bicalutamide (LHRH agonist)
• Castration (orchidectomy/oophorectomy)	GnRH analogue (Goserelin, Buserelin, Leuprolide)
• Pancreatectomy	Streptozotocin, Alloxan

AGENTS USED IN GOUT AND RHEUMATOID ARTHRITIS

• DOC for acute gouty arthritis	• NSAIDS (except Aspirin)
• DOC for chronic gout	• DOC: Allopurinol (Xanthine oxidase inhibitor)
	• Febuxostat (if allergy w/ Allopurinol)
• Uricosuric agent used in gouty arthritis	• Probenecid, Sulfinpyrazone, Lesinurad, Benzbromarone
• DOC for Rheumatoid arthritis	• Mtx
• Calcineurin inhibitor causing gum hypertrophy and Hirsutism	• Cyclosporine
• Fastest acting anti rheumatoid agent	• Leflunomide
• TNFα inhibitor	• Adalimumab, certolizumab, Etanercept, Infliximab, Golimumab
• IL-1 R#	• ANAKINRA
• IL-2#	• DACLIZUMAB
	• BASILIXIMAB
• IL-6 R#	• TOCILIZUMAB
• Costimulation inhibitor	• Abatacept
	• Belatacept (b/w CD 80 & 28)
• Calcineurin inhibitor:	• Cyclosporine, Tacrolimus
• Mtor inhibitor	• SIROLIMUS, EVEROLIMUS

1275

Pathology

• Number of DNA base pairs in human genome	3.2 billion DNA Base pairs
• Total Number of genome that is encoding protein in human	20,000
• Mobile genetic element/Jumping genes	Transposons (1/3rd of human genome)
• Person to person variation (susceptibility to diseases, drug action) in genome	1.5% (represents 15 million base pairs)
• MC forms of DNA variation	SNP and CNV (single nucleotide polymorphism and Copy number variation)
• Function of PDGF	Chemotactic for neutrophils, macrophages Stimulate proliferation of fibroblast Stimulate ECM protein synthesis
• MC adhesion molecule for Diapedesis	PECAM/CD 31
• VEGF that stimulate embryonic vessel development	VEGF-B
• VEGF that causes Lymphangiogenesis	VEGF-C and D
• Maximum volume of cell contributed by	Cytosol (54%)
• Number of mitochondria/cell	1700
• Most abundant glycoprotein in basement membrane	Laminin

IMPORTANT POINTS ON NECROSIS

• MC type of necrosis/cell death due to sudden occlusion of blood supply	Coagulative necrosis
• Primary mechanism of coagulative necrosis	Denaturation of I/C proteins

Contd...

• Primary mechanism of liquefactive necrosis	Enzymatic digestion of cell
• Solid organ where ischemic necrosis is liquefactive	Brain
• Variants of coagulative necrosis	Caseous necrosis, gangrene
• Caseous necrosis is caused by	TB (most common), syphilis, fungal (Histoplasmosis, Coccidioidomycosis)
• Malignant hypertension causes this type of necrosis	Fibrinoid necrosis

NECROPTOSIS VS PYROPTOSIS

<ul style="list-style-type: none"> • Necroptosis (programmed necrosis) 	<ul style="list-style-type: none"> • Resembles necrosis morphologically and apoptosis mechanistically • Caspase independent programmed cell death → Triggered from signaling by RIP1 and RIP3 complex → reduces mt.ATP gen, production of ROS, inc permeability of lysosomal membrane → cellular swelling and membrane damage • Necroptosis is seen in: (RAPS) <ul style="list-style-type: none"> • Reperfusion injury • Acute pancreatitis • Parkinson's disease • Steatohepatitis • Backup defence against CMV (they encode caspase inhibitors)
<ul style="list-style-type: none"> • Pyroptosis 	<ul style="list-style-type: none"> • Occurs in cells infected with microbes • Involves activation of caspase-1 → Activate IL-1 • IL 1 and IL11 → causes cell death of infected death • Characterized by swelling of cells, loss of plasma membrane integrity, and release of inflammatory mediators

Most common mediastinal tumor: Thymoma (anterior mediastinum)

Most common middle mediastinal tumor: Lymphoma

Most common middle mediastinal mass: Pericardial cyst

Cancer associated with Epstein-Barr virus:

- Nasopharyngeal Carcinoma
- Burkitt's lymphoma
- Hodgkin's disease

Caseous necrosis is seen in organ in which organ: Lung (Tuberculosis)

Viral infection causing genial CA: HPV

Contd...

Trilateral retinoblastoma involves: Bilateral eye retinoblastoma plus pinealoblastoma
Most common source of brain metastasis: Lung
Thyroid CA associated with pheochromocytoma and hyperparathyroidism: Medullary cancer thyroid (MEN IIa)
India ink is used for diagnosing: Cryptococcus neoformans
Patau syndrome is: Trisomy 13
Edward syndrome: Trisomy 18
Down syndrome: Trisomy 21
Pitting is: Removal of nuclei from old RBC's by the spleen without destroying the cell, and the cell send back plasma circulation.
Culling is defined as: Removal of abnormal RBC form the blood by spleen
Removal of worm out and abnormal RBC's and platelets from the bloodstream by phagocyte cells in the spleen is: Phagocytosis
Highly aggressive lung cancer with rapid doubling capability and metastasis: Small cell lung CA
Type of necrosis seen in Brain pathology: Liquefactive necrosis
MC urinary bladder CA: Transitional cell CA
GITRE CELLS are modified CNS macrophages
Acrocentric chromosomes are: 13, 14, 15, 21, 22, Y
Pregnancy tumor of gums: Granuloma pyogenicum
Grawitz tumor is also known as Hypernephroma/RCC
HPE finding of type IV lupus nephritis: Wire loop lesions
Noonan syndrome has phenotype similar to: Turner syndrome
Largest gene: Dystrophin gene
Partial trisomy of chromosome 22: Cat eye syndrome
Garland triad aka 1-2-3 sign is suggestive of: Thoracic sarcoidosis
Coast of California sign is seen in: Neurofibromatosis
Accordion sign seen in: Pseudomembranous colitis
Rosenthal fibers in affected brain is characteristic of- Alexander's disease
Bear paw sign is seen in: Xanthogranulomatous pyelonephritis
Subendothelial Deposits are seen in SLE patients
<ul style="list-style-type: none"> Necroptosis resembles necrosis morphologically and apoptosis mechanistically as a form of programmed cell death. Necroptosis is triggered by ligation of TNFR1, and viral proteins of RNA and DNA viruses. Pyroptosis occurs in cells infected by microbes. It involves activation of caspase-1 which cleaves the precursor form of IL-1 to generate biologically active IL-1. Caspase-1 along with closely related caspase-11 also cause death of the infected cell.

Contd...

- Autophagy is an adaptive response to enhanced nutrient deprivation and involves sequestration of cellular organelles into cytoplasmic autophagic vacuoles (autophagosomes) that fuse with lysosomes and digest the enclosed material.
- Location of selectins
 - L- selectin:** Leucocytes, monocytes, T cell, B cell
 - E selectin:** Endothelium activated by cytokines
 - P selectin:** endothelium activated by cytokines (TNF, IL1), Histamine, platelets
- Chédiak-Higashi syndrome:** Decreased leukocyte functions because of mutations affecting protein involved in lysosomal membrane traffic
- Chronic granulomatous disease:** Due to decreased oxidative burst

TABLE: Classification of Ehlers-Danlos syndromes

EDS Type	Clinical findings	Inheritance
Classic (VII)	Skin and joint hypermobility, atrophic scars, easy bruising	Autosomal dominant
Hypermobility (III)	Joint hypermobility, pain, dislocations	Autosomal dominant
Vascular (IV)	Thin skin, arterial or uterine rupture, bruising, small joint hyperextensibility	Autosomal dominant
Kyphoscoliosis (VI)	Hypotonia, joint laxity, congenital scoliosis, ocular fragility	Autosomal dominant
Arthrochalasia (VIIa, b)	Severe joint hypermobility, skin changes (mild), scoliosis, bruising	Autosomal dominant
Dermatosparaxis (VIIc)	Severe skin fragility, cutis laxa, bruising	Autosomal dominant

TABLE: Examples of trinucleotide repeat mutations

Disease	Repeated nucleotide	Number of repeats
Fragile X syndrome	CGG	55-200 (pre); >230 (full)
Friedreich ataxia	GAA	34-80 (pre); >100 (full)
Myotonic dystrophy	CTG	34-80 (pre); >100 (full)
Spinobulbar muscular atrophy (Kennedy disease)	CAG	38-62
Huntington disease	CAG	36-121

FMGE Solutions Screening Examination

TABLE: Mechanisms of hypersensitivity reactions

Type	Immune mechanisms	Prototypical disorders
Immediate (type I) hypersensitivity	Production of IgE antibody → immediate release or vasoactive amines and other mediators from mast cells; later recruitment of inflammatory cells	Anaphylaxis; allergies; bronchial asthma (atopic forms)
Antibody-mediated (type II) hypersensitivity	Production of IgG → binds to antigen on target cell or tissue → phagocytosis or lysis or target cell by activated complement or Fc receptors; recruitment or leukocytes	Autoimmune hemolytic anemia; goodpasture syndrome
Immune complex—mediated (type III) hypersensitivity	Deposition of antigen-antibody complexes → complement activation → recruitment of leukocytes by complement products and Fc receptors → release of enzymes and other toxic molecules	Systemic lupus erythematosus; some forms of glomerulonephritis; serum sickness; Arthus reaction
Cell-mediated (type IV) hypersensitivity	Activated T lymphocytes → (1) release of cytokines, inflammation and macrophage activation; (2) T cell-mediated cytotoxicity	Contact dermatitis; multiple sclerosis; type 1 diabetes; tuberculosis

NEPHROPATHY AND HPE FINDINGS

HPE finding	Associated abnormality
Subepithelial Humps	Acute Poststreptococcal Glomerulonephritis
Linear Subendothelial deposits	Goodpasture syndrome (Type II)
Mesangial deposits	IgA Nephropathy
Spike and dome shaped deposits	Membranous nephropathy
Subendothelial humps	Membranoproliferative glomerulonephritis
Holly leaf mesangial deposits	FSGS

MEN SYNDROMES

Type (Chromosomal location)	Tumors	Remark
MEN 1 (11q13)	<ul style="list-style-type: none"> Parathyroid adenoma (90%) Entropancreatic tumors (30-70%) Pituitary adenoma (15-50%) 	<ul style="list-style-type: none"> Overall MC type of MEN1 is Parathyroid adenoma MC enteropancreatic tumor is: Gastrinoma (>50%) VIPoma is least common type of enteropancreatic tumor (<1%) MCC of pituitary adenoma is Prolactinoma
MEN 2A	<ul style="list-style-type: none"> Medullary CA thyroid (90%) Pheochromocytoma (10-50%) Parathyroid adenoma (>25%) 	
MEN 2B Aka MEN 3	<ul style="list-style-type: none"> Medullary CA thyroid (>90%) Pheochromocytoma (>50%) Associated abnormalities (40-50%) Mucosal neuroma Marfanoid habitus Megacolon Medullated corneal nerve fibers 	
MEN 4	<ul style="list-style-type: none"> Parathyroid adenoma Pituitary adenoma Reproductive organ tumors (testicular cancers, neuroendocrine cervical CA). 	

- Most common cause of cell injury is – **Hypoxia**
- Most common cause of hypoxia – **Ischemia**
- Most common and sensitive cells in the body damaged due to hypoxia – **Neurons**
- Cytochrome C plays an important role in: **Apoptosis**
- Not a cellular adaptation: **Necrosis**.
- Barrett's esophagus is an example of: **Metaplasia**.
- Myelin figures are derived from: **Damaged cell membrane**.
- H₂O₂ is produced as well as destroyed in: **Peroxisome**.
- CNS** – liquefactive necrosis (only solid organ where liquefactive necrosis seen)
- TB** – caseous necrosis
- Most characteristic **feature of apoptosis** – Absence of inflammation and intact cell membrane
- Important indicator of free radical injury – **Lipofuscin** (alveolar wall)
- Myositis ossificans – Connective tissue metaplasia

Contd...

- Most common site for metastatic calcification – **Lungs**
- **Haber-Weiss reaction is:** Generation of free radical from H_2O_2 .
- **Fenton Reaction** – $H_2O_2 + Fe^{2+} \rightarrow Fe^{2+} + OH + OH$
- The most common fixative for light microscope is – **10% neutral buffered formalin**
- The most common fixative for electron microscope is – **Glutaraldehyde**
- Hall mark of acute inflammation – **Increased vascular permeability**
- Formation of endothelial gaps – **Mechanism of increased vascular permeability**
- Rolling of neutrophils done by – **Selectins**
- Leukocytes with giant granules in peripheral blood smear seen in – **Chédiak-Higashi syndrome**
- Eosinophils have major basic protein which is toxic to **parasites**
- Most important chemical mediators of acute inflammation – **Histamine**
- Most potent **microbicidal system** – oxygen dependent MPO system, NADPH oxidase / Respiratory burst
- Most important fibrogenic agent → **TGF – beta**
- **SRS** – A components – LTB4 & LTC4
- Most common complement deficiency associated with **Streptococcal septicemia** and **lupus** like syndrome in children – Deficiency of C2
- Chemotactic for neutrophils – **IL 8**
- Most common type of inflammation - **Catarrhal inflammation**
- **Vitamin K** dependent clotting factors – 2, 7, 9, 10, protein C & S
- **Functions of bradykinin**
 - Contraction of smooth muscles (bronchospasm, vasospasm of muscular arteries)
 - Pain
 - Dilation of the venules
- Monocytes and macrophages are the primary leukocytes in **chronic inflammation**
- Epithelioid cells are macrophages activated by **INF – Gamma**
- Granulation tissue is the hallmark of – **Fibrogenic repair**
- Severe generalized edema is called – **Anasarca**
- Hemosiderin laden macrophages (heart failure cells) found in **Lung**
- **Bernard-Soulier syndrome** – A defect in the glycoprotein factor results in defective platelet adhesion

Contd...

- **Virchow triad** – Endothelial cell injury + alteration of blood flow+ hypercoagulability
- **Thrombin** is procoagulant but thrombin-thrombomodulin complex is anticoagulant
- Most common inherited cause of hypercoagulability – **Leiden mutation** (factor 5 mutation)
- **Lines of Zahn** are produced by the alternating pale layers of platelets mixed with some fibrin and dark layers containing more red cells
- Most common site for **DVT** – **Deep veins below the knee**
- **Chargaff's rule** – amount of purine is equal to pyrimidine ($A + G = C + T$)
- Most common death in Marfan syndrome – **Aortic Dissection**
- Autosomal recessive diseases are most common type of mendelian mode of inheritance
- **In AR inheritance**, both parents must have mutant gene
- Essential amino acid in PKU – **Tyrosine**
- **Uniparental Disomy** – Should be suspected in an individual manifesting a recessive disorder, where only one parent is a carrier
- **PGF2a is a vasoconstrictor** where PGD2, PGE2 are vasodilators
- The chief cell responsible for scar contraction is **myofibroblast**
- **Heart failure cells are:** Hemosiderin laden macrophages.
- Heart failure cells seen in: **Lungs**
- Platelet aggregation requires: **Glycoprotein IIb-IIIa**
- Fibrin is degraded by: **Plasmin**
- **Virchow's triad of thrombosis include:** Vascular (endothelial) injury; abnormal blood flow (stasis or turbulence); hypercoagulability.
- Virchow's fifth sign of inflammation is: **Loss of function**
- **Leiden factor is:** Mutated factor V.
- Most common source of embolism: **DVT (deep vein thrombosis)**.
- **Red aka hemorrhagic infarcts are seen in:** Ovary, lung, small intestine.
- **Pale aka white infarcts are seen in:** Heart, spleen, liver, kidney, brain.
- In inflammation Rubor is due to: **Arteriolar dilatation**.
- **Hallmark of acute inflammation:** Increased vascular permeability.
- Which Cells primarily involved in acute inflammation: **Neutrophils**.

Contd...

FMGE Solutions Screening Examination

1280

- Major microcirculation involved in acute inflammation: **Venules**.
- Cell-matrix adhesion is mediated by: **Integrins**.
- Major cells which are involved in chronic inflammation: **Macrophages**.
- **Life span of neutrophils**: 4–8 hours (in blood) and 2–5 days (in tissues).
- Phagocytic cells in brain (CNS): **Microglia**.
- Oxygen dependent killing in phagocytes is through: **NADPH oxidase**.
- **Chédiak–Higashi syndrome** is a defect of: **Phagocytosis**.
- Most abundant glycoprotein in basement membrane: **Laminin**.
- **Warthin finkeldey** giant cells are seen in measles
- **Reed–sternberg cells** seen in **hodgkin's lymphoma**
- Most common site for keloid – **Sternum**
- Triplet repeat of CCG nucleotides seen in-**Fragile X syndrome**
- There is presence of CAG repeats associated with – **Hunting-ton's chorea**
- **Gonadal/Germline mosaicism** seen in – osteogenesis imperfecta and tuberous sclerosis
- Diagnosis of choice for **Fragile X Syndrome** – PCR
- White spots on the iris known as brushfield spots seen in **Down syndrome**
- Mitotic non-disjunction is responsible for development of **mosaicism**
- Patients of Down syndrome having predisposition for **Hirschsprung's disease, duodenal atresia** and **Alzheimer's disease**.
- **Robertsonian translocation** seen in about 4% cases of Down syndrome
- **AML M7** variety is associated with Down syndrome
- Maternal meiotic non-dysjunction is most common cause of **down syndrome**
- **Triple test and Quadruple screen** test is used for screening of Down syndrome at 15–20 weeks of pregnancy
- Maternal serum of alpha fetoprotein + estriol + hCG are the components of triple test this are low in **Edward syndrome**
- **AFP** is increased in neural tube defects but reduced in Edward and down syndromes
- **Patau syndrome** is trisomy 13, features are polydactyly cleft lip and holoprosencephaly.
- **Edward syndrome** is trisomy 18, features are micrognathia overlapping flexed fingers.

Contd...

- **Cat eye syndrome** is a partial trisomy of chromosome 22 and is coined due to the particular appearance of the ventricular colobomas in the eyes.
- **Klinefelter syndrome** is male chromosomal disorder of chromosome 47, XXY, there is decrease in testosterone and inhibin but increase in LH and FSH.
- **Noonan syndrome** is autosomal congenital disorder mostly mutation in genes on chromosome 12.
- Trisomy 7 mostly occur due to mitotic non – Disjunction.
- Trisomy 18 is more commonly seen in **2nd meiotic division**.
- **Lyon's hypothesis** says inactivation of either maternal or paternal x chromosome among all the cells of blastocyst by about 16th day of embryonic life
- **Barr bodies** are absent in normal males and turner syndrome but female has 1 Barr body.
- Benign tumor developing from all three germ layers – **Teratoma**
- Lesion with normal differentiation at abnormal site – **Choristoma**
- Hallmark of malignant transformation – **Anaplasia**
- **Hamartoma** – Abnormal differentiation in normal site
- **Malignant tumors** have upregulation of telomerase activity
- HNPCC is AD but is due to defective **DNA repair**
- Cell cycle sequence **G1-S-G2-M-G0**
- The initiation of DNA replication involve the formation of an active complex between **Cyclin E** and **CDK2**
- The main mediator that propels the cell beyond prophase is – **Cyclin B CDK1 complex**
- Proto-oncogenes were discovered by **Harold Varmus** and **Michael Bishop**
- The point mutation of **Ras family gene** is the single most common abnormality of oncogenes in human tumors
- **MYC** is associated with conflict model in carcinogenesis
- **K-RAS**- Colon, lung & pancreatic tumors
- **N-RAS** – Melanoma, AML
- **H-RAS** – Bladder and kidney tumors
- **C-MYC** – Burkitt's lymphoma
- **L-MYC** – Small cell lung cancer
- **N-MYC** – Neuroblastoma
- **RB gene** was the first tumor suppressor gene to be discovered
- **RB gene** is present on chromosome 13q14
- Retinoblastoma is associated with **Knudsen two hit hypothesis**

Contd...

<ul style="list-style-type: none"> • P53 gene is the most commonly mutated gene in human cancer • The nonmutated P53 gene is also called as – Wild type • Toll – like receptor causes the activation of NF – Kappa beta and AP-1 	
<ul style="list-style-type: none"> • CD45 is also called a leukocyte common antigen (LCA) • Antigen presenting cells include – B-cells macrophages and dendritic cells • HEV are lined by simple cuboidal cells as opposite to regular venules lined by endothelial cells. 	
<ul style="list-style-type: none"> • Pan B cell – CD 19 • Isotype switching – Change in the class of the antibody produced by the plasma cell • IgM and IgG are responsible for activation of classical pathway • IgA, IgE and IgD are responsible for activation of alternate pathway 	
<ul style="list-style-type: none"> • NK cells are unique as they are capable of direct cell lysis • MHC is located on short arm of chromosome 6 • MHC 1 molecule is present on all the nucleated cells and platelets 	
<ul style="list-style-type: none"> • MHC 2 molecule is present on all the APC'S (Antigen Presenting Cells) 	
<ul style="list-style-type: none"> • Crumpled tissue paper app • Hunner ulcer • Cushing ulcer • Curling ulcer • Cameron ulcer 	<ul style="list-style-type: none"> • Gaucher's disease (massive splenomegaly) • Interstitial cystitis • Stomach ulcer due to raised ICP • Ulcer in D1 portion d/t burns • Hiatus hernia

IMPORTANT ONE LINERS

<ul style="list-style-type: none"> • Foam Cells are: Lipid Laden Macrophages • Artery not involved in atherosclerosis: Pulmonary trunk. • Most common cause of aortic aneurysm: Atherosclerosis. • Infection causing atherosclerosis: Chlamydia pneumoniae, herpes virus (CMV). • Tree bark calcification is seen in: Syphilitic aneurysm. • Pulseless disease is: Takayasu arteritis. • Most common benign vascular tumor: Hemangioma. • Kaposi's sarcoma is associated with: HHV-8.

Contd...

<ul style="list-style-type: none"> • Characteristic of rheumatic carditis: Pancarditis. • Most commonly involved valve in Rheumatic fever: Mitral valve. • McCallum plaque is seen in: Rheumatic carditis (on left atrium). • Most common cause of constrictive pericarditis: TB. • Gitter cells are: Microglia • Maximum decrease in CSF chloride: TB meningitis. • Characteristic pathological feature of parkinsonism: Lewy bodies. • Most common cause of intracerebral (intraparenchymal) hemorrhage: Hypertension. • Important features of Dandy-Walker syndrome: Agenesis of cerebellar vermis and corpus callosum, cystic enlargement of 4th ventricle, hydrocephalus. • Most common cerebellar tumor in children: Astrocytoma • Most common cerebellar tumor in children: Astrocytoma • Wermer's syndrome is: MEN-I. • Sipple's syndrome is: MEN-IIA. • Orphan Annie eye nuclei is characteristic of this thyroid CA: Papillary thyroid carcinoma. • Most common thyroid carcinoma: Papillary carcinoma. • Weight range of adrenal in Cushing's disease: 25-40 gm. • Nesidioblastoma is due to: Hyperplasia of pancreatic beta cells. • Tadpole cells are seen in: Rhabdomyosarcoma. • Brown tumor of bone is seen in: Hyperparathyroidism. • Most common mutation in Ewing's sarcoma: Translocation t 11:22. • Tophus is pathognomonic for: Gout. • Bilateral breast cancer: Lobular carcinoma. • Most common breast cancer: Invasive ductal carcinoma. • Most common gene involved in breast cancer (overall): P53. • Most common gene involved in familial breast cancer: BRCA-1. • Call-Exner bodies are seen in: Granulosa-theca cell tumor. • Most common testicular tumor and testicular germ cell tumor: Seminoma. • Definitive marker for hepatoblastoma: AFP. • Canals of herring are present in: Liver. • 'Comet tail artefact' with thickening of gallbladder wall: Adenomyomatosis. • 'Onion skin' fibrosis of bile duct is seen in: Primary sclerosing cholangitis.

FMGE Solutions Screening Examination

1282

- **Nutmeg liver is seen in:** Right sided heart failure (chronic passive congestion).
- **Rate limiting step in bilirubin metabolism:** Excretion of conjugated bilirubin into canaliculi.
- **Most common site of intestinal amebiasis:** Cecum and ascending colon.
- Pipe-stem appearance is seen in: **Ulcerative colitis**.
- Most specific marker of GIST: **C-Kit (CD 117)**.
- Most common site of GIST: **Stomach**.
- Most common site of gastric carcinoma: **Pylorus and antrum**.
- **Most common complication of peptic ulcer:** GI bleeding (e.g. Haematemesis).
- **Most common site of peptic ulcer:** 1st part of duodenum.
- **Most common symptoms of bladder cancer:** Painless hematuria.
- Michaelis-Gutmann bodies are seen in: **Malakoplakia**.
- Kimmelstiel-Wilson lesion is characteristic of: **Diabetic nephropathy**.
- **Hallmark of IgA nephropathy:** Hematuria after 1-2 days of an upper respiratory tract infection.
- Most common cause of nephrotic syndrome in adults: **Membranous GN**.

- Crescent formation is characteristic of: **RPGN**.
- Most common cause of nephritic syndrome: **RPGN**.
- Tamm-Horsfall protein is produced by: **Loop of Henle**.
- Carcinoid tumors arise from: **Enterochromaffin cells**.
- Marker of squamous cell carcinoma of lung: **Cytokeratin**.
- Most common lung carcinoma: **Adenocarcinoma**.
- Potato nodes are seen in: **Sarcoidosis**.
- Bilateral hilar lymphadenopathy with non-caseating granuloma: **Sarcoidosis**.
- Most common form of emphysema seen clinically: **Centriacinar emphysema** (centrilobular emphysema).

HEPATITIS

Mnemonic for failure: causes of acute liver

- A: Acetaminophen, hepatitis A, autoimmune hepatitis
- B: Hepatitis B
- C: Hepatitis C, cryptogenic
- D: Drugs/toxins, hepatitis D
- E: Hepatitis E, esoteric causes (Wilson disease, Budd-Chiari)
- F: Fatty change of the microvesicular type (fatty liver of pregnancy, valproate, tetracycline, Reye syndrome)

Contd...

TABLE: The hepatitis viruses

Virus	Hepatitis A	Hepatitis B	Hepatitis C	Hepatitis D	Hepatitis E
Type of virus	ssRNA	Partially dsDNA	ssRNA	Circular defective ssRNS	ssRNA
Viral family	Hepatovirus; related to picornavirus	Hepadnavirus	Flaviviridae	Subviral particle in Delta Viridae family	Hepevirus
Route of transmission	Fecal-oral (contaminated food or water)	Parenteral, sexual contact, perinatal	Parenteral; intranasal cocaine use is a risk factor	Parenteral	Fecal-oral
Mean Incubation period	2 to 6 weeks	2 to 26 weeks (mean 8 weeks)	4 to 26 weeks (mean 9 weeks)	Same as HBV	4 to 5 weeks
Frequency of chronic liver disease	Never	5%–10%	>80%	10% (co-infection); 90%–100% for superinfection	In Immunocompromised hosts only
Diagnosis	Detection of serum IgM antibody	Detection of HBsAg or antibody to HBcAg; PCR for HBV DNA	3rd-generation ELISA for antibody detection; PCR for HCV RNA	Detection of IgM and IgG antibodies; HDV RNA serum; HDAg in liver	Detection of serum IgM and 10 antibodies; PCR for HEV RNA

**TABLE: Hereditary hyperbilirubinemia**

Disorder	Inheritance	Defects in bilirubin metabolism	Liver pathology	Clinical course
Unconjugated hyperbilirubinemia				
Crigler-Najjar syndrome type I	Autosomal recessive	Absent UGT1A1 activity	None	Fetal in neonatal period
Crigler-Najjar syndrome type II	Autosomal dominant with variable penetrance	Decreased UGT1A1 activity	None	Generally mild, occasional kernicterus
Gilbert syndrome	Autosomal recessive	Decreased UGT1A1 activity	None	Innocuous
Conjugated hyperbilirubinemia				
Dubin-Johnson syndrome	Autosomal recessive	Impaired biliary excretion of bilirubin glucuronides due to mutation in canalicular multidrug resistance protein 2 (MRP2)	Pigmented cytoplasmic globules	Innocuous
Rotor syndrome	Autosomal recessive	Decreased hepatic uptake and storage? Decreased biliary excretion?	None	Innocuous

UGT1A1, Uridine diphosphate-glucuronyl transferase family, peptide A1

HODGKIN'S LYMPHOMA

	Classical				Non-Cl:
	Nodular sclerosis	Mixed cellularity	Lymphocyte rich	Lymphocyte depleted	Lymphocyte predominant
Incidence	MC type	MC type in India		a/w HIV	
RS cell	Variant = lacunar cell	Max no. of RS cell	Least no. of RS cell	3 types of RS cell	Popcorn cell
CD marker	15 + and 30+	15 + and 30+	15 + and 30+ CD 20-ve	15 + and 30+	CD 20+ 15 and 30 -ve
Prognosis	Excellent	Very good	Good to Excellent	Poor	Excellent

Types of Graft Rejection

	Acute	Hyperacute	Chronic
Duration	5 days to 3 months	Immediately within minutes or hours	Occurs after months or years
Mechanism	Involves humoral (antibodies) and Cellular (T cell) rejection	Due to preformed antibodies (humoral)	Involves T cell (cellular rejection)
Hypersensitivity	IV	II	IV and III

FMGE Solutions Screening Examination

• Antoni A and B	Schwannoma, Sarcoidosis, Sporotrichosis (Gardner's disease)
• Asteroid body	Sporotrichosis
• Azzopardi effect	Oat cell lung CA
• Banana bodies	Farber disease (Dec Ceramidase)
• Birbeck granules	Histiocytosis X
• Cigar bodies	Sporotrichosis
• Caterpillar cell/Anitschnow cell	Aschoff Nodule (RF)
• Caterpillar body	Porphyria
• Civatte bodies	Lichen planus
• Councilman body	Acute viral hepatitis, YF
• Donovan body	Granuloma inguinale
• Dutcher body	Multiple myeloma
• Guarnieri body	Small pox
• Gamma gandy body	Portal HTN, sickle cell disease
• Globi bodies	Leprosy
• Globoid cell	Krabbe disease
• Hirano bodies	Alzheimer's
• Hurthle cell	Hashimoto's thyroiditis
• Kamino bodies	Nevus
• Marquee bodies	Kala-azar-Leishmania donovani
• Odland bodies	Normal skin body
• Orphan annie nuclei	Papillary CA thyroid
• Psammoma bodies	Papillary CA thyroid, Serous cystadenoma, Meningioma (PSM)
• Russell bodies	MM
• Schaumann bodies	Sarcoidosis
• Zellballen bodies	Chemodectoma/Paraganglioma

Microbiology and Parasitology

Culture Media	
VR media	V. cholerae alkaline peptone water
Stuart transport medium	Resp. specimen
Enrichment media	Selenite F broth, Salmonella, Shigella
Enriched media	Blood agar chocolate agar
Selective media	Wilson Blair medium Salmonella
Potassium tellurite blood agar	C. diphtheriae

Staining Method

Z-N stain	Acid fast stain for mycobacteria, Nocardia
Kinyoun stain	Cold acid fast stain cryptosporidium parvum, Mycobact, Nocardia
Albert stain	Metachromatic stain for C. diphtheriae

Colony Appearance

• Thumb print app	Bordetella pertussis
• School of red fish	H. ducreyi (Chancroid)
• Fried egg colony	Mycoplasma hominis
• Poached egg colony	C. diphtheriae (Mitis) In tellurite agar
• Frog head colony	C. diphtheriae (intermedius)
• Nagler reaction	Cl. perfringens
• Medusa head	Bacillus anthracis
• Draughtsman colony	Strep. pneumoniae

TABLE: Agglutination tests and their uses

Agglutination test	Used mainly for
Direct agglutination test	Determination of blood group Bacterial agglutination test for serotyping and serogrouping. E.g.: Vibrio Cholera, Salmonella Sp.
Slide agglutination test	Used for serotyping of salmonella VDRL for syphilis
Tube agglutination test	Aka standard agglutination test. Used for serological diagnosis of typhoid, brucellosis and typhus fever. E.g.: Widal Test, Weil-Felix reaction, and Kahn test
Passive agglutination test	Rheumatoid factor ANA for SLE Antibody to Trichinella spiralis and antibody to group A strep.

- Sporulation of bacteria seen in which phase: **Stationary phase**
- Doubling of bacteria seen in this phase: **Exponential phase**
- Bacterial cell wall is made up of: **Peptidoglycan**
- Fungal cell wall is made up of: **Chitin**
- Eukaryotic ribosomes are **80s ribosomes** (60s + 40s subunits)
- Prokaryotic ribosomes are **70s ribosomes** (50s + 30s subunits)
- **Staph. aureus** is the most common organism causing hospital acquired wound infections/surgical wounds

Contd...

- **Hot air oven** utilizes 180°C for 1 hour, used for lab glass wares/glass syringes
- **Autoclaving**-attain temperature of 122°C under 15lb/sq inch pressure
- **Formaldehyde** gas is used for fumigation of OT/labs/rooms/woollen blankets
- **Bacillus stearothermophilus** is a thermophile organism whose spores are extremely heat resistant.
- **Bacillus subtilis** is the biological indicator for testing dry heat sterilizers, ethylene oxide sterilizers
- **Bacillus subtilis** is used in Guthrie test
- **Clostridium botulinum** spores are the most heat resistant organism and require 120°C 4 min or 100°C 330 min
- Proteus strains are used as antigens for **Weil-Felix reactions**
- **Classical pathway** is activated by IgM, IgG and immune complexes
- **Alternate pathway** is activated by bacterial endotoxin, zymogen, IgA and IgG4, cobra venom
- Most important **opsonizing complement-C3b**
- Most important chemotactic: **C5a**
- Proinflammatory cytokines that are present with dominance of **CMI-IL2, INF gamma, TNF alpha, IL1**
- Anti-inflammatory cytokines that are present with dominance of humoral immunity: **IL4, 5, 6, 10**
- Bruton agammaglobulinemia is X linked disease characterized by defective opsonization due to deficiency of **opsonizing antibodies**
- **Ataxia telangiectasia** is AR disorder characterized by triad of *cerebellar ataxia + oculocutaneous telangiectasia and immunodeficiency.
- **Chédiak-Higashi syndrome**: AR disorder associated with mutation in LYST gene
- **SCID**- due to lack of combined T cell, B cell, NK cells
- Most common primary tumor of anterior mediastinum is **Thymoma**
- **Nagler's reaction** is seen in clostridium perfringens, it is due to alpha toxin
- Most common species of pseudomonas causing intravenous catheter related infection: **Pseudomonas maltophilia**
- Most common organism implicated in osteomyelitis: **Staph. aureus**
- Most common cause of Hand foot mouth disease- **coxsackievirus A16**
- Most common viruses implicated in encephalitis- **Echoviruses**
- **Leptospirosis**-triad of fever, jaundice, renal failure,
- Gas gangrene most commonly caused by clostridium perfringens (**clostridium welchii**)

Contd...

- Pikes media is transport media for **streptococcus pyogenes**
- Culture media for corynebacterium diphtheriae is - **Loeffler's serum slope**
- Culture media for neisseria gonorrhoeae is - **Thayer Martin medium**
- Fir tree appearance of colonies on culture shown by - **Bacillus anthrax**
- Daisy head appearance of colonies on culture shown by **C. diphtheria**
- Fried egg colonies- **Mycoplasma**
- Darting motility shown by - **vibrio cholera**
- Swarming motility - **cl. tetani, proteus**
- Tumbling motility - **Listeria monocytogenes.**
- HACEK group of organisms
 - **H**-haemophilus species
 - **A**-actinobacillus actinomycetemcomitans
 - **C**-cardiobacterium hominis
 - **E**-eikenella corrodens
 - **K**-kingella kingae
- Weil Felix reaction is used for diagnosis of rickettsial disease
- **Toxins inhibiting protein synthesis**: Diphtheria, pseudomonas, shiga toxin
- MCC of traveler's diarrhea - **ETEC**
- Sereny test is an invasive test for Shigella
- Causative organism for trench fever - **Bartonella Quintana**
- **Mycoplasma** are also known as PPLO/eaton agent
- All DNA viruses are usually double stranded except **parvovirus (single stranded)**
- All RNA viruses are single stranded except **reovirus**
- Largest virus-pox virus, smallest virus-**parvovirus**
- HP body seen in: **Molluscum contagiosum**
- Negri bodies: **Rabies**
- Small pox- **Guarnieri bodies**
- **Primary infection with VZV** in non immune individuals causes-Chicken pox. Reinfection with VZV in immunocompromised individuals causes-herpes zoster (shingles)
- Swimming pool conjunctivitis - **Adenovirus** type 3, 7, 14
- Enterovirus 70- causes acute **Hemorrhagic conjunctivitis.**
- MCC of diarrhea in infants - **Rotavirus**
- Genital warts - **HPV 6, 11**
- **Antigenic drift in influenza** is due to point mutation under selection pressure of community
- **Antigenic shift in influenza** is due to genetic reassortment of human with avian/animal viruses → antigenic variations
- Yeast like organism-**Candida**
- Septate hyphae is seen in **Aspergillus**

Contd...

FMGE Solutions Screening Examination

- Most common fungal infection seen in immunocompetent host - **Aspergillus**
- Most common opportunistic fungal infection in HIV/AIDS patient - **Candida**
- Prominent polysaccharide capsule is seen in **Cryptococcus**
- Most common fungus producing meningitis in immunocompromised host is **Cryptococcus**
- Only rickettsia which can be cultured is - **R. Quintana**
- Enterotoxins are not produced by - **Streptococcus**
- Casoni test is done in case of - **Hydatid cyst**
- Most common Protozoan parasite is **toxoplasma gondii**
- Mega esophagus is seen in **Chagas' disease**
- Smallest tapeworm - **echinococcus granulosus**
- Dwarf tapeworm is **H. nana**
- Longest tapeworm - **T. saginata**
- Cutaneous larva migrans- are caused by Ancylostoma **Braziliense**
- Bile stained eggs in stool is seen in ascariis, trichuris
- **Dumbbell** shaped eggs seen in case of: **Trichuris trichiura**
- Not commonly seen in ascariasis - **Anemia**
- Cystic stage is not seen in - **Trichomonas vaginalis.**
- Cellulitis is caused by: **Streptococcus**
- Pyoderma most commonly caused by staph aureus
- Cetrimide agar isolate which of the following bacteria: **Pseudomonas**
- Thayer martin agar is for: **N. meningitis**
- Traveller's diarrhea is caused by: **ETEC**
- HUS is caused by which strain of E. coli: **EHEC (0157: H7)**
- Incubation period of Diphtheria: **2-5 days**
- IP of chicken pox-**10-21 days**
- Infectious period of chicken pox is 2 days before to 5 days after the onset of rash
- Which protein attached to surface of bacteria and phagocytized: **Antibody**
- Food poisoning 2 hours after intake of food: **Staph. aureus**

TABLE: Some important motilities to note

Tumbling motility	Listeria
Swarming motility	Proteus
Gliding motility	P. aeruginosa, mycoplasma
Darting motility	Campylobacter, Vibrio Cholera
Falling leaf motility	Giardia
Shooting star motility	Vibrio
Cork screw motility	T. pallidum
Lashing motility	Borrelia

TABLE: Various shapes of bacteria

Shape	Associated bacteria
Club shape	Corynebacteria
Lanceolate	Pneumococci
Half-moon/lens	Meningococci
Kidney shape	Gonococci
Comma	Vibrio and campylobacter
Drumstick appearance	Clostridium tetani
Chinese letter pattern	Corynebacterium diphtheria
D-shaped	Neisseria meningitides
Kidney shaped appearance	N. Gonorrhoeae
Flame shaped appearance	Strep. pneumoniae

TABLE: Types of food poisoning caused by bacillus cereus

Diarrhea type-main symptom	Emetic type-main symptom
Associated with wide range of food intake including meat, puddings etc. I.P. 8-16 hours Occurs due to heat labile enterotoxin	Associated with intake of Chinese fried rice I.P. 1-5 hours Due to pre-formed, heat stable toxin

TABLE: Clostridium microbes that causes food poisoning

Clostridium perfringens type A: Gastroenteritis
Clostridium perfringens type C: Necrotising enteritis
Clostridium botulinum: Botulism
Clostridium difficile: Acute colitis

TABLE: Viral inclusion bodies and their sites

Intracytoplasmic	Intranuclear	Intracytoplasmic + Intranuclear
Negri bodies in Rabies Guarnieri bodies in Small pox Henderson-Peterson bodies in Molluscum contagiosum	Cowdry type A in Herpes simplex virus and Varicella zoster virus and Torres bodies in Yellow fever Cowdry type B in Polio and adenovirus	Warthin finkeldey bodies in Measles

**TABLE: Rickettsial diseases, their causative agents and vector**

Disease	Cause	Vector
Epidemic typhus	R. prowazekii	Louse
Endemic typhus	R. typhi	Rat flea
Scrub Typhus	R. tsutsugamushi	Trombiculid mite
Indian tick typhus	R. conorii	Tick
RMSF	R. rickettsia	Tick
Trench fever	Bartonella quintana	None
Q fever	Coxiella	None but rarely soft tick

TABLE: Some or important points about Immunoglobulin (Ig)

Ig having maximum molecular weight: IgM
First antibody produced by newborn: IgM
All immunoglobulin are heat stable except: IgE
Ig present in breast milk : IgA
Ig present in oral cavity : IgA
Ig with maximum half-life : IgG
Ig with minimum half-life : IgE
Ig having maximum serum concentration : IgG
Ig having least serum concentration : IgE

TEST FOR HIV

- Ser. Elisa – (Screening)
- Western blot – (Confirmatory)
- PCR RNA – IOC
- PCR DNA – IOC for window period
- Viral culture – Efficiency of antiviral

PARASITIC EGGS

Bile stained	Non-bile stained
<ul style="list-style-type: none"> • Ascaris • Trichuris 	<ul style="list-style-type: none"> • Necator americanus • Enterobius vermicularis • H. nana • Ancylostoma duodenale

FLOATING VS NON FLOATING EGGS IN SATURATED SALT SOLUTION

Floats (FATEH)	Sink/Doesn't Float (STUF)
<ul style="list-style-type: none"> • Fertilized eggs of Ascaris • Ancylostoma duodenale • Trichuris trichiura • Enterobius vermicularis • H. nana 	<ul style="list-style-type: none"> • Strongyloides stercoralis • Taenia solium/saginata • Unfertilized eggs of ascaris • Fasciola hepatica

TABLE: Important to know

• Sclerotic bodies are seen in	Chromoblastomycosis
• Organism present as cluster of round yeast cell with short, stout hyphae which is branched or curved	Tinea nigra
• Culture colonies are creamy white, smooth and with yeast odour	Candida albicans
• Culture shows round colonies with "cut-glass" appearance in transmitted light/inverted Fir tree app:	Bacillus anthrax
• Largest protozoa	Syngammina Fragilissima (20 cm)
• Largest liver fluke	Fascioloides magna
• Largest nematode	Ascaris

*Forensic Medicine*Blood stain specific test: **Hemin test****Plaintiff is:** A person who files case in civil court**Grounds for MTP (Act 1971):**

- **Therapeutic:** Risk to pregnant women
- **Eugenic:** Risk for child to be born
- **Humanitarian:** Pregnancy caused by rape
- **Socioeconomic:** Pregnancy due to contraceptive failure

Most common type of finger print: **Loops**Postponement of hanging of pregnant lady is defined by which CrPC: **416**IPC for marital rape: **IPC 376 A**Declaration of Geneva is related with: **Hippocratic oath****Declaration of Helsinki:** Ethical principles for medical research involving human subjects**Declaration of Tokyo:** International guidelines for physicians concerning torture and other cruel, inhuman or degrading treatment or punishment in relation to detention and imprisonmentDeclaration of Lisbon: **Deals with the rights of the patient**Declaration of Malta: **Hunger strikers**Blanket consent is taken: **While admission to do any surgery**Best bone specimen for sex differentiation: **Pelvis**

Contd...

FMGE Solutions Screening Examination

Davidson body is used to determine: Sex
Pearson formula is used for: Stature
Rugoscopy is study of: Palate prints
Locard system is: Poroscopy
Galton's system is used for: Dactylography
Instantaneous rigors is seen in: Cadaveric spasm
Time of floating of dead body in drowning in summer: 24 hours
For toxicology sampling, best site for blood collection: Femoral vein
Hara-kiri is suicide by stabbing in: Abdomen
In blast injury which organ injured first: Tympanic membrane > Lung
Kennedy phenomenon is seen in: Gunshot injury
Pond's fracture is commonly seen in which age group: Children
Telefono is: Beating on ears
Outer covering of diatom is made of: Silica
Raygat's test is used for: Specific gravity of lung
Latte's crust of blood stain is used to detect: Blood group
Angel dust is: Phencyclidine
Borax is: Gastrointestinal irritant
Widmark's formula helps in measurement of blood level of: Alcohol
McEwan's sign is seen in: Alcoholic intoxication
White vitriol is: Zinc sulfate
Blue vitriol is: Copper sulfate
Lee-Jones test is used for: Cyanide
Trousseau sign is positive in which poisoning: Oxalic acid
Odor of cyanide is: Bitter almond

Sexual asphyxia is associated with – Masochism & Transvestism
Arborescent or Filigree burns (Lichtenberg's flowers pattern) are seen in – lightening
Crocodile/Flash burns/joule burns/arc eye burn are seen in- Electrocution
Poisoning which does not affect diffusion at tissue level – Curare (It affects conduction at N-M level)
Chicken fat clot is never a characteristic feature of antemortem wounds
Defense attitude/boxer's attitude/pugilistic attitude is seen in burns
Gettler's test is used in death due to drowning
Podogram – study of footprints
Finger printing bureau of the world was established at writer's building at Calcutta in year 1897

Contd...

Rounded (horse shoe shaped) nasal openings, orbits, palate: Mongols
Triangular (narrow & elongated) nasal openings, orbits, palate: Europeans
Quadrangular (square or rectangular) nasal openings, orbits, palate: Negros
Bertillon system (anthropometry) is applicable after age of 21 years
Quetelet's rule of biological variation: No two hands have similar finger prints
Criminals may attempt to mutilate finger prints by applying CO ₂ now, corrosive agents, burns, eroding against hard surface
Infrared photography: Makes old tattoos readily visible
First temporary teeth to appear is lower central incisor, first permanent (secondary) teeth to appear is 1 st molar.
Angle of mandible is obtuse in infancy and old age.
Heart shaped pelvic inlet is seen in males & is widest in its posterior part, in females it is oval, widest most anteriorly than in males.
Whiplash injury results from acute hyperextension of cervical spine in region C4-C6 vertebrae
Ring fracture is any fracture round the foramen magnum
Brush burn/Friction burn/gravel rash are type of graze
Gun powder a term usually used for black power consists of pot nitrate: 75%, charcoal: 15 %, sulphur: 10%
MC organ to be damaged in under water blast is Gastrointestinal tract.
Zenker's degeneration: Electrical injury produced in muscle
Cause of death in judicial hanging is fracture of C2-3 or C3-4 vertebrae
Frequency of hyoid fracture: Throttling > strangulation > Hanging.
Most reliable micro-chemical test for detecting blood in both recent & old stains: Spectroscopic test
Res Ipsa Loquitur: Thing or facts speak for itself
Corpus delicti: Body of offense.
Novus actus interveniens: A person is not only responsible for his action but also for logical consequences of actions.
Atavism: The child does not resemble its parents but its grand-parents.
Autopsy of the spinal cord is most commonly done through posterior approach
Subpoena/Summon: A document compelling attendance.
Albuminuria is seen with krait bite; Hematuria is seen in viper bite; Myoglobinuria is seen in sea snakes
Fatal period in drowning:
Death in fresh water: 4-5 minutes
Death in salt water: 8-10 minutes

Contd...

Barberio's test is used for identification of: Semen
Test to distinguish human vs. animal blood - Precipitin Test.
Snake bite: Cobra & krait: Neurotoxic Sea snake: Myotoxic Viper: Vasculotoxic, Hemotoxic

TABLE: Some important IPC's on Hurt (very potential topic)

Sec 319	Hurt
Sec 320	Grievous hurt
Sec 321	Voluntarily causing hurt
Sec 322	Voluntarily causing grievous hurt
Sec 325	Punishment for voluntarily causing grievous hurt
Sec 326	Punishment for voluntarily causing grievous hurt by a dangerous weapon

Dowry death investigation is done by: Magistrate
IPC for perjury: IPC 191
Punishment for perjury: IPC 193
Sexual gratification by contact. Ex: rubbing genitalia on another person: Frotteurism
Blood alcohol level while driving: 30 mg%
Phytobezoar is: Intake of indigestible plant materials
A female forges to have a child, whereas she doesn't have. It is Suppositious child
A child who is born to an unmarried women: Illegitimate child

TABLE: Types of hair on basis of medulla

Ladder or lattice type: Animals
Discontinuous type: Animals
Interrupted type: White race, Caucasians
Fragmented type: Fetus, newborn

TABLE: Different metallic poisoning and their effect on hair and skin

Poisoning	Color of hair and skin
Arsenic (As)	<ul style="list-style-type: none"> Yellow color of skin, hair & mucous membrane Milk rose (Brownish pigmentation)/Rain drop pigmentation Black foot disease
Copper (Cu)	<ul style="list-style-type: none"> Jaundiced skin Green - Blue skin, hair & perspiration Green - Purple line on gums
Mercury (Hg)	<ul style="list-style-type: none"> Blue-black line on gums with jaw necrosis and loosening of tooth Brown deposits on anterior lens capsule (mercurialentis) Acrodynia (pink disease)
Lead (Pb)	<ul style="list-style-type: none"> Blue stippled burtonian line on gums, especially on upper jaw.

TABLE: Poisoning and organ preserved

Poisoning	Organ preserved
Strychnine poisoning	Spinal cord (entire length)
Pesticides and Insecticides poisoning	Fat
CO, Cyanide, Organophosphates, Opiates, Barbiturates, Alkaloids and Strychnine poisoning (Mn: COOBAS)	Brain
Arsenic, Radium and Thallium poisoning (Mn: ART)	Bone

TABLE: Poisoning and their Antidote

Poisoning	Antidote/treatment
Oxalic acid (ink remover)	Calcium gluconate
Phosphorus	Copper sulfate
Organophosphorus	Atropine
Datura	Physostigmine
Arsenic	BAL, DMSA
Mercury	BAL, DMSA
Lead (Plumbism)	EDTA, DMSA
Alcohol	Ethyl alcohol
Opium (Afeem)	Naloxone
Heroine/Brown sugar/ Junk/ Smack	Amyl nitrite
Bhang/Ganja/Charas	Diazepam
Strychnine	Diazepam
Copper	Potassium ferro ferricyanide
Cyanide	Hydroxocobalamin

TABLE: Gun powders types and its constituent

Black gun powder	Smokeless powder
Consists of: Potassium nitrate 75% Sulfur 10% Charcoal 15%	Consists of: <ul style="list-style-type: none"> Nitrocellulose (single base; gun cotton) Nitroglycerine + Nitrocellulose Nitroglycerine + Nitrocellulose + Nitroguanidine (triple base)

Preventive and Social Medicine (PSM)

UPDATES IN PSM

• Ayushman Bharat Programme (ABP)	Health protection scheme (covers insurance of 5L)
• 2 major initiatives under ABP	Health and Wellness centre, National Health Protection Scheme
• Aim of health and wellness Centre	"bring health care closer to home" (1.5 L in number)
• Nobel prize in physiology to Jeffrey C Hall et al	Discovery of molecular mechanism controlling circadian rhythm
• Theme for world health day 7 Apr 2019	Universal health coverage- everyone everywhere
• Definition of blindness	Person unable to count fingers from 3 meter distance
• NPCB now new term	NPCB and Visual impairment
• Goal to reduce blindness by 2020	0.3% (now 1%)
• HDI	0.55
• GFR	2.3
• Sex ratio in India	940/1000
• Age 0 – 6 year sex ratio	914/1000
• Highest sex ratio	Kerala
• Birth and death rate	21.6 and 7 respectively
• What is PENCIL portal	Electronic platform for effective enforcement for no child labor under ministry of labour and Employment
• 2 new contraceptives launched by health ministry	Antara (Inj) and Chhaya (pill) MPA: Methylprogesterone Acetate
• JEET program	Joint Effort for Elimination of TB
• SAPNA model	A local school going girl, a role model for leprosy elimination (MEENA- UNICEF)

Contd...

• World malaria day	25 April 2019
• Mosquirix vaccine (RTS,S)	First approved malaria vaccine (available in Malawi for 5 mo to 2 years child)
• Pre-exposure prophylaxis if rabies	I/D: 2 site on 0 and 7 day IM: 1 site on 0 and 7 day
• Rabies Ig is given in this category of bite	Category III
• Td vaccine advantage	Freeze and heat resistant, open vial policy is applicable. Shelf life- 24 – 36 month
• Characteristics of mentally healthy person	<ul style="list-style-type: none"> • Feels comfortable, secure and adequate about himself • Feels right towards other • Able to meet demands of life
• NITI Aayog (replaced planning commission on 1 st Jan 2015)	National Institution for Transforming India <ul style="list-style-type: none"> • Provides a critical directional and strategic input into the development process. "Think tank" • Monitor and evaluate the implementation of programmes • Focus on technology upgradation and capacity building
• 3 years action agenda of NITI Aayog (2018-18 to 2019-20)	<ul style="list-style-type: none"> • The Aayog was told to prepare: • 15 year vision, 7 year strategy and Three Year Action agenda documents • Proposed agenda is attached at the end of this sec:
• Proposed ICD 11 to be presented in 2019 contains how many chapters	26
• EYE strategy for	Elimination Yellow Fever Epidemic (by WHO, UNICEF)

IMPORTANT ONE LINERS

Father of Medicine/First true Epidemiologist – Hippocrates
' Epidemiological Triad ' comprises of – Agent, Host and Environment
Extermination of organism is – Eradication
Action taken prior to onset of disease is – Primary Prevention
Early diagnosis and treatment – Secondary Prevention
Ivory Towers of disease – Large hospitals
Prevalence is a ratio not rate

Contd...

Total no of deaths /total no of cases – Case fatality
Observe deaths/expected deaths is – Standardized mortality ratio (SMR)
Cohort study is forward looking /prospective study
Relative risk is incidence among exposed /incidence among non-exposed
Framingham heart study is a cohort study
First case to come to notice of investigator is index case
Gap between primary case and secondary case is serial interval
First vaccine to be discovered is smallpox vaccine (Edward Jenner)
Risk of cold chain failure is greatest at- subcenter/village level
Bleaching powder – 33% available chlorine
Most effective sterilizing agent is – Autoclaving
Sensitivity identifies – true positives, specificity identifies - True Negative.
Usefulness of a screening test is given by – Sensitivity
Koplik's spots are diagnostic of – Measles (upper 2nd molar)
DOTS is – Directly Observed Treatment, Short Course Chemotherapy
HBeAg is marker of – Infectivity/Viral replication
SARS is caused by – Coronary virus
DANISH 1331 strain for – BCG vaccine
Chandlers Index for hookworms is – Average number of Eggs/g of stool
Only communicable disease of man that is always fatal – Rabies
Slim disease is – AIDS
MC cause of heart disease in 5-30 years old is – Rheumatic fever
WHO blindness is – <3/60
Prevalence of blindness in India – 1%
MC complaint of IUD insertion is – bleeding
MTP Act, 1971 was passed in – April 1972
3 most important MCH problems – Malnutrition, Infection and Unregulated fertility
Tocopherols are – Vitamin E
Richest source of vitamin-C – Amla (Indian Gooseberry)
Adult Pregnant females are anemic if – Hb < 11 g%
IQ calculation by = Mental Age/Chronological Age × 100
Disinfecting action of chlorine is due to – Hypochlorous acid
Residual level of chlorine in water – 0.5 mg × Contact period 1 hr

Contd...

Paris green is a – Stomach Poison
Sickness benefit under ESI Act, 1948 – 91 days
World Health day – 7th April
17 D strain – Yellow fever vaccine
DOC for lymphogranuloma venereum – Doxycycline
Hepatitis A & E transmission – Faecal-oral route
DOC cholera in pregnancy – Furazolidone
Tourniquet test (dengue) is +ve - >20 petechial spots/sq. inch in cubital fossa
8 th Day Disease – Tetanus neonatorum
The Factory Act and ESI Act were passed in – 1948
No plant source for vitamins – B₁₂ and D
Milk is poor in – Vit C and iron
Multi-purpose Workers introduced by – Kartar Singh Committee
DOTS Plus refers to – MDR TB treatment (Cat. IV)
Midday meal program provides – 1/3 calories and ½ proteins
MC side effect of Depot contraceptives – Irregular menstrual bleeding
Q-fever is caused by Coxiella burnetii
Carcinoma protected by OCP's – Ovarian carcinoma
Mortality is included in – NR (Net reproduction rate)
Health worker in Malaria control must visit all houses every – Fortnight
Hepatitis B vaccine is type of – killed vaccine
Vaccine strain for swine flu vaccine in India – A7/California/2009
Normal IQ is – 90 to 109
Amplifier host of Japanese encephalitis – Pigs
In ORS, Na ⁺ absorption is due to – Glucose
Plasmodium discovered by – Laveran
MDR TB is – Resistance to INH and Rifampicin
Denominator of GFR – Women in reproductive age group (15-49 years)
Most abundant Ig in breast milk – IgA
Most important step after disaster – Chlorination of water
Category 9 biomedical waste is – Incineration ash
Rural health Scheme was recommended by – Srivastava Committee
In DOTS diagnosis is based on – Sputum smears
Maximum tolerable sound level to human ears – 85 dB
Wasted sharps biochemical waste category – Four
OPV vaccine doses in immunization program – 5

Contd...

FMGE Solutions Screening Examination

Least priority color in triage – Black
Marc Koska discovered – K1 auto-disable syringes
Sufficiency of pasteurization is tested by – Phosphatase test
MC organism of food poisoning – Staphylococcus
1994 epidemic in India was – Plague
Father of Modern Toxicology – Mathieu Orfila
Main aim of vision 2020 – Eliminate avoidable blindness
Doors + windows area in school area - >25% floor area
Web of causation proposed by – McMahon and Pugh
Prophylactic treatment of rheumatic heart disease – Benzathine penicillin
Ambulatory patients in triage – Cat III (Green)
MDG Goal 4 is to reduce child mortality by – Two-thirds by 2015
Blood screening before transfusion – HIV/HBV/HCV/Malaria/Syphilis
Failure rate of condoms – 2-14 per HWY
India is in Demographic cycle – Stage 3 (Declining Birth rate and Declining Death rate)
Avian influenza DOC – Oseltamivir 150 mg BD x 5 days
Normal distribution curve is – Bell shaped symmetric
MPW is located at – Subcenter level
International Conference at Alma-Ata (1978) gave concept of – primary health care
MC disorder to be screened in neonates – Neonatal hypothyroidism
Richest source of vit-A/D is – Halibut liver oil
Under RNTCP, Case finding is – Passive
Annual growth rate for India – 1.93%
Yaws is caused by- Treponema pertenue
For every 1 clinical case of Poliomyelitis, there are – 1000 sub-clinical cases
Small Pox was declared Eradicated on- 8th May, 1980
Only Non-steroidal OCP – Centchroman (Saheli)
MCC of blindness – Cataract
Elimination level for leprosy – <1/10,000
Polio stool samples are transported in – Reverse cold chain (+2°C to +8°C)
Reverse smoking causes: Carcinoma of hard palate
ORS solution should be used within – 24 hours
Year of great divide: 1921
MCC of MMR in India: Postpartum hemorrhage
MC direct cause of MMR: PPH
MC indirect cause of MMR: Anemia

Contd...

Gap between primary case and secondary case: Serial interval
Total amount of iron given during the pregnancy: 1000 mg
Best contraceptive for a lactating female: Progesterone only pill
Ebola virus is spread by: Through contact of body fluids
Vitamin D richest source is: Fish liver oil
Chronic malnutrition is assessed by: Height/age
Refrigerated breast milk can be kept for: 24 hours
In cholera epidemic which step should be first taken: Safe water supply and sanitation
Toxin in Epidemic dropsy is: Sanguinarine
Beds in CHC: 40
Iodized salt is given in an area endemic of Goiter. Type of prevention: Specific protection
Graph showing Sharp rise and sharp fall in number of cases: Point source epidemics
Changes in occurrence of a disease over a long period of time: Secular trend
Lead time: Delay between initiation and completion of a process

TABLE: Levels of prevention

Level of prevention	Timing	Mode of prevention
Primordial	Before emergence of risk factor	–
Primary	Risk factor present but NO disease yet	Health promotion Specific protection
Secondary	When probably Disease has started	Early diagnosis Treatment
Tertiary	Disease in progression	Disability limitation Rehabilitation

TABLE: Vaccines and their associated strain

Vaccine	Strain
Anti HIV	Ankara strain (<i>under trial</i>)
Anti-malarial	Lytic cocktail (SPF 66)
BCG	DANISH 1331
Japanese Encephalitis	Nakayama Strain (killed) SA 14-14-2 (live)- Currently used
Killed H1N1	California strain
Measles	Edmonston strain
Mumps	Jeryl Lynn Strain
Rabies	Fixed viral strain
Rubella	RA 27/3 strain
Varicella	Oka strain
Yellow fever	17 D strain

**TABLE: Some common infectious diseases and their incubation period**

Disease	Causative organism	Incubation period
Mumps	RNA Myxovirus	14 to 21 days
Influenza	Orthomyxovirus	18 to 72 hours
Measles (Rubella)	RNA Paramyxovirus	10 to 14 days
Chickenpox	Human Herpes Virus 3	14 to 16 days

TABLE: Common mosquitos and their associated diseases

Anopheles (Sophisticated mosquito)	Culex (nuisance mosquito)	Aedes (tiger mosquito)	Mansonoides
Malaria	<ul style="list-style-type: none"> Japanese encephalitis West Nile fever <i>Bancroftian filariasis</i> Viral hemorrhagic 	<ul style="list-style-type: none"> Yellow fever Rift valley fever Chikungunya fever Dengue Dengue hemorrhagic fever 	Brugian filariasis

TABLE: Some national health programs and their respective years

National Mental Health Programme: 1987
National Family Planning Programme: 1951
National Tuberculosis Programme (NTP): 1962
Revised National TB Control Programme (RNTCP): 1992
National AIDS Control Programme (NACP): 1987
National Malaria Control Programme (NMCP): 1953
National Leprosy Control Program: 1955
Integrated Child Development Services scheme (ICDS): 1975
National Programme for Control of Blindness (NPCB): 1976

TABLE: IQ scoring of mental retardation

Mental status	IQ range
Normal IQ	70 and below
Mild mental retardation	50–69
Moderate MR	35–49
Severe MR	21–34
Profound MR	20 and below

TABLE: Food adulteration diseases and their toxins

Disease	Toxin	Adulterant
Lathyrism	BOAA	Khesari Dal
Epidemic dropsy	Sanguinarine	Argemone oil
Endemic ascites	Pyrrolizidine alkaloids	Crotalaria seeds
Ergotism	Ergot/clavine alkaloids	Claviceps fusiformis
Aflatoxicosis	Aflatoxins	Aspergillus flavus

TABLE: Interpretation of Chandler's index

Average number of eggs/g of stool	Interpretation
<200	No significance
200–250	Potential danger
250–300	Minor public health problem
>300	Major public health problem

MODIFIED KUPPUSWAMI SCALE

It includes 3 components:

- Education status of head
- Occupation status of head
- Income per capita.

Total score of 3 components	Socioeconomic class
26–29	Upper
16–25	Upper-middle
11–15	Lower-middle
05–10	Upper-lower
03–04	Lower

TABLE: Triage color code and their significance

Category	Color	Remarks/steps
Category 1	Red	Highest priority - Patient immediate resuscitations or lifesaving surgery (0 to 6 hours)
Category 2	Yellow/blue	High possible resuscitation or life-saving surgery (within 6 to 24 hours)
Category 3	Green	Ambulatory/low minor injuries; non-life threatening
Category 4	Black	Dead, Moribund; least priority

TABLE: Biomedical waste management

Color Category	Type of biomedical waste	Treatment options
Yellow	<ul style="list-style-type: none"> Human & animal anatomical waste Soiled waste (with blood, body fluid) Expired/Discarded/ cytotoxic medicine Chemical waste Chemical liquid waste Discarded linen, mattress, beddings contaminated with blood or body fluids 	Incineration/ Deep burial Non-chlorinated chemical disinfection
Red	<ul style="list-style-type: none"> Recyclable contaminated waste <ul style="list-style-type: none"> Disposable items such as tubes, bottles, IV sets, urine bags, syringes without needle, gloves 	Autoclaving or microwaving/ hydroclaving followed by shredding
White/ Trans-lucent (puncture/ leak proof container)	<ul style="list-style-type: none"> Waste sharps including metals: Needles, blades or any contaminated sharp object 	Autoclaving or dry heat sterilization followed by shredding and mutilation
Blue	<ul style="list-style-type: none"> Glassware: included medicine vials except those contaminated with cytotoxic waste Metallic body implants 	Disinfection (by soaking waste with detergent and sodium hypochlorite)/ Autoclaving/ Microwaving/ Hydroclaving

INSTRUMENT OF IMPORTANCE PUBLIC HEALTH

Instruments	Use
• Ice Lined Refrigerator	Cold chain temperature maintenance
• Dial Thermometer	Cold chain temperature monitoring
• Horrocks apparatus	Chlorine demand estimation in water
• Chloroscope	Measuring level of residual chlorine in drinking water

Contd...

Instruments	Use
• Winchester Quart/ Quart Bottle	Assess physical & chemical quality of drinking water
• Kata Thermometer	Assess cooling power and velocity of air
• Psychrometer	Humidity
• Anemometer	Assess air & wind velocity
• Hygrometer/Sling Psychrometer	Assess air humidity
• Salter's Scale	Field instrument to assess lbw
• Stadiometer	Height of adult
• Shakir's Tape	Mid arm circumference

Medicine

SPECIFIC GRAVITY

• Specific gravity of ascitic fluid/Edema	<1.012 (transudate); >1.020 (exudate)
• Effusion fluid	<1.016 (transudate); >1.016 (exudate)
• Urine	1.015–1.025
• Hydatid fluid	1.005–1.009

TABLE: Classification of weight status and disease risk

Classification	Body mass Index (kg/m ²)	Obesity class	Disease Risk
Under weight	<18.5	–	–
Healthy weight	18.5–24.9	–	–
Over weight	25.0–29.9	–	Increased
Obesity	30.0–39.9	I	High
Obesity	35.0–39.9	II	Very high
Extreme obesity	≥40	III	Extremely high

**TABLE Ethnic-specific cut point values for waist circumference**

Ethnic group	Waist circumference
Europeans	
Men	>94 cm (>37 in)
Women	>80 cm (>31.5 in)
South Asians and Chinese	
Men	>90 cm (>35 in)
Women	>80 cm (>31.5 in)
Japanese	
Men	>85 cm (>33.5 in)
Women	>90 cm (>35 in)
Ethnic south and central Americans	Use south asian recommendations until more specific data are available
Sub-Saharan Africans	Use European data until more specific data are available
Eastern Mediterranean and Middle Eastern (Arab) Populations	Use European data until more specific data are available

TREMORS

• Physiological tremors	Anxiety, Fright (8–12 Hz)
• Resting tremor, Pin rolling	PD (4–6 Hz)
• Intentional tremor	Cerebellar lesion <4 Hz
• Essential/Fine tremor	Hyperthyroidism Rosenbach sign: Fine tremor of closed eyelids
• Flapping tremor/Asterixis	Hepatic and metabolic tremor
• Perioral tremor	Rabbit synd. General paresis of insane

Most common type of headache: Tension headache
Most common type of headache in males: Cluster headache
Most common type of seizure in neonate: Subtle seizure
Most common type of seizure in adults: GTCS
Most common cause of meningitis in neonate: Klebsiella > Staph. Aureus
Most common primary malignant brain tumor: Glioma
Most common benign brain tumor: Meningioma
IOC for Addison's disease: ACTH stimulation test
IOC Conn's syndrome: Plasma renin/Aldosterone ratio
Congenital adrenal hyperplasia: 21a- Hydroxylase

Contd...

Best test for short term control of diabetes: Serum Fructosamine
Curschmann's spirals are seen in Bronchial asthma
Pink frothy sputum is seen in Pulmonary edema
Most common cause of acute bacterial endocarditis: Staph aureus
Most common cause of sub-acute bacterial endocarditis: Step viridans
Most common cause of prosthetic valve endocarditis: CONS
Libman sacks endocarditis is seen with: SLE
Strongest layer of GIT: Sub mucosal layer
Pacemaker of GIT: Cells of Cajal
Most common cause of hemoptysis: Pulmonary TB
Most common cause of hematemesis: PUD
IOC of GERD: 24-hour pH monitoring
Marker of eradication of H. Pylori: Urea breath test
DOC of IBD: Sulfasalazine
Hepatitis B antigen first to appear in blood: HBsAg
Hepatitis B antigen which never appears in blood: HBcAg
Pseudochyolous ascites is seen in: Malignant ascites
Pseudo-lymphoma is seen in: Sjögren's syndrome
Most common type of nephrotic syndrome in adults: Focal segmental glomerulosclerosis
Most common type of nephrotic syndrome in children: Minimal change disease
Most sensitive marker of SLE: ANA (Antinuclear antibody)
Investigation of choice for SLE: ds- DNA
Antibody causing psychosis in SLE: Anti-Ribosomal-P antibody
IOC for antiphospholipid antibody syndrome: Anti-B2 Glycoprotein antibody
Earliest clinical feature of scleroderma: Raynaud's phenomenon
Interstitial pneumonia is most frequently due to influenza virus
Bulging fissure on CXR is seen in: Klebsiella pneumonia
Most common site of Bronchiectasis: Left Lower lobe
Most common clinical presentation of lung CA: Cough
Glucose fever is relates with: Aldosterone
Partial pressure of oxygen in alveoli: 103 mm Hg
CSF glucose compared to blood glucose: 60–70% of concentration of blood
Resistant hypertension: Resistance to 3 or more anti-hypertensive drugs including thiazides

Contd...

FMGE Solutions Screening Examination

1296

Antibody incriminated causing Henoch-Schonlein purpura: IgA
Iron is absorbed from: Duodenum with fast clearance
Thalassemia: Autosomal Recessive
Diarrhea can present with hypokalemia and Metabolic acidosis
Seborrheic dermatitis, cellulitis, alopecia and apathy is seen in: Biotin deficiency
RBC cast is present in: Acute Glomerulonephritis
In Wilson disease, chelation is done by: ZINC
In hemochromatosis, all organs are affected except: CNS
CNS bleed in boxers: Subdural hemorrhage
LE cells are seen in: SLE
Emphysema seen due to chronic smoking: Centriacinar emphysema
Wegener's granulomatosis is diagnosed by: c-ANCA
DOC for enteric fever: Ceftriaxone
DOC for listeria meningitis: Ampicillin
DOC for Herpes simplex encephalitis: Acyclovir
Mottling of lung is seen in: Silicosis
Antibody in Goodpasture syndrome: Anti-GBM
Most common Callum patch in rheumatic heart disease is seen in: Left Atrium
Canon A wave is seen in: Complete Heart Block
Most common cause of mitral stenosis: Rheumatic fever
In case of severe MS how much left atrial pressure required to maintain a normal cardiac output: ~25 mm Hg
Malar flush with pinched and blue facies are clinical findings in case of: Severe Mitral stenosis
Carvallo's sign is seen in: Functional tricuspid regurgitation (TR) secondary to severe pulmonary hypertension
Carvallo's sign: Functional TR may be audible along the left sternal border. This murmur is usually louder during inspiration and diminishes during forced expiration

TABLE: Congenital heart diseases and their CXR finding

Total anomalous pulmonary venous connection	Figure of 8 or snowman heart
Transposition of great arteries	Egg on side appearance
TOF	Boot shaped heart
Ebstein anomaly	Box shaped heart
Coarctation of aorta	'3' sign

TABLE In HIV positive individuals/AIDS

Most common malignancy	Kaposi sarcoma (70%)
Most common cause of seizures	HIV encephalopathy > Toxoplasmosis
Most common fungal infection	Cryptococcus neoformans
Most common lymphoma (NHL)	B- cell immunoblastic lymphoma (CMS lymphoma)
Most common cause of blindness	CMV retinitis
Most common eye lesions	Cotton wool spots, HIV keratitis
Most common opportunistic infection	Pneumocystis carinii (Tuberculosis in India)
Most common CXR finding in TB with HIV	Miliary shadows
Most common electrolyte abnormality	Hyponatremia, SIADH

TABLE: ECG basics

ECG finding	Significance
P wave	Atrial depolarization
QRS	Ventricular depolarization
T wave	Ventricular repolarization
U wave	Delayed repolarization of papillary muscles
PR interval	Spread of impulse from SAN to AVN
ST segment	Isoelectric segment

TABLE: S1 heart sounds and its variables

Loud S1	Soft S1	Variable S1	Reversed split S1
Normal in children	Sinus bradycardia	AV dissociation	Mitral stenosis
Anemia	Prolonged PR interval	Atrial fibrillation	Left atrial myxoma
Pregnancy	Severe MR	Complete heart block	Left bundle branch block
Sinus tachycardia	Chronic severe MR	Multiple ectopics	
Thyrotoxicosis,	Acute MI	Ventricular tachycardia	
Beriberi	Myocarditis	Atrial flutter with varying block	
AV fistula	Ventricular aneurysm		
Mitral and tricuspid stenosis	Cardiomyopathy		
Short PR interval	Calcified MS		

**TABLE: Heart sounds and murmurs**

Mid-systolic murmur	Pansystolic murmur	Late systolic murmur	Early diastolic murmur	Mid-diastolic murmur	Continuous murmurs
AS PS HOCM TOF ASD	MR VSD TR	MVP OCM	AR PR Graham Steell murmur (pulmonary incompetence due to pulmonary HT and MS)	MS Austin flint (aortic regurgitation) TS Carey-Coombs murmur (Rheumatic fever)	PDA Coronary AV fistula ASD Mammary souffle Anomalous left coronary artery Ruptured aneurysm of sinus of Valsalva Proximal coronary artery stenosis Aortopulmonary window

TABLE Mediastinal masses: Most common lesions are

Anterior mediastinum	Middle mediastinum	Posterior mediastinum
Thymoma (Most common) Lymphomas Teratomatous neoplasms Thyroid masses	Pericardial cyst (<i>Most common mediastinal mass</i>) Lymphoma (<i>MC mediastinal tumor</i>) Vascular masses Granulomatous disease Bronchogenic cysts	Neurogenic tumors Meningoceles Meningomyeloceles Gastroenteric cysts Esophageal diverticula

TABLE: Anemia and their causes

Microcytic Hypochromic anemia	Normocytic Normochromic	Macrocytic anemia
Sideroblastic anemia Iron deficiency Thalassemia Anemia of chronic disease Lead poisoning	CRF A.I.H.A HL/NHL C.L.L Aplastic anemia	CLD Hypothyroidism Aplastic anemia Decrease B ₁₂ and Folic acid level

TABLE: Extravascular and intravascular hemolysis

Extravascular hemolysis	Intravascular hemolysis
Hereditary Spherocytosis Thalassemia Sickle cell anemia	Cold agglutinin syndrome G6PD (XLR)
Haptoglobin level normal	Haptoglobin level decreases or absent

TABLE: Common hematological malignancies

Disease	Finding	IOC	TOC
Polycythemia vera	Hb >19 gm%	Urinary erythropoietin level	Venesection (phlebotomy)
CML	Ph (9:22)	Flow cytometry	Imatinib
Essential thrombocytosis	Platelets conc: ↑↑	Platelets conc:	Hydroxyurea
Myelofibrosis	Tear drop RBC	BM Biopsy	BM Tx

TABLE: Intracranial bleed and their CT findings

Subdural hematoma	Concavo-convex bleed hyper-density
Extradural hemorrhage	Biconvex /flame shaped hyper-density
Subarachnoid hemorrhage	Intraventricular bleed/blood in sylvian fissure
Intraparenchymal bleed	Mostly a lesion or hyperdensity in basal ganglia secondary to hypertension.

FMGE Solutions Screening Examination

1298

TABLE: CSF findings in common infections

CSF	Normal	Acute bacterial meningitis	Tubercular meningitis	Viral meningitis	Guillain-Barre syndrome	Fungal meningitis
Pressure	50–180 mm H ₂ O	Increased	Increased	Increased	Normal	Elevated
Color	Clear	Turbid	Straw	Clear	Normal	
Cells	0–4 lymphocytes/cu.mm	>1000	>100	>25	Normal	25–500
Sugar	2/3 rd of blood sugar	Decreased	Decreased	Normal	Normal	Low
Protein	15–45 mg %	Increased	Increased	Increased	Increased (<i>albumin-cytological disassociation</i>)	Normal/elevated

TABLE: Differences between lower and upper motor neuron lesion

	LMN	UMN	Extra pyramidal damage
TONE	Decreased tone/flaccidity	Increased spasticity	Decreased rigidity
DTR	Areflexia	Brisk reflex	Normal
Special features	Fasciculations + wasting	Babinski's sign + No wasting	Chorea, athetosis, hemiballismus
Superficial reflex	Present	Absent	–
Example	Motor neuron disease	Cerebral malaria	Punch drunk syndrome

TABLE: Modified Jones Criteria

Major criteria	Minor criteria	Essential criteria
Carditis	Fever	ASO titer > 333 IU for children 5–15 years
Arthritis	Arthralgia	Throat swab positive for group A beta hemolytic streptococcus
Sydenham chorea	Laboratory parameters Increased PR interval CRP positive Leukocytosis Increased ESR	
Erythema marginatum		
Subcutaneous nodules		

TABLE: Hormonal levels in some common adrenal pathologies

Aldosterone	↑Conn's ↓Addison's
Cortisol	↑Cushing syndrome
Sex steroids	↑Congenital adrenal hyperplasia ↓Hypogonadism

TABLE: Common infections and their causative organism

Infection	Causative organism
Lobar pneumonia/Community acquired Pneumonia	Pneumococcus

Contd...

Infection	Causative organism
Nosocomial pneumonia	<i>Staph. aureus</i>
HIV associated pneumonia	<i>P. Jiroveci</i>
Meningitis adults (sporadic)	Pneumococcus
Meningitis adults (epidemic)	<i>Neisseria meningitidis</i>

TABLE: Anion gaps

Normal anion gap (Mn: FUSED CAR)	Increased anion gap (Mn: MUDPILES)	Decreased anion gap (Mn: BPH-M)
F - Fistula pancreatic U -Ureterosigmoidostomy S - Small bowel fistula E - Extra chloride D - Diarrhea C - Carbonic anhydrase Inhibitor (<i>acetazolamide</i>) A - Adrenal insufficiency R - Renal tubular acidosis	M - Methanol U - Uremia D - DKA/KA/SKA (<i>diabetic/alcoholic/starvation</i>) P - Paraldehyde / phenformin I - Iron / INH L - Lactic acidosis E - Ethylene glycol S - Salicylates	Bromide intoxication Plasma cell dyscrasia Hypoalbuminemia Monoclonal protein

TABLE: Important casts

Hyaline cast: Present normally in urine RBC cast: Seen in acute glomerulonephritis WBC cast: Seen in interstitial nephritis, pyelo nephritis Brood granular casts: Seen in chronic renal failure

**TABLE: Tumor markers**

Tumor markers	Cancer	Non-neoplastic conditions
Hormones		
Human chorionic gonadotropin	Gestational trophoblastic disease, gonadal germ cell tumor	Pregnancy
Calcitonin	Medullary cancer of the thyroid	
Catecholamines	Pheochromocytoma	
Oncofetal antigens		
α Fetoprotein	Hepatocellular carcinoma, gonadal germ cell tumor	Cirrhosis hepatitis
Carcinoembryonic antigen	Adenocarcinomas of the colon, pancreas, lung, breast, ovary	Pancreatitis, hepatitis, inflammatory bowel disease, smoking
Enzymes		
Prostatic acid phosphatase	Prostate cancer	Prostatitis, prostatic hypertrophy
Neuron-specific enolase	Small-cell cancer of the lung, neuroblastoma	
Lactate dehydrogenase	Lymphoma, Ewing's sarcoma	Hepatitis, hemolytic anemia, many others
Tumor-associated proteins		
Prostate-specific antigen	Prostate cancer	Prostatitis, prostatic hypertrophy
Monoclonal immunoglobulin	Myeloma	Infection, MGUS
CA-125	Ovarian cancer, some lymphomas	Menstruation, peritonitis, pregnancy
CA 19–9	Colon, pancreatic, breast cancer	Pancreatitis, ulcerative colitis
CD30	Hodgkin's disease anaplastic large-cell lymphoma	–
CD 25	Hairy cell leukemia, adult T cell leukemia/lymphoma	–

TABLE: Suspected carcinogens

Tumor markers	Cancer
Carcinogens	Associated cancer of neoplasm
Alkylating agents	Acute myeloid leukemia, bladder cancer
Androgens	Prostate cancer
Aromatic amines (dyes)	Bladder cancer
Arsenic	Cancer of the lung, skin
Benzene	Acute myelocytic leukemia
Chromium	Lung cancer
Diethylstilbestrol (prenatal)	Vaginal cancer (clear cell)
Epstein-Barr virus	Burkitt's lymphoma, nasal T cell lymphoma
Estrogens	Cancer of the endometrium, liver, breast
Ethyl alcohol	Cancer of the breast, liver esophagus, head and neck
<i>Helicobacter pylori</i>	Gastric cancer, gastric MALT lymphoma
Hepatitis B or C virus	Liver cancer
Human immunodeficiency virus	Non-hodgkin's lymphoma, kaposi's sarcoma, squamous cell carcinomas (especially of the urogenital tract)
Human papilloma virus	Cancers of the cervix, anus, oropharynx
Human T cell lymphotropic virus type 1 (HTLV-1)	Adult T cell leukemia/lymphoma
Immunosuppressive agents (azathioprine cyclosporine, glucocorticoids)	Non-hodgkin's lymphoma
Ionizing radiation (therapeutic or diagnostic)	Breast, bladder, thyroid, soft tissue, bone, hematopoietic and many more
Nitrogen mustard gas	Cancer of the lung, head and neck, nasal sinuses
Nickel dust	Cancer of the lung, nasal sinuses
Phenacetin	Cancer of the renal pelvis and bladder
Polycyclic hydrocarbons	Cancer of the lung, skin (especially squamous cell carcinoma of scrotal skin)
Radon gas	Lung cancer
Schistosomiasis	Bladder cancer (squamous cell)
Sunlight (ultraviolet)	Skin cancer (squamous cell and melanoma)
Tobacco (including smokeless)	Cancer of the upper aerodigestive tract, bladder
Vinyl chloride	Liver cancer (angiosarcoma)
Agents that are thought to act as cancer initiators and/or promoters	

1299

TABLE: A comparison of syndromes of obesity—hypogonadism and mental retardation

1300

Feature	Syndrome				
	Prader-Willi	Laurence-Moon-Biedl	Ahlstrom's	Cohen's	Carpenter's
Inheritance	Sporadic; two-thirds have defect	Autosomal recessive	Autosomal recessive	Probably autosomal recessive	Autosomal recessive
Stature	Short	Normal; infrequently short	Normal; infrequently	Short or tall	Normal
Obesity	Generalized Moderate of severe onset 1–3 years	Generalized Early onset, 1–2 years	Truncal Early onset, 2–5 years	Truncal Mid-childhood, age 5	Truncal, gluteal
Craniofacies	Narrow bifrontal diameter almond-shaped eyes strabismus v-shaped mouth high-arched palate	Not distinctive	Not distinctive	High nasal bridge Arched palate Open mouth Short philtrum	Acrocephaly Flat nasal bridge High-arched palate
Limbs	Small hands and feet hypotonia	Polydactyly	No abnormalities	Hypotonia Narrow hands and feet	Polydactyly Syndactyly Genu valgum
Reproductive status	1° Hypogonadism	1° Hypogonadism	Hypogonadism in males but not in females	Normal gonadal function or hypogonadotropic hypogonadism	2° Hypogonadism
Other features	Enamel hypoplasia Hyperphagia Temper tantrums Nasal speech			Dysplastic ears Delayed puberty	
Mental retardation	Mild to moderate		Normal intelligence	Mild	Slight

IMPORTANT TO KNOW

• Light's criteria is used to determine	Exudative vs transudative pleural fluid
• MCC of pleura effusion	CHF
• MCC of exudative pleural Effusion	TB
• Comprehension and Fluency and in Broca's and Wernicke's aphasia	BCWF Broca: Comprehension preserved Wernicke: Fluency preserved
• Triad of Miller Fisher syndrome	Acute ext Ophthalmoplegia Areflexia Ataxia
• Useless hand syndrome of oppenheimer	MS (MRI: Dawson finger sign)

• Charcot's triad of MS	Intentional tremor, Nystagmus, Dysarthria (IND)
• Charcot triad of Ascending cholangitis	RUQ pain, fever, jaundice
• Ashleaf spot, Shagreen patch seen in	Tuberous sclerosis/Koenen tumor
• Vogt triad of tuberous sclerosis	Seizure, MR, facial angiofibroma
• DAS 28 score is used for	To assess severity of RA
• Anti Histone A/B is specific for	Drug induced lupus
• McGinn white sign is seen in	Pulm Embolism (S1Q3T3)
• Sputum containing charcot-leyden crystal, curschmann spirals, Creola bodies	Bronchial Asthma
• Current jelly sputum	Klebsiella pneumoniae

Contd...

Contd...

• Giant cell/Hecht's pneumonia is seen in	Measles
• Austin flint murmur is heard in	Severe AR
• Osborn wave/ J wave is seen in	Hypothermia
• ST segment in ECG	End to S to beginning of T
• ECG finding of digitalis toxicity	T wave inversion, Inverse check mark sign
• Wenckebach phenomenon is seen in	2 nd degree heart block (Mobitz 1) Seen in digitalis toxicity, B# toxicity
• Murmur which is increased in valsava maneuver	HOCM, MVP
• Aschoff bodies are pathognomonic of this condition	RF
• D Xylose test is used for	Malabsorption (pancreatic vs intestinal cause)
• Fulminant hepatitis rate is maximum in	Hep D superinfection
• Diuretic which can cause barter syndrome	Furosemide
• Nephrocalcinosis is a feature of this type of RTA	Type I
• Hyperkalemia is feature of this type of RTA	Type IV
• MM, Fanconi synd, Wilson's disease can cause this RTA	Type II (MC type of RTA)
• RIFLE criteria is used for	ARF
• Reid index is used in	Chronic bronchitis (>0.4)
• MC cause of BUDDCHIARI syndrome –	polycythemia vera
• MC symptom of portal hypertension –	GI bleeding
• Most specific tumor marker of HCC –	alpha fetoprotein
• MC renal lesion associated with HCV-MPGN -1	MPGN
• MC GN associated with HIV	FSGS
• MC cause of nephrotic syndrome in adult	MGN
• MC type of MI	Ant wall MI
• MC type of HIV in India	HIV 1 subtype C

Contd...

• MC organ affected in amyloidosis	Kidney
• MC cause of death in amyloidosis	Heart
• First enzyme rise in MI	Myoglobin
• First enzyme to diagnosed in MI	CKMB
• Most important enzyme diagnosed MI	Trop I
• MC type of stroke	EMBOLIC
• MC site of hemorrhagic stroke	Putamen
• MC type of fistula in CD	Colocolic
• MC type of incontinence in LMN bladder	over flow incontinence
• MC type of incontinence in UMN balder	urge incontinence
• Ankle Jerk in UMNL	Brisk (and absent in LMNL)
• MC cause of cardiac tamponade	Neoplastic disease, idiopathic pericarditis, uremia
• MC nerve affected intracranial aneurism	III
• MC nerve inv in increased ICP	VI
• MC complication of hemodialysis	HTN
• Least common RCC	chromophobe renal carcinoma
• MCC of chr. renal failure	DM nephropathy
• MCC of HTN	Essential HTN
• MCC Of hematuria	Ig A nephropathy

CHANNELOPATHIES

Disease	Ion channel involved
• Hypokalemic periodic paralysis	Slow Ca ⁺ channel
• Hyperkalemic periodic paralysis	Na ⁺
• Cystic fibrosis, Myotonia congenital	Cl ⁻
• Episodic ataxia-1	K channel
• Episodic ataxia-2, Malignant hyperthermia	Ca ⁺ channel

Surgery

Most common site for polymazia is **axilla**

Amazia refers to absence of stromal and glandular part of breast but presence of nipple and areola

Tietze disease: Costochondritis, MC involves 2nd costal cartilage

Mondor's disease – Superficial thrombophlebitis of veins over chest wall and upper abdominal wall

Fibrocystic disease of breast is usually B/L and common in younger women

Mastitis

MC organism: ***Staph aureus***

Rx – modified Hiltons method

IOC – USG

Breast cyst

Well defined **lump**

IOC – USG GUIDED FNAC

Rx – USG guided aspiration

Fibroadenoma

MC benign **tumor of breast**

Highly mobile – **Breast mouse**

MC breast tumor in females less than **30 yrs of age**

Firm in consistency

Upon mammography: Popcorn calcification

IOC – FNAC

Rx – Excision

Nipple discharge

Bloody – Duct papilloma (MCC)

Greenish / grumous – Duct ectasia (MCC)

Milky – Galactorrhea (MCC pathologically)

Serous – Fibro cystic disease of breast (MCC)

Duct ectasia

IOC – Mammography

Rx – Hadfield's operation

Duct papilloma

IOC – Mammography

Rx – Microdochectomy

Cystosarcoma phyllodes

Huge lump

Irregular and variable consistency

IOC – FNAC

Rx – benign – Wide local excision

Malignant – Simple mastectomy

Breast cancer

Genetic – BRCA 1, BRCA 2, P53 (Li-Fraumeni syndrome)

IOC – Mammography

Ductal carcinoma in situ

MC non-invasive breast cancer

MC comedo cell pattern

IOC – Incisional biopsy

Rx – Simple mastectomy

TABLES: Types of mastectomy

Simple or total mastectomy	Removal of breast tissue, nipple-areola complex, and skin
Extended simple mastectomy	Simple mastectomy + removal of level I axillary LNs.
Modified radical mastectomy	Removes all breast tissue and skin, nipple areola complex, pectoralis major and minor muscles and the level, I, II and III axillary LNs,
Extended radical mastectomy	Radical mastectomy + Removal of internal mammary, LNs
Super radical mastectomy	Radical mastectomy + Removal of internal mammary, mediastinal and supraclavicular LNs

3 IMPORTANT TYPES OF MRM

Patey's	Pectoralis minor removed to dissect level III LN
Auchincloss's	Preservation of both pectoralis major and minor. Level I and II LN dissection
Scanlon's	Pectoralis minor divided to remove level III LN

NOTE: Structure NOT removed in radical mastectomy: Supraclavicular LN

Bile and gallbladder facts

Maximum capacity gall bladder - **50 mL**

Concentration of bile: **5-10 times**

Production of bile: **40 mL/hr**

Terminal ileum absorbs – **B₁₂ & bile salts**

**Congenital choledochal cyst**

Cyst like dilatation of biliary tree due to weakness of wall

Type 1 is most common

Type 4 is Caroli's disease

IOC – MRCP

Rx: Excision

Cholelithiasis

Pigmented stones: Hemolytic anemia MC cause

Predisposing factor 5f's – fatty, forty, female, fertile and flatulence

IOC-USG abdomen

Rx-laparoscopic cholecystectomy

Acute cholecystitis

IOC – HIDA scan

Rx - Conservative

Chronic cholecystitis

IOC-USG

Rx-Laparoscopy cholecystectomy

Mucocele of gallbladder

Stone in Hartmann's pouch cannot cause mucocele

C/f-lump in Right Upper Quadrant

IOC-USG

Rx-Laparoscopic cholecystectomy

Empyema/pyocele

Clinical feature-Tender lump + fever

IOC-USG

Rx-Cholecystectomy +/- antibiotics

Pneumobilia

Air from D1 passes in gall bladder through fistula, presence of air in biliary tree

Management: Ileostomy with extraction of stone

Acalculous cholecystitis

Cause-Typhoid infection, trauma, septicemia, DM

IOC-HIDA scan

Rx-Usg guided drainage + Antibiotics

Saint's triad

Gallstones

Hiatus hernia

Diverticulosis

Rigler's triad

Small bowel obstruction

Gas within Gall Bladder and or bile ducts

Ectopic gallstone

TABLE: Gallstones

10% gallstones – Radio opaque

90% gallstones – Radio lucent

Gallstones – Mercedes Benz sign, sea gull sign

Limey bile – Sequestration of calcium salts in bile after gradual obstruction of CBD

TABLE: Important tumor staging and classification

Chang staging	Medulloblastoma
Masaoka staging	Thymoma
Shimada index	Neuroblastoma
Rees	Ellsworth classification, Esson prognostic index, Retinoblastoma
Bloom–Richardson classification	CA breast
Noguchi's classification	Adenocarcinoma lung
Sullivan modification of MacFarlane system	Adrenocortical CA
Gleason score	CA prostate
Nevin staging	CA GB
Duke staging	Colorectal ca
Robson staging	RCC
Jackson score	CA penis

Most common Nodes involved:

CA penis: Inguinal nodes

CA testis: Para-aortic LN

On right: Inter aorto-caval LN

On left: Para-aortic LN

CA bladder: Obturator LN

CA prostate: Obturator LN

Must know facts

Nigro regimen is used for: **Anal Canal CA**

TOC for Duodenal Atresia, Annular pancreas:

Duodenoduodenostomy

TOC for superior mesenteric artery syndrome:

Duodenojejunostomy

Length of these instruments:

- Proctoscope 10–12 cm
- Rigid Sigmoidoscope: 25 cm
- Flexible sigmoidoscope: 60 cm
- Colonoscope: 160 cm

Contd...

FMGE Solutions Screening Examination

1304

Must know facts

Intracranial bleed:

EDH: Due to tear of middle meningeal artery, appear biconvex on CT, **lucid interval** is present.

SDH: Due to rupture of bridging veins, appear crescentic or concavo - Convex on CT.

Duret hemorrhage is small area of bleeding in ventral and para median part of upper brain stem. Diagnosis: CT or MRI

Bilateral grade 4 or 5 VUR is better treated surgically with ureteric reimplantation.

Berry aneurysm is the most common intra cranial aneurysm

Young women on OCP's are predisposed to **stroke due to venous thrombosis** of sagittal sinus or small cortical veins

Major causes of delayed neurological deficit after CVA: re-rupture, hydrocephalus, vasospasm, hyponatremia.

Commonly used preparation of mannitol: **20% solution, 0.25 g/kg is given IV bolus**

Primary brain injury occurs at the time of injury, secondary brain occurs at some time after impact

MC tumors of brain: **Metastatic/Secondaries**

MC posterior fossa tumor in children: **Astrocytoma**

MC site of Medulloblastoma: **Vermis**

MC spinal tumor: **Metastatic**

MC primary spinal tumor: **Nerve sheath tumor**

MC intra medullary tumor: **Astrocytoma**

MC site of primary spinal tumor: **Intradural extramedullary**

The term "dumbbell" lesion is used to describe **neurofibroma**

Acoustic neuroma can arise from any nerve except optic and olfactory nerve.

Common uses of **stereotactic radiosurgery**: **Metastatic** tumors, benign lesions of cranial nerve, A-V malformations, trigeminal neuralgia.

Struma ovarii: Benign ovarian tumor containing thyroid tissue, some patients develop thyrotoxicosis.

Lingual thyroid: rounded swelling developed at the back of the tongue at the foramen cecum.

Refetoff syndrome: End organ resistance to T4

Father of thyroid surgery: Theodor Kocher.

The **external laryngeal** nerve runs close to superior thyroid artery and **recurrent laryngeal nerve** runs close to inferior thyroid artery.

Wolff-chaikoff effect: Iodine induced hypothyroidism

Jod-Basedow effect: Iodine induced hyper thyroidism

MC site of thyroglossal cyst: **Sub hyoid**.

Acute suppurative thyroiditis is rare seen in children & caused by streptococcus & anaerobes.

Must know facts

Hashimoto's thyroiditis or Struma Lymphomatosa is MC inflammatory disorder of thyroid and leading cause of hypothyroidism. Auto antibodies are produced against Tg, TPO, TSH-R.

Grave's disease (Diffuse toxic goiter): MC cause of hyperthyroidism caused by stimulatory autoantibodies to TSH-R.

Toxic adenoma (Plummer's disease): single hyper functioning nodule typically occurs in young patients.

Thyroid storm (Thyrotoxic crisis): It is an emergency due to decompensated hyperthyroidism.

Thyroglossal fistula is never congenital

MC postoperative complication after thyroidectomy: **Hemorrhage**.

MC benign tumor of thyroid gland: **Follicular adenoma**.

Papillary carcinoma: MC carcinoma of thyroid associated with history of radiation exposure. It has best prognosis.

Predisposing factor for long standing goiter: **Follicular carcinoma of thyroid**.

Anaplastic CA of thyroid: MC carcinoma with worst prognosis, neck gets frozen with hard fixed mass.

Medullary carcinoma of thyroid is associated with RET oncogene; tumor marker: Calcitonin.

Sub- Acute thyroiditis/granulomatous thyroiditis/de quervain's thyroiditis is associated with viral infection & can occur as a consequence of viral infection. Only painful condition of thyroid

Pemberton's sign is MC associated with Retrosternal goiter.

MC type of kidney stone (85%) is **calcium oxalate**.

Xanthine & uric acid stone are radio lucent.

Struvite stones composed of Ca^+ , NH_3 , $\text{Mg}(\text{PO})_4$ and best treated by **PCNL + ESWL**.

Randall's plaques are soft tissue calcification found in the deep renal medulla.

Infectious stones are more common in females.

Stone in upper ureter: Pain referred to testis.

Stone in mid ureter: Pain referred along iliohypogastric nerve to iliac fossa, mimicking appendicitis.

Stone in lower ureter: Pain referred along ilioinguinal nerve to thigh, scrotum and perineum.

Acidic urine is seen in **calcium oxalate, cystine, uric acid**.

Alkaline urine is seen in **calcium phosphate, struvite**.

NCCT is most sensitive investigation for renal calculi.

If Stone <2 cm treatment is **ESWL**.

Stone >2 cm treatment is **PCNL**.

**Must know facts**

MC cause of ureteric obstruction is **Stone**.

MC cause of ureteric colic in hematuria is **Clot**.

Pyelonephritis MC caused by **E coli**

Clinical feature: Fever, flank pain, vomiting and 80 – 90% of patients have diabetes.

Pyonephrosis MC cause is renal stone

Clinical feature: Anemia, fever, swelling in loin.

M. Tuberculosis reaches the genitourinary organs by hematogenous route from lungs.

Intermittent hydronephrosis (diet's crisis) associated with swelling in the loin.

MC type of RCC mainly sporadic is **clear cell carcinoma**.

RCC/VHL syndrome: MC sites of distant metastasis are lungs > bone > liver > brain.

MC primary renal tumor of childhood is **wilm's tumor**.

Transitional cell carcinoma accounts for 90% of upper urinary tract cancers.

ADPKD associated with cyst in all sites except brain.

Most common gas produced in intestinal obstruction: **N₂**

Most common gas produced in Clostridial infection: **H₂S**

MC gas used to create pneumoperitoneum in laparoscopy: **CO₂**

MC cause of upper G.I bleeding: **Peptic ulcer**

MC cause of lower G.I bleeding: **Non-specific ulcers**

MCC of jejunostomy feeding: **Diarrhea**

MC site of aortic rupture: **Ligamentum arteriosum**

MCC of leg ulcer: **Venous ulcer**

MC site of fasciotomy: **Calf**

Best treatment for subaponeurotic hematoma: **I & D**

Hardy was first surgeon to do proximal ureteric implantation

Grayhack shunt is shunt for priapism made between corpora cavernosa & corpora spongiosa

TABLE: Strawberry Q' forms

- Strawberry gingivitis: **Wegeners granulomatosis**
- Strawberry cervix: **Trichomonas vaginalis**
- Strawberry gallbladder: **Cholesterosis**
- Strawberry nasal mucosa: **Sarcoidosis**
- Strawberry nasal mass: **Rhinosporidiosis**
- Strawberry tongue: **Kawasaki disease**

Some most common neoplasm

MC childhood tumor - **Leukemia**

MC childhood leukemia - **ALL**

MC solid tumor of childhood - **Brain tumor**

MC tumor of infancy - **Neuroblastoma**

MC abdominal tumor of child - **Neuroblastoma**

THE SURGICAL MOST COMMON LIST**What is/are the most common...**

- MC Cause of acute prostatitis is **E. coli**.
- MC Reason to get treatment for BPH is **symptomatic relief**.
- MC Location for prostate CA is in the **peripheral zone of the prostate gland**.
- MC Renal anomaly is **horseshoe kidney**
- MC Renal inflammatory disorder is **pyelonephritis**
- MC Renal tumor is **renal cell carcinoma**
- MC Source of renal neoplasm is **metastasis**.
- MC Surgery performed on males is **circumcision**
- MC Cause of erectile dysfunction is **vasogenic**
- MC Motility disorder of the esophagus is **achalasia cardia**
- MC Site of peptic ulcer disease is **the first part of the duodenum**
- MC Cause of surgical abdomen is **acute appendicitis**.
- MC Causes of appendix obstruction in the young is **mesenteric lymphadenitis or lymphoid hyperplasia**
- MC Causes of appendix obstruction in older patients is **fecolith and foreign body**.
- MC Tumor of the appendix is **carcinoid**.
- MC Benign tumor of the small bowel is **leiomyoma**.
- MC Primary tumor of the small bowel **adenocarcinoma**.
- MC Malignant tumors of the small bowel are **adenocarcinoma, carcinoid, and lymphoma**.
- MC Small bowel malignancy of children is **lymphoma**.
- MC Surgical condition of the small bowel is **obstruction secondary to adhesions**
- MC Anaerobe in the colon is **Bacteroides fragilis**
- MC Site for metastases from the colon is **the liver**.
- MC Location of colonic obstruction is the **sigmoid colon**.
- MC Cause of colonic obstruction is **adenocarcinoma**.
- MC Site of volvulus is the **sigmoid colon**.
- MC Site of bile duct carcinoma is the **bifurcation of the common hepatic ducts**.
- MC Causes of acute pancreatitis are alcohol consumption and biliary calculi.
- **MC Causes of death in a patient** with pancreatitis are respiratory distress, cardiovascular collapse, coagulopathy and hemorrhage.
- **MC Local complications of acute pancreatitis** are **paralytic ileus**, sterile peripancreatic fluid collection, and pancreatic abscess.
- MC Best **diagnostic imaging technique** for prostate CA is **TRUS**

Contd...

FMGE Solutions Screening Examination

1306

SURGERY

- MC site of carcinoma in oral cavity – **Bucco alveolar complex**
- MC oral cancer – **squamous cell carcinoma**
- Carcinoma tongue MC site – **lateral middle 1/3**
- Carcinoma oral cavity best prognosis – **carcinoma lip**
- MC site of peptic ulcer diseases – **first part of duodenum**
- Second most common site of PUD – **antropyloric junction**
- Third most site of PUD – **laser curvature of antrum and pylorus**
- MC site of carcinoma stomach – **esophago gastric junction and cardia**
- Maximum conc. of H. pylori – **antrum**
- MC complication of PUD – **Bleeding**
- MC cause of death in PUD – **Perforation**
- Second MC site of gastric carcinoma – **antropyloric junction**
- MC gastric carcinoma – **adeno carcinoma (histological type)**
- MC benign tumor in small intestine – **adenoma (Ileum)**
- MC malignant tumor in small intestine – **adeno carcinoma (deodeno jejunal junction)**
- MC site of carcinoid tumor in body – **bronchus**
- MC site of carcinoid in intestine – **ileum**
- MC hormone release in carcinoid – **5 HT**
- MC symptom of carcinoid – **flushing and diarrhea**
- MC type of intestinal polyp – **Hyperplastic polyp**
- MC site colorectal carcinoma – **rectum and sigmoid**
- MC effected by metastasis form of colorectal carcinoma – **Liver**
- MC presenting symptom of congenital pyloric stenosis – **vomiting (metabolic alkalosis)**
- MC used surgery in India for duodenal ulcer – **trunkalvegatomoy + drainage**
- MC cause of pernicious anemia – **vitamin B12**
- MC affected part of stomach in pernicious anemia – **fundus and body**
- MC site of leimyomas in GIT – **Stomach**
- MC type of benign tumor of stomach – **leimyomas**
- MC hallmark of Whipplies disease – **SI mucosa macrophages**
- MC test in small intestine malabsorption – **D- xylose absorption test**
- MC CNS manifestation in Whipplies disease – **Dementia**
- MC cause of persistent symptoms of celiac disease – **control intake of gluten**

Contd...

- MC cause of massive bleeding through PR (55 yrs) – **diverticulosis**
- MC cause painless maroon colored stool – **diverticulosis**
- MC long term affect of radiation on GIT – **telangiectasis**
- MC site of polyp in GIT – **small intestine**
- MC site for Hamartomatous polyp – **small intestine**
- MC site for polyp in Peutz-Jeghers syndrome – **small intestine**
- MC site for polyp in juvenile polyposis – **large intestine**
- MC cause of acute of loss vision – **acute pancreatitis (Purtscher's retinopathy)**
- MC cause of complication of pancreatic pseudocyst – **body and tail of pancreas**
- MC presentation of ZES-PUD+ diarrhea
- MC site of PUD in ZES – **Duodeno bulb (second part of duodenal)**
- MC tumor associated with neurofibroma-1—**optic glioma**
- MC tumor associated with NF-2 – **acoustic neuroma**
- PAUD E ORANGE is seen in – **carcinoma of breast**
- PAUD E ORANGE is due to – **lymphatic obstruction**
- MCC of UTI- **E. coli**
- MCC of renal stone – **Ca+ Oxalate**
- MCC Ca+ oxalate stone – **idiopathic hypercalcemia**
- MCC stag horn calculus- **roteus infection**
- ADPKD cysts not seen in – **lung and brain**
- Best treatment for formed abscess: **I/D**
- Best treatment for TB/cold abscess: **ATT**
- MCC of mycotic aneurysm: **Staph aureus**
- Selmonosky triad is seen in: **Thoracic outlet synd (supraclavicular tenderness, hand paleness on elevation, weakness of 4th and 5th finger)**
- Thrombophlebitis of superficial veins of breast: **Mondor's disease**
- Absence of nipple from breast is condition known as: **Athelia**
- MC type of diaphragmatic hernia: **Posterolateral hernia of Bochdalek**
- Hourglass stomach is seen in: **Pyloric stenosis**
- Cullen sign is seen in: **Hemoperitoneum (periumbilical)**
- Gray turner sign: **Dark bluish/greenish discoloration of flank**
- Karydaki/Bascom's procedure is done in: **Pilonodal sinus**
- Scoring/criteria used in acute pancreatitis: **APACHE score (bed side), Balthazar score (CT severity index), Ranson's criteria**
- Kehr sign is seen in: **Splenic rupture**

Contd...

- Intra-op fluid of choice for irrigation in BPH: **1.5% isotonic Glycine**
- Post op fluid of choice for irrigation: **0.9% NS**
- For cutting umbilical cord of a newborn baby blade used is: **No. 10**
- Use of fogarty catheter: removal of fresh clot embolus in artery
- Needle used for bone marrow biopsy: **Jamshidi Needle**
- Cleft lip corrected at this age and weight: **10 weeks age/10 pounds weight (Millard criteria)**
- Ogilvie syndrome is: **Acute pseudo colonic obstruction**

TABLE: Salivary gland tumors**Pleomorphic adenoma**

- Overall most common tumor of salivary gland
- MC benign salivary gland tumor
- MC tumor of major salivary glands
- MC site is parotid tail (superficial lobe)

Warthin's tumor

- 2nd MC benign tumor of parotid gland
- MC malignant tumor of parotid gland: **Mucoepidermoid CA**
- 2nd MC malignant tumor of parotid gland: **Adenoid cystic CA**
- Most common organism associated with sialadenitis: **Staph. aureus and Strep. viridans**
- Most common salivary gland associated with sialolithiasis: **submandibular gland (80 %) > Parotid gland (20%)**

What is/are the most common...

MC Complication of spinal anesthesia is posture-related headache one day after anesthesia, probably secondary to CSF leakage.

MC Indication for nasogastric tube placement is: **gastric decompression.**

MC Reason for recurrent post-operative ulcer disease is **inadequate vagotomy.**

MC Injury to the thoracic cage is **rib fracture.**

MC Hernia in both sexes and all age groups is **bilateral inguinal hernia.**

MC Causes of true aneurysm are acquired **atherosclerosis, congenital fibromuscular dysplasia (Marfans)**

MC Cause of spontaneous, bloody unilateral nipple discharge is **intraductal papilloma.**

MC Cause of hypercalcemia is **hyperparathyroidism**

MC Cause of pre-sinusoidal portal hypertension is **schistosomiasis.**

MC Appliance for compression of bleeding esophageal varices is the **Sengstaken-Blakemore tube.**

MC Cause of secondary hypersplenism is **portal hypertension.**

MC Type of primary liver cancer is **hepatoma.**

MC Benign liver tumor is **hemangioma**

MC Indication for splenectomy is **splenic injury.**

MC Cause of spontaneous splenic rupture is **malaria > mononucleosis.**

MC Hemolytic anemia to respond to splenectomy is **congenital hereditary spherocytosis.**

Indication for aortic/bifemoral bypass graft is **bilateral iliac obstruction**

Cause of renovascular hypertension in children is **fibromuscular dysplasia.**

Site of embolic occlusion is **the femoral artery.**

Benign type of melanoma is **superficial lentigo malignant melanoma**

The variant of Hodgkin's Disease with the best prognosis is **lymphocyte predominant**

The variant of Hodgkin's Disease with the worst prognosis is **lymphocyte depleted**

SOME NAMED SURGERIES

• Patey's operation	Parotidectomy, mastectomy
• Commando operation	CA tongue (Post 1/3 rd)
• Nissen's fundoplication, Toupet's partial fundoplication, Belsey mark, Hills	GERD
• Ramsted's operation	Congenital Hypertrophic Obstructive Pyloric Stenosis
• Allison's repair	Hiatus hernia
• Hartmann's operation	Hydrocele (small, medium sized)
• Lords operation	Hydrocele (large sized)

MISCELLANEOUS**The most common...**

MC Suture is over and over.

MC Cause of **hypercalcemia** in a surgical patient is primary and secondary hyperparathyroidism and metastatic bone disease.

MC Cause of **hypermagnesemia** secondary to renal failure.

MC NSAID that decreases platelet function is **aspirin.**

MC Cause of hypovolemic shock is **hemorrhage.**

MC Toe problem is **ingrown toe nails.**

MC Cause of death in children and adults less than 35 years of age is **trauma.**

Contd...

FMGE Solutions Screening Examination

IMPORTANT SIGNS

1308

Chvostek's sign	Contraction of facial m/s (masseter spasm) elicited by tapping the facial n. anterior to ear.
Homan's sign	Calf tenderness may be exaggerated by passive dorsiflexion of ankle
Hamman's sign	Mediastinal crunch seen in esophagus rupture.
Trousseau's Phenomenon/ sign (Carpopedal spasm elicited by occlusion of brachial artery with a BP cuff for 3 minutes)	Seen in hypocalcemia (hypoparathyroidism, alkalotic or latent tetany, hypomagnesemia, hypo and hyperkalemia).
Troisier's sign	Enlargement of Virchow's nodes (left supraclavicular LN) in occult gastric carcinoma etc.
Trousseau's sign	Seen in migratory superficial thrombophlebitis (as in pancreatic CA).
Tinel's sign	Tingling sensation on percussion. It indicates partial lesion or beginning of regeneration of nerve

Pediatrics

Infant usually doubles his birth length by **4 ½ yrs of age**.

Most full term infants regain their birth weight by the age of **10 days**.

Central incisors is first to develop and second molar is last to develop in primary dentition.

The circumference of head and chest are almost same by the age of **9 months** to 1 year.

Insulin and insulin like growth factor **stimulate fetal growth**.

First sign of sexual maturation is enlargement of breast in females and testes in boys.

Malnutrition measurement

Acute malnutrition – Weight for height

Chronic malnutrition – Height for age

Most vulnerable period of organogenesis is b/w 18-55 days of gestation.

Most common epileptic drug causing Neural tube defects- **Valproate**

Hyperbilirubinemia in girl babies – Oxytocin induced to mother

Premature closure of ductus in preterm baby – indomethacin

Most common complication during vaginal delivery in diabetic mother – **Shoulder dystocia**

Highest risk of transmission of Hepatitis – At the time of delivery.

Triad of Congenital Rubella – Deafness + cataract + heart defect (PDA)

Triad of congenital Syphilis – Deafness + interstitial keratitis + Hutchinson's teeth

Triad of Toxoplasmosis – Chorioretinitis + intracranial calcification + hydrocephalus

Most common congenital infection is **CMV**

Most common organism causing fetal malformation – **Rubella**

Recurrent abortions and IUGR are usually–not seen in – **Syphilis**

Sabin field man dye test is used to detect immunoglobulin G in toxoplasmosis

Most of the new born pass urine by **12 hours of age** and almost all of them do so by **48 hrs**

Fetal adrenal cortex is largest organ of fetus.

Most common manifestation of acute hypoxemia in a new born- **bradycardia, cardiac systole**.

Early conjugated NNHB with direct bilirubin more than 0.5 mg/dl is noted as neonatal syphilis.

Vitamin E has role in prevention of **PBD** and **ROP**.

Protein required in a new born – **100 kcal/kg**

Breast milk does not provide immunity against **pertussis**.

Minimum time of breast feeding per episode – **15-20 min**.

Vitamin absent in breast milk – Vitamin C > Vitamin D

Mature Breast milk by **day 7**.

Lactalbumin in breast milk - Soft/Golden yellow color stool.

Sucking + swallowing – **34 weeks**.

Earliest fetal breathing movements – **11-16 weeks**

Flag sign – **Kwashiorkor**

Chipmunk faces in case of – **Thalassemia**

Monkey faces in case of– **Marasmus**

Most common cause of congenital hydrocephalus – **Aqueductal stenosis**

Contd...

**TABLE: Development of fetus according to age**

Social smile develops by 2 months
Head control develops by 3 months
4 months – Hand regard
5 months – Ulnar grasp
Child can sit with support by 5 months
5 months – Lumbar control, Tripod position
7 months – Palmar grasp
7 months – Stranger anxiety
9 months – Wave bye bye
Pincer grasp develops by 9 months (9-11 months)
Mature pincer grasp at 12 months
24 months – Can speak in a sentence
2 years - Dry by day
3 years – Dry by night
Can draw- at:
• Circle: 3 years
• Square: 4 years
• Triangle: 5 year
36 months – Climb upstairs with alternate feet
Child knows his full name, gender, eats without spilling, dress without supervision- 5 years
Tells age and sex, uses pronouns, handedness by 3 years
Child stands without support by 1 year
Child can build tower of 3 cubes at 15 months
Child can go up and downstairs with one step at a time by 2 years .
Parachute reflex develops during 9th month of life.
A child can skip by the age of 5 years

TABLE: Fetal birth weight according to maturity

ELBW: < 1 kg
VLBW: < 1.5 kg
LBW: < 10th percentile (<2-5 kg)
Preterm: < 37 weeks
Post-term: >42 weeks

Early sign of puberty in male is enlargement of testes. In females it is determined by: Thelarche
Anemia for an infant at Hemoglobin less than 12 gm%
In neonatal sepsis, acute phase reactant: CRP
Acyanotic congenital heart disease: ASD, VSD, PDA
Cyanotic congenital heart disease: TGA, TOF, TAPVR

TABLE: Apgar score and its interpretation

	Score 0	Score 1	Score 2
Appearance	Blue or pale all over	Blue at extremities	Pink all over
Pulse rate	Absent	<100	>100
(Grimace) Reflex irritability	No response	Grimace	Cry or pull away when stimulated
Activity	None	Some flexion	Flexed arms and legs that resist extension
Respiratory effort	Absent	Weak, irregular, gasping	Strong, lusty cry
Total score: 10	No distress: 7-10	Mild distress: 4-6	Severe distress: 0-3

TABLE: Triple test parameter and its value in different congenital defects

Triple test parameters	Alpha fetoprotein	Unconjugated estriol	Beta hCG
Down syndrome	Low	Low	High
Edward syndrome	Low	Low	Low
Neural tube defects Omphalocele, multiple gestation	High	Not applicable	Not applicable

- MC enzyme deficiency in CAH -21 HYDROXYLASE
- MC teratogenic effect of steroid-Cleft lip & palate
- MC childhood solid tumor other than brain tumor- Neuroblastoma & germ cell tumor
- MC tumor of newborn-sacrocoxygeal teratoma
- MC malignancy in newborn----neuroblastoma
- MC intrarenal tumor in newborn-mesoblastic nephroma
- MC abdominal mass in neonate-Multicystic kidney
- MC cell seen in bronchiolitis- Clara cell
- MCC of bronchiolitis -RSV
- Upper segment and lower segment ratio becomes equal at this age: 7 Years
- Most common cause of short stature in childhood in India: Constitutional
- Physiological weight loss in a preterm baby is upto: 15%
- Best indication for successful resuscitation in an Indian child: Inc Heart rate
- Earliest clinical feature of neonatal sepsis: Poor feeding
- Mode of heating in a radiant warmer: Radiation

Obstetrics and Gynecology

EMBRYOLOGY OF UTERUS

- Mullerian duct present in both sexes and appear at 6 weeks
- Mullerian duct disappear in male fetus at 8-9 weeks.
- Remnant of mullerian duct in male are- utriculus masculinus ,appendix of testis.
- Male internal genitalia develop from mesonephric duct/ wolfian duct.
- Remnant of wolfian duct in female – epoophoron(cranial part),paraophoron (caudal end),gartner duct
- All the remanant of wolfian duct are present in borad ligament.
- 15-20 epoophoron join to form gartner duct
- Mullerian duct give rise to- fallopian tube,uterus,cervix,vagina (upper 2/3) (mesodermal origin)
- Lower 1/3 of vagina is derived from rogenital sinus (endodermal origin)

ANATOMICAL FACTS

- Water under bridge- point where uterine artery(bridge) crosses over the ureter
- Water under the bridge is the most common site for ureter injury.
- This point is 2 cm lateral to cervix and 1.5 cm lateral to internal os.
- During menstruation blood is lost from spiral artery, hence menstrual blood is arterial blood not venous
- Shape of uterus: Pyriform
- **Cavity: Triangular shape cavity on coronal section (Slit shape cavity on sagittal section)**
- Volume:
 - 10cc- non pregnant
 - 5000cc –term pregnancy (volume of uterus=volume of adult blood approximately)
- Weight:
 - Nullipara- 50-70 gram
 - Multipara- 80 gram
 - Term pregnancy- 1 kg
 - Immediately after delivery-1 kg

TABLE: Supports of the genital organs

Level I	Uterosacral ligaments and cardinal ligaments support the uterus and vaginal vault
Level II	Pelvic facias and paracolpos which connects the vagina to the white line on the lateral pelvic wall through arcus tendinous
Level III	Levator ani muscles support the lower one third of vagina

IMPORTANT ONE LINERS

- Tubal blockage is most commonly seen with this infection: **Chlamydia**
- Fulminant hepatitis in pregnancy most commonly caused by: **HEV**
- Constipation in pregnancy is due to this hormone: **Progesterone**
- According to American fertility society classification system, unicornuate uterus is classified under this class: **Class II**
- Type of molar pregnancy in which fetal tissue is formed: **Partial H Mole**
- T shaped uterus seen due to this drug exposure: **Diethylstilbestrol (DES)**
- Stage of Cervix cancer reaching involving bladder and rectum: **Stage IVa**
- Fruit juice which can prevent UTI: **Cranberry juice (due to its anti-adhesion property)**
- Tip of iceberg sign on USG: **Dermoid cyst of ovary**
- Karman cannula is used for: **Endometrial aspiration**
- In this stage of ovarian carcinoma both ovaries are involved and but the capsule is intact: **IB**
- Ovarian Capsule is first involved in this stage of ovarian CA: **Ic**
- MC clinical presentation of genital T. B-**Infertility**
- MC change in fibroid-**Hyaline degeneration**
- MC complication of TAH-**Bleeding**
- MC regime is used inchoriocarcinoma-**MAC regime**
- MC site of metastasis of choriocarcinoma-**Lung**
- MCC of infertility-**Tubalfactor**
- MC C Of tubal disease-**PID**
- MC presentation of treated genital T.B-**Ectopic pregnancy**
- MC complication of ECV is-**fetal distress**
- MC fetal complication of forceps application-**asphyxia**
- MC complication of MTP produce is bleeding-**due to Incomplete evacuation**
- MC type of episiotomy-**mediolateral**
- MC complication of forceps application-**extension of episiotomy**

Contd...

• MC site for ectopic pregnancy— Ampulla
• MC cause of congenital anomaly in baby of diabetic mother— sacralegenesis
• MC congenital anomaly in baby of diabetic mother— neural tube defect
• MC problem seen in baby born to diabetic mother— hypoglycemia
• MC problem associated in delivery of macrosomia baby— shoulder dystocia
• MC cause of PPH— Uterine atony
• MC type of PPH— Primary PPH
• MC maternal complication of twin vaginal delivery— atonic PPH
• MC cause of secondary PPH is— retained placental bits
• MC reason for caesarian hysterectomy— atonic PPH
• MC indication of forcep is— prolong second stage of labour
• MC cancer cervix is squamous cell carcinoma— 95%
• Most important support of uterus— cardinal ligament
• Ovulation occurs at 14 th day before menstruation.
• Endometrium before ovulation is k/a proliferative endometrium.
• Proliferative endometrium is due to effect of estrogen.
• Endometrium after ovulation is k/a secretory endometrium.
• Secretory endometrium is due to effect of progesterone.
• Major source of progesterone in non pregnant female is corpus luteum, hence secretory phase is also k/a luteal phase

TABLE: Indications of conization

Diagnostic	<ul style="list-style-type: none"> • Entire squamocolumnar junction not visible, large lesion • Endocervical CIN • Microinvasion suspected • Discrepancy between cytology and colposcopy
Therapeutic	In INC II, III
Methods	<ul style="list-style-type: none"> • Cone biopsy • LLETZ, LEEP (loop electrosurgical excision procedure), NETZ

TABLE: Bethesda system of cytology reporting

Satisfactory cytology—endocervical cells seen
Unsatisfactory
<ul style="list-style-type: none"> • Squamous cell abnormalities
Atypical squamous cells (ASC)
<ul style="list-style-type: none"> ▪ ASC-US—atypical cells of undetermined significance ▪ ASC-H—cannot rule out high-grade lesion

Contd...

<ul style="list-style-type: none"> ▪ Low-grade squamous intra epithelial lesion (LSIL)—includes CIN I ▪ High-grade squamous intraepithelial lesion (HSIL)—includes CIN II, III ▪ Squamous cell carcinoma
• Glandular abnormalities
Atypical glandular cells
Adenocarcinoma in situ
Adenocarcinoma
• Other malignant neoplasms

Main support of uterus is **cardinal ligament (aka transverse cervical ligament)**.

Broad ligament, infundibulopelvic ligament, ovarian ligaments—**Does not support uterus.**

Most important muscle of pelvic floor - **Levator ani.**

Uterus, fallopian tube, cervix and upper 2/3 vagina arise from—**müllerian duct/paramesonephric duct (mesodermal origin)**

Lower 1/3 vagina - **Urogenital sinus** (endodermal origin)

Weight of pregnant term uterus - **1 kg**

Wt of uterus immediately after delivery - **1 kg**

Volume of nulliparous uterus = 10 mL, term uterus = 5 liters

Round ligament and ovarian ligaments arise from **gubernaculum.**

Uterus shows both **hypertrophy** and **hyperplasia** during pregnancy.

Endometrium of pregnancy is called **decidua.**

Thickness of endometrium

After menses = .5 mm

Mid cycle = 2–3 mm

Luteal phase = 5–6 mm

At time of implantation = 10–12 mm

Thickness of endometrium is taken at body near fundus by **USG.**

Water under bridge-ureter crossed by **uterine artery.**

Ratio of cervix to corpus:

1:1 - At birth, menopause

1:2 - Post-menarche

1:3 - Reproductive life

2:1 - Pre-menarche

Shape of cervix—round (nullipara), transverse slit like—after deliver/multipara

pH of vagina in adult women - 4–5.5

Vaginal secretions are—cervical secretion, bartholin duct secretion (during coitus)

Epithelial lining—FT (ciliated columnar), uterus (columnar), endocx (high columnar), ectocx (squamous), vagina (st. squamous)

Contd...

FMGE Solutions Screening Examination

MC CA

Fallopian tube - Adenocarcinoma
 Uterus - Adenocarcinoma
 Cervix - Squamous cell CA
 Vagina - Squamous cell CA
 Vulva - Squamous cell CA

Sentinel LN used for vulva CA (which is superficial inguinal LN).

Bartholin's cyst - MC cyst of vulva, MC due to obstruction and gonococcus infection, causes fluctuant non tender swelling, at Anterior 2/3rd and posterior 1/3rd of junction between labia minora and Hymen.

Rx-Marsupialization

Length of fallopian tube: **10-12 cm**.

Genital tubercle forms - **Clitoris** (in female), **penis** (in male)

Genital swelling - **Labia majora (f)**, **scrotum (m)**

1st polar body - **Released at ovulation**.

2nd polar body-**released after fertilization**.

Ovarian cycle initiated by - **FSH**

Ovulation is due to - **LH** surge, which is due to high level of *estrogen*.

To cause ovulation in ART inj **hCG** is given.

In ART after HCG inj-ovulation occurs after **36 hrs**.

Ovulation occurs at **14th day** (irrespective of cycle length)

Corpus luteum (CL) secretes-progesterone (**Mainly**), estrogen, relaxin, inhibin A

Life span of CL - **14 day**

Max function/peak activity of CL- *8th day after ovulation/22nd day of Cycle*.

Steroidogenesis of CL maintained by **LH**

Luteolysis of CL prevented by - **hCG**

Telescoping of glands, pseudostratification - **Proliferative/estrogenic phase**

1st Histopathological evidence of ovulation-Sub **nucleolar vacuolation**.

Cork screw glands, stromal edema- **late secretory/progesterone phase**.

MC cause of 1° amenorrhea-**gonadal dysgenesis** (Turner syndrome)

MC cause of 2° amenorrhea-**ovulatory dysfunction** (PCOD)

Amenorrhea, absent uterus, normal sex sexual characters - **Mullerian agenesis**

Triad of MRKH s* - Mullerian agenesis, renal anomalies, skeletal anomalies.

Amenorrhoea, absent uterus, absent/dec pubic hair-androgen insensitivity s*/testicular feminization s* (XY (s* = syndrome)

BEST test to differentiate MRKH s* vs AIS - **Karyotyping**.

AIS (androgen insensitivity s*)- risk of gonadoblastoma in undescended testis.

MCC cause of Asherman's*- Vigorous curettage done for PPH.

TOC for **Asherman's*** - Hysteroscopic adhesiolysis + IUCD + high dose estrogen.

Imperforated hymen - C/o Amenorrhea, bluish bulging membrane in vagina.

Imperforated hymen-hematocolpos, hematometra, cyclic ab pain. T/t by cruciate incision.

Premature ovarian failure-FSH>40 IU on 2 separate occasion (1 month apart), at age <40 years.

MC used test of ovarian reserve- **sr FSH** (done at day 3)

Streak gonad, high FSH, hypogonadotropic hypogonadism- **Turner syndrome**

Inability to conceive even after 1 yr of unprotected intercourse - **Infertility**.

MC female factor for infertility - **PCOD**

MC male factor for infertility - **Psychogenic**.

Test of ovulation - Sr progesterone level (BEST, done at day 21), TVS (MC USED), endometrial biopsy, cervical mucus, vaginal cytology, basal body temp.

Peri-ovulatory follicle/follicle rupture at - **18-20 mm**

Peri ovulatory uterus show- **Trilaminar sign**.

1st stage of labor - Onset of true labor pain to full cx dilation (i.e. 10 cm)

4th stage of labor - 1 hour observation (post delivery)

True labor pain-progressive dilation, effacement, show, contraction increase in duration frequency and intensity.

1st stage - Nullipara (12 hr), multipara (8 hrs)

Prolonged 1st stage- nulli (20 hrs), multi (14 hrs)

Rate of cervical dilation in active stage

1.2 cm/hr - Nulliparous

1.5 cm/hr - Multiparous

Rate of descent:

1 cm/hr - Nulliparous

2 cm/hr - Multiparous

MCC of unstable lie - **Placenta previa**.

MC type of pelvis in female - **Gynecoid (50%)**.

Least common type of pelvis - **Platypelloid (<5%)**.

Pelvis is classified on the basis of **inlet of pelvis**.

Tri-radiate pelvis (VIT D def), rachitic pelvis (rickets)

Vaginal delivery is never possible in naegle's and robert's pelvis.

Slow progress of labor is called **dystocia**.

Contd...

Contd...

Contracted inlet - when AP diameter < 10 cm.
Contracted midcavity - when interischial diameter < 8 cm.
Contracted outlet - when intertuberous diameter < 8 cm.
Best predictor for CPD - trial of labor.
Best method to do pelvic assessment – MRI > pelvimetry (manual)
Pacemaker of uterine contraction -at cornu (right > left)
Adequate uterine contraction - 200-220 Monte Video Unit.
MVU - no of contraction in 10 min × pressure generated in 1 contraction in mm Hg.
Arrest of labor -no change in cervical dilation even after 2 hours of adequate uterine contractions.t/t is LSCS.
MCC cause of vesico vaginal fistula in developing countries- Obstructed labor .
Rx for obstructed labor- LSCS .
Obstructed labor with IUD- LSCS (no role of destructive procedure at all).
MC position of fetal head when it enters pelvis - LOA (left occipito anterior)
Direct op position seen in Anthropoid pelvis .
MCC of face/brow presentation - Anencephaly .
Face/ brow presentation/transverse lie- mcc associated with which type of pelvis- platypelloid .
Rx of face presentation - VD (if mentum anterior), LSCS (if mentum post).
Longest diameter of fetal head - mentovertical (14cm) - Brow presentation.
Rx of brow -CS, no role of VD (vaginal delivery).
Grid iron feel - Transverse lie.
Rib cage as presenting part/shoulder presentation- transverse lie .
Rx of transverse lie - LSCS
MCC of breech- prematurity/preterm .
MC type - Frank breech .
Worst prognosis/max cord prolapse among breech - Footling breech .
Highest risk of cord prolapse among all malpresentation- trans. Lie
Stargazer baby -footling breech with hyperextended neck.
Oogonia and spermatogonia are derived from yolk sac.
Folds of Hoboken -umbilical artery.
Day 21 -fetal circulation is 1st intact/functional/separated from mother circulation.
MC presentation cephalic , MC presenting part vertex .

Contd...

Living ligature -middle layer of myometrium.
MCC of 1* PPH - Uterine atony
MCC of 2* PPH - Retained placental tissue
Syntometrine - oxytocin + methergine
Early cord clamping - HIV/Rh - /baby has heart ds/preterm/ premature
MCC of uterine rupture - Previous CS
MCC of APH - Abruptio placenta (1/200 preg), Placenta previa (1/300)
Most imp risk factor for both (AP, PP) - Previous history of the same.
Placenta Previa : Painless, causeless, bright-red, nontender uterus, normal FHS
Abruptio Placenta -painful, h/o trauma, dark altered blood, tender tense uterus, dec FHS
IOC for placenta previa (PP) & abruptio placenta (AP) - USG .
Paget's classification used for: Abruptio placenta
Macafee's regimen is used for: Placenta Previa - (for conservative management).
DOC for lung maturity - Betamethasone 12 mg, IM, 2 doses, 24 hours apart.
Indication for CS in Placenta Previa - Mother unstable, fetal distress, type 3 & 4
Management of Abruptio Placentae - Always termination of pregnancy.
Indication of CS in Abruptio Placentae - Mother unstable, fetal distress.
IOC for adherent placenta - MRI, Rx- Hysterectomy .
DOC for chronic hypertension (in preg)- Methyl dopa .
DOC for pre-eclampsia - Labetalol 100 mg bd
DOC for eclampsia - MgSO₄
DOC for DM in preg - Insulin. (only FDA approved oral hypoglycemic - Glyburide)
MTP ACT - Year 1971 .
MTP- opinion of 2 doctors needed if POG > 12 weeks .
Minimum age for MTP consent - 18 years .
Time of cerclage operation - 12-14 weeks
Decidul cast - pathognomic of ectopic pregnancy.
Recurrent abortion with isolated rise of APTT - Lupus anticoagulant .
MCC of thrombocytopenia in preg - Benign gestational > idiopathic .
MCC drug used for 2nd Tm abortion - Prostaglandins
Rubin criteria is used for- cervical ectopic .

Contd...

FMGE Solutions Screening Examination

Spiegelberg criteria-ovarian ectopic, studdiford - **Abdominal ectopic.**

Follow up of a case of ectopic/molar preg - **Serial hCG level.**

Most consistent finding in ectopic pregnancy - **Pain**

Most consistent sign of ectopic pregnancy - **Tenderness**

MC non tubal site for ectopic - **Ovary.**

Overall, MC ovarian tumor: **Epithelial cell tumor**

Most common germ cell ovarian tumor: **Teratoma**

Most common Malignant germ cell ovarian tumor:
Dysgerminoma

Menstrual blood stored in vagina: **Hematocolpos**

In a diabetic mother, most common fetal complication will be:
Congenital heart disease

In Brow presentation, head of the fetus: **Partial Extension**

Recurrence of hydatidiform mole accessed by: **β -hCG level**

Mechanism of action of combined OCP: **Prevent release of ovum from ovary**

Placental circulation is established by: **21 days**

Primary treatment for hirsutism in PCOD: **Combined OCP**

Oxygenated blood from placenta goes to fetal heart via:
Ductus venosus

Pace maker of uterine contraction is located at: **Tubal ostia**

Treatment of choice of Acute hydramnios with fetal distress in pregnancy: **Amniocentesis**

Cardiac activity in fetus can be assessed via transabdominal scan by: **6 weeks**

Umbilical cord attached to the margin of placenta: **Battledore Placenta**

TABLE: Diameter of fetal skull

Diameters	Measurement (in cm)	Presentation
Suboccipito-bregmatic	9.5 cm	Vertex
Suboccipito-frontal	10 cm	Vertex
Occipito-frontal	11.5 cm	Vertex
Mento-vertical: Extend from mid-point of chin to the highest point on the sagittal suture	14 cm	Brow
Submento-vertical	11.5 cm	Face
Submento-bregmatic	9.5 cm	Face

TABLE: Important vessels and their remnants

Ductus venosus	Ligamentum venosum
Ductus arteriosus	Ligamentum arteriosum
Umbilical arteries	Medial umbilical artery
Left umbilical vein	Ligamentum teres of liver

TABLE: Gestational age and fundal height landmark

Gestational age	Fundal height landmark
12 weeks	Pubic symphysis
24 weeks	Umbilicus
36 weeks	Xiphoid Process of sternum
37–40 weeks	Regression of fundal height between 36 and 32 cm

TABLE: Uterine pressure in a nutshell

Period	Contraction pressure
During the first 30 weeks	20 mm Hg
First stage of labor	40–50 mm Hg
2 nd stage of labor	100–120 mm Hg
3 rd stage of labor	100–120 mm Hg
Contraction felt clinically	> 10 mm Hg
Contraction associated with pain	15 mm Hg
Pressure required for distending lower uterine segment	15 mm Hg

TABLE: Stages of labor and their respective duration

Stages of Labor	Duration	
	Primipara	Multipara
Stage I: From uterine contraction to full cervical dilatation (10 cm)	12 hours	6 hours
Stage II: Full dilatation to delivery of baby	2 hours	30 minutes
Stage III: Delivery of baby to placental delivery	15 minutes	15 minutes
Stage IV: 1 hour post partum to rule out PPH and vulvar hematoma.	1 hour	1 hour

**TABLE: Examination signs during pregnancy**

Signs	At AOG
Palmer's sign: Regular and rhythmic uterine contraction	4-8 weeks
Vaginal sign: Softened vaginal wall with copious mucoid discharge	6 th week
Goodell's sign: Cervix feels soft and congested	6 th week
Hegar's sign: Uterus is enlarged and soft; cervix empty.	6-10 weeks
Osiander sign: Increased pulsation at lateral fornices	8 th week
Chadwick's sign or Jacquemier's sign: Dusky hue of the vestibule and anterior vaginal wall (due to local vascular congestion)	8 th week
Piskacek's sign: Asymmetrical enlargement of the uterus if there is lateral implantation	8 th week

TABLE: Types of abortion and its examination and USG findings

Abortion	Size of uterus	Cervix OS	USG finding
Threatened	Equal to AOG	Closed	Fetus alive
Missed	Smaller than AOG	Closed	Dead fetus
Incomplete	Smaller than AOG	Open	Retained products of conception
Complete	Smaller than AOG	Closed	Uterine cavity empty

TABLE: Division of zygote and types of twinning

Division of zygote on/ after	Types of twinning
72 hours/3 days	Dichorionic, Diamniotic
Between 4 and 8 days	Diamniotic, Monochorionic (DAMC)
Between 8 and 12 days	Monoamniotic, Monochorionic (MAMC)
>12 days	Siamese, Conjoined Twins

TABLE: Types of prior uterine incisions and risk of uterine rupture

Prior incision	Rupture rate (percentage)
1. Classical	4-9%
2. T-shaped	4-9%
3. Low-vertical	1-7%
4. Low-transverse	0.2-1.5%

TABLE: Ovarian tumor at a glance

Overall, MC ovarian tumor: Epithelial cell tumor
Overall, MC benign tumor of the ovary: Dermoid cyst
MC benign epithelial tumor of the ovary: Serous cystadenoma
MC malignant ovarian tumor: Serous cystadenocarcinoma
MC germ cell tumor: Mature Teratoma (Dermoid Cyst)
Most common ovarian tumor associated with pregnancy: Dermoid Cyst
Most common ovarian tumor which undergo torsion: Dermoid cyst
MC malignant germ cell tumor: Dysgerminoma
Ovarian tumor mostly in young age: Dysgerminoma
Ovarian tumor metastasized to contralateral ovary: Granulosa cell tumor

TABLE: Ovarian tumors and their HPE findings

Ovarian tumor	HPE characteristics
Serous cystadenoma	Psammoma bodies
Clear cell tumor	Hobnail cell
Yolk sac tumor	Schiller duval bodies
Granulosa cell tumor	Call exner bodies
Krukenberg tumor	Signet ring cell

ENT

- Auricle is derived from which Branchial arch: **I & II**
- Stapes is derived from which Branchial arch: **II**
- Hyoid bone is derived from: **Branchial arch II & III**
- Auricle is made of how many cartilages: **1 (yellow elastic cartilage)**
- Area of auricle devoid of cartilage: **Lobule and Incisura terminalis**
- Eustachian tube length – 36 mm (**lateral 1/3 is bony and medial 2/3 is cartilage**)
- External auditory canal length – 24 mm (**outer 1/3 is cartilage and inner 2/3^d is bony**)
- Layer of tympanic membrane: **3 layers**

Contd...

FMGE Solutions Screening Examination

1316

- Functional area of tympanic membrane: **45–55 mm²**
- Lever ratio between handle of malleus and long process of incus is – **1.3: 1**
- Ear ossicle which has no muscle attachment: **Incus**
- Origin of tensor tympani muscle on which wall: **Anterior wall (from canal of tensor tympani)**
- Origin of stapedius muscle on which wall: **Posterior wall (Tip of pyramid)**
- While cochlear implant, electrode is placed at: **Scala tympani**
- While cochlear implant, electrode is passed via: **Round window**
- Tuning fork most commonly used for this frequency: **512 Hz**
- Otoacoustic emissions arise from: **Outer cells**
- Best test for screening of hearing in newborn: **Otoacoustic emission**
- Roll over phenomena seen in **Retrocochlear Lesion**
- Bills bar location: **Inner ear**
- Bills bar separates which structure in inner ear: **Facial nerve and Superior vestibular nerve**
- Macewen's triangle or suprameatal triangle is landmark of **mastoid antrum**.
- Organ of Corti contains endolymph, hair cells, and supporting **cells of Hansen's**
- Otolith membrane of macula is made up of **Ca (CO)₃** crystals.
- Hamartoma of auricle may result in **cauliflower ear**.
- Most common organism causing cauliflower ear: **Stap aureus**
- Perichondritis of the auricle m/c pathogen is **pseudomonas**
- Normal hearing capacity is from 20 Hz to 20,000 Hz.
- Moderately severe hearing loss: **56–70 dB**
- Noise induced hearing loss seen maximum at: **5–6 khz**
- **Hennebert sign** is seen in: Meniere's disease
- In case of BPPV, which semicircular canal affected: **Posterior semi-circular canal**
- Acute otitis media most commonly caused by: **Streptococcus pneumonia**
- Bullous myringitis is most commonly caused by: **Adenovirus**
- Wax softened by NaHCO₃ solution and syringing by sterile water at body temperature.
- Furunculosis of external ear caused by **staphylococcus**.
- Malignant otitis externa caused by **pseudomonas** seen in diabetics and immune compromised.
- **Central perforation of TM**: Safe CSOM
- **Peripheral perforation of TM** – Unsafe CSOM

- In keratosis obturans external ear canal is filled up by: **Cholesteatoma mass**.
- **Cholesteatoma** is: Old Keratinized mass of squamous cell in middle ear
- **MC site congenital cholesteatoma** - Petrous part of temporal bone
- **MC site of acquired cholesteatoma** – Prussack's space or attic area
- Most **common complication** of CSOM is **brain abscess**
- Most **common intracranial manifestation** of late chronic otitis media: **Brain abscess**
- Most common **extracranial** complication of CSOM: **Mastoiditis**
- Most common organism causing mastoiditis: group A beta hemolytic streptococcus
- Pulsatile tinnitus is seen in **Glomus Tumor**
- Pulsatile otorrhea (aka Lighthouse sign) seen in– ASOM
- **Grommet**: Small tube to drain middle ear
- Most common quadrant preferred for insertion of grommet: **Antero-inferior quadrant**
- Fluctuating hearing loss is seen in – **Ménière's Disease**
- Most common cause of sensorineural hearing loss – **Presbycusis**
- **Paracusis willisii**: Patient hears better in noisy environment. Seen in case of otosclerosis
- Cohort notch at 2000 Hz seen in **Otosclerosis**
- Loudness of sound is measured by its **Intensity**
- Glomus tumor is a tumor of **paraganglionic cells**
- **Phelp's sign**-Glomus tumor (glomus jugulare)
- Cranial nerve involved in Gradenigo's syndrome: **5th & 6th cranial nerve**
- 3 D's of Gradenigo's syndrome: **Diplopia, Deep pain, Discharge**
- Lyre sign is seen in **Carotid Body** tumor
- Most common tumor of CP angle: **Vestibular schwannoma aka Acoustic neuroma**
- Osteomeatal complex is an important landmark during **FESS**
- Chronic dacryocystitis and mucocele of lacrimal sac are treated by **Dacryocystorhinostomy**
- **Osteomeatal complex includes** – middle meatus, uncinate process and ethmoidal bulla
- Most common site of epistaxis – **Little's area**
- Nasal septum perforation can be a side effect of antiangiogenesis drugs like – **Bevacizumab**
- This illicit drug abuse can cause septal perforation: **Cocaine**

Contd...

Contd...

- MC type of DNS present with epistaxis: **Spur**
- Mikulicz cell upon HPE in case of– **Rhinoscleroma**
- Most common organism causing rhinoscleroma: **Klebsiella Rhinoscleromatis**
- Most common organism causing Rhinosporidiosis: **Rhinosporidiosis seeberi**
- Most common sinusitis in children – **Ethmoidal**
- Most common sinusitis in adults – **Maxillary**
- Polyp in adults most commonly arises from which sinus: **Ethmoid sinus**
- Polyp in child most commonly arises from which sinus: **Maxillary sinus**
- Best treatment for polyp: FESS
- **Vidian Neurectomy** is done for: Vasomotor Rhinitis
- Recurrent facial nerve paralysis seen in **Melkersson Rosenthal Syndrome**
- Frog sign, antral sign– **Juvenile angiofibroma**
- Characteristic feature of Juvenile angiofibroma: **Recurrent severe epistaxis in adolescent male.**
- Caldwell-Luc's operation is done for: **Maxillary sinusitis**
- Young's operation is surgical procedure for: **Atrophic rhinitis**
- Most common bone fractured on face: **Nasal septal fracture**
- MC site of fracture on mandible: **Condylar neck**
- **Reinke's space** – seen in glottis area. Often affected by edema causes polypoid degeneration of vocal cords.
- Narrowest portion of larynx in adult: **Glottis**
- Narrowest portion of larynx in child: **Subglottis**
- Intrinsic muscles of larynx is mainly supplied by: **Recurrent laryngeal nerve**
- Only intrinsic laryngeal muscle NOT supplied by RLN: **Cricothyroid muscle**
- Nerve supplying cricothyroid muscle: **Superior laryngeal nerve (external branch)**
- Abductor of vocal cord: **Posterior cricoarytenoid**
- Most common site of vocal cord nodule: **Anterior 1/3rd and Posterior 2/3rd**
- MCC of vocal cord nodule/Singer's nodule: **Vocal abuse**
- Thumb sign on X-ray neck- **acute epiglottitis**
- Steeple sign in X-ray neck: **Croup**
- Most common organism causing acute epiglottitis: **H. influenza B**
- Most common organism causing croup: **Parainfluenza Type I & II**
- Key hole glottis is seen in: **Phonasthenia**

Contd...

- Omega shaped glottis: **Laryngomalacia**
- Turban epiglottis is seen in this case: **TB larynx**
- Mouse nibbled appearance of vocal cord: **TB larynx**
- Most common risk factor for CA larynx: **Smoking**
- Laryngeal papillomatosis most commonly caused by: **HPV 6 & 11**
- **Montgomery tube** – silicon tracheal tube used for surgical management of tracheal stenosis
- **Mobius syndrome**: Bilateral facial nerve paralysis associated with abducens nerve palsy (patients unable to smile and unable to move their eyes from side to side)
- **Choanal atresia**: Persistence of bucconasal membrane; UL > BL
- In choanal atresia membrane is most commonly comprised of: **Bone**
- **McGovern's procedure**: In case of Choanal atresia (placing a wide bore nipple in baby's mouth)
- **Ludwig angina**: Airway obstruction due to laryngeal edema

The most common...

- MC benign lesion of the ear is **actinic keratosis**
- MC tumor is benign **acoustic neuroma.**
- MC cause of vertigo is **vestibular neuritis.**
- MC location of **epistaxis in children** is anterior, often traumatic.
- MC location of **epistaxis in adults** is posterior, secondary to system causes such as hypertension and atherosclerosis.
- MC tumor of the paranasal sinuses is **osteoma**
- MC infectious disease in humans is **acute viral rhinitis**
- MC noninfectious cause of rhinitis is **allergic** (about 20% of population).
- MC medical cause of rhinitis is **decongestant abuse**
- MC orbital infection is acute **ethmoidal sinusitis**
- MC fungal infection of the oral cavity is **moniliasis.**
- MC benign neoplasm of the oral cavity and pharynx is **squamous papilloma.**
- MC malignant neoplasm of the oral cavity and pharynx is **squamous cell carcinoma.**
- MC benign neoplasm of the parotid gland in children is **hemangioma**
- MC malignant neoplasm of the parotid gland is **mucoepidermoid carcinoma**
- MC malignant neoplasm of salivary glands (except parotid) is **adenoid cystic carcinoma.**
- MC cause of stridor in infant is **laryngomalacia**

Contd...

FMGE Solutions Screening Examination

1318

The most common...

MC inflammatory condition of the larynx in adults is **acute laryngitis**.

MC benign tumor of the larynx in children is **squamous papilloma**

MC malignant tumor of the larynx is **squamous cell carcinoma**

MC etiologies of neck masses in children are **congenital and inflammatory**.

MC etiology of neck masses in adults is **neoplasm**.

MC **benign neck tumors** are lipoma and neurogenic tumors (schwannoma, neurofibroma).

MC malignant lateral neck masses in children are **lymphoma and rhabdomyosarcoma**.

MC the **cricothyroid muscles** are the only ones that **abduct the vocal cords**.

Sinus	Condition at Birth	Adult size	First radiological evidence
Maxillary	+ (6–8 mL)	15 years	4–5 months
Ethmoid	+	12 years	1 year
Frontal	–	20 years	6 years
Sphenoid	–	15 years	4 years

TABLE: Larynx anatomy

	Adult larynx	Pediatric larynx
Location	C3 – C6	High in neck At rest: C3 or C4 While swallowing: C1 or C2
Cartilage	Soft	Softer
Thyroid cartilage	Elevated at thyroid angle	Flat
Shape	Cylindrical	Conical
Length of vocal cord	Female: 15–19 mm Male: 17–23 mm	Female: 6 mm Male: 8 mm

TABLE: Male vs female larynx

Male	Female
Length = 44 mm	36 mm
AP = 43 mm	41 mm
Transverse: 36 mm	26 mm

Orthopedics

Term orthopedics was coined by **Nicolas Andry**.

Bone within bone appearance is seen in **osteoporosis**

Short 4th and 5th metacarpal is seen in **pseudo hypoparathyroidism**.

Frankel's line and Wimberger's ring seen in **scurvy**.

Rocker bottom foot is seen in congenital vertical talus and in correction of CTEV.

Kienbock's disease is avascular necrosis of **lunate**.

Codfish vertebrae is seen in osteoporosis

Triple arthrodesis includes talonavicular, talocalcaneal, calcaneocuboid fusion.

Intra-articular calcification is seen in Charcot's joints.

Quadriceps femoris is main extensor of knee joint.

Knuckle-blender splint: Claw hand

Cock up splint is used for radial nerve palsy.

Locking of knee is seen in bucket handle tear of meniscus.

Mallet finger is avulsion of base of distal phalanx.

Maximum weight for skeletal traction is 20 kg

Chauffeur's fracture involves radial styloid.

K-wire is used for cerclage and fore arm bone fixation.

Barton's fracture involve fracture distal end radius with wrist subluxation.

Scaphoid is treated by glass holding cast.

MCC of bony ankylosis is pyogenic arthritis.

Onion peeling is seen in Ewing's sarcoma.

MC bone to fracture on face is **nasal bone**

MC site of fracture of mandible is **neck of condyle**.

Earliest X-ray finding of Osteomyelitis: **Periosteal reaction**

Drug of choice for acute gouty arthritis: **Indomethacin**

Deformities in RA

Swan-neck deformity: Hyperextension of the PIP joint with flexion of the DIP joint.

Boutonnière deformity: Flexion of the PIP joint with hyperextension of the DIP joint.

Z-line deformity

Deformities in OA:

- Bouchard's node: Node at PIP
- Heberden node: Node at DIP

COMMON FRACTURES AND INJURIES

Fracture	Description
Bankart's fracture	Fracture of anterior glenoid associated with anterior shoulder dislocation
Bennett's fracture	Intra-articular fracture of base of Thumb metacarpal
Boxer's fracture	Fracture of neck of little metacarpal
Bumper fracture	Compression fracture of lateral tibial plateau
Burst fracture	It is a comminuted fracture of the vertebral body where fragments "burst out" in different directions
Chauffeur's #	Intra-articular fracture of radial styloid
Colles' fracture	Distal radius fracture with dorsal angulation, im- impaction and radial drift
Chance fracture aka seat-belt fracture	The fracture line running horizontally through the body of the vertebra and through, the posterior elements
Dashboard fracture	A fracture of posterior lip of the acetabulum, often associated with posterior dislocation of the hip
Duverney fracture	Isolated fracture of the iliac wing
Galeazzi fracture	Radius shaft fracture with dislocation of distal radio-ulnar joint
Gosselin fracture	V-shaped distal tibia fracture extending into the tibial plafond
Hangman's #	Fracture of both pedicles of C2
Hill-Sachs fracture	Impacted posterior humeral head fracture occurring during anterior shoulder dislocation
Jefferson fracture	Fracture of first cervical vertebra
Jones fracture	Fracture of base of 5th metatarsal extending into intermetatarsal joint
Lisfranc fracture	Fracture dislocation of midfoot
March fracture	Stress fracture of 2nd and 3rd metatarsal shaft
Monteggia fracture	Proximal ulna fracture with dislocation of radial head
Moore's fracture	Distal radius fracture with ulnar dislocation and entrapment of styloid process under annular ligament
Pipkin fracture-dislocation	Posterior dislocation of hip with avulsion fracture of Fragment of femoral head by the ligamentum teres

Contd...

Fracture	Description
Pott's fracture	Bimalleolar fracture of the ankle
Cotton's fracture	Trimalleolar ankle fracture
Rolando fracture	Extra-articular comminuted fracture of base of first metacarpal
Runner's fracture	Stress fracture of distal fibula 3–8 cm above the lateral malleolus
Salter-Harris #	Fractures involving a growth plate
Shepherd's fracture	Fracture of the lateral tubercle of the posterior process of the talus
Smith's fracture	Distal radius fracture with volar displacement
Straddle fracture	Bilateral superior and inferior pubic-rani fracture
Whiplash injury	Cervical spine injury where sudden flexion followed by hyperextension takes place

TABLE: Static stabilizer vs dynamic stabilizer of shoulder joint

Static stabilizer	Dynamic stabilizer
Glenoid labrum	Supraspinatus
Glenohumeral ligament	Infraspinatus
Negative pressure in glenoid cavity	Teres minor
	Subscapularis

TABLE: Shoulders pathology and nerve involved

Ant. Shoulder dislocation	Axillary nerve
Surgical neck humerus #	Axillary nerve
Humerus shaft #	Radial nerve
Supracondylar #	Anterior interosseous nerve > median nerve
Cubitus valgus	Tardy ulnar nerve palsy
Medial condyle humerus #	Ulnar nerve

TABLE: Different splint and their uses

Splint	Used in
Knuckle bender splint	Ulnar nerve
Aeroplane splint	Brachial plexus injury
Dennis brown splint	CTEV
Bohler Braun splint	Fracture femur (anywhere from neck to supracondylar region)
Turn buckle splint	VIC (Volkmann ischemic contracture)

SOME IMPORTANT SIGNS AND TESTS

Adson's test: For thoracic outlet syndrome
Allen's test: For testing patency of radial and ulnar arteries
Alli's test: For CDH
Anvil test: For testing tenderness of the spine
Ape thumb: For median nerve injury
Apley's grinding test: For meniscus injury
Apprehension test: For recurrent dislocation for the shoulder
Barlow's test: For CDH
Galeazzi sign: For CDH
Galeazzi fracture: Radius shaft fracture with dislocation of distal radioulnar joint
Blue sclera: Osteogenesis imperfect
Bryant's test: For anterior dislocation of the shoulder
Callaways' test: For anterior dislocation of the shoulder
Chvostek's sign: For tetany
Claw hand: For ulnar nerve injury
Coin test: For dorso-lumbar tuberculosis of spine
Cozen's test: For tennis elbow
Drawer test: For ACL and PCL injuries
Anterior: For ACL injury
Posterior: For PCL injury
Finkelstein's test: For de Quervain's tenovaginitis
Foot drop: For common peroneal nerve injury
Froment's sign: For ulnar nerve injury
Gaenslen's test: For SI joint involvement
Gower's sign: For muscular dystrophy
Hamilton-ruler test: For anterior dislocation of the shoulder
Kanavel's sign: For infection in ulnar bursa
Lasegue's test: For disc prolapse
Lachman test: For ACL injury
Ludloff's sign: For avulsion of lesser trochanter
McMurray's test: For meniscus injury
Naffziger's test: Disc prolapse
Ober's test: For tight iliotibial band (e.g. in polio)
O'Donoghue triad: Triad of MCL, ACL & medial meniscus injuries occurring together
Ortolani's test: For CDH
Pivot-shift test: For ACL injury
Policeman tip: For Erb's palsy
Sulcus sign: For inferior dislocation of the shoulder
Thomas's test: For hip flexion deformity
Trendelenburg's test: For unstable hip due to any injury?

IMPORTANT CLASSIFICATION

Neer's: For upper end of humerus fractures
Gustilo: For open fractures
Salter and Harris: For epiphyseal injuries
Lauge Hansen's: For ankle injuries
Pauwel's: For fractures neck of the femur
Garden's: For fractures neck of the femur
Winquist: Femur fracture
Milch: lateral condylar fracture
Campbell: Clavicle fracture
Tile's/Young → Pelvic bone fracture
Thompson and Epstein: Post Hip dislocation
Rockwood: Acromioclavicular Joint injury

RADIOLOGICAL SIGNS

Special views
Judet views: For acetabular fracture
Oblique view of the wrist: For fracture scaphoid
Mortise view: For ankle injuries
Sunset view: For patella - Femoral dysplasia
Von Rosen view: For CDH
Shenton's line: Hip X-ray

Angle
Carrying angle: Elbow
Pauwel's angle: Fracture neck of the femur
Bohler's angle: Fracture of the calcaneum
Kite's angle: Angle in CTEV
Neck-shaft angle: Of the femoral neck

Classic features
Wormian bones: Osteogenesis imperfecta
Sun-ray appearance: Osteosarcoma
Soap-bubble appearance: Osteoclastoma
Onion-peel appearance: Ewing's Sarcoma
Shepherd-Crook deformity: Fibrous dysplasia
Risser's sign: Epiphysis of iliac bone
Aneurysmal sign: TB spine (anterior type)
Tonguing of vertebra: Morquio-Brails disease
Trethowan's sign: Slipped capital femoral epiphysis
Sagging rope sign: Perthe's disease
Patchy calcification: Chondrosarcoma
Fabella: Sesamoid bone in the lateral head of gastrocnemius
Spondylosis: Degenerative spine disease

GAITS

Antalgic gait: Occurs in painful condition of lower limb
Trendelenburg gait: Occurs in an unstable hip due to CDH, gluteus medius weakness, etc.
Stiff hip gait: Occurs in ankylosis of the hip
Duck waddling gait: Occurs in bilateral CDH
Scissoring gait: Occurs in CP
High stepping gait: Occurs in foot drop
Circumduction gait: Occurs in hemiplegia
Charlie-Chaplin gait: Occurs in tibial torsion
Sailor's gait: Occurs in bilateral CDH

ORTHOPEDICS—THE MOST COMMON LIST

Location of hip fracture is at the femoral neck and intertrochanter.
Sprained ligament is the anterior talofibular ligament.
Foci of acute hematogenous osteomyelitis are the metaphases of long bones secondary to turbulent flow.
Variety of osteoporosis is the involutional type, often seen in post-menopausal women.
Musculoskeletal morbidity in the elderly is osteoarthritis.
The most movable joint is the glenohumeral joint.
The strongest bone segment is the femoral shaft.

BONE INFECTION—MOST COMMON

Most common organism causing acute osteomyelitis: Staph. aureus
MCC of osteomyelitis in sickle cell anemia patient: Salmonella
MCC of osteomyelitis in IV drug abuser: Pseudomonas
MC organism causing osteomyelitis in open foot injury: Pseudomonas
MC organism causing osteomyelitis in HIV patient: Staph. Aureus
MC organism causing osteomyelitis in case of animal bite: Pasteurella Multocida
MC organism causing osteomyelitis in case of human bite: Eikenella Corrodens

TABLE: Radiological appearance of some common bone tumors

Sun burst appearance: Osteosarcoma
Nidu/Seed in cortex: Osteoid osteoma
Onion skin appearance: Ewing's sarcoma
Exostosis (cartilage cap): Osteochondroma
Soap bubble appearance: Giant cell tumor/Osteoclastoma

Tumor	Site
Solitary bone cyst	Upper end of humerus
Aneurysmal bone cyst	Lower limb metaphysis
Osteochondroma	Distal femur
Osteoid osteoma	Femur
Osteoblastoma	Vertebrae
Osteoma	Skull, facial bones
Enchondroma	Short bones of hand
Chordoma	Sacrum
Adamantinoma	Tibial
Ameloblastoma	Mandible
Osteoclastoma	Lower end femur
Fibrous dysplasia	Polyostotic – craniofacial Monostotic – upper femur
Multiple myeloma	Lumbar vertebrae
Osteosarcoma	Lower end femur
Ewing's sarcoma	Femur
Chondrosarcoma	Pelvis
Secondary tumors	Dorsal vertebrae

Some important facts

- **MC type of ant. shoulder D/L:** Subcoracoid (head lies below coracoid process)
- **Blounts disease:** Dysplasia of proximal posteromedial tibial epiphysis
- **Steinberg and Walker Murdoch sign:** Marfans syndrome
- **MC translocation in Ewing's:** t(11:22)
- **David letterman sign/Terry Thomas sign:** Scapholunate dislocation
- **Game keeper's thumb:** Torn ulnar collateral ligament after injury to thumb MCP joint
- **Booadie's Abscess:** Subacute OM
- **Kanavel Sign:** Tenosynovitis
- **Heberden node and Bouchard Node:** OA
- **Swan neck and Boutonniere deformity:** RA
- **Bag of bone sign:** Charcot's Joint (in DM)
- **IOC for CDH:** MRI
- **Screening for CDH:** USG
- **Trethowan's sign:** SCFE
- **Wimberger corner sign:** Cong. Syphilis
- **Froment sign:** Ulnar nerve palsy
- **Phalen test +ve:** Carpal tunnel syndrome
- **Meralgia paresthetica:** Lat cutaneous nerve of thigh
- **Cheiralgia paresthetica:** Superficial radial nerve

FMGE Solutions Screening Examination

1322

Ophthalmology

EYEBALL AT BIRTH

- **AP diameter:** 16.5 mm (adult size 24 mm by 7–8 years)
- **Corneal diameter:** 10 mm (adult size 11.7 mm 2 years)
- NB hypermetropic by 2–3 D
- Fixation starts at 1 month. Completed by 6 mo
- Macula fully developed by—4–6 mo
- Fusional reflex and accommodation well developed by 4–6 mo
- 3D depth perception/stereopsis—6 years

LENS

- Grow throughout the year
- **Diameter:** 9–10 mm
- **Thickness:** 3.5–5 mm
- **Weight:** 135 mg to 255 mg
- **Total dioptric power:** 18 D (16D – 20D)
- **Refractive index:** 1.39
- **Accommodative power:** 14–16 D at birth; 7–8 D at 25 years and 1–2 D at 50 year

Length of eyeball: **24 mm**

Volume of orbit: **30 ml**

Weight of eyeball: **7 gram**

Volume of eyeball: **6 ml**

Anterior chamber: **Between iris and cornea (posterior wall)**

Posterior chamber: **Between lens and iris**

Deep anterior chamber in: **Young, Male and Myopes**

Shallow anterior chamber in: **Elderly, female and hypermetropes**

DDO (distant direct ophthalmoscope): **Performed at a distance 22 cm (20–28 cm)**

Direct ophthalmoscope: Done closest to patient
Image is Direct, Erect and Virtual; magnified by 15 times

Indirect ophthalmoscope: Performed at a distance of 1 m
Image is real (true), inverted; magnified by 5 times

Slit lamp is the best investigation method for diagnosis of vitreous opacities

Functional assessment of optic nerve is done by **Perimetry**.

Acuity for distant vision is tested by - **Snellen chart**

Acuity for near vision is tested by - **Jaeger type cards**

Ishihara chart is used for: **Color blindness**

Retinoscopy

Done at a distance 1m. If reflex moves in:

Same direction - Emmetropia, hypermetropia, myopia <1D

Opposite direction - Myopia >1D

No movement - Myopia -1D

Field of vision is tested by - Perimetry, Bjerrum's screen, confrontation method

Finchams test: Differentiates colored halos of acute congestive glaucoma from that of acute conjunctivitis

Gonioscope: The angle of anterior chamber can be examined with the help of a Gonioscope and slit lamp.

Tonometry: Used for accurate determination of IOT (intraocular tension)

Arden index: It the ratio between light peak to dark trough. Normally it is 1.85

Ring scotoma: Seen in retinitis pigmentosa, glaucoma (double arcuate scotoma)

Roth spots- white centered retinal hemorrhages
Seen in **Leukemia, SABE, DM**

Lens develop from **surface ectoderm**

Lower and lateral walls of orbit are derived from **visceral mesoderm**

Total refractive power of eye is **58-60D (Avg-58.6)**

Total refractive power of cornea **43.78D +/- 1.86D**

Normal cup-disc ratio-**1:3**

Maximum refractive index is **at center of lens (1.40)**

Newborn eye is short axial length is 17.5 mm generally hypermetropic +2.5D and fovea is immature.

Critical period for the development of fixation of eye reflexes is 2-4 months

Glycolysis is the main route of metabolism of glucose in the lens.

IOT ranges from **10-20 mmHg**

Optic disc - Depressed area of optic disc contains no rods/ cones is therefore insensitive to light and called physiological blind spot.

CME (cystoid macular edema)- shows flower petal appearance of fundus.

Ink-blot pattern and smoke-stake patterns is seen in: **CSR** (central serous retinopathy).

CRAO - Cattle truck appearance of retinal veins, cherry red spots.

Aphakia produces high degree of hypermetropia

Frequent changes of presbyopic glasses is an early symptom of **primary open angle glaucoma**.

Contd...

Contd...

First sign of cavernous involvement /raised ICT IS 6th CN palsy.

Structures passing through optic foramen are - **Optic nerve and ophthalmic artery**

Bielschowsky sign is for superior oblique palsy.

Sea saw nystagmus of Maddox - Found in para chiasmal lesion.

Argyll-Robertson pupil Light reflex absent, accommodation reflex present Seen in Neurosyphilis, DM, syringomyelia, disseminated sclerosis.

Horner's syndrome: Triad of MIOSIS, IPSILATERAL PTOSIS, ANHYDROSIS.

Marcus gunn pupil is diagnostic of-acute retrobulbar neuritis (optic neuritis)

Parvocellular pathway - Located on layers 3, 4, 5, 6 of retina

Most common cause of viral conjunctivitis-**Adeno virus**

Most common cause of bilateral conjunctivitis in neonates within 3-5days - **Neisseria gonorrhoea**.

Most common cause of severe keratoconjunctivitis in contact lens user - **Acanthamoeba**

Most characteristic lesion of HSV recurrent infection is **the-dendritic ulcer (dendritic keratitis)**

Trachoma-leading preventable cause of blindness

SAFE strategy used for trachoma - Surgery, Antibiotics, Facial hygiene, Environmental change

Corneal transparency is maintained by - **Descemet membrane**

Donor cornea from **cadaveric eye** can be used 6 hours of death. It is stored in **Mc Kaufmanns media** for 4 days.

Corneal ulcers - Ulcer Serpens is due to pseudomonas.

LASIK is absolutely contraindicated in keratoconus

Most common fungus infecting lids - **Candida albicans**.

Posterior staphyloma is due to ectasia at posterior pole, seen in myopia

Anterior staphyloma is due to ectasia of cornea at anterior pole, seen in corneal ulcer perforation.

Sympathetic ophthalmia: retrolental flare is the first sign, Dalen Fuchs nodules

Lens capsule is thinnest at posterior pole.

Ascorbic acid in lens is derived from myo inositol phosphate.

Snow flake/snow storm cataract - Seen in diabetes

Oil drop cataract - Seen in galactosemia

Sunflower cataract - Seen in Wilson's disease

Bread crumb appearance - Seen in complicated cataract

Most common complication of morgagnian cataract-**Phacolytic glaucoma**.

Contd...

Supero temporal dislocation of lens - Seen in Marfans syndrome

Infero nasal dislocation of lens-seen in **homocystinuria**.

Antero inferior dislocation of lens-Weill marchesani syndrome.

Hard contact lenses and IOL lens are made up of **PMMA**

Soft contact lenses are made up of **HEMA (Hydroxyethyl Methacrylate), Silicon Hydrogel**

Earliest filed defects in glaucoma - Central/para central scotoma in bjerrums area.

Most effective surgery for congenital or infantile glaucoma is **goniotomy or trabeculotomy**.

Aphakia - Absence of crystalline lens.power of Aphakic eye is 44 D

Most radioresistant structure in retina-**ganglion cell layer**.

Cotton wool spots (cytoid bodies) are due to focal ischemia in the nerve fiber layer, found in HIV retinopathy.

Flame shaped hemorrhages found in - **Hypertensive and arteriosclerosis retinopathy**.

Field defect in toxic amblyopia - **Centrocecal scotoma**.

TOC for paralytic squint-**surgery**

TOC for amblyopia with unilateral strabismus - **Conventional occlusion (of normal eye)**

TOC for accommodative squint-**correction of refractive errors**.

TOC for concomitant squint-**orthoptic exercises**

Most common intraocular foreign bodies - **Chips of iron and steel**.

Most common cause of intermittent proptosis-**orbital varix** (varicose vein in the eye)

In children:

Most common intraocular tumor - Retinoblastoma

Most common intra orbital tumor - Rhabdomyosarcoma

In adults

MC intraocular tumor - **Malignant melanoma of choroid**

MC intra orbital tumor - **Cavernous Hemangioma**

MC tumor which metastasize to eye - **Neuroblastoma**

MC tumor of eyelids **basal cell carcinoma**

MC tumor of lacrimal gland - **Benign mixed tumor**

Mutations in retinoblastoma are seen at 13q14

MC presentation in retinoblastoma - leukocoria > strabismus.

Vitreous is composed of type II collagen+hyluronic acid.

Trichiasis: Is mis directed eye lashes.

Madarosis: Loss of eye lashes/eyebrows

Tylosis: Thickening of lid margin

Blepharitis: **Inflammation of eyelid**

Fastest acting mydriatic and cycloplegic -**Tropicamide**

Shortest acting mydriatic and cycloplegic -**Tropicamide**

Shortest acting mydriatic without cycloplegia-**phenylephrine**.

Contd...

FMGE Solutions Screening Examination

1324

MC congenital color blindness - Green (deuteranopia)
MC cause of blindness in AIDS patients - CMV retinitis .
MC cause of blindness worldwide - Cataract
MC cause of blindness in India - Cataract
MC cause of ocular morbidity - Refractive errors
MC cause of ocular morbidity in youngs - Refractive errors
MC cause of preventable blindness in children - Vit A deficiency
Tear production starts at 6 months
Sjogren's syndrome is due to aqueous deficiency
MC ocular manifestation of measles - Vit A deficiency
Corneal nerve is visible in- leprosy, keratoconus .
Bluish discoloration of sclera - osteitis deformans .
MC cause of sudden unilateral loss of vision - Optic neuritis
MC treatment modality for acute angle closure glaucoma- Laser iridotomy
Not seen in herpes zoster ophthalmicus- sclero-keratitis
Cricket ball injury to eye does not lead to - Hypopyon .
WHO vision 2020 do not include- epidemic conjunctivitis .
Worth 4 dot test is done for: Binocular vision
Jack in a box is seen in: Aphakia
Tranta's spots , Ropy discharge is seen in: Vernal conjunctivitis
Interstitial keratitis is seen in: Syphilis
Side effect of oral steroid: Cataract
Side effect of topical steroid: Glaucoma
D/Dx of color haloes:
ACG
Cataract
Mucopurulent conjunctivitis (Not in angular)
Vertically fixed mid-dilated pupil seen in: ACG

RECENT ONE'S

MCC of blindness in India: Cataract
Retrolental Flare is seen in: Sympathetic Ophthalmitis
Ipsilateral CN 3 palsy can lead to: Weber syndrome
Most radiosensitive layer of retina: Rods and cones
Most radioresistant layer of retina: Ganglion cell layer
Ascorbic acid in lens is transported by: Myoinositol
Orbital floor is formed by: Maxillary bone and palatine bone
MC complication after lens extraction in PHPV: Vitrous Hemorrhage
Cornea can be harvested: Till 6 hours after death
Alcaftadine trail used this concentration of drug: 0.25%
Definition of blindness according to WHO: <3/60

Contd...

Vossius ring in eye is due to: Blunt trauma
Alkali injury in eye causes: Symblepharon
Ankyloblepharon : Upper and lower lid margin fusion
Titmus fly test is for: Stereopsis
Jack in the box phenomenon: Aphakia
Anterior lenticonus: Alport syndrome
Posterior lenticonus: Lowe syndrome
Dalen fuch's nodule is seen in: Sympathetic ophthalmitis
Buphthalmos is seen in: Congenital glaucoma (AR condition)
Krukenberg spindle is seen in: Pigmentary glaucoma (iris pigment on cornea)
IOC for indirect ophthalmoscopy: Indirect ophtha
Flame shaped hemorrhages are hallmark of: Hypertensive retinopathy
Flower petal appearance upon fluorescein angiography: Cystoid macular edema

OPHTHALMOLOGY—MOST COMMON LIST

WHAT IS/ARE THE MOST COMMON
MC Refractive surgery is radial keratotomy
MC Type of glaucoma is chronic open -Angle glaucoma.
MC Glaucoma-related surgical procedure is trabeculectomy.
MC Cause of blindness: Cataract
MC etiology of visual loss in patients with diabetes mellitus is macular edema.
MC Cause of proptosis in children is: Orbital Cellulitis
MC Cause of proptosis in adults is Grave's Disease .
MC Cause of red eye is Conjunctivitis .
MC Cause of ocular venous occlusion is glaucoma .
MC Indication for corneal treatment: Pseudophakic bullous keratopathy

TABLE: CN, their respective nucleus location and their function

Cranial nerve	Nucleus location	Function
Oculomotor III	Upper midbrain	Eye ball movements: Extrinsic ocular muscles
Trochlear IV	Lower midbrain	Eye ball movements: Extrinsic ocular muscles
Abducens VI	Pons	Eye ball movements: Extrinsic ocular muscles
Hypoglossal XII	Medulla	Tongue muscles and movements

**TABLE: Few Instruments which are used for ocular examination**

Measurement parameter	Instruments used
Corneal thickness	Pachymeter
Corneal curvature	Keratometer
Angle of anterior chamber	Gonioscope
Corneal surface	Placido disc
Corneal endothelium	Specular microscope
Direct ophthalmoscope Remembered as: "DEV"	Routine fundus examination. <i>"Image formed is Erect and Virtual and magnified, 15 times"</i>
Indirect ophthalmoscope	For assessment of retinal detachment and other peripheral retinal lesions. <i>The image is real, inverted and magnified 5 times.</i>
Perimetry	Optic nerve function

Aqueous humor physiology

- **Protein:** conc less than plasma
- **Glucose:** less than plasma (used by cornea and lens as they are avascular)
- **Acid:** Lactic, Pyruvic, Ascorbic. Conc higher than plasma
- **pH:** 7.2 (lower than plasma)
- **Formed by:** Diffusion (10%), Ultrafiltration: 20% and Active transport: 70%

Must Know Facts

Types of nystagmus	Staphyloma: an ectatic condition of the eyeball w/ herniation of uveal tissue.	Proptosis
<ul style="list-style-type: none"> • Downbeat: arnold chiari malformation • Ocular bobbing- downbeat ff by slow upbeat: Pontine lesion • See saw: Optic chiasma lesion 	<ul style="list-style-type: none"> • Anterior: corneal ulcer • Posterior: Pathological myopia • Intercalary: trauma at limbus • Ciliary: Scleritis 	<ul style="list-style-type: none"> • Sequence of ms involved: IR > MR > SR > LR • MCC of B/L proptosis: thyroid ophthalmopathy • MCC of U/L proptosis: thyroid Ophth... • MCC of B/L proptosis in child: orbital cellulitis • MCC of U/L proptosis in child: ALL

TABLE: WHO classification of xerophthalmia

Class	Signs
X1A	Conjunctival xerosis
X1B	Conjunctival xerosis with bitot's spot
X2	Corneal xerosis
X3A	Corneal xerosis with ulceration
X3B	Keratomalacia

TABLE: Swimming pool related infections

Disease	Causative agent
Swimming pool conjunctivitis	<i>Adenovirus</i>
Swimming pool granuloma	<i>Mycobacterium marinum</i>
Swimmer's itch	<i>Schistosoma mansoni</i> <i>S. japonicum</i>

TABLE: Eye discharge and possible etiological agent

Discharge	Etiological agent
Purulent/mucopurulent	Bacterial conjunctivitis
Watery	Viral conjunctivitis
Ropy	Allergic conjunctivitis
Mucopurulent	Chlamydial conjunctivitis

Causes of Painless and Painful Loss of Vision

Sudden painless loss of vision	Sudden painful loss of vision
Vascular occlusion (CRAO, CRVO) <i>Retinal detachment</i> <i>Vitreous hemorrhage</i> Ischemic optic neuropathy	Acute iridocyclitis Chemical injuries Mechanical injuries Acute congestive glaucoma Optic neuritis
Gradual painless loss of vision	Gradual painful loss of vision
Progressive pterygium involving the pupil Corneal degeneration Corneal dystrophy Developmental cataracts Senile cataracts Optic atrophy Chorioretinal degeneration Age- related macular degeneration <i>Diabetic retinopathy</i> Refractive errors Papilloedema & Papillitis	Chronic iridocyclitis Corneal ulceration Chronic simple glaucoma

FMGE Solutions Screening Examination

Cherry red spot of retina is seen in—

- CRAO
 - Trauma (Blunt trauma, Berlin's edema)
 - Neimann pick disease
 - Gaucher's disease
 - Tay – Sach's disease
 - Sand hoff's disease
- Mnemonic: Cherry Tree Never Grow Tall in Sand.

TABLE: Comparison of anterior, intermediate and posterior uveitis

	Anterior	Intermediate	Posterior
Aka	Iridocyclitis	Pars Planitis	Chorioretinitis
Cause	Idiopathic	Idiopathic	Toxoplasmosis
Clinical feature	Sudden painless loss of vision	Floaters	Sudden painless loss of vision
Cells	WBC's Keratic precipitate	Snowballs/ snowbanks	Headlight in fog appearance
Treatment	Topical steroids DOC: Cycloplegics	Inj: Triamcinolone	Antimicrobials Systemic steroids

TABLE: Types of cataract and their causes

Type of cataract	Cause
Snow flake/snow storm cataract	Diabetes mellitus/ Down's syndrome
Sunflower/Petals of flower cataract	Wilson's disease Chalcosis (mild reaction to copper) Penetrating trauma (with retention to copper)
Blue dot cortical cataract	Atopic dermatitis Myotonic dystrophy
Vossius ring/Rosette shaped cataract	Blunt trauma
Christmas tree cataract	Myotonic dystrophy
Oil drop cataract	Galactosemia
Dust like lenticular opacity	
Breadcrumb appearance	Complicated cataract/
Polychromatic lustre	Secondary cataract
Rainbow cataract	
Morgagnian cataract	Hypermaturation senile cataract

TABLE: Points to know about treatment of glaucoma

First line DOC for ACG: **Mannitol**
 TOC for ACG: **Laser iridotomy**
 DOC for OAG: PG analogue (**Latanoprost**)
 Most powerful anti glaucoma drug: **Latanoprost**
 DOC for OAG in India - **Timolol**
 Safest anti-glaucoma for children - **Dorzolamide**

TABLE: Lesion in the optic pathway and the type of blindness

Unilateral optic nerve lesion: Unilateral blindness
Binasal hemianopia: Bitemporal optic chiasma lesion. Two different lesions compressing the chiasma from the lateral parts.
Bitemporal hemianopia: Binasal retinal damaged → optic chiasmal lesion. Most common lesion is <i>pituitary adenoma</i> .
Homonymous hemianopia: Lesion at optic tract AND optic radiation
Homonymous superior quadrantanopia: All superior quadrantanopia goes to the temporal lobe (<i>pie in the sky</i>).
Homonymous inferior quadrantanopia: All inferior quadrantanopia goes to the parietal lobe (<i>Pie on the floor</i>).
Homonymous hemianopia w/ macular sparing: Lesion in occipital cortex lesion.

Important Nodules

• Dalen fuch nodule	Sympathetic ophthalmitis
• Koeppes nodule	Granulomatous anterior uveitis
• Liesh nodule	NF – 1 and Von Ricklinghausen syndrome
• Foster fuch nodule	Myopia <i>Foster fuch spot: High myopia</i>
• Koeppes nodules	Granulomatous uveitis
• Iris nodules	Hansen's disease, NF, fuch heterochromatic iridocyclitis

*Dermatology***DERMATOLOGY— AT A GLANCE**

Average weight of skin: ~ 4 kg
Normal skin turnover 4–5 weeks
Skin turnover period in case of psoriasis: 4 days
Epidermis is composed of 4 layers -Stratum Basale/germinatum, Stratum spinosum, Stratum granulosum, Stratum corneum.
Dermis is composed of collagen, elastic fibers, sweat/sebaceous glands.

Contd...

Tzanck smear – Useful in diagnosis of herpes lesion (HSV/VZV multinucleate giant cells)

Tzanck test – Used to differentiate viral lesions of skin from pemphigus.

Body Odor is due to: **Apocrine Gland**

MUST KNOW TERMS

• Cell cycle of keratinocytes	311 hours (28 days)
• Growth rate of scalp hair	0.37 mm/day (90% hair in Anagen phase all time)
• Nail growth rate	Finger nail: 1 cm/3 month (0.1 mm/d) Toe nail: 1 cm/9 month
• Keratin involved in Epidermolysis bullosa simplex	K5 and K14
• Dermis thinnest at	Eyelid and Penis (0.3 mm)
• Type VII collagen defect at basement membrane zone	Epidermolysis bullosa Aquisita
• LIGA disease (Linear IgA bullous disease) due to	BP Ag2
• Bullous pemphigoid is due to this BMZ defect	BP Ag1 and 2
• Herpes gestationis is due this BMZ defect	BP Ag2
• Defect in Hereditary angioedema	C1 esterase inhibitor absent
• Patch test type of HPS reaction	Type IV
• MCC of tinea Unguim	T. Rubrum
• MCC of tinea Mannum	T. Rubrum
• Buddha ears are feature of	Leprosy
• Nevus of ota is seen at this site	Face and Sclera
• Nevus of Ito	Scapular region/ Back
• Becker's lesion	Macular lesion + hair
• Sausage digits are seen in	Psoriatic arthritis
• Dermatitis herpetiformis	Celiac sprue (anti epidermal transglutaminase A/B)
• Heliotrope rash/Gottron papule/ Mechanic hand is seen in	Dermatomyositis (anti Jo-1 A/b)
• Elephantiasis face is a feature of	Plexiform NF

Contd...

• Piebaldism+ increased interpupillary distance+ sensory neural deafness	Waardenburg syndrome
• Occlusion due to staph epidermidis in eccrine gland	Miliaria
• Fordyce spot	Ectopic sebaceous gland
• Epidermolysis bullosa simplex	Trauma induced blisters
• Epidermolysis bullosa dystrophica	Absent collagen since birth
• Dilapidated brick wall appearance seen in	Hailey Hailey disease
• Row of tombstone appearance and fishnet pattern seen in	Pemphigus vulgaris
• Desmoglein involved in pemphigus foliaceus	DSG 1
• Desmoglein involved pemphigus vulgaris	DSG 3

COLOR ON WOOD LAMP'S LIGHT

- **Pseudomonas, psoriasis** – Pale blue color
- **Corynebacterium minutissimum** (erythrasma) – Coral red color
- **Erythrasma** – Coral red
- **Tuberous sclerosis** – Ash leaf spots (blue white)
- **Vitiligo** – Chalky white
- **Porphyria cutanea tarda** – Pinkish red (urine)
- **Tinea versicolor** – Golden fluorescence
- **Pityriasis versicolor**: Yellow
- **Squamous cell carcinoma** – Red fluorescence
- **Burrow of scabies**: Green

Fungi which give fluorescence in wood's light are – **M. Canis, M. audouinii, T. schoenleinii.**

KOH preparation – Used for diagnosis of Tinea infections

Köbner's isomorphic phenomena seen in:

- Psoriasis
- Lichen planus, lichen nitidus, lichen sclerosus
- Vitiligo
- Kaposi sarcoma
- Pityriasis rubra pilaris
- Necrobiosis lipidica

Pseudo-isomorphic phenomenon is seen in – **Pityriasis Rubra Pilaris (PRP), molluscum contagiosum, warts**

Nikolsky's sign is seen in–

- Pemphigus
- Staphylococcal scalded skin syndrome (SSSS)
- Toxic shock syndrome
- Porphyria

Contd...

FMGE Solutions Screening Examination

Pseudo-Nikolsky's sign seen in:

- Toxic epidermal necrolysis
- Steven Johnson syndrome
- Erythema multiforme

Dermatomal involvement is seen in—**Herpes zoster**.

Painful lesions are seen in—**Herpes infection**

Painless lesions are seen in—**Dermatitis herpetiformis (itchy lesions), pemphigoid, pemphigus, erythema multiforme**.

Sub-epidermal lesions are seen in—**Dermatitis herpetiformis, pemphigoid, erythema multiforme**.

Intraepidermal lesions are seen in—**Herpes, pemphigus**.

Lesions involving oral mucosa are seen in—**Secondary and congenital syphilis, pemphigus, Peutz Jegher syndrome, lichen planus**.

MC type of warts—**Verruca vulgaris/common warts**.

MC site of common warts—**Dorsum of hand/finger**

Condyloma acuminata (venereal warts) is associated with HPV 16 and 11.

TOC for anogenital warts in pregnancy is **cryotherapy/laser**.

Molluscum contagiosum is due to infection with pox virus.

Extra-genital molluscal lesions are marker of AIDS in adults.

Darier white disease is Autosomal dominant characterized by warty papules and plaques in seborrheic sites.

Dowling Degos disease is autosomal dominant genodermatosis.

MC bacterial skin infection in children is **Impetigo** in which Honey colored crusts are seen.

MC site of Impetigo is **face**.

MC cause of Impetigo is **Staphylococcus aureus**.

Bullous **pemphigoid** is also known as Senile pemphigoid.

Treatment of bullous pemphigoid is **prednisolone in low doses**.

MC type of pemphigus is **P. vulgaris while the rarest is P. vegetans**

P. vulgaris has worst prognosis.

P. vulgaris is diagnosed by **Tzanck TEST**, Fish-net pattern of IgG in epidermis in direct immunofluorescence.

Dermatitis Herpetiformis is recurrent papulovesicular disease with pruritus. Associated with HLA-B8 or DRW3

Max-Joseph spaces, are artificial sub epidermal clefts, often seen in lichen ruber variants of Lichen planus.

Psoriatic arthropathy treated with **Methotrexate (DOC)**

Pityriasis rosea—First feature is Herald patch usually over trunk or upper arm, thigh.

Christmas tree/fir tree pattern seen in **pityriasis rosea**.

Pityriasis versicolor/tinea versicolor caused by **Malassezia furfur**.

“Spaghetti & Meatball” appearance or “Banana & grape” appearance on KOH microscopy: **Pityriasis versicolor**

In **pityriasis rubra** pilaris isolated patches of normal skin are also seen.

Hyperpigmentation is seen in diseases like:

- Addison's disease
- Nelson syndrome
- Hyperthyroidism
- Cushing syndrome
- Ectopic ACTH syndrome
- Freckles

Hypopigmentation is seen in diseases like:

- Vitiligo, piebaldism
- Nevus anemicus
- Nevus depigmentosus
- Pityriasis
- Scleroderma
- Sarcoidosis

Nevus ota, ito, mongolian spots, café au lait spots are causes of local **hypopigmentation**.

Pruritis is hallmark of Atopic dermatitis in which dennie's line and Monk's crawl are seen.

MC presentation of Contact dermatitis is hand **eczema**.

MC cause of air-borne contact dermatitis in India is Allergic Contact Dermatitis due to plant **Parthenium**.

Nummular eczema (discoid dermatitis) is circular/oval coin like pruritic lesions over trunk/extensor surface of limbs in middle age males (M>F).

Asteatotic/xerotic eczema (Winter itch) is inflammatory dermatitis with fine cracks. Seen in summer and involves lower legs in elderly.

Cradle Cap is seen in **Seborrheic Dermatitis**.

Pseudomonas aeruginosa is the MC organism which causes Ecthyma gangrenosum.

Pyoderma Gangrenosum is diagnosed clinically (Morphology of lesions).

MC cause of **Erythema Multiforme** is HSV while MC drug causing it is sulfonamides.

Erythema nodosum is due to infections like streptococcal infection, TB, Leprosy (LL).

Darier sign is seen **Urticaria Pigmentosa**.

Steven Johnson Syndrome is characterized by blisters and epidermal detachment.

In tinea capitis infection of scalp is caused by **trichophyton tonsurans**.

Infection of foot (athlete foot) is caused by **T. rubrum**.

Pistia line is seen in Scarlet fever.

Beau's line is seen in psoriatic arthropathy.

Swimmer's itch – **Bilharziasis/ Schistosomiasis**.

Contd...

Contd...

Dhobi's/Jock itch – Tinea cruris .
Ground itch – nematode larvae
Barber's itch Syncosis barbae
Itch mite – Acarus scabiei (which transmits Scabies)
Scabies is caused by mite ' Sarcoptes scabiei '.
Pediculosis is caused by Pediculosis corporis .
TB-skin caused by Mycobacterium tuberculosis bovis and under some conditions by BCG.
Fox-fordyce disease involves axilla and pubis.
Fordyce spots are ectopic sebaceous glands in neonates.
Retinoic acid is DOC in Acne vulgaris, comedonal acne, nodulocystic acne, pustular acne.
Exclamation marks are seen in Alopecia Areata .
Half and half nail sign is seen in Uremia .
Koilonychia is seen in Iron Deficiency Anemia.
Pterygium, anonychia, pitting is seen in lichen planus .
Onycholysis, ridging, pitting, thimble nails are seen in psoriasis .
Café-au-lait spots are seen in: <ul style="list-style-type: none"> • Neurofibromatosis • Albright's syndrome & Fibrous dysplasia. • Watson's syndrome • Leopard syndrome • Fanconi's anemia
Leonine facies are seen in: <ul style="list-style-type: none"> • LL-Leprosy • Paget's disease of bone • Fibrous dysplasia • Hyperphosphatemia.
Pinch purpura is seen in Primary systemic amyloidosis, EDS, Scurvy.
MC route of transmission of Syphilis is sexual and sometimes transmitted by BT, transplacental .
DOC for syphilitic chancre (hard sore) is BPG 2.4 million U single i.m. dose
DOC for chancroid (soft sore) is Single dose of Azithromycin (or i/m ceftriaxone).
DOC for Lymphogranuloma venereum/inguinale is Doxycycline or erythromycin for 2 weeks .
DOC for Donovanosis is Azithromycin
Satellite lesions are seen in BT.
Inverted saucer shaped ulcers are seen in Borderline leprosy .
Virchow cell is diagnostic of lepromatous leprosy.
Most commonly involved nerve in leprosy: Ulnar nerve
Radial nerve is involved last in leprosy but if it is involved complications are more serious.

TABLE: Pathologies arising due to obstruction of sweat gland appendage

Obstruction of eccrine sweat gland ducts: Miliaria Obstruction of apocrine sweat gland ducts: Fox fordyce spot/disease also known as Apocrine Miliaria MC site of fox fordyce spot: Axilla MC age group of fox fordyce spot: 13–35 years (Females are MC affected). Fordyce spot are ectopic sebaceous glands.
Classical features of Acrodermatitis Enteropathica include: (Mnemonic-“DEAL”) <ul style="list-style-type: none"> • Diarrhea, Depression • Eczematous erosive dermatitis • Alopecia (non scarring), Apathetic look • Lethargy, irritability, whining & crying.

TABLE: Difference between pemphigus and pemphigoid bullae

Features	Pemphigus	Pemphigoid
Row of Tomb stone	Present	Absent
Nikolsky Sign	Present	Absent
Bullae location	Intraepidermal – flaccid Bullae	Subepidermal & tense Bullae
Mucosa involvement	Present (common)	Absent or less common
Acantholysis	Present	Absent
Prognosis	Poor	Good

TABLE: The ringworm genera

Trichophyton	Microsporum	Epidermophyton
Infects skin, hair & nail Infecting species include: Trichophyton rubrum mentagrophytes Violaceum Verrucosum schoenleinii	<i>Infects skin and hair but does not involve nails</i> Several infecting species include: Microsporum audouinii, M. gypseum and M. canis	<i>Infect skin & nails but does not involve hair</i> Only infecting species is Epidermophyton floccosum.
Mnemonic: TSH-N (<i>Trichophyton</i> infects S kin, H air and N ail) MSH (<i>Microsporum</i> infects S kin and H air) ESN (<i>Epidermophyton</i> infects S kin and N ail)		

1330

TABLE: Causes of genital ulcer

Bacterial	Viral	Parasitic	Non-infectious
Haemophilus ducreyi Treponema pallidum Chlamydia trachomatis Donovanosis balanitis	Herpes simplex Varicella zoster EBV Cytomegalovirus	Sarcoptes scabiei Phthirus pubis Entamoeba histolytica Trichomonas vaginalis	Trauma Pyoderma gangrenosum Reiter's syndrome Wegner's Neoplasms

TABLE: Warts and its associated disease

Warts	Seen in
Plane wart	Verruca plana
Filiform wart	Verruca filiformis
Plantar wart	Verruca plantaris or myrmecia wart
Venereal wart	Condylomata accuminata
Massive wart	Buschke–Löwenstein tumor
Condyloma lata	Treponema Pallidum

TABLE: Differences between syphilis, chancroid and LGV

Disease	Ulcer	Lymph node
Syphilis	Painless	Painless
Chancroid	Painful	Painful
LGV	Painless	Painful (Bubo)

TABLE: Differences between type 1 and type 2 lepra reaction

Type I Lepra Reaction: Reversal reaction	Type II Lepra R: Erythema nodosum leprosum
Type IV delayed HPS reaction	Type III HPS (Jarisch-Herxheimer) reaction
Found in TT (tuberculoid type)	Found in LL (Lepromatous Leprosy)
Thalidomide has no role	Thalidomide is most effective drug.
DOC is corticosteroid	DOC is corticosteroid

IMPORTANT SIGNS

• Carpet Tack Sign	DLE
• Chandelier's sign:	PID in women.
• Antenna sign:	Seen in Keratosis Pilaris
• Buttonholing sign:	NF 1
• Dimpling sign	Dermatofibrosarcoma protuberans
• Asboe Hansen sign	Pemphigus
• Nikolsky sign	Pemphigus, SSSS, TEN
• Auspitz sign/Grattage test	Psoriasis

MUST KNOW TERMS

• Persistence of nuclei in stratum spinosum	Parakeratosis
• Increase in keratinocyte population of spinous layer with thickening of the epidermis	Acanthosis
• Increase in keratinocytes with formation of projections from the surface of the skin	Papillomatosis (Ex: Wart)

Anesthesia

- Guedel's stages of ether anesthesia
 - Stage 1 analgesia
 - Stage 2 delirium
 - Stage 3 surgical anesthesia
 - Stage 4 medullary paralysis.
- Nitric oxide produces second gas effect and fink phenomenon.
- Direct measurement of BP done in **Radial artery**.
- Neuromuscular monitoring performed at **ulnar nerve**.
- Sufentanil is most potent opioid.
- Remifentanil is shortest acting opioid.
- **Alfentanil** is opioid of choice for day care surgery
- Muscle relaxant of choice in shock: **Pancuronium**
- Most cardiostable anesthetic agent: **Etomidate**
- Most cardiostable inhalational agent **Isoflurane**
- Most cerebroprotective inhalational agent **Sevoflurane**
- Whitacre and Spott procedure is used for: **Spinal anesthesia**
- **Successful sign of spinal anesthesia:** Flaccid and engorged penis (Reason: Nervi erigentis paralysis)
- **Sequence of block by local anesthesia:** Temperature (cold > Hot) – pain – touch – deep pressure – proprioception
- Nerve fiber Sensitivity to pressure: **A > B > C**
- Nerve fiber sensitivity to hypoxia: **B > A > C**
- Nerve fiber sensitivity to LA: **A gamma, A Delta > Aα & Aβ**
- Anesthetic agents contraindicated in porphyria: **Pentazocine, Etomidate, Thiopentone (PET)**
 - DOC in such condition: **Propofol**

Contd...

- Protein intake in ICU : **1–1.5 g/kg/day**
- Most common ophthalmic complication during anesthesia: **Corneal abrasion.**
- History of postdural puncture headache is not a contraindication of epidural block
- **Flat Capnogram seen in:**
 - Accidental extubation
 - Dissociation of anesthetic tube
 - Mechanical ventilation failing
- O₂ content of anesthetic mixture: **33%**
- Preanesthetic drug which causes longest amnesia: **Lorazepam**
- Anesthetic with least decrease in systemic vascular resistance: **Halothane**
- MC anaesthetic agent causes Malignant hyperthermia: **Sch**
- LA having highest incidence of malignant hyperthermia: **Lignocaine**
- Inhalational test having highest incidence of malignant hyperthermia: **Halothane**
- Malignant hyperthermia is caused by: **Ryanodine receptor**
- Dextrose fluid is never used for resuscitation
- Opioid given as transdermal: **Fentanyl**

PIN INDEX AND COLOR CODING OF COMMONLY USED GASES

Gas	Color code		Pin index position
	Body	Shoulder	
Air	Grey	White/black quartered	1, 5
Oxygen	Black	White	2, 5
Nitrous oxide	Blue	Blue	3, 5
CO ₂	Gray	Gray	1, 6
Helium	Brown	Brown	2, 5

AMBU Bag stands for Artificial Maneuver Breathing Unit.

Cyclopropane cylinder is **orange**

ENTONOX cylinder color: **Blue body w/ blue and white shoulder**

Spinal cord extends **from medulla oblongata to lower border of L1** in adults and lower border of L3 in infants and neonates.

Structures pierced by spinal needle:

Skin → Subcutaneous tissue → supraspinatus ligament → interspinous ligament → Ligamentum flavum → Dura mater → Arachnoid space

Spinal block/sub arachnoid block is given in L3–L4 interspace in adults and L4–L5 in children.

Contd...

Postdural puncture headache presents 12–24 hours of spinal block.

Epidural block is given between dura mater and ligamentum flavum.

Commonly used needle for epidural block is **Tuohys Needle.**

DOC for laryngeal mask insertion is **propofol**

Mallampati grading is used for assessment of size of tongue for laryngoscopy, also for assessment of difficult airway during orotracheal/nasotracheal intubation

Capnography is monitoring of EtCO₂ (end tidal CO₂) and it's waveform, normally it is 35–45 mmHg

Normal CVP is **4–7 cmH₂O** (3–12mm Hg is the range)

Seldinger technique is used for catheterization of vein (guide wire technique for central access)

Inotrope of choice for intra operative management of right heart failure due to pulmonary hypertension: **Dobutamine and Milrinone**

Potency of inhalational agent is determined by **MAC (minimum alveolar concentration)**

Methoxyflurane is most potent while **N₂O** is minimum in potency

ENTONOX- 50:50 mixture of **N₂O** and **O₂**, cylinder is blue colored with white shoulder

Induction agent of choice in children **Sevoflurane**

Fastest acting induction agent-**Desflurane**

Bupivacaine is most Cardiotoxic LA

Longest acting LA: **Dibucaine**

Most commonly used LA: **Lignocaine**

Local anesthetic which causes methemoglobinemia: **Benzocaine, Prilocaine, Lignocaine (BPL)**

Most common LA which causes Methemoglobinemia: **Prilocaine**

Thiopentone sodium causes reverse coronary steal phenomenon.

Ketamine produces Dissociative anesthesia

Diazepam causes retrograde amnesia

Anesthesia of choice in day care surgery-**Propofol**

Shortest acting depolarizing muscle relaxant: **Succinylcholine**

Shortest acting NDMR (*Non-depolarizing muscle relaxant*)-**Gantacurium (5-10 min) > Mivacurium (10-15 min)**

Fastest acting NDMR - **Rocuronium**

Longest acting NDMR - **Doxacurium (120 min)**

MC used SMR (skeletal muscle relaxant) in routine surgery -**Vecuronium**

MC used method of brachial plexus block is **supraclavicular block.**

Contd...

FMGE Solutions Screening Examination

1332

Mendelson syndrome: regurgitation of gastric contents causes aspiration pneumonitis
Selliks maneuver: to prevent regurgitation, pressure is applied on cricoid cartilage which compresses esophagus against vertebral column.
Drug not useful for induction in infants - Morphine
Muscle relaxant of choice in renal failure: Atracurium
Muscle relaxant of choice in renal and, or hepatic failure: Cis-atracurium
Hoffman elimination is seen in which muscle relaxant: Atracurium, Cis-atracurium
Boyle's Machine operates on: Continuous flow principle
Venturi mask:
<ul style="list-style-type: none"> High flow oxygen delivery device Maximum oxygen delivered is 60%
Maximum oxygen delivered by nasal cannula: 44%
Mapleson circuits type A is Also known as Magills circuit
Mapleson circuit type E is known as Ayres T piece best suited for neonates .

TABLE: Ester and amides

Ester (one 'l' in name)	Amides (2 'l' in name)
Cocaine	Lignocaine
Benzocaine	Bupivacaine
Chloroprocaine	Prilocaine
Tetracaine	Dibucaine
	Etidocaine
Remember: Amide group of LA contain "2 i" in their name	

CLASSIFICATION OF MUSCLE RELAXANTS

Neuromuscular blocking agent	
Depolarizing (Non-competitive) MR	Non-depolarizing (Competitive) MR
Suxamethonium/succinyl choline/Scoline	All others, For eg: Gallamine, D-tubocurarine, Atracurium, Mivacurium Ve/ Pan/ro-curonium
Decamethonium	

ANESTHETIC DOC

Condition	DOC
• Day care	Propofol (i/v), Desflurane (inhalation)
• Epilepsy	Thiopentone
• Neurosurgery	Isoflurane, Thiopentone

Contd...

Condition	DOC
• Renal failure/hepatic failure	Isoflurane Cis-atracurium (M/R)
• ECT (Electro convulsive therapy)	Methohexital
• Bronchial asthma, COPD	Ketamine (i/v), Halothane (inhalational)
• Aneurysm surgery, IHD	Etomidate
• Cardiac surgery (preserved LV function)	Isoflurane
• Cardiac surgery (poor LV function)	Opioid
• CHD: Lt to right shunt	Isoflurane/sevoflurane
• Cyanotic HD: Rt to left shunt	Ketamine
• CHF, Shock	Ketamine
• Inhalational agent for induction in children	Sevoflurane
• IVRA (I.V Regional Anesthesia)	Prilocaine > Lignocaine
• TIVA (Total I.V. Anesthesia)	Propofol+Remifentanil

PSYCHIATRY—AT A GLANCE

Van Gogh syndrome: Dramatic self-mutilation occurring in schizophrenia
Squeeze technique is used for: Premature ejaculation
Schizophrenia is a thought disorder
Prevalence of schizophrenia: 1%
Insight is absent in schizophrenia, mood disorder, delusional disorder
Dementia is not seen in schizophrenia
Not seen in schizophrenia: Intellectual impairment
Delusion of Fragmentary —delirium, hebephrenic schizophrenia.
Milieu therapy /family therapy / Therapeutic community – in schizophrenia

Contd...

Drug of choice of schizophrenia: Olanzapine
Clozapine is particularly effective in resistance schizophrenia
Depersonalization & derealization usually occur together & are seen in – depression, anxiety, schizophrenia, epilepsy.
Pseudo-community , split personality seen in schizophrenia
Morbid jealousy – Mood disorder, alcoholism, drug abuse, epilepsy, schizophrenia
Ambulatory schizophrenia and pseudoneurotic schizophrenia are now included in border line personality disorder.

TABLE: Neurotransmitter levels

Disease	Related neurotransmitter
Schizophrenia	Increased serotonin and Dopamine Decreased Glutamate
Depression	Decreased serotonin, NA, Dopamine
OCD	Decreased serotonin
Alzheimer's disease	Decreased Ach

TABLE: Prognostic factor of schizophrenia

Good prognostic factor	Bad prognostic factor
<i>Female sex</i>	Male sex
Acute onset (late onset)	Gradual onset (early onset)
No family history of schizophrenia	Family history of schizophrenia
History of depressive order	Emotional blunting
Premorbid personality	

DEPRESSION

- Depression is the **most common psychiatric disorder** in hospitalized patients.
- MC psychiatric illness: **Anxiety**
- Nihilistic delusion and delusion of guilt** and poverty – Seen in depression.
- Depression is the MC psychiatric disorder in: **Hypothyroidism, AIDS, patients on ocp's, postpartum psychosis**
- OCD leads to **secondary depression**
- DOC for manic depressive disorder: **Lithium**
- Long term use of lithium can cause: **Hypothyroidism**
- Pseudo depression & nihilistic delusion** are seen in depression.

Insomnia is seen in this withdrawal: **Alcohol withdrawal**

Hypersomnia is seen in **cocaine withdrawal**

Kubler Ross classified 5 stages of death: Denial → Anger → Bargain → Despair → Acceptance.

Contd...

Super ego: Based on moral principle. Ego ideal. E.g.: Mother Teresa, Mahatma Gandhi (idealistic thing)

Ego: Based on reality

Instinct: Inborn, based on principle of pleasure, maternal/paternal instincts

Fibromyalgia is not a somatoform disorder.

CBT does not include: **Interpretation**

Not a defense mechanism – **Transference, derailment**

Generalized anxiety disorder is not an indication for lithium

Angel dust is **Phencyclidine** it produce catatonic syndrome

REM Sleep is characterized by PGO spikes.

NREM stage 2 is characterized by sleep spindles and k-complex.

Muscle hypotonia is most characteristic REM sleep which differentiate it from wakefulness.

Classical tetrad of **Narcolepsy**: Sleep attacks, cataplexy, hypnagogic hallucinations, sleep paralysis.

Illusion: False perception of external object which has real existence.

Impulse: Irresistible desire

Obsessions: recurrent, irrational, intrusive, ego-dystonic and ego-alien ideas.

Overall most common type of hallucination: **Auditory hallucination**

Visual hallucination are mc seen in organic disease

Tactile hallucination are seen in chronic amphetamine poisoning.

Synaesthesia: Stimulus in one modality & hallucination in other modality

Delusion is not a feature of **conversion disorder**.

Delusion of Grandiosity – **MANIA**

Othello syndrome – Jealousy (infidelity)

Induced delusional disorder – Sharing of delusions b/w usually two or occasionally more persons.

Concrete thinking stage **2-7 years**

MC mental disorder in children – **Neurosis**

MC form of pica is **Geophagia**.

Fear of death most commonly at age of **5 years**

Age of onset in **Autism** < 2 ½ years, there is a marked impairment of language

Rett's syndrome

Occurs exclusively in girls

A neuropsychiatric illness, with normal head circumference at birth

Characterized by: Midline hand winging/hand washing stereotypies

Contd...

In Asperger's syndrome language is normal AND no delay in **cognitive development** (remember *Shahrukh Khan* in movie- *My Name is Khan*)

Treatment of choice for Hypochondriasis, somatoform disorder Anxiety neurosis, Hysteria – **Supportive Psychotherapy**

Treatment of choice for phobia – **Behavior therapy**

Treatment of choice Gilles de la Tourette's syndrome – **Clonidine/Haloperidol**

EPS are NOT seen with **clozapine**

Akathisia is most common with haloperidol. It is treated by propranolol

Antidepressant which can be used in t/t of nocturnal enuresis, ADHD, chronic pain: **Imipramine**

Patients of anorexia nervosa are vulnerable to sudden death due to ventricular **arrhythmias**

Delirium is most common organic disorder

Drugs inducing delirium: Alcohol, heroin, morphine, cannabis, cocaine, LSD.

Psychosis may occur in pregnancy, postpartum, epilepsy

Main symptom of Korsakoff psychosis: **Confabulation**

In late phase profound anterograde amnesia & milder retrograde amnesia is found in **delirium & dementia**

In acute delirium sun downing phenomenon is present.

In Korsakoff's psychosis immediate & remote memory is usually retained

Amotivation is lethargy, apathy, loss of interest, anergia, reduced drive, lack of ambition seen in chronic cannabis abuse.

Anxiety is most common psychiatric symptom & generalized anxiety disorder in general population.

Splitting is a defense mechanism against **BPD**.

Sensate focus technique is used for t/t of impotency

Master's and Johnson's technique is most popular t/t method for psycho sexual dysfunction in which both partners are treated together.

Excessive sexual drive is called satyriasm in men and nymphomania in female.

Visual hallucination is characteristic of alcohol withdrawal.

Most important dependency producing derivatives are **morphine & heroin**.

ECT most effective in the treatment of major depression with **psychosis, delusion, or suicidal tendency**.

ECT is never indicated in cyclothymia, Dysthymia, Chronic Schizophrenia (with negative symptoms)

MC complication of direct (modified) ECT: **Fracture T4-T8 spine**.

MC complication of modified ECT: Anterograde & Retro Grade amnesia more of retrograde type.

Alcohol is the most common substance abused in India and worldwide.

Most common illicit drug/substance abused: **Cannabis > Amphetamine (2nd MC)**.

DOC for prophylaxis of bipolar disorder - **Lithium**

DOC for acute mania: **Lithium**

Therapeutic level of lithium: 0.8 – 1.2 mEq/L

Toxicity seen after >1.5 mEq/L

Most common side effect of lithium: **Tremor**

Most common cause of impotency in male: **Psychogenic**

Antipsychotics

Recently approved sublingual antipsychotic: **Asenapine**

Most common side effect of typical antipsychotic: **Extrapyramidal symptoms (EPS)**

Most common EPS: **Akathisia**

MC side effect of atypical antipsychotics: **Metabolic/ Lipodystrophy syndrome (Weight gain, Inc glucose, altered lipid profile)**

Atypicals with least weight gain: **Aripiprazole, Ziprasidone**

Atypicals with max weight gain: **Clozapine**

Atypicals with least risk of EPS: **Clozapine**

Typical with least EPS: **Chlorpromazine and Thioridazine**

Typicals with max risk of EPS: **Haloperidol**

Atypicals associated with cardiac arrhythmia: **Sertindole, Zotepine**

Most potent atypical antipsychotic: **Risperidone**

Atypicals with maximum risk of hyperprolactinemia: **Risperidone**

Atypical antipsychotic causing corneal opacity: **Chlorpromazine and Thioridazine**

Known side effects of clozapine: **Agranulocytosis, Sialorrhea, Sedation, weight gain**

TABLE: Eating disorder

	Anorexia nervosa	Bulimia nervosa
Feature	Refusal to maintain body weight above a minimal normal	Irresistible craving for food with episodes of over eating in less time (Binge eating)
Method of weight control		Attempts to counter act the effects of over eating by self-induced vomiting; Purgative abuse, Periods of starvations Appetite suppressants

Contd...

Contd...

	Anorexia nervosa	Bulimia nervosa
Ritualized exercise	Common	Rare
Amenorrhea	100%	50%
Decreased Vital aBP, Pulse	Common	Uncommon
Hypothermia	Common	Rare
Skin changes (hirsutism)	Common	Rare
Medical Complications	Hypokalemia Cardiac arrhythmias	Hypokalemia Cardiac arrhythmias

FEATURE OF CORTICAL & SUBCORTICAL DEMENTIA

Features	Cortical dementia	Subcortical dementia
Site	Cortex (frontal, parietal, temporal, occipital, hippocampus)	Subcortical grey matter
Memory impairment	Severe, early Recall helped very little by cues	Mild to moderate Recall helped partially by cues & recognition tasks
Mathematical skills	Impaired early (Acalculia)	Preserved
Language	Early, Dysphasia (Aphasia)	Normal & Anomia (in severe cases)
Speech	Articulate until late	Dysarthria
Personality	Indifferent	Apathetic, inert

TABLE: Appearance of alcohol withdrawal symptoms

Time	Symptoms
6–12 hours	Minor withdrawal symptoms: Insomnia, tremulousness, anxiety, GIT upset, headache, diaphoresis, palpitations, anorexia
12–24 hours	Alcoholic hallucinosis; visual, auditory, or tactile hallucination
24–48 hours	<i>Withdrawal seizures</i> : generalized tonic-clonic seizures
48–72 hours	Delirium tremens; visual hallucinations, disorientation, <i>tachycardia</i> , hypertension, low-grade fever, agitation, diaphoresis

TABLE: Substance abuse and its characteristic clinical feature

Substance	Characteristic clinical feature
Cocaine	Magnus symptoms (cocaine bugs or Tactile hallucination)
Cannabis	Run Amok Amotivational syndrome Flash backs
Alcohol	Mc-Evan's sign Morbidity jealousy
LSD	Bad Trips Flash backs
Amphetamine	Paranoid Hallucinatory syndrome (like paranoid schizophrenia)
Phencyclidine (Angel dust)	Dissociative anesthesia

Therapeutic Modes for Diseases

• Milieu therapy Therapeutic community/family therapy	In Schizophrenia
• Bio feedback, Jacobson's relaxation technique, Autohypnosis	In type A behavior/personality (Psychosomatic disorder)
• Semens Sequeeze tech (Masters & Johnson's)	In premature ejaculation
• Abreaction therapy (Amytal interview)	In hysteria & d/g of catatonic syndrome. (Interview with mute, stupor)
• Systemic desensitization	• TOC in Phobias, OCD
• Aversion therapy	• Alcohol dependence, transvestism, homosexuality, hysteria
• Flooding:	• Phobias

Types of Personality

	Clinical features	Increased risk of
Type A	Ambitious, achievement oriented people, often high-achieving career oriented "workaholics", impatient	Coronary heart diseases
Type B	Easy going relaxed individuals	-
Type C	No assertive at all and they always suppress their own desires	Depression, cancer
Type D	Distressed	CHD patient has ↑ Mortality & recurrence from MI

- Father of radiology/X-ray: **W.C. Roentgen** (Discovered on 8 November, 1895)
- Father of USG: **John Wild**
- Father of Obstetrical USG: **Ion Donald**
- Father of Doppler: **Doppler John**
- Father of CT Scan: **Godfrey Hounsfield**
- Father of MRI: **Laterbuer and Mansfield**

Components of X-ray machine:

- Cathode-tungsten
- Anode-tungsten
- Anode in mammography: Molybdenum
- Filter- Al, or Al + Cu or Mo
- Collimator- Pb (Lead)

Radiation Units

- Unit of radiation exposure - **Roentgen** (SI = Coulomb/kg)
- Unit of absorbed radiation - **RAD** (SI = GRAY)
- Unit of biologic effectiveness - **Rem** (SI = Sievert)

Normal distance from which a chest **X-ray** is performed: 180 cm (6 ft")

Thickness of lead jacket – **0.5 mm**

Best X-rays are performed in: **60 – 90 kVp**

Minimal amount of pleural fluid required to detect pleural effusion on CXR– **100 – 200 mL**

Best X-ray view to detect minimal effusion is – **Lateral decubitus view of the same side.**

Best investigation to detect minimal fluid – **USG**

FAST Scan is: Focussed Assessment with Sonography for Trauma. Assess four main area to detect fluid in pericardium, RUQ (Morrison pouch), LUQ (Perisplenic), Pelvic area.

Best view to see normal chest- Right lung-LAO; Left lung- RAO

Major part of the radiological hilar shadow – **Pulmonary artery**

In anterior segment of upper lobe is uncommon in **secondary TB.**

Water lily sign or Camalote sign is seen in – **Hydatid lung**

Hounsfield unit of:

- Bone: +1000
- Blood: +40 to +50
- Water: 0
- Fat: - 50 to - 100
- Air: - 1000

IOC for bronchiectasis – **HRCT**

Signet-ring sign is seen in **Bronchiectasis**

MC thoracic manifestation of rheumatoid arthritis – **Pleural effusion**

Egg shell calcification is seen in Silicosis, Sarcoidosis

Bat wing appearance on CXR is seen in **Pulmonary edema.**

X-ray signs of Pulmonary embolism- Fleischner's sign, Knuckle sign, Palla's sign.

V/Q mismatch is a sign of pulmonary infarct.

Gold standard investigation of Pulmonary embolism – **Pulmonary angiography**

Golden S sign is seen in **Bronchogenic carcinoma.**

Cannon ball appearance is seen in – **Lung metastasis**

Pop Corn calcification is seen in **Pulmonary Hamartoma**

Bronchial atresia more common in **Left upper lobe.**

Poland syndrome on CXR: **Unilateral hyperlucent lung**

IOC for aortic dissection: **MRI**

Rim sign is seen in: Massive hydronephrosis

Money bag or leather bottle or flask shaped heart is seen in **Pericardial effusion.**

Most sensitive investigation of Pericardial effusion – **Echocardiography-15 ml** can be detected

Pruned tree appearance – Pulmonary arterial hypertension

IOC for Aortic dissection – **MRI**

Champagne glass appearance – **Achondroplasia**

IOC for cardiac tamponade, Pericardial effusion – **2D Echo**

Molten candle wax appearance seen in - **Melorheostosis**

Telephone handle long bones seen in – **Thanatophoric Dwarfism**

Metacarpal sign – Pseudohypoparathyroidism, Turner's syndrome

Pepper-pot skull seen in – **Hyperparathyroidism**

Looser's zones or pseudofractures is the hallmark feature of – **Osteomalacia.**

Rugger jersey spine seen in Renal osteodystrophy, **Osteopetrosis**

Hair on end or crew cut or hair brush appearance seen in – **Thalassemia**

Earliest change in thalassemia – Widening of short bones of hand.

Flask shaped femora seen in- **Thalassemia**

Cotton wool skull seen in – **Paget's disease**

Tram track appearance on skull X-ray: **Sturge weber syndrome**

Most common intracranial calcification: **Pineal Calcification**

Basal ganglia calcification is seen in this condition: Wilson's disease

Erlenmeyer Flask deformity seen in – Metaphyseal dysplasia, Osteopetrosis, Thalassemia
Earliest seen in Osteomyelitis - Soft tissue swelling and loss of soft tissue planes.
Hot cross Bun Skull seen in – Congenital syphilis
Celery stalk appearance – Congenital Rubella
Bone most commonly involved in osteoarthritis – Patella
Earliest appearance seen in rheumatoid arthritis is – Periarticular soft tissue swelling
Cup and pencil appearance seen in Psoriasis
Bamboo spine, Romanus sign, Dagger sign, Squaring of vertebrae seen in – Ankylosing spondylitis
Codmans triangle, Sunray appearance seen in Osteosarcoma Onion peel appearance seen in – Ewing's sarcoma
Trap door sign, Fallen fragment sign seen in- Simple Bone Cyst
Soap bubble appearance seen in – Giant cell tumor or Osteoclastoma
Shepherd Crook deformity femur, Ground glass appearance on X-ray is feature of – Fibrous Dysplasia .
Corduroy Cloth appearance on X-ray, Polka dot appearance on CT – Hemangioma
Rain drop appearance, punched out lesions on skull is seen in – Multiple Myeloma
Inverted napoleon hat sign on AP view, Scotty dog appearance seen in Spondylolisthesis
Barium is better for evaluation of motility disorders and for cricopharyngeal dysphagia than endoscopic evaluation.
Pencil tip or bird beak tapering seen in Achalasia Cardia
Corkscrew Esophagus seen in – Diffuse esophageal spasm
Initial investigation for Hypertrophic Pyloric Stenosis – USG
String sign, apple core appearance, Beak sign on barium is seen in – Hypertrophic Pyloric Stenosis .
Carman's meniscus sign seen in Malignant ulcer
Double bubble appearance seen in Duodenal atresia, Annular pancreas
Triple bubble sign seen in – Jejunal atresia
If coin accidentally ingested in esophagus, it will be oriented in coronal plane whereas coins Trachea is oriented sagittally.
Half-life of 18-FDG: 110 minutes
Best test for avascular necrosis of bone: MRI
MC type of ASD in down's syndrome: Ostium primum
Overall, MC type of ASD: Ostium primum
Widening of C loop of duodenum on barium study: CA pancreas head

Contd...

Double duct sign is seen in: **Periampullary carcinoma**IOC for acute pancreatitis: **CECT**

In chest X-ray Lordotic view is used for:

- **Lung apex pathology**
- Best view for middle lobe examination
- Interlobar fissural examination

IOC for posterior urethral valve: **VCUG (Voiding Cystourethrogram)**

- **Comet tail app on HRCT**: Round Atelectasis
- Hallmark of ureteric TB: **corkscrew ureter**
- Moth eaten calyces on IVP: **Renal TB**
- Ulcer crater sign and Hampton's line: Benign gastric ulcer
- Double atrial shadow is seen in: **LA enlargement**
- Signs of pneumoperitoneum: saddle bag/Mustache/Cupola/Falciform lig sign/ Rigler sign/urachus sign
- IVP-Spider leg app/swiss cheese appearance: **PCKD**
- IOC for pulm embolism: **CT angio**
- Chamber enlarged in Ebstein anomaly
- MC ASD: **Septum secundum**
- Bulging fissure sign: **Klebsiella Pn**
- CXR finding of Pulm embolism: **Westermarck sign, Palla sign, Hampton hump, Fleischner sign**
- Dye used in Bronchography: **Dianosil**
- Scan done for parathyroid adenoma: **Sestamibi scan**
- Radioactive agent used in treatment for ascites: **Gold**
- First sign of radiation exposure: **Erythema**

TABLE: Congenital cardiac conditions and its radiological findings

Lutembacher Syndrome - Congenital ASD with Acquired MS.
Figure of 3 appearance seen in – Coarctation of Aorta
Boot shaped heart or Cor-en-sabot seen in – Tetralogy of Fallot
Box shaped heart on CXR – Ebstein anomaly
Figure of 8 appearance or Snowman appearance seen in – TAPVC
Egg on side appearance seen in TGA
Most common type of VSD – Perimembranous
Most common type of ASD – Ostium secundum
Hilar dance on fluoroscopy – ASD

TABLE: Some important half-life of radionuclides

Gold-198: 2.7 days
Iodine- 123: 13.3 hours
Iodine-131: 8 days
Phosphorus-32: 14.3 days
Yttrium 90: 64 hours
Cobalt-60: 5.26 years
Caesium-137: 30 years
Radium-226: 1620 years

REMEMBER THESE IMPORTANT RADIOLOGICAL SIGNS IN UROLOGY

Spider leg appearance → Polycystic kidney
Cobra head appearance → Ureterocele
Flower vase appearance of ureters → Horseshoe kidney
Sandy patches → Schistosomiasis of bladder
Soap bubble appearance → Hydronephrosis
Golf hole ureter → TB bladder
String of purse appearance: Ureteric TB

TABLE: Conditions where 'Hair on End Appearance' is seen:
Mnemonic: HI NEST

<ul style="list-style-type: none"> • Hereditary spherocytosis • Iron deficiency anemia • Neuroblastoma • Enzyme deficiency (e.g. G-6-P deficiency causing hemolytic anemia) • Sickle cell disease • Thalassemia major

TABLE: Radiological findings and their respective pathology

Barium enema findings	Associated pathology
Apple core deformity Irregular filling defect	Colon CA
Lead pipe appearance Loss of haustrations	Ulcerative colitis
String sign of Kantor Raspberry thorn ulcers	Crohn's disease
Smooth irregular filling defects	Colonic polyps
Dilated proximal zone with narrow distal zone of coning	Hirschsprung disease
Saw tooth appearance Champagne glass sign	Diverticulosis of colon

Contd...

Barium enema findings	Associated pathology
Thumb print sign	Ischemic colitis
Claw sign Coiled spring sign	Intussusception
Bird beak sign, Ace of spades	Volvulus
Bird beak appearance	Achalasia cardia
Rat tail appearance	Esophageal CA
Corkscrew appearance Nut cracker esophagus Curling esophagus	Diffuse esophageal spasm
String sign	Congenital hypertrophic pyloric stenosis
Inverted 3 sign of Forsberg Widening of C loop of duodenum/Antral pad sign.	Pancreas head CA
Coffee bean sign	Sigmoid volvulus

MRI Head Appearances

• Eye of the tiger	Hallervorden spatz disease
• Face of giant panda	Wilson's disease
• Racing car app	Corpus callosum agenesis
• Humming bird sign, Mickey mouse app	PSP (Progressive Supranuclear Palsy)
• Hot cross bun sign	MSA (Multiple System Atrophy)
• Molar tooth app	Joubert syndrome
• Figure of 8 app	Lissencephaly

TABLE: Radiation exposure in different investigations

Procedure	Mean effective dose (mSv)
• Chest X-ray (PA View)	0.02
• Chest X-ray (PA + Lateral view)	0.1
• Mammogram	0.4
• Abdomen X-ray	0.7
• HSG	0.9–1.3
• CT Brain	2.2
• IVP	3
• ERCP	4
• Coronary angiography	7 (2–16)
• Barium enema	8 (2–18)
• CT Colonography	6
• CT Abdomen and Pelvis	10
• Thallium scan	16.9

OMR Sheet 1 for Model Test Paper-I

Model Test Paper-I

1. **Medusa head appearance of the colonies is seen in**
 - a. Bacillus anthracis
 - b. Proteus mirabilis
 - c. Clostridium tetani
 - d. Pseudomonas aeruginosa
2. **Which of the following is not a component of the crush syndrome?**
 - a. Myo-hemoglobinuria
 - b. Massive crushing of muscles
 - c. Acute tubular necrosis
 - d. Bleeding diathesis
3. **Transfer of drug resistance in Staphylococcus is by:**
 - a. Transduction
 - b. Transformation
 - c. Conjugation
 - d. Transfection
4. **Which growth factor is involved in fibrosis at lung, liver and kidney after chronic inflammation:**
 - a. IL 1
 - b. FGF 2
 - c. TGF beta
 - d. TNF
5. **All of the following are enriched media except-**
 - a. Blood agar
 - b. Chocolate agar
 - c. LSS
 - d. Tetrathionate broth
6. **All of the following statements about surgical management of gastric lymphomas are true except:**
 - a. Stage I gastric lymphomas (small lesions confined to the stomach wall) can be cured completely with surgical therapy alone
 - b. Extensive gastric lymphomas that initially are treated with radiation and/or chemotherapy occasionally perforate during treatment and require secondary resection
 - c. Patients explored with a presumptive diagnosis of gastric lymphoma should undergo an attempt at curative resection when this is safe and feasible
 - d. Without a preoperative diagnosis resection for gastric mass should not be attempted unless lymphoma can be excluded
7. **All of the following statements are true regarding human T cell leukemia virus 1 except:**
 - a. It causes adult T cell lymphoma/leukaemia
 - b. It has tropism for CD8 + T cell
 - c. It has long latent period of about 40 to 60 years
 - d. Leukaemia develop in only 3 to 5% of infected individual
8. **At relatively low concentrations, phospholipids form:**
 - a. Chylomicrons
 - b. Micelles
 - c. Monolayer
 - d. Bilayer
9. **Choose the correct statement about dronedarone:**
 - a. It is more effective than amiodarone
 - b. It increases risk of death in patients with permanent atrial fibrillation
 - c. QT prolongation is not a risk factor
 - d. No need to monitor LFT
10. **Which is the most non-invasive modality to find the chemical environment of the brain?**
 - a. PET-CT
 - b. MR spectroscopy
 - c. CT Angiography
 - d. MR PERFUSION
11. **Intraepithelial microabscess seen in psoriasis is called as:**
 - a. Pautrier abscess
 - b. Munro abscess
 - c. Phoenix abscess
 - d. None of the above
12. **Lipogranulomatous inflammation is seen in?**
 - a. Fungal infection
 - b. Tuberculosis
 - c. Chalazion
 - d. Viral infection
13. **Type 2 Diabetes need screening within what time interval from diagnosis**
 - a. Immediately
 - b. Within 6 months
 - c. Within 5 years
 - d. Within one week
14. **All are true about osteoclasts, except:**
 - a. Derived from monocyte
 - b. Stimulated by PTH
 - c. Phagocytosis of foreign bodies
 - d. Resorption of bone
15. **Which of the following intrinsic muscles of the thumb attached to 1st metacarpal bone?**
 - a. Abductor pollicis brevis
 - b. Flexor pollicis brevis
 - c. Opponens pollicis
 - d. Adductor pollicis
16. **Free edge of Falciform ligament encloses:**
 - a. Ligamentum venosum
 - b. Portal vein and common bile duct
 - c. Ligamentum teres
 - d. Right and left gastroepiploic vessel
17. **During moderately intense isotonic exercise all of the following increase except:**
 - a. Mean arterial pressure
 - b. Heart rate
 - c. Respiratory rate
 - d. Total Peripheral resistance

18. Lensometer is used to

- a. Measure refractive index of lens
- b. Measure lens thickness
- c. Measure power of spectacles
- d. Measure corneal thickness

19. Rupture of supraspinatus manifest as

- a. Painful movements
- b. Difficulty in initiation of abduction
- c. Difficult abduction after 90°
- d. Flat shoulder

20. Which of the following is the pathognomonic sign of active anterior uveitis

- a. Cells in anterior chamber
- b. Hyphema
- c. Keratic precipitates
- d. Snow ball opacities

21. Correct about right and left main bronchi is

- a. Right bronchus is more vertical and broader than the left
- b. Right bronchus is more vertical and has a narrow calibre than the left
- c. Left bronchus is more vertical and broad than right
- d. Left bronchus is more vertical and narrower than right

22. All are sites of insulin administration except?

- a. Dorsum of hands b. Arms
- c. Lateral aspect of thigh d. Around umbilicus

23. All are true about diabetic ketoacidosis except?

- a. Raging thirst
- b. It is an early presentation in type 1 DM
- c. Sodium Nitroprusside test is done to detect ketones
- d. Serum bicarbonate > 15 mmol/L

24. All of the following will be seen in the patient shown below except?

- a. Myxedema b. Dalrymple sign
- c. Moist warm hands d. Constipation

25. What is shown in the X-ray skull?

- a. Pepper pot skull
- b. Artifacts
- c. Silver -beaten appearance
- d. Mug shot with pellets

26. The calorie-nitrogen ratio for an infant should be maintained at:

- a. 75:1 b. 100:1
- c. 50:1 d. 150:1

27. Which is not true of cardiopulmonary resuscitation (CPR)?

- a. Closed chest massage is as effective as open chest massage
- b. The success rate for out-of-hospital resuscitation may be as high as 30% to 60%.
- c. The most common cause of sudden death is ischemic heart disease.
- d. Standard chest massage generally provides less than 15% of normal coronary and cerebral blood flow.

28. Smooth muscle is not pain sensitive to:

- a. Cutting b. Distension
- c. Stretching d. Torsion

29. All are criteria for identifying 'At Risk' infants except:

- a. Birth weight less than 2.8 kg
- b. Birth order 5 or more
- c. PEM, diarrhoea
- d. Working mother

30. Leiden factor is -

- a. Factor VI b. Factor VIII
- c. Factor IV d. Factor V

31. Which of the following statements regarding thyroid physiology are true?

- a. Normally about 20% of T3 is secreted directly from the thyroid gland
- b. The thyroid gland is the only endogenous source of T4
- c. Excess thyroid hormone results in an increase in the number of ATP-dependent sodium pumps on the cell membrane
- d. All of the above

32. Which of the following statement are true regarding asthma?
 - a. Occlusion of bronchi and bronchioles by mucus
 - b. Curschmann spirals
 - c. Charcot laden crystal
 - d. All of the above
33. Pulmonary hypertension is defined as a mean pulmonary artery pressure at rest:
 - a. 15 mm Hg
 - b. 25 mm Hg
 - c. 35 mm Hg
 - d. 50 mm Hg
34. Surfactant production in lungs starts at:
 - a. 18 weeks
 - b. 24 weeks
 - c. 28 weeks
 - d. 32 weeks
35. Brunner's glands secrete
 - a. Enterogastrones B. C. D.
 - b. Bicarbonate-rich secretion
 - c. Enzyme-rich secretion
 - d. K⁺-rich secretion
36. A 72-year old man with normal renal functions presents with new onset focal seizures. Which of the following is the best drug to manage the patient?
 - a. Sodium valproate
 - b. Oxcarbazepine
 - c. Levetiracetam
 - d. Pregabalin
37. How much ml of CSF can be safely removed in a routine lumbar puncture?
 - a. 10-20 ml
 - b. 20-30 ml
 - c. 30-40 ml
 - d. 40-50 ml
38. For monitoring warfarin therapy we use:
 - a. PT
 - b. CT
 - c. aPTT
 - d. PT-INR
39. A 64-year-old man complains of pain in the lower chest. A CT scan confirms the presence of a tumor of the lung at T10 level to the left of the midline and invading the surrounding left lung base. Because of the structure most likely involved and penetrating the diaphragm at this level, what could be associated?
 - a. Hoarseness
 - b. Latissimus dorsi palsy
 - c. Budd-Chiari syndrome (hepatic venous outlet obstruction)
 - d. Dysphagia
40. Most favoured site for ectopic pregnancy is:
 - a. Ovary
 - b. Abdominal cavity
 - c. Fallopian tube
 - d. Cornual ligament
41. The gold standard for identifying liver lesions by imaging is
 - a. Intraoperative ultrasound
 - b. Computed tomography (CT) with triple-phase contrast
 - c. Magnetic resonance imaging (MRI) with gadoxetate-based contrast
 - d. Positron emission tomography (PET) scan
42. All of the following test mentioned below are related to synthetic function of hepatocyte except:
 - a. Serum albumin
 - b. Prothrombin time
 - c. Serum ammonia
 - d. Serum γ -glutamyl transpeptidase (GGT)
43. Which of the following is not required in case the second puff is to be taken from an inhaler?
 - a. Wash your mouth between 2 puffs
 - b. Shake again
 - c. Wait for one minute before taking second puff
 - d. Keep the mouthpiece dry
44. All of the following diseases are associated with peripheral blood eosinophilia except?
 - a. Allergic Bronchopulmonary Aspergillosis (ABPA)
 - b. Loeffler syndrome
 - c. Pulmonary Eosinophilic Granuloma
 - d. Churg Strauss syndrome
45. Increased Reid index is classically associated with?
 - a. Chronic Bronchitis
 - b. Emphysema
 - c. Bronchiectasis
 - d. Interstitial lung disease
46. ESR is a very critical investigation in the diagnosis of TB. Which of the following is true about ESR in TB?
 - a. No change in ESR
 - b. Confirms recovery from TB
 - c. ESR is raised because of increased RBC aggregate
 - d. ESR is raised due to decreased RBC size
47. Which of the following is most important molecule for antioxidant pathway in lens?
 - a. Glutathione
 - b. Superoxide dismutase
 - c. Catalase
 - d. Vitamin C
48. What is the complication of the diuretic phase of acute renal failure?
 - a. Convulsion
 - b. Hyperkalemia
 - c. Increased sodium excretion in urine
 - d. Metabolic acidosis
49. Within the age group 10 to 35 years, the incidence of carcinoma of the testis in males with intra-abdominal testes is:
 - a. Equal to that in the general population.
 - b. Five times greater than that in the general population.
 - c. Ten times greater than that in the general population.
 - d. Twenty times greater than that in the general population.
50. All of the following developmental events are dependent on the production of maternal or fetal glucocorticoids EXCEPT
 - a. Induction of thymic involution
 - b. Production of surfactant by type II alveolar cells
 - c. Functional thyroid
 - d. Functional hypothalamo-pituitary axis

51. Osteoclast has specific receptor for:
a. Parathyroid hormone b. Calcitonin
c. Thyroxin d. Vit D3
52. The following type of glomerulonephritis should not be treated with prednisolone?
a. Minimal change disease
b. Lipoid nephrosis
c. Congenital Nephrotic Syndrome
d. Post-streptococcal GN
53. Regarding HSV 2 infection, which of the following is correct:
a. Primary infection is symptomatic in developed countries
b. Recurrent attacks are rare
c. Encephalitis is commonly caused by it
d. Newborn acquires the infection via the birth canal
54. Ideal time to start iron therapy in a child with fever, malnutrition and haemoglobin of 7 gm% is?
a. Immediately b. At least 1 month later
c. When fever goes down d. At any time
55. Earliest sign in visual field suggestive of glaucoma:
a. Isopter contraction b. Baring of blind spot
c. Seidels scotoma d. Arcuate scotoma
56. Known gene loci is can be diagnosed by:
a. FISH
b. Comparative gene hybridization
c. PCR
d. Chromosomal painting
57. Most common site for medulloblastoma is
a. Medulla b. Cerebellum
c. Cerebral cortex d. Pineal gland
58. Which of the following is not functional components of basal ganglia
a. Substantia nigra b. Subthalamus
c. Red nucleus d. Caudate nucleus
59. Cranial nerve most commonly involved in Posterior communicating artery aneurysm is
a. Oculomotor b. Optic
c. Facial d. Trigeminal
60. A 2-year-old boy who attends day care has a fever for 3 days. The fever finally subsides, but then a maculopapular pink rash develops over his trunk and spreads to his arms and face. His mother has not noticed the child scratching at the rash, but says that he does seem more irritable. What is the likely causative agent?
a. Candida albicans b. Chlamydia trachomatis
c. Escherichia coli d. HHV-6
61. Chronic infection by HBV:
a. Occurs in over 90% of acute infections.
b. Results in continuous production of infectious virus
c. Occurs with reduced frequency when HBV is acquired as a perinatal infection
d. Never resolves spontaneously

62. A 40-year-old woman was involved in a car crash. She was unconscious for 5 minutes. X-ray revealed a depressed fracture in the frontal region. Which of the following statements is true of skull fracture?
a. It always requires surgical exploration.
b. It is compound if multiple.
c. It requires burr holes if compound.
d. In the anterior cranial fossa, it may produce rhinorrhea.
63. False about Red Cross sign?
a. Can be used by army medical services
b. Can be used by members of International red cross Organizations
c. Can be used by any Medical doctor
d. Punishable to use without permission
64. All of these drugs are used in treatment of acute gout except:
a. Allopurinol b. Steroids
c. Colchicine d. Naproxen
65. An 85 years old woman presented with bilateral osteoarthritis of the knees. She had no history of previous gastrointestinal disease. Which of the following is the most appropriate initial treatment for her?
a. Paracetamol b. Naproxen
c. Celecoxib d. Dihydrocodeine
66. The most common primary immunodeficiency is:
a. Common variable immunodeficiency
b. Isolated IgA immunodeficiency
c. Wiskott-Aldrich syndrome
d. AIDS
67. Onion skin spleen is seen in:
a. ITP b. Thalassemia
c. SLE d. Scleroderma
68. Identify

- a. Ectropion b. Entropion
c. Tylosis d. Corneal ulcer
69. Iodine salt supplementation is:
a. Primordial prevention
b. Tertiary prevention
c. Primary prevention
d. Secondary prevention

70. The National Environmental Engineering Research Institute, Nagpur formulated a new type of chlorine tablet which is ____ times better than ordinary halogen tablets:
- 2
 - 5
 - 10
 - 15
71. Economic productive age group for calculating societal dependency ratio is
- 15-44 years
 - 15-64 years
 - > 65 years
 - < 15 years
72. Adenoidectomy is contraindicated in:
- Obstructive Sleep Apnoea
 - Cleft lip
 - High Arched Palate
 - Cleft Palate
73. 18 years old man presented with dysphagia, fever and trismus. On examination one side tonsil is enlarged, congested pushing soft palate to other side. All of the following statements about this condition are true except
- Abscess is located between Superior Constrictor and Tonsillar Capsule
 - Trismus seen is due to spasm of Lateral Pterygoid muscles
 - Single episode of Quinsy is an absolute Indication for Tonsillectomy in children
 - Interval Tonsillectomy is done after 6 weeks
74. Bone within bone appearance is seen in:
- CML
 - Osteoporosis
 - Osteopetrosis
 - Bone infarct
75. "Swiss cheese" nephrogram is a feature of:
- Acute ureteral obstruction
 - Severe hydronephrosis
 - Polycystic Kidney Disease
 - Medullary cystic disease of kidney
76. Transfusing blood after prolonged storage could lead to:
- Citrate intoxication
 - Potassium toxicity
 - Circulatory overload
 - Haemorrhagic diathesis
77. The most appropriate drug used for chelation therapy in beta thalassemia major is:
- Oral desferrioxamine
 - Oral deferiprone
 - Intramuscular EDTA
 - Oral Succimer
78. What is the most effective treatment for chronic myeloid leukaemia?
- Allogeneic bone marrow transplantation
 - Heterogeneous bone marrow transplantation
 - Chemotherapy
 - Hydroxyurea & interferon
79. Platelets transfusion must be completed in:
- 1 hour
 - 2 hours
 - 3 hours
 - 4 hours
80. The coagulation profile in a 13 year old girl with menorrhagia having von Willebrand's disease is:
- Isolated prolonged PTT with a normal PT
 - Isolated prolonged PT with a normal PTT
 - Prolongation of both PT and PTT
 - Prolongation of thrombin time
81. Which of the following is best to prevent rejection after bone marrow transplantation in aplastic anemia?
- Anti-thymocyte globulin + cyclosporine
 - Prednisolone
 - Cyclosporine
 - Tacrolimus plus prednisolone
82. Treatment of choice of acute dacryocystitis:-
- Massage over lacrimal sac
 - Syringing and probing
 - Systemic antibiotics and analgesics
 - Dacryocystorhinostomy
83. Of the following options, which is not a risk factor for subdural haematoma?
- Pregnancy
 - Alcoholism
 - Dementia
 - Old age
84. Not true regarding inferior walls of orbit
- Formed by Maxilla & zygomatic bones
 - Infraorbital foramen is about 1 cm from orbital rim.
 - It transmits trigeminal nerves and vessels
 - Triangular in shape
85. Generally accepted indications for mechanical ventilatory support include
- PaO₂ of less than 70 kPa and PaCO₂ of greater than 50 kPa while breathing room air
 - Alveolar arterial oxygen tension difference of 150 kPa while breathing 100% O₂
 - Vital capacity of 40-60 mL/kg
 - Respiratory rate greater than 35 breaths/min
86. The primary mechanism of action of cyclosporine A is inhibition of
- Macrophage function
 - Antibody production
 - Interleukin 1 production
 - Interleukin 2 production
87. Grade I lymphedema means?
- Pitting edema up to the ankle
 - Pitting edema up to the knee
 - Non-pitting edema
 - Edema disappearing after overnight rest
88. Constipation in children is most commonly due to?
- Psychological problems
 - Bad bowel habits
 - Chagas disease
 - Hirschsprung disease
89. Which of the following is a feature of propaganda?
- Knowledge & skills actively acquired
 - Information centered
 - Appeals to reason
 - Discipline primitive desires

- 90. Which of the following indicator denotes the proportion of diseased persons killed by a particular disease?**
- Case Fatality rate
 - Proportional mortality rate
 - Cause-specific death rate
 - Crude death rate
- 91. Action of Inferior oblique on adduction is**
- Elevator
 - Depressor
 - Extorter
 - Intorter
- 92. Which of the following is not a feature of chronic progressive external ophthalmoplegia**
- Starts with bilateral ptosis
 - May be associated with heart block.
 - Finally ocular motility palsy
 - Significant diplopia
- 93. Amount of squint is different in different directions. This type of squint is called**
- Comitant squint
 - Incomitant squint
 - Intermittent squint
 - Alternate squint
- 94. The specimen that is least likely to provide recovery of Trichomonas vaginalis is?**
- Urine
 - Urethral discharge
 - Prostatic discharge
 - Feces
- 95. Which of the following is characteristic of the events occurring at an excitatory synapse?**
- There is a massive efflux of calcium from the presynaptic terminal
 - Synaptic vesicles bind to the postsynaptic membrane
 - Voltage-gated potassium channels are closed
 - Ligand-gated channels are opened to allow sodium entry into the postsynaptic neuron
- 96. Exposure to ultraviolet light directly facilitates which of the following?**
- Conversion of cholesterol to 25-hydroxycholecalciferol
 - Conversion of 25-hydroxycholecalciferol to 1,25-dihydroxycholecalciferol
 - Transport of calcium into the extracellular fluid
 - Formation of calcium-binding protein
- 97. What accompanies sloughing of the endometrium during the endometrial cycle in a normal woman?**
- An increase in progesterone
 - The LH "surge"
 - A decrease in both progesterone and estrogen
 - An increase in estradiol
- 98. A female athlete who took testosterone-like steroids for several months stopped having normal menstrual cycles. What is the best explanation for this observation?**
- Testosterone stimulates inhibin production from the corpus luteum
 - Testosterone binds to receptors in the endometrium, resulting in the failure of the endometrium to develop during the normal cycle
 - Testosterone binds to receptors in the anterior pituitary that stimulate the secretion of FSH and LH
 - Testosterone inhibits the hypothalamic secretion of GnRH and the pituitary secretion of LH and FSH
- 99. Lesion at which level can cause complete blindness on the side of lesion and loss of reflex in the contralateral side:**
- Optic nerve
 - Chiasma
 - Lateral geniculate body
 - Occipital lobe
- 100. True statement regarding postmortem hypostasis is/are -**
- Also known as rigor mortis
 - Starts after 8 hours of death
 - Present all over the body
 - Starts as blotchy discoloration
- 101. Which of the following is known as MCH sub-centre**
- Type A
 - Type B
 - Type C
 - Type D
- 102. All of the following are difficult to visualize or examine on Indirect Laryngoscopy except:**
- Ventricle
 - Anterior commissure
 - Pharyngeal Surface of Epiglottis
 - Subglottis
- 103. 1 PHC in Hilly areas is established for _____ population?**
- 3000
 - 30000
 - 5000
 - 20000
- 104. IQ is calculated by**
- Mental age/Chronological age $\times 100$
 - Mental age-chronological age $\times 100$
 - Chronological age/ Mental age $\times 100$
 - Chronological age-Mental age $\times 100$
- 105. Zenker's diverticulum presents with:**
- Dysphonia
 - Reflux esophagitis
 - Dysphagia
 - It is found in stomach
- 106. Which is true regarding Barrett's esophagus?**
- Squamous metaplasia of lower esophagus
 - Seen mainly in females
 - Premalignant
 - Respond to conservative management
- 107. A neonate has been diagnosed with necrotizing enterocolitis with X ray abdomen showing gas in the portal vein. The correct staging of the patients is?**
- Stage 1
 - Stage 2A
 - Stage 2B
 - Stage 3
- 108. The subunits of the heterotrimeric G proteins are called the __, __, and __ subunits.**
- α , β and γ
 - α , β and θ
 - α , γ and δ
 - α , β and γ

109. A 5 year old with history of barefoot walking and open air defecation presents with anemia and swelling around eyes. Which of the following infestation is most likely to be present.
- Roundworm
 - Hookworm
 - Pinworm
 - Whipworm
110. Which of the following excludes a diagnosis of irritable bowel syndrome:
- Relieved by defecation
 - Straining during stool passage
 - Passage of blood per rectum
 - Changes of stool form
111. In a high risk patient, in active phase of 1st stage of labour, fetal heart rate should be monitored every:
- 15 minutes
 - 30 minutes
 - 5 minutes
 - 60 minutes
112. Which of the following is NOT true for Blindness?
- Prevalence in India is 6%
 - WHO cutoff is <3/60
 - NPCB India cutoff is <3/60
 - MCC is Cataract in India Prevalence in India
113. Which of the following is not component of three zeros for AIDS control
- Zero new infections
 - Zero number of HIV patients without treatment
 - Zero AIDS-related deaths
 - Zero discrimination
114. Which of the following country is the highest TB burden country worldwide
- China
 - India
 - Pakistan
 - South Africa
115. All of the following are true about genomic library, EXCEPT
- Collection of cloned DNA fragments
 - Screening is done by oligonucleotide probes
 - Only exons are present
 - Vectors are used to carry and replicate the fragments
116. NOT True about Typhoid is
- Blood culture is useful in Diagnosis Week 1 onwards
 - Leads to Rice-watery diarrhoea
 - Cephalosporins are useful in treatment
 - Rose spots appear in 2nd week of disease
117. Most common cause of congestive splenomegaly is?
- Chronic congestive cardiac failure
 - Cirrhosis
 - Hepatic vein occlusion
 - Stenosis of splenic vein
118. Not transmitted by blood transfusion?
- Hepatitis A
 - Hepatitis B
 - Hepatitis C
 - Hepatitis E
119. In hemochromatosis, all are affected EXCEPT:
- CNS
 - Bronze Pancreas
 - Hyperpigmentation
 - Restrictive cardiomyopathy
120. Medical treatment in gallbladder stone is amenable for?
- Size of stone less than 10 mm
 - Radiopaque
 - Calcium bilirubinate oxalate
 - GB non-functioning
121. Mainly cholecystokinin is secreted by:
- Duodenum
 - Pancreas
 - Gallbladder
 - Ileum
122. All of the following are true about simple febrile seizures except?
- Antiepileptic treatment is required for at least 1 year
 - Usually lasts for <15 minutes
 - Generalized
 - Antipyretics do not decrease the risk of febrile seizure recurrence
123. Tourniquet test is used for monitoring patients with?
- Infectious mononucleosis
 - Zika Virus infection
 - Dengue fever
 - Chikungunya
124. The following statements are correct for *Helicobacter pylori* except:
- It shows positive urease test
 - It is spiral gram negative flagellate
 - It can invade tissue to a great depth
 - It is linked with duodenal ulcer
125. You are in the eye OPD and wish to use a topical beta blocker in a patient. The chosen drug by you should have all the following properties EXCEPT:
- Strong local anaesthetic activity
 - High lipophilicity
 - High ocular capture
 - Low systemic activity
126. Ketoconazole should not be given to a patient being treated with astemizole because:
- Ketoconazole induces the metabolism of astemizole
 - Dangerous ventricular arrhythmias can occur
 - Astemizole inhibits the metabolism of ketoconazole
 - Astemizole antagonizes the antifungal action of ketoconazole
127. Name the following instrument:

- Flushing curette
- Uterine curette
- Karman's cannula
- Cervical dilator

- 128. Differential expression of the same gene depending on parent of origin is referred to as**
a. Genomic imprinting
b. Mosaicism
c. Anticipation
d. Non-penetrance
- 129. In firearm injury, Entry wound blackening is due to:**
a. Flame
b. Hot gases
c. Smoke
d. Unburnt powder
- 130. ATP is generated in ETC by:**
a. ADP kinase
b. $\text{Na}^+ \text{Cl}^-$ ATPase
c. $\text{F}_0\text{-F}_1$ ATPase
d. $\text{Na}^+ \text{K}^+$ ATPase
- 131. Mechanism of action of uncouplers:**
a. Inhibition of ATP synthesis only not ETC
b. Inhibition of both ATP synthesis and ETC
c. Inhibition of only ETC not ATP synthesis
d. None of the above
- 132. Glyconeogenesis is**
a. Synthesis of glucose from non-carbohydrate sources
b. Synthesis of glycogen from glucose
c. Synthesis of glucose from glycerol
d. Synthesis of glycogen from non-carbohydrate sources
- 133. Collagen is composed of all EXCEPT:**
a. Proline
b. Glycine
c. Hydroxylysine
d. Desmosine
- 134. Vitamin which is more in Cow's milk than breast milk is:**
a. Vitamin A
b. Vitamin C
c. Vitamin D
d. None of the above
- 135. Dietary fibre reduces atherosclerosis by:**
a. Binding to cholesterol
b. \downarrow VLDL
c. Forming antioxidants
d. Increasing fluid retention
- 136. Which one of the following tissues can metabolize glucose, fatty acids, and ketone bodies for ATP production:**
a. Liver
b. Muscle
c. Brain
d. Red blood cells
- 137. Human genome contains approximately DNA base pairs**
a. 3.2 billion
b. 2.3 billion
c. 3.2 million
d. 2.3 million
- 138. Injectable tetanus toxoid (TT) is an example of:**
a. Active immunity
b. Passive Immunity
c. Native Immunity
d. Reaction Immunity
- 139. Due to recent advances in Health care system, quarantine has been replaced nowadays by:**
a. Active surveillance
b. Passive surveillance
c. Sentinel surveillance
d. Isolation
- 140. Infant mortality rate, IMR is expressed per:-**
a. 1000 pregnancies
b. 1000 total births
c. 1000 live births
d. 1000 married women
- 141. Caloric requirement of adult male worker with moderate levels of activity is:**
a. 2320 Kcal /day
b. 2230 Kcal /day
c. 2730 Kcal/day
d. 3490 kcal/day
- 142. Socially attained behavior is:**
a. Culture
b. Acculturation
c. Socialization
d. Society
- 143. All are side effects of Oral Contraceptive Pills (OCPs) except:**
a. Breast cancer
b. Ovarian Cancer
c. Liver disease
d. Thromboembolism
- 144. Chinese letter arrangement of bacilli under microscopy is shown by:**
a. Mycobacterium tuberculosis
b. Mycobacterium leprae
c. Clostridium tetani
d. Corynebacterium diphtheria
- 145. When correlation between two variables is very strong, the correlation coefficients will be:**
a. >1
b. $+1$
c. $+0.3$
d. -1
- 146. Most common type of emphysema clinically is:**
a. Panacinar
b. Centriacinar
c. Paraseptal
d. Segmental
- 147. Sexual gratification by inflicting pain on partner?**
a. Sodomy
b. Sadism
c. Necrophilia
d. Bestiality
- 148. Back examination of polytrauma patient is done by which method:**
a. Logroll
b. Barrel roll
c. Chin lift
d. None
- 149. Which of the following is not an indication for liver transplantation?**
a. Fatty liver
b. HIV
c. Wilson's disease
d. Primary hyperoxaluria
- 150. Which gas is used in laparoscopy?**
a. CO_2
b. N_2O
c. O_2
d. N_2
- 151. Catgut is preserved in:**
a. Glutaraldehyde
b. Isopropyl alcohol
c. Iodine
d. Cetrimide
- 152. What is the X-ray view used for Superior orbital fissure?**
a. Water's view
b. Caldwell's view
c. Lateral skull view
d. Stenver's Towne's view

153. Type of CT Scan used to characterise the chemical composition of kidney stones?

- a. Spiral CT
- b. Multidetector CT
- c. Dual source CT
- d. HRCT

154. Frequency of ultrasound waves in USG

- a. 2000 Hz
- b. 5000 Hz
- c. <2 MHz
- d. >2 MHz

155. Which of the following is NOT found in lipid profile after an overnight fast:

- a. Chylomicrons
- b. VLDL
- c. LDL
- d. HDL

156. All true about postdural puncture headache (PDPH) except-

- a. This is due to loss of CSF and decreased CSF pressure
- b. The incidence of PDPH decreased with increasing age
- c. The headache is less in erect posture increases with supine position
- d. Headache may be accompanied with cranial nerve symptoms

157. This maneuver is described as:

- a. Heimlich maneuver
- b. Chest compression
- c. Charles maneuver
- d. Boyles maneuver

158. A 50 year old female has under gone mastectomy for CA breast. After mastectomy patient is not able to extend adduct and internally rotate the arm. Now supply to which of the following muscle is damaged?

- a. Pectoralis major
- b. Teres minor
- c. Latissimus dorsi
- d. Long head of triceps

159. True about breast cancer in pregnancy:

- a. Occurs in 1 of every 3000 pregnant women
- b. MC non-gynecologic malignancy associated with pregnancy
- c. Ductal carcinoma is MC type, accounting for 75-90% of breast cancer in pregnancy
- d. All of the above

160. All are features of Fournier's gangrene except:

- a. Testicles are involved
- b. Obliterative arteritis seen
- c. Hemolytic streptococci, isolated
- d. Necrotizing fasciitis

161. Candida albicans causes all of the following except

- a. Endocarditis
- b. Meningitis
- c. Mycetoma
- d. Oral thrush

162. Ancylostoma enters the human body by-

- a. Ingestion
- b. Inhalation
- c. Penetration of skin
- d. Inoculation

163. Heat labile immunoglobulin-

- a. IgA
- b. IgG
- c. IgE
- d. IgM

164. Which part of bacteria is most antigenic-

- a. Protein coat
- b. Lipopolysaccharide
- c. Nucleic acid
- d. Lipids

165. Which of the following is agglutination test

- a. Widal test
- b. VDRL
- c. Ascoli's test
- d. Kahn test

166. A three year old child born to a primigravida mother presented with hoarseness. On examination following picture is seen. Which of the following statements is not true about the given condition?

- a. Caused by Human Papilloma Virus 16 and 18
- b. Surgical Excision by Microdebrider is the treatment of Choice
- c. Interferon- α is used as adjuvant therapy to decrease recurrence
- d. Radiotherapy is contraindicated as it may cause malignant transformation

167. A 5-day-old female infant was born with a laryngeal defect. The greater cornuae and the inferior part of the hyoid bone were absent at birth. Failure of development of which of the following embryonic structures has most likely led to these defects?

- a. First Pharyngeal Arch
- b. Second pharyngeal arch
- c. Third pharyngeal arch
- d. Fourth pharyngeal arch

168. The activity of which of the following enzymes is increased in Diabetes Mellitus:

- a. CPT-1
- b. Phosphoenol Pyruvate carboxykinase (PEPCK)
- c. Glucose-6-Phosphatase
- d. All

169. Glucose is a

- a. Ketohexose
- b. Ketopentose
- c. Aldopentose
- d. Aldohexose

170. A patient with a history of road traffic accident, two months back, presents with complaints of dreams about the accident. He has visualizations of the same scene whenever he visits the place and is afraid to go back to the accident site. Identify the type of disorder that he might be suffering from?

- a. Adjustment disorder
- b. PTSD
- c. Anxiety disorder
- d. Major depression

171. Drugs not used in Attention deficit hyperactivity disorder is/are:

- a. Clonidine
- b. Atomoxetine
- c. Methylphenidate
- d. Barbiturate

172. Expression and consequent release of previously repressed emotion is called as:

- a. Regression
- b. Dissociation
- c. Abreaction
- d. All of the above

173. Cardiac event at the end of isovolumic relaxation phase is:

- a. AV valves open
- b. AV valves close
- c. Corresponds to C wave in JVP
- d. Corresponds to T wave in ECG

174. Choose the correct statement regarding sinus arrhythmia–

- a. It is more pronounced in adults than in children
- b. Increase in heart rate during expiration and decrease in heart rate with inspiration
- c. It is indicative of some dysfunction in the conducting system
- d. It occurs due to alterations in the parasympathetic discharge

175. Best index of platelet function is:

- a. Bleeding time
- b. Clotting time
- c. Clot retraction time
- d. Prothrombin time

176. CECT Image given suggests:

- a. Caroli's disease
- b. Primary sclerosing cholangitis
- c. Polycystic liver disease
- d. Liver hamartoma

177. 'Dipstick test' for rapid diagnosis of plasmodium falciparum is based on:

- a. Arginine-rich protein
- b. Histidine-rich protein
- c. Tyrosine-rich protein
- d. Serine-rich protein

178. All are true about glycosaminoglycans EXCEPT:

- a. Protein associated with glycosaminoglycans are called core proteins
- b. May be associated with connective tissues
- c. Highly positively charged
- d. Negatively charged
- e. Component of ECM

179. There are several points in the course of a disease process:

- A. Disease onset
- B. Point of first possible detection
- C. Final critical point
- D. Final outcome

For a screening programme to be effective, it should be applied between:

- a. A and B
- b. A and C
- c. B and C
- d. C and D

180. The diagnostic power of a test to correctly exclude the disease is reflected by:

- a. Sensitivity
- b. Specificity
- c. Positive predictivity
- d. Negative predictivity

181. Incorrect match or unit of study is

- a. Cohort study - Individual
- b. Ecological Study - Population
- c. RCT - Healthy human volunteer
- d. Descriptive study - Population

182. Which of the following is called 'first immunization' of the baby?

- a. Colostrum
- b. Handing over the baby to mother
- c. OPV
- d. DPT + BCG

- 183. Area under time and plasma concentration curve signifies:-**
 a. Potency
 b. Extent of absorption of drug
 c. Efficacy
 d. Plasma clearance of a drug
- 184. Which of the following is a recommended step in management of salicylate poisoning?**
 a. Chelating agents
 b. Atropine
 c. Alkaline diuresis
 d. Observation
- 185. Inotropic drugs act by stimulating which of the following receptors:**
 a. Alpha 1
 b. Alpha 2
 c. Beta 1
 d. Beta 2
- 186. Which of the following is a selective estrogen receptor modulator (SERM)?**
 a. Danazol
 b. Mifepristone
 c. Raloxifene
 d. Dantrolene
- 187. Drug which reduces both microvascular and macrovascular complications of diabetes mellitus is:-**
 a. Tolbutamide
 b. Repaglinide
 c. Pioglitazone
 d. Metformin
- 188. Which of the following is an absolute contraindication for the use of lithium?**
 a. Renal failure
 b. Glaucoma
 c. Epilepsy
 d. Angina
- 189. Drugs indicated in drug induced vomiting are all except:-**
 a. Metoclopramide
 b. Hyoscine
 c. Ondansetron
 d. Chlorpromazine
- 190. Which of the following statement is true regarding warfarin group of oral anticoagulants?**
 a. These interfere with the synthesis of vitamin K dependent clotting factors
 b. These can produce anticoagulant effect both in vivo and in vitro
 c. These can produce bleeding like hematuria and cerebral hemorrhage
 d. Their action starts immediately, so are useful for initiation of therapy in deep vein thrombosis.
- 191. Mechanism of action of methotrexate in chemotherapy is:-**
 a. Folic acid antagonism
 b. Pyrimidine antagonism
 c. Purine antagonism
 d. All of these
- 192. Which of the following is an advantage of adding adrenaline to lignocaine for local anesthetic injection?**
 a. Decreases the systemic toxicity
 b. Higher doses can be given
 c. Duration of action can be prolonged
 d. All of the above
- 193. Most common cause of AVN of the hip is:**
 a. Idiopathic
 b. Alcoholism
 c. Caissons disease
 d. Fracture neck of femur
- 194. Embalming solution constituents are all EXCEPT:**
 a. Ethanol
 b. Phenol
 c. Glycerine
 d. Formalin
- 195. In the following nutrient arteries to bones, choose the WRONG pair:**
 a. Humerus: Profunda brachii
 b. Radius: Anterior interosseous
 c. Fibula: Peroneal
 d. Tibia: Anterior tibial
- 196. Internal anal sphincter is a part of**
 a. Internal longitudinal fibers of rectum
 b. Internal circular muscle fibers of rectum
 c. Puborectalis muscle
 d. Deep perineal muscles
- 197. Internal pudendal artery is a branch of**
 a. Anterior division of internal iliac
 b. Posterior division of internal iliac
 c. Anterior division of external iliac
 d. Posterior division of external iliac
- 198. Recommended transport medium for stool specimen suspected to contain enteric pathogen is**
 a. Amie's medium
 b. Buffered glycerol saline medium
 c. MacConkey medium
 d. Stuart's medium
- 199. All the following are the examples of enveloped viruses except:**
 a. Polio virus
 b. Rubivirus
 c. Molluscum contagiosum virus
 d. Herpes virus.
- 200. Which of the following is usually the first procedure done for shoulder Dystocia management?**
 a. Sharp flexion of hip joints towards abdomen
 b. Suprapubic pressure
 c. 90 degree rotation of posterior shoulder
 d. Emergency C- section
- 201. Which intravenous anesthetic agent has effect on opioid receptors:**
 a. Ketamine
 b. Propofol
 c. Thiopentone
 d. Etomidate
- 202. Which of the following contraceptive will be effective when used alone on the 15th day of menstrual cycle:-**
 a. Copper IUCD
 b. Progesterone only pill or Combined oral contraceptives
 c. Mifepristone
 d. All of these can work if used within 3 days of Unprotected Intercourse
 e. All can be used

203. What is malignant hyperthermia (MH)

- a. Genetic hypermetabolic muscle disease
- b. Genetic hypometabolic muscle disease
- c. Acquired hypermetabolic muscle disease
- d. Acquired hypometabolic muscle disease

204. All of the following can be used for induction of general anesthesia except:

- a. Propofol
- b. Thiopentone
- c. Sevoflurane
- d. Succinylcholine

205. Calcium is absorbed from:

- a. Duodenum
- b. Jejunum
- c. Ileum
- d. Colon

206. Which of the following is the diluting segment of the nephron?

- a. PCT
- b. Descending limb of loop of Henle
- c. Thick ascending limb of loop of Henle
- d. Collecting duct

207. Massive blood transfusion is defined as:

- a. Whole blood volume in 24 hours
- b. Half blood volume in 24 hours
- c. 40% blood volume in 24 hours
- d. 60% blood volume in 24 hours

208. Which colour of triage is given the highest priority?

- a. Red
- b. Green
- c. Yellow
- d. Black

209. D-Dimer is the most sensitive diagnostic test for:

- a. Pulmonary embolism
- b. Acute pulmonary edema
- c. Cardiac tamponade
- d. Acute myocardial infarction

210. Allopurinol is used in organ preservation as:

- a. Antioxidant
- b. Preservative
- c. Free radical scavenger
- d. Precursor for energy metabolism

211. Post-transplant lymphoma is most commonly associated with:

- a. EBV
- b. CMV
- c. Herpes simplex
- d. HHV -6

212. The most effective bariatric surgery with treatment in the form of weight loss for morbid obesity is:

- a. Roux-en-Y surgery
- b. Biliopancreatic diversion
- c. Vertical banded gastroplasty
- d. Any of the above

213. Most common type of malignant melanoma is:

- a. Superficial spreading
- b. Lentigo maligna melanoma
- c. Nodular
- d. Acral lentiginous

214. Spontaneous regression is seen in:

- a. Port Wine Hemangioma
- b. Strawberry Hemangioma
- c. Cavernous Hemangioma
- d. Arterial angioma

215. Pott's puffy tumor refers to:

- a. Osteomyelitis of the frontal bone
- b. Tuberculosis of the spine
- c. Actinomycosis of maxilla
- d. Osteonecrotic tumor of jaw

216. A clean incised wound heals by:

- a. Primary intention
- b. Secondary intention
- c. Excessive scarring
- d. None of the above

217. Which of the following is true for shock?

- a. Hypotension
- b. Hypoperfusion to tissues
- c. Hypoxia
- d. All of the above

218. Non - noxious stimuli perceived as pain is termed as:

- a. Allodynia
- b. Hyperalgesia
- c. Hyperesthesia
- d. Hyperpathia

219. In children, most common posterior fossa tumor is:

- a. Meningiomas
- b. Astrocytoma
- c. Medulloblastoma
- d. Glioblastoma multiforme

220. In the perspective of the busy life schedule in the modern society, the accepted minimum period of sexual cohabitation resulting in no offspring for a couple to be declared infertile is:

- a. One year
- b. One and a half-year
- c. Two years
- d. Three year

221. Which of the following is not one of the phases of Implantation of Embryo?

- a. Epithelialization
- b. Apposition
- c. Adhesion
- d. Invasion

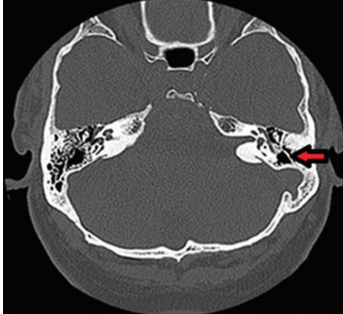

222. A pregnant woman with fibroid uterus develops acute pain in abdomen with low grade fever and mild leucocytosis at 28 weeks. The most likely diagnosis is:

- a. Preterm labour
- b. Torsion of fibroid
- c. Red degeneration of fibroid
- d. Infection in Fibroid

223. IUGR is defined when:

- a. Birth weight is below the tenth percentile of the average of gestational age
- b. Birth weight is below 20 percentile of the average of gestational age
- c. Birth weight is below the 30 percentile of the average of gestational age
- d. Weight of baby is less than 1000 gm

224. Which of the following factors is not an important risk factor for tubal ectopic?
- A history of tubal surgery
 - Intrauterine device (IUD) use
 - In utero diethylstilbestrol (DES) exposure
 - History of pelvic inflammatory disease
225. Gold standard for diagnosis of endometriosis is:
- Laparoscopic visualisation
 - Histopathological examination
 - Ultrasound examination
 - MRI pelvis
226. Which of the following cannot be reason for abnormal bleeding in reproductive age?
- Thyroid dysfunction
 - Fibroids
 - Atrophy
 - Anovulation
227. Apoptosis can occur by change in hormone levels in the ovarian cycle. When there is no fertilization of the ovum, the endometrial cells die because:
- The involution of corpus luteum causes estradiol and progesterone levels to fall dramatically
 - LH levels rise after ovulation
 - Estradiol levels are not involved in the LH surge phenomenon
 - Estradiol inhibits the induction of the progesterone receptor in the endometrium
228. A 45 yrs old women present with hot flush after stopping of menstruation. 'Hot Flush' can be relieved by administration of following agents:
- Ethinyl estradiol
 - Testosterone
 - Fluoxymesterone
 - Danazol
229. Myocardial Viability is best evaluated by?
- Thallium 201
 - 18 FDG PET
 - Tc-99m Sestamibi
 - Tc-99m Pyrophosphate
230. Flaring of anterior ends of ribs are seen in?
- Neurofibromatosis
 - Hyperparathyroidism
 - Rickets
 - Coarctation of Aorta
231. A case of carcinoma cervix is found in altered sensorium and is having hiccups, likely cause is:
- Septicemia
 - Uremia
 - Raised ICT
 - None of the above
232. Definitive diagnosis of Hirschsprung's disease is done by?
- Rectal Manometry
 - Barium enema
 - Rectal Biopsy
 - Enteroclysis
233. All are seen with scar dehiscence, except:
- Maternal bradycardia
 - Fetal bradycardia
 - Vaginal bleeding
 - Haematuria
234. Hypothalamic amenorrhoea is seen in:
- Asherman syndrome
 - Stein leventhal syndrome
 - Kallmann syndrome
 - Down syndrome
235. A girl presents, with cystic swelling at the junction of lower 1/3rd and upper 2/3rd of anterior wall of vagina at 10 O' Clock position. The Diagnosis is:
- Bartholin's cyst
 - Gartner's cyst
 - Adenocarcinoma
 - Vaginal Inclusion Cyst
236. A pregnant lady is diagnosed to be HBsAg positive. Which of the following is the best way to prevent infection to the child.
- Hepatitis B vaccine to the child
 - Full course of Hepatitis B vaccine and immunoglobulin to the child
 - Hepatitis B immunoglobulin to the mother
 - Hepatitis B immunization to mother
237. If iodine supplementation in the diet was completely stopped today, thyroid hormone levels in blood will fall to zero after:
- 7 days
 - 30 days
 - 90 days
 - 360 days
238. The thick plate of bone marked with an arrow in the picture below is seen in persistent:
- 
- Petrosquamous suture
 - Temporosquamous suture
 - Petromastoid suture
 - Frontozygomatic suture
239. Which of the following is not true about spread of maxillary sinus carcinoma?
- Medial spread occurs to nasal cavity
 - Anterior spread occurs to facial skin
 - Posterior spread occurs to orbit
 - Inferior spread occurs to Alveolus
240. Identify this skin lesion seen in a neonate, noticed first on day 2 of life:
- 
- Milia
 - Mongolian spot
 - Diaper Dermatitis
 - Erythema toxicum

241. What should be used for the treatment of this child with intellectual disability?

- a. Biotin
- b. Hydroxocobalamin
- c. Pyridoxine
- d. Thyroxine

242. Bone marrow examination of a 2 year old child with massive splenomegaly and pancytopenia showed cells with wrinkled paper appearance of cytoplasm. What could be the possible diagnosis?

- a. Niemann Pick disease
- b. Gaucher disease
- c. Acute Leukemia
- d. Hereditary spherocytosis

243. In primary tuberculosis, all of the following may be seen except:

- a. Cavitation
- b. Caseation
- c. Calcification
- d. Langhans giant cell

244. Most common form of drowning in India:

- a. Suicidal
- b. Homicidal
- c. Accidental
- d. Infanticide

245. Traumatic asphyxia is a type of

- a. Hanging
- b. Ligature Strangulation
- c. Suffocation
- d. Manual strangulation

246. Declaration of venice is related with

- a. Medical ethics
- b. Human experimentation
- c. Terminal illness
- d. Rights of patients

247. Increasing doses of alcohol depresses brain in the following order:

- a. Cerebellum, Frontal lobe, occipital lobe
- b. Frontal lobe, Cerebellum, occipital lobe
- c. Occipital lobe, cerebellum, Frontal lobe
- d. Cerebellum, Occipital lobe, Frontal lobe
- e. Frontal lobe, occipital lobe, cerebellum

248. Masque Ecchymotique is seen in:

- a. Ligature strangulation
- b. Manual strangulation
- c. Traumatic asphyxia
- d. Burking
- e. Chocking

249. A patient presented to ENT OPD with complaints of headache and nasal stuffiness On CT scan Heterogeneous opacification involving multiple sinuses along with Bone erosion (as shown below) was noticed. What would be the most likely diagnosis?

- a. Acute bacterial rhinosinusitis
- b. Chronic Bacterial rhinosinusitis
- c. Allergic Fungal rhinosinusitis
- d. Invasive Fungal Rhinosinusitis

250. In CSF rhinorrhea CSF from middle cranial fossa reaches the nose via:

- a. Sphenoid sinus
- b. Frontal sinus
- c. Cribriform plate
- d. Fovea ethmoidalis

251. The encircled area, in blue, in the given picture is

- a. Woodruffs Area
- b. Browne's Area
- c. Little's Area
- d. Kiesselbach's Area

252. In a Normal distribution, statement which is correct is

- a. Mean +/- 2 SD covers 95% values
- b. Mean +/- 3 SD covers 68% values
- c. Mean +/- 1 SD covers 99% values
- d. Mean > Median > Mode

253. Which of the following are referred to as “Ivory Towers of Disease”:

- Small health centres
- Large hospitals
- Private practitioners
- Health insurance companies

254. In which stage of the demographic cycle is India currently?

- High stationary
- Late expanding
- Early stationary
- Low stationary

255. A family where all of its members are playing a part in its management is known as:

- Elementary family
- New family
- 3-Generation family
- Communal family

256. A 30 yrs old female present with hearing loss and following audiogram is obtained. What is her most likely diagnosis?

- Ototoxicity
- Noise Induced Hearing Loss
- Otosclerosis
- Meniere's Disease

257. Recurrent facial nerve palsy is seen in all except

- Melkersson syndrome
- Diabetes
- Sarcoidosis
- Herpes zoster oticus

258. True about Vestibular Schwannoma is

- Converging ABLB Laddergram
- Recruitment phenomenon is present
- High SISI score
- Rollover phenomenon is seen

259. Spongiosis involves:

- Stratum granulosum
- Stratum corneum
- Stratum spinosum
- Stratum basal

260. A 60 year old man is brought to a psychiatrist with a 10 year history, that he suspects his neighbors and he feels that whenever he passes by they sneeze and plan against him behind his back. He feels that his wife has been replaced by a double and calls police for help. He is quite well- groomed, alert, occasionally consumes alcohol, likely diagnosis is:

- Paranoid personality disorder
- Paranoid schizophrenia
- Alcohol withdrawal
- Conversion disorder

261. Nitric oxide acts by increasing:

- BRCA 1
- BRCA 2
- Interleukin
- cGMP

262. VMA is excreted in urine in:

- Alkaptonuria
- Phenylketonuria
- Diabetic ketoacidosis
- Pheochromocytoma

263. Which of the following mood stabilizers has anti suicide property?

- Lithium
- Carbamazepine
- Valproate
- Lamotrigine

264. The primary pathology in Athletic Pubalgia is:

- Abdominal muscle strain
- Rectus femoris strain
- Gluteus medius strain
- Hamstring strain

265. A patient with tuberculosis of spine first neurological sign is:

- Motor loss
- Sensory loss
- Increased deep tendon reflexes
- Bladder involvement

266. A child presents with indurated boggy swelling with crusts and hair loss over scalp as shown in the image. Most likely cause is:

- Trichophyton
- Epidermophyton
- Microsporum
- Staph. aureus

267. Identify the implant:

- a. Partial Ossicular Replacement Prosthesis
- b. Total Ossicular Replacement Prosthesis
- c. Piston
- d. Grommet

268. Identify the space marked below by red arrow?

- a. Facial recess
- b. Epitympanic recess
- c. Sinus tympani
- d. Prussak's space

269. Gallbladder in starvation death is:

- a. Contracted
- b. Distended
- c. Mummified
- d. Not affected

270. Which of the following cannot be done by a 15 month child?

- a. Walking with support
- b. Transfers objects from 1 hand to another
- c. Builds tower of 2 cubes
- d. Speaks three-word sentences

271. Growth spurt occurs:

- a. Just before appearance of axillary hair
- b. Just before menarche
- c. After 16 years
- d. After menarche

272. The use of highly active antiretroviral therapy is associated with the development of:

- a. Keratitis
- b. Uveitis
- c. Retinitis
- d. Optic neuritis

273. After a leisure trip, a patient comes with gritty pain in eye and joint pain. What is the most probable diagnosis?

- a. Reiter's syndrome
- b. Behcet's syndrome
- c. Sarcoidosis
- d. SLE

274. Active immunity is not acquired by:

- a. Infection
- b. Vaccination
- c. Immunoglobulin transfer
- d. Subclinical infection

275. Most common cancer in children less than 10 years:

- a. Leukemia
- b. Neuroblastoma
- c. Brain tumor
- d. Wilms tumor

276. A 4-year-old child presents to the emergency department with high grade fever, respiratory difficulty and noisy breathing. On examination. X ray of his neck is shown below. The most probable diagnosis is?

- a. Recurrent papillomatosis
- b. Croup
- c. Epiglottitis
- d. Tonsillitis

277. Drug of choice for a child with first episode nephrotic syndrome is?

- a. Cyclophosphamide
- b. Prednisolone
- c. Mycophenolate
- d. Cyclosporine

278. Most common cause of urinary tract infection in children is:

- a. Klebsiella pneumoniae
- b. Proteus mirabilis
- c. Escherichia coli
- d. Pseudomonas aerogenes

279. Drug of choice for neonatal seizures is?

- a. Phenobarbitone
- b. Valproate
- c. ACTH
- d. Lamotrigine

280. Which of the following is not a sign of active rickets?

- a. Frontal bossing
- b. Wrist widening
- c. Hutchinson teeth
- d. Prominence of costochondral junction

281. 18 year old female with hypopigmented patches near both ankles. What is not used for treatment?

- a. Topical clobetasol b. Topical tretinoin
c. Topical tacrolimus d. Topical methoxsalen
282. The ventral surface of the adult heart as seen on gross examination or radiography is comprised primarily of the
- a. Left atrium b. Left ventricle
c. Inferior vena cava d. Right ventricle
283. Which of the three primary germ layers forms the histologically definitive endocardium of the adult heart?
- a. Ectoderm
b. Endoderm
c. Mesoderm
d. Epiblast
284. A 39-year-old woman with headaches presents to her primary care physician with a possible herniated disk. Her magnetic resonance imaging (MRI) scan reveals that the posterolateral protrusion of the intervertebral disk between L4 and L5 vertebrae would most likely affect nerve roots of which of the following spinal nerves?
- a. Third lumbar nerve b. Fourth lumbar nerve
c. Fifth lumbar nerve d. First sacral nerve
285. Identify the structure depicted below which is the most important source of noradrenergic innervations to cerebral cortex:

- a. Basal nucleus of Meynert b. Locus coeruleus
c. Raphe nucleus d. Amygdala

286. Medial meniscus is more prone to injury because:

- a. It is semi lunar
b. Attached firmly to tibial collateral ligament
c. It is avascular
d. Connected to lateral meniscus by lateral ligament

287. Riders bone is developed in the tendon of:

- a. Gastrocnemius b. Adductor longus
c. Quadriceps femoris d. Flexor polices brevis

288. Floor of femoral triangle is formed by all except

- a. Pectineus
b. Iliacus
c. Adductor brevis
d. Adductor longus

289. All of the following are components of a BPP except

- a. Contraction stress test
b. Amniotic fluid volume
c. Nonstress test
d. Fetal tone

290. Which of the following clinical conditions is not an indication for induction of labor?

- a. Intrauterine fetal demise
b. Severe preeclampsia at 36 weeks
c. Complete placenta previa
d. Post term pregnancy

291. You are delivering a 26-year-old G3P2A0L2 at 40 weeks. She has a history of two previous uncomplicated vaginal deliveries and has had no complications this pregnancy. After 15 min of pushing, the baby's head delivers spontaneously, but then retracts back against the perineum. As you apply gently downward traction to the head, the baby's anterior shoulder fails to deliver. McRoberts maneuver is done. The baby finally delivers and the pediatricians attending the delivery note that the right arm is hanging limply to the baby's side with the forearm extended and internally rotated. What is the baby's most likely diagnosis?

- a. Erb palsy b. Klumpke's paralysis
c. Humeral fracture d. Clavicular fracture

292. All EXCEPT which of the following are associated with episiotomy dehiscence?

- a. Smoking
b. Human papilloma virus (HPV) infection
c. Coagulopathy
d. Asthma

293. A pregnant patient has a history of multiple substance abuse. She has a little boy that is 2 years old who is slow in school and has difficulty concentrating. Which of the following substances has been associated with behavioral and developmental abnormalities in children?

- a. Tobacco b. Cocaine
c. Caffeine d. Marijuana

294. You see a 42-year-old patient in your office who is now 5 weeks pregnant with her fifth baby. She is very concerned regarding the risk of Down syndrome because of her advanced maternal age. After extensive genetic counseling, she has decided to undergo a second-trimester amniocentesis to determine the karyotype of her fetus. Prior to performing the procedure, you inform the patient that all of the following are possible complications of the amniocentesis except
- Amniotic fluid leakage
 - Chorioamnionitis
 - A fetal loss rate of less than 0.5%
 - Limb reduction defects
295. Contraindications to combination oral contraceptive pill use include which of the following?
- Prior acute hepatitis
 - Prior cervical dysplasia
 - Prior thromboembolism
 - Prior simple endometrial hyperplasia
296. Fetal kidneys start producing urine by:
- 3 months
 - 4 months
 - 5 months
 - 6 months
297. Ideal time for screening of blood sugar for diabetes in a pregnant female is:
- 16-20 weeks
 - 20-24 weeks
 - 24-28 weeks
 - 12-16 weeks
298. Amenorrhea in an 18 year old with a milky discharge from the nipples is a most recognized feature of:
- Addison's disease
 - Hyperprolactinemia
 - Occult carcinoma
 - Hypothyroidism
299. Golden colour amniotic fluid is seen in:
- Rh incompatibility
 - Foetal death
 - IUGR
 - Foetal distress
300. Primigravida with full term, complains of faintness on lying down and she feels well when turns to side or sitting position. This is due to:
- Increased abdominal pressure
 - IVC compression
 - Increased intracranial pressure
 - After heavy lunch

Ans.

ASSESSMENT OF MOCK TEST ON THE BASIS OF SCORES- BY THE AUTHORS

Score	Interpretation	Authors Comments
270 Plus	OUTSTANDING	<ul style="list-style-type: none"> Highly appreciable score. Keep doing MCQs
240 – 269	EXCELLENT PERFORMANCE	<ul style="list-style-type: none"> Great score. Pay attention on some silly mistakes
210 – 239	VERY GOOD PERFORMANCE	<ul style="list-style-type: none"> Keep doing MCQs and continue with revising the notes Advised not to flow in overconfidence
180 – 209	GOOD PERFORMANCE	<ul style="list-style-type: none"> Learn the time management while doing MCQs Keep moving on same track and avoid overconfidence Work on anxiety issues if there are any
150 – 179	SATISFACTORY	<ul style="list-style-type: none"> You are going well. Continue on the same track Lacking confidence on studied topics due to lack of revision Practice more MCQs
130 – 149	UNSATISFACTORY	<ul style="list-style-type: none"> You are studying but lacking concept and lack of revision. Improve on silly mistakes by working on basic subjects Definite improvement expected
Below 130	POOR SCORE	<ul style="list-style-type: none"> Need to work on basic subjects Conceptual based study is recommended Do FMGE Solutions to cover 3–4 times with explanations

INSTRUCTIONS FOR FILLING THE SHEET

1. This sheet should not be folded or crushed.
2. Use only blue/black ball pen to fill the circles.
3. Use of pencil is strictly prohibited.
4. Circles should be darkened properly and completely.
5. Cutting & erasing on this sheet is not allowed.
6. Do not use any stray marks on the sheet.
7. Do not use marker, white fluid or any other device to hide the shading already done.

Score	Interpretation	Authors Comments
270 Plus	OUTSTANDING	<ul style="list-style-type: none"> Highly appreciable score. Keep doing MCQs
240 – 269	EXCELLENT PERFORMANCE	<ul style="list-style-type: none"> Great score. Pay attention on some silly mistakes
210 – 239	VERY GOOD PERFORMANCE	<ul style="list-style-type: none"> Keep doing MCQs and continue with revising the notes Advised not to flow in overconfidence
180 – 209	GOOD PERFORMANCE	<ul style="list-style-type: none"> Learn the time management while doing MCQs Keep moving on same track and avoid overconfidence Work on anxiety issues if there are any
150 – 179	SATISFACTORY	<ul style="list-style-type: none"> You are going well. Continue on the same track Lacking confidence on studied topics due to lack of revision Practice more MCQs
130 – 149	UNSATISFACTORY	<ul style="list-style-type: none"> You are studying but lacking concept and lack of revision. Improve on silly mistakes by working on basic subjects Definite improvement expected
Below 130	POOR SCORE	<ul style="list-style-type: none"> Need to work on basic subjects Conceptual based study is recommended Do FMGE Solutions to cover 3–4 times with explanations

INSTRUCTIONS FOR FILLING THE SHEET

1. This sheet should not be folded or crushed.
2. Use only blue/black ball pen to fill the circles.
3. Use of pencil is strictly prohibited.
4. Circles should be darkened properly and completely.
5. Cutting & erasing on this sheet is not allowed.
6. Do not use any stray marks on the sheet.
7. Do not use marker, white fluid or any other device to hide the shading already done.

Model Test Paper-II

1. A feature of high-pressure low volume cuffs is?

- a. Higher incidence of postoperative sore throat
- b. Mucosal ischemia
- c. Higher risk of aspiration
- d. Risk of spontaneous extubation

2. Identify the instrument:

- a. Rigid bronchoscope
- b. Laryngoscope
- c. Otoscope
- d. Urethroscope

3. Options for “invasive airway” include.

- a. Supraglottic airway devices
- b. Endotracheal intubation
- c. Cricothyrotomy
- d. Combitube

4. The percentage of drug remaining in the plasma after 3 half life is

- a. 6.25%
- b. 12%
- c. 6%
- d. 12.5%

5. In preoperative interview patient tells you about history of DM II since last 10 years. Which particular investigation will you ask to check for recent control of the disease?

- a. Urine ketones
- b. Post prandial sugar
- c. Fasting sugar
- d. HBA1c

6. Daily production of CSF is?

- a. 250 ml/day
- b. 500 ml/day
- c. 750 ml/day
- d. 1000 ml/day

7. The most effective way of preventing tetanus:

- a. Surgical debridement and toilet
- b. Hyperbaric oxygen
- c. Antibiotics
- d. Tetanus toxoid

8. All are true regarding pseudomembranous colitis except:

- a. It is caused by Clostridium difficile
- b. The organism is a normal commensal of gut
- c. It is due to production of phospholipase A
- d. It is treated by vancomycin

9. The Corynebacterium species causing prosthetic valve endocarditis is

- a. C. Jeikeium
- b. C. Ulcerans
- c. C. Hoffmannii
- d. C. XEROSIS

10. The best method for destroying anthrax spores is:

- a. Dry heat at 140°C for 1 hour
- b. Boiling for 10 minutes
- c. 5% phenol for 6 hours
- d. Formaldehyde 2% for 20 minutes

11. The mu(μ) rhythm on EEG arises from?

- a. Primary visual area
- b. Primary auditory area
- c. Primary sensorimotor area
- d. Primary olfactory area

12. Pruning is:

- a. Programmed elimination during development
- b. Programmed elimination during senility
- c. Programmed elimination during cancer
- d. Programmed elimination during irradiation

13. Copropraxia is seen in:

- a. Dissociative disorder
- b. Frontotemporal Dementia
- c. Tourette's disorder
- d. Narcolepsy

14. All of the following are features of pathological grief, except:

- a. Onset of grief after 2 weeks
- b. Grief beyond 6 months
- c. Absence of grief symptoms
- d. Fleeting experience of the dead in the initial few days after their death

15. Which of the following symptoms is not part of a panic attack?

- a. Tinnitus
- b. Impending doom
- c. Breathing discomfort
- d. Trembling

16. Which ultrasound imaging mode accurately displays reflector depth?

- a. B-mode
- b. M-mode
- c. C-mode
- d. A-mode

17. Identify the gene that encodes for serine/ threonine kinase & with a loss of function mutation causes Peutz Jeghers syndrome:

- a. SMAD 4
- b. STK 11
- c. WT 1
- d. E cadherin

18. All of the following are paraneoplastic syndrome that can be associated with lung carcinoma except:

- a. Cushing's syndrome
- b. Hypercalcaemia
- c. Hypertrophic osteoarthropathy
- d. Hypoglycemia

19. High level of beta hCG is seen in all except:

- a. Neural tube defect
- b. Germ cell tumor
- c. Gestational trophoblastic disease
- d. Multiple pregnancy

20. Calculate bioavailability of the drug shown in image if $AUC(Injected) = 450$ and $AUC(oral) = 150$

- a. 25.55
- b. 33.33
- c. 35.66
- d. 36.66

21. Toughest layer of cornea that protects against infection to seep through the aqueous humor is

- a. Endothelium
- b. Stroma
- c. Descemet's membrane
- d. Bowman's membrane

22. Identify the sign

- a. Rizutti Sign
- b. Munson Sign
- c. Bow tie pattern
- d. Bull's eye sign

23. Identify

- a. Bitot's spots
- b. Pinguecula
- c. Pterygium
- d. Ocular surface squamous neoplasia

24. What is the drug of choice to control sudden onset supraventricular tachycardia?

- a. Adenosine
- b. Propranolol
- c. Verapamil
- d. Digoxin

25. A patient had RTA and was put on mechanical ventilation. He is opening his eyes on verbal command. He moves all his limbs spontaneously. What will be his GCS score?

- a. 9T
- b. 10T
- c. 11T
- d. 12T

26. Which is the most common mechanism of arrhythmia?

- a. Re-entry
- b. Early after depolarization
- c. Late after depolarization
- d. Automaticity

27. Visual field defect seen in Optic chiasma damage is

- a. Bitemporal hemianopia
- b. Pie in the floor (inferior Quadrantanopia)
- c. Pie in the sky (superior Quadrantanopia)
- d. Binasal Hemianopia

28. Nerve which is NOT directly related to humerus:

- a. Ulnar nerve
- b. Median nerve
- c. Radial
- d. Axillary nerve

29. Thoracic outlet syndrome is best diagnosed by:

- a. MRI
- b. CT
- c. Digital subtraction angiography
- d. Clinical examination

30. Which statement is true about the heart sounds:

- a. S1 is of higher frequency and longer duration as compared to S2.
- b. S2 is of higher frequency and longer duration as compared to S1.
- c. S1 has higher frequency but shorter duration compared to S2.
- d. S2 has higher frequency but shorter duration compared to S1.

31. Most medially located renal structure is:

- a. Renal pyramids b. Minor calyx
- c. Renal papillae d. Renal pelvis

32. Finger by which all the muscles in the hand can be tested

- a. Index b. Ring
- c. Thumb d. Middle

33. Select the wrong pair of Yolk muscles

- a. RSR LIO b. RSO LIR
- c. RMR LMR d. RIR LSO

34. Single skin lesion is seen in which type of leprosy?

- a. TT b. BL
- c. BT d. LL

35. All the following are inspiratory muscles except

- a. External intercostal b. Internal intercostal
- c. Diaphragm d. Elastic recoiling of lungs

36. Which of these is true about trachea?

- a. 20 cm long
- b. Trachea bifurcates at level of T6, in deep inspiration
- c. Lined by stratified columnar epithelium
- d. Tracheal cartilage is circular

37. On breast MRI, which of the following features of a breast mass is more suggestive of a malignant lesion than a benign lesion?

- a. Low-signal internal septations
- b. Lobulated mass which shows no enhancement
- c. Rim-like enhancement of the mass
- d. A focal area of hypointense T2 signal adjacent to the mass

38. Which of the following is the first to improve after surgery for GH producing adenoma?

- a. Impaired glucose tolerance
- b. Hypertension
- c. Cardiomegaly
- d. Soft tissue swelling

39. Which is the first drug to be started in Sheehan's syndrome?

- a. Gonadotropins b. Estrogen
- c. Thyroxine d. Corticosteroids

40. Prolactinoma presents with?

- a. Inferior quadrantanopia
- b. Superior quadrantanopia
- c. Priapism
- d. Failure of lactation

41. All are true about Diabetes insipidus except.

- a. Low urine osmolality
- b. Dilutional Hyponatremia
- c. Water deprivation test is used for diagnosis
- d. Polyuria

42. Inactivation of cortisol into cortisone occurs mainly in which organ?

- a. Lungs
- b. Liver
- c. Adrenals
- d. Kidney

43. Conn's syndrome is characterized by all except?

- a. Polyuria b. Polydipsia
- c. Weakness d. Anasarca

44. Which is not a feature of MEN 3?

- a. Medullated corneal nerve fibers
- b. Megacolon
- c. Mucosal neuroma
- d. Meningioma

45. In the clinical sign shown below, which is the best test for diagnosis?

- a. Thyroid Function test b. Thyroid Scan
- c. USG Neck d. CT neck

46. Reversible Dementia is a feature of?

- a. Hyperparathyroidism b. Hypothyroidism
- c. Hyperthyroidism d. Cushing's disease

47. TSH cannot be used for monitoring response to treatment in?

- a. Primary hypothyroidism
- b. Secondary hypothyroidism
- c. Thyroprivic hypothyroidism
- d. Iodine deficiency

48. Blade of grass lesion of found in?

- a. Osteoporosis
- b. Thalassemia
- c. Paget's disease
- d. Carcinoma prostate

49. Which type of diabetes has impaired glucose induced secretion of insulin with preserved β cell mass?
- MODY
 - Wolfram syndrome
 - Type 1 diabetes
 - Latent autoimmune diabetes in adults
50. Which of the following changes in the breast is NOT associated with pregnancy?
- Accumulation of lymphocytes, plasma cells, and eosinophils within the breast.
 - Enlargement of breast alveoli.
 - Release of colostrum.
 - Accumulation of secretory products in minor duct lumina.
51. **Hypocortisolism:**
- Is most often ACTH-dependent, owing to an ACTH-producing pituitary adenoma.
 - May be caused by small cell carcinoma of the lung, carcinoid tumors, tumors of the endocrine pancreas, pheochromocytoma, or medullary thyroid carcinoma (MTC).
 - In children is most often caused by adrenocortical neoplasia.
 - All of the above
52. **Estrogen receptor activity is clinically useful in predicting**
- The presence of ovarian cancer
 - The presence of metastatic disease
 - Response to chemotherapy
 - Response to hormonal manipulation
53. All of the following statements are true regarding histological features of ARDS except:
- In the acute stage, the lungs are heavy, firm, red, and boggy
 - Alveolar wall are lined by hyaline membrane
 - In the organizing stage, type I pneumocytes proliferate
 - In most cases the granulation tissue resolves, leaving minimal functional impairment
54. All of the following statements are true regarding asbestosis except:
- Amphiboles are more pathogenic
 - It begins in a upper zone
 - Can cause mesothelioma
 - Pulmonary hypertension is be seen
55. Most common cause of community acquired pneumonia is:
- | | |
|------------------|---------------|
| a. S. Pneumoniae | b. S. Aureus |
| c. M. Pneumoniae | d. Klebsiella |
56. CO_2 is carried in blood mainly by/in:
- Dissolved form
 - Carboxy-Hb
 - Bicarbonate form
 - Carbamino-compounds
57. Epilepsy is defined as:
- One or more unprovoked seizures
 - Two or more unprovoked seizures
 - Three or more unprovoked seizures
 - Four or more unprovoked seizures
58. Adenocarcinoma is the predominant malignant lesion in which of the following?
- Hard palate
 - Lip
 - Anterior two-thirds of the tongue
 - Larynx
59. The most important hepatic function to consider after hepatic resection is:
- Hepatic synthetic function.
 - Detoxification
 - The liver's role in lipid metabolism.
 - The liver's role in vitamin metabolism.
60. A patient is found to develop evidence of hepatitis approximately eight weeks after receiving blood transfusions during a surgical procedure. Which of the following statement(s) is/are true?
- The virus responsible is most likely hepatitis C
 - A chronic carrier state will never develop in most patients
 - There is no role for interferon in the treatment of chronic hepatitis C viral infection
 - Chronic infection with hepatitis C is not associated with an increased risk of developing hepatocellular carcinoma
61. Which of the following statement(s) is/are true concerning the pathophysiology of variceal hemorrhage?
- All patients with portal hypertension will develop esophageal varices
 - All patients with esophageal varices eventually bleed
 - Variceal size can predict the incidence of variceal hemorrhage
 - None of the above
62. Most common skin infection in children is:-
- | | |
|-------------------------|--------------------------|
| a. Scabies | b. Warts |
| c. Impetigo contagiosum | d. Molluscum contagiosum |
63. Hypopigmented patches may be seen in:
- | | |
|-------------------|-------------------|
| a. Becker's nevus | b. Nevus anemicus |
| c. Nevus of Ota | d. Nevus of Ito |
64. All of these are disorders associated with vitiligo except?
- | | |
|------------------------|----------------------|
| a. Androgenic Alopecia | b. Hypothyroidism |
| c. Addison's disease | d. Diabetes mellitus |
65. Radial keratotomy is done for:
- | | |
|-----------------|------------------|
| a. Myopia | b. Hypermetropia |
| c. Corneal scar | d. All the above |
66. Snowflake cataract is seen in:
- | | |
|-----------------------|----------------------|
| a. Myotonic dystrophy | b. Atopic dermatitis |
| c. Diabetes mellitus | d. Neurofibromatosis |

67. Which of these is not true regarding rubella cataract:
- Pearly white cataract
 - May harbor virus inside the lens
 - Can be associated with cardiovascular anomalies
 - Reversible
68. Correct sequence of sperm movement is:
- Rete testis–straight tubules–efferent tubules
 - Straight tubules–Rete testis–efferent tubules
 - Straight tubules–efferent tubules–epididymis
 - Straight tubules–Rete testis–epididymis
69. A 62-year-old farmer had received chemotherapy for cancer of the head and neck. He has developed classical multidrug resistance (MDR) to which of the following?
- Alkylating agents
 - Antimetabolites
 - Bleomycin
 - Vinca alkaloid
70. The renal arteries arise at which intervertebral level?
- T11/T12
 - T12/L1
 - L1/L2
 - L2/L3
71. The antibody with the highest affinity is
- IgG
 - IgA
 - IgM
 - IgD
72. Paul Bunnell is a type of:
- Agglutination reaction
 - CFT
 - Precipitation
 - Flocculation
73. Membrane attack complex is made up of
- C3Bb
 - C3b4b
 - C3b Bb 3b
 - C5b,6,7,8,9
74. C1 esterase deficiency leads to
- Systemic Lupus erythematosus
 - Angioneurotic edema
 - Pyogenic infections
 - Disseminated Neisserial infection
75. Endogenous pyrogens are
- IL-1 & TNF- α
 - IL-2 & TNF- α
 - IL-1 & TNF- β
 - IL-1 & IFN- γ
76. Which of the following has the least failure rate?
- CuT
 - LNG IUCD
 - DMPA
 - OC pills
77. Paralysis of 3rd, 4th, 6th nerves with involvement of ophthalmic division of 5th nerve, localizes the lesion to:
- Cavernous sinus
 - Apex of the orbit
 - Brainstem
 - Base of the skull
78. Which of the following is related to floor of tympanic cavity?
- Tensor tympani muscle
 - Eustachian tube.
 - Internal carotid artery
 - Internal jugular vein
79. All are true about Zenker's diverticulum except
- Results due to neuromuscular incoordination
 - Lies in the anterior wall of pharynx
 - They are normal in pig
 - Food may get accumulated
80. Derivatives of urogenital sinus include all except
- Bladder
 - Membranous urethra
 - Prostatic urethra
 - Ejaculatory duct
81. Which is derived from Wolffian duct?
- Appendix of testis
 - Uterus
 - Appendix of epididymis
 - Hydatid of morgagni (appendix of testis)
82. Which of the following is not a radiographic feature of pericardial effusion?
- 'Flask shaped' cardiac silhouette
 - Pulmonary oligemia
 - Pulmonary plethora
 - Spurious cardiomegaly
83. Visual defect is contralateral homonymous hemianopia with macular sparing. What is the cause for it?
- Block in optic tract
 - Block in optic nerve
 - Block in optic chiasma
 - Block in posterior cerebral artery supplying visual cortex
84. Which of the following is not a cerebellar lesion?
- Ataxia
 - Hypertonia
 - Intentional tremors
 - Nystagmus
85. Which of the following can cause both superior and inferior rib notching?
- Blalock Taussig shunt
 - Neurofibromatosis-1
 - Pulmonary atresia with large VSD
 - Interrupted Aorta
86. The most sensitive and practical technique for detection of myocardial ischemia in the perioperative period is:
- Magnetic Resonance Spectrography
 - Radio-labeled lactate determination
 - Direct measurement of end-diastolic pressure
 - Regional wall motion abnormality detected with the trans-esophageal echocardiography (TEE)
87. Which of the following is associated with atresia of the foramen of magendie and foramina of luschka?
- Cranium bifidum with meningoencephalocele
 - Cranium bifidum with meningoencephalocele
 - Arnold – Chiari syndrome
 - Dandy – Walker syndrome
88. Which is true about the skin disease seen in the picture below?
- Most common contagious skin disease in children
 - Caused by arthropods
 - Caused by Corynebacterium minutissimum
 - Idiosyncratic drug reaction

89. Which of these is a Rave drug?
- Cannabis
 - Hashish
 - Ecstasy
 - Heroin
90. Enzyme catalysing the rate-limiting step of glycolysis is:
- Hexokinase
 - Phosphofructokinase-1
 - Phosphoglyceratekinase
 - Pyruvate Kinase
91. Which artery does not contribute to Little's area:
- Septal branch of facial artery
 - Anterior ethmoidal artery
 - Sphenopalatine artery
 - Posterior ethmoidal artery
92. Fulminant hepatitis is most often seen with-
- HCV
 - HBV
 - HDV
 - HEV
93. Following a sudden impact in an accident, a 34-year-old race car driver becomes unconscious and is admitted to the hospital. A CT scan is performed, and a right space-occupying lesion is noted. What is the most likely diagnosis?

- Corpus callosum injury
- Pituitary apoplexia
- Acute subdural hematoma
- Acute epidural hematoma

94. Which of the following is correct regarding "with the rule astigmatism"?
- Horizontal Diameter is more
 - Vertical Diameter is more
 - Oblique Diameter is more
 - None of the above
95. Not true regarding atropine
- Used as an eye ointment
 - Used in refraction in children less than 5 yr of age
 - Fast action
 - Experimentally used in treatment of myopia
96. Which blood product is best for multiple clotting factor deficiency and active bleeding?
- FFP
 - Whole blood
 - Packed RBC
 - Cryoprecipitate
97. Postural tremors are seen in all except?
- Alcohol withdrawal
 - Essential tremors
 - Generalized paresis
 - Physiological tremors
98. A patient with ITP on steroids underwent splenectomy. Patient got fever on 3rd post-operative day. Next investigation is likely to reveal?
- Left lower lobe consolidation
 - Port site infection
 - Focal Intra-abdominal collection
 - UTI
99. Which statement is most appropriate for DIC?
- Increased fibrinogen
 - Increased D dimer
 - Resolves if causative factor removed
 - Absence of bleeding abnormalities rules out DIC
100. Thrombocythemia is characterized by?
- Platelets elevation
 - Low Platelets
 - Neutrophilia
 - Monocytosis
101. Which of these is a clotting factor?
- Kallikrein
 - Platelet phospholipid
 - Calcium
 - All of these
102. Microcytic Hypochromic anemia is seen in:
- Iron deficiency
 - Thalassemia
 - Hypoproteinemia
 - All of the above
103. Positive predictive value is a function of sensitivity, specificity and
- Incidence
 - Prevalence
 - Negative predictive value
 - Accuracy

- 104. Advantages of dialysis over renal transplantation include**
- Less expense if the treatment continues for less than 2 years
 - Increased number of pregnancies in female dialysis patients
 - Return of normal menses in female dialysis patients
 - Less anemia in dialysis patients
- 105. Which committee is known as “The Committee on Multipurpose Workers under Health and Family Planning”**
- Kartar Singh Committee
 - Mudaliar committee
 - Chadah committee
 - Jungalwalla committee
- 106. Site most infected in genital warts?**
- Vulva
 - Cervix
 - Vagina
 - Anus
- 107. Incubation period of chicken pox is:**
- 14–18 hours
 - 3 days
 - 1 week
 - 2–3 weeks
- 108. Protein quantity is assessed by?**
- Amino acid score
 - NPU
 - PE ratio
 - None
- 109. Which of the following portion of optic nerve is longest?**
- Intraorbital
 - Intraocular
 - Intracranial
 - Intracanalicular
- 110. Which of the following is not a primary sign of Vitamin A deficiency?**
- Corneal xerosis
 - Bitots Spots
 - Corneal Scar
 - Keratomalacia
- 111. Economic blindness is defined as**
- Vision <6/60 to 3/60
 - Vision <3/60 to 1/60
 - Vision <1/60 to Finger counting
 - No PL
- 112. Bow tie optic atrophy is seen in: -**
- 
- Glaucoma
 - Ischemic optic neuropathy
 - Chiasma lesion
 - Optic tract lesion
- 113. 35 year Alcoholic has presented with 2 episodes of hematemesis. On examination his pulse rate is 100/min with BP of 90/60 mm Hg. Per abdomen examination shows spleen palpable 3 cm below costal margin. Which is true about this patient?**
- Elevated CRP and Low C3
 - Most common site of bleeding is First part of duodenum
 - Urgent Elective intubation of patient
 - The increased pressure of portal vein pressure should be lowered with octreotide
- 114. All of the following are true regarding G.E.R.D. except?**
- Occurs during transient relaxation of LES.
 - Can present with nocturnal cough
 - Bicarbonate secreted by esophageal mucosa neutralizes the acid
 - Normal esophageal mucosa on endoscopy excludes G.E.R.D.
- 115. Gastro-esophageal tear is best detected with:**
- CT with oral contrast
 - Angiography
 - UGI endoscopy
 - Barium swallow
- 116. The following conditions can cause protein-losing enteropathy except?**
- Ulcerative colitis
 - Irritable bowel syndrome
 - Celiac disease
 - Lymphoma
- 117. Malabsorption syndrome features include all, except:**
- Anemia
 - Constipation
 - Tetany
 - Steatorrhea
- 118. Aspirin is given for?**
- Peptic ulcer disease
 - Transient ischemic attack
 - Hemorrhagic stroke
 - Protein losing enteropathy
- 119. Which of the following is regulated by Calcium-Calmodulin complex?**
- Smooth muscle contraction
 - Cell division
 - Endocytosis
 - All of the above
- 120. Most common cause of acute pancreatitis is:**
- Trauma
 - Hyperlipidemia
 - Alcoholism
 - Viral infection
- 121. A 20-year-old female presents with excess facial hair and oligomenorrhea, increased levels of free testosterone, and normal ovaries on USG. Most likely diagnosis is:**
- PCOD
 - Adrenal hyperplasia
 - Idiopathic hirsutism
 - Testosterone-secreting tumor
- 122. Decreased dietary intake of potassium is incriminated in leading to all except?**
- Hypertension
 - Stroke
 - CHF
 - Diabetes mellitus

- 123. Acute hyponatremia becomes symptomatic at:**
a. <135 mEq b. <125 mEq
c. <120 mEq d. <110 meq
- 124. Chronic vomiting leads to?**
a. Metabolic acidosis b. Metabolic alkalosis
c. Respiratory acidosis d. Respiratory alkalosis
- 125. Blast crisis leads to.**
a. Hyperphosphatemia b. Hypophosphatemia
c. Hyperkalemia d. Hypokalemia
- 126. What is the sequence of HIV following entry into a host cell?**
a. RNA – DNA – RNA b. RNA – DNA
c. DNA – RNA d. DNA – RNA – DNA
- 127. Dose of folic acid in prophylaxis of neural tube defects (in micrograms) in a primigravida, without any specific risk factors is?**
a. 40 b. 400
c. 4000 d. None of above
- 128. Approximate time interval between HIV infection and manifestations of AIDS is?**
a. 7.5 years b. 10 years
c. 12 years d. 15 years
- 129. All of the following patients should be tested for respiratory tuberculosis except?**
a. HIV positive patients with persistent cough
b. Diabetic patients with persistent cough
c. Known case of extra-pulmonary TB with persistent cough
d. Contact with sputum positive patient of TB with persistent cough
- 130. Burking includes:**
a. Choking b. Ligature
c. Overlying d. Traumatic asphyxia
- 131. Drug of choice for the treatment of peptic ulcer caused due to chronic use of NSAIDs is:**
a. Pirenzepine b. Loxatidine
c. Misoprostol d. Esomeprazole
- 132. Roopmati, a 56-year-old female with lymph-node-positive breast cancer was treated with systemic chemotherapy. Four weeks later, she developed frequent urination, suprapubic pain, dysuria, and hematuria. Which of the following could have prevented this patient's condition?**
a. Folinic acid b. Mesna
c. Dexrazoxane d. Amifostine
- 133. You decide not to prescribe sildenafil in a patient because the patient told you that he is taking an antianginal drug. Which of the following can it be?**
a. Calcium channel blockers
b. β adrenergic blockers
c. Organic nitrates
d. Angiotensin converting enzyme inhibitors
- 134. Which of the following is NOT associated with thiazide diuretics?**
a. Hypercalciuria b. Hyponatremia
c. Hypokalemia d. Hyperuricemia
- 135. Which of the following statements about imipenem is most accurate?**
a. The drug has a narrow spectrum of antibacterial action
b. It is used in fixed dose combination with sulbactam
c. In renal dysfunction, dosage reductions are necessary to avoid seizures
d. Imipenem is active against methicillin-resistant staphylococci
- 136. An old woman, Nanda suffered a stroke for which she was given alteplase. She improved considerably. To prevent the recurrence of stroke, this patient is most likely to be treated indefinitely with:**
a. Aspirin b. Warfarin
c. Urokinase d. Enoxaparin
- 137. Mr. Surya Kant was prescribed a first generation H1 antihistamine drug. He should be advised to avoid:**
a. Driving motor vehicles
b. Consuming processed cheese
c. Strenuous physical exertion
d. All of the above
- 138. Which of the following drugs is most likely to cause hypoglycemia when used as a monotherapy in the treatment of type 2 diabetes?**
a. Acarbose b. Glipizide
c. Metformin d. Rosiglitazone
- 139. All of the following are tumor suppressor genes, EXCEPT**
a. RB b. P53
c. VHL d. HER-2
- 140. Most common upper eyelid tumor is**
a. Squamous cell carcinoma
b. Sebaceous cell carcinoma
c. Basal cell carcinoma
d. Malignant melanoma
- 141. Reversible loss of polarity with abnormality in size and shape of cells is known as:**
a. Metaplasia b. Dysplasia
c. Hyperplasia d. Anaplasia
- 142. Dystrophic calcification is seen in:**
a. Atheroma
b. Paget's disease
c. Renal osteodystrophy
d. Milk-alkali syndrome
- 143. Which one of the following is true of antemortem abrasions?**
a. Bright red colour
b. Exudation of serum is more
c. Vital reactions are seen
d. All of the above

- 144. What is paradox gun:**
 a. A shot gun with smooth barrel
 b. A shot gun whose muzzle end is rifled
 c. A shot gun whose muzzle wider
 d. A rifle that fires a single ball
- 145. In a firearm injury if there is burning, blackening, tattooing around the wound and it is circular in shape, then it is a:**
 a. Close shot
 b. Close contact shot
 c. Contact shot
 d. Distant shot
- 146. Which of the following is not true about innate immunity?**
 a. It is present prior to antigenic exposure
 b. It is relatively non-specific
 c. Memory is seen
 d. It is the first line of defense
- 147. HLA is located on:**
 a. Long arm of chromosome 6
 b. Long arm of chromosome 3
 c. Short arm of chromosome 6
 d. Short arm of chromosome 3
- 148. Major source of Acetyl CoA:**
 a. Triglycerides
 b. Fatty acids
 c. Pyruvate
 d. Alanine
- 149. Most important source of ATP:**
 a. Oxidative phosphorylation
 b. Substrate level phosphorylation
 c. Aerobic glycolysis
 d. TCA
- 150. Cyanide is toxic because it:**
 a. Inhibits cytochrome oxidase
 b. Forms cyan methHb
 c. Inhibits Na-K ATPase
 d. Inhibits ATP carrier in mitochondria
- 151. Barbiturates act on ETC complex:**
 a. I
 b. II
 c. III
 d. IV
- 152. A 30-year-old presents with intractable vomiting and inability to eat or drink for the past 3 days. His blood glucose level is still normal. Which of the following is most important for the maintenance of Blood glucose in this patient?**
 a. Liver
 b. Heart
 c. Skeletal muscle
 d. Lysosome
- 153. Oil drop cataract is produced because of the activity of which enzyme?**
 a. Aldose reductase
 b. Galactose reductase
 c. Fructose dehydrogenase
 d. Sorbitol reductase
- 154. Which lipoprotein has maximum phospholipids?**
 a. HDL
 b. LDL
 c. VLDL
 d. Chylomicrons
- 155. Vaccine indicated in HIV positive baby of a HIV positive mother is:**
 a. Typhoral vaccine
 b. Yellow fever vaccine
 c. BCG vaccine
 d. Live varicella vaccine
- 156. Mortality is taken into account while computing:**
 a. Total fertility rate
 b. Gross reproduction rate
 c. Net reproduction rate
 d. General fertility rate
- 157. Minimum number of post-natal visits to be done by a Healthworker in rural areas is/are:**
 a. 1
 b. 2
 c. 3
 d. 4
- 158. Breastfeeding must be initiated within:**
 a. Half an hour
 b. One hour
 c. Two hours
 d. Four hours
- 159. What is the content of pediatric iron folic acid tablet supplied under the reproductive and child health programme?**
 a. Iron 60 mg, Folic Acid 500 mcg
 b. Iron 100 mg, Folic Acid 500 mcg
 c. Iron 500 mg, Folic Acid 100 mcg
 d. Iron 20 mg, Folic Acid 100 mcg
- 160. A group is addressed and a series of lectures is given on a specific health topic; this is a:**
 a. Focused group discussion (FGD)
 b. Panel discussion
 c. Symposium
 d. Workshop
- 161. Primary health centre (PHC) is supposed to provide all except:**
 a. Treatment of common ailments
 b. Surgeries for acute emergency conditions
 c. Vaccination
 d. Health education
- 162. Urine bag is disposed in _____ Biomedical waste management bag:**
 a. White
 b. Yellow
 c. Red
 d. Black
- 163. Reid's index is increased in which of the following?**
 a. Bronchiectasis
 b. Bronchial asthma
 c. Chronic bronchitis
 d. Emphysema
- 164. Caplan's syndrome is seen in:**
 a. COPD
 b. Pneumoconiosis
 c. Pulmonary edema
 d. Bronchial asthma
- 165. Xanthogranulomatous pyelonephritis is often associated with infection by:**
 a. Proteus
 b. E. coli
 c. H. Influenza
 d. Klebsiella
- 166. Staghorn calculus is made of:**
 a. Oxalate
 b. Phosphate
 c. Uric acid
 d. Cystine

167. Rule of nine to estimate surface area of a burnt patient was introduced by:
a. Mortix Kaposi b. Wallace
c. Joseph Lister d. Thomas Barclay
168. During fluid resuscitation in a burns patient using Parkland's formula, volume of fluid given in first 8 hours:
a. 25% b. 50%
c. 75% d. 100%
169. All of the following are markers of melanoma except:
a. S-100 b. Cytokeratin-20
c. HMB-45 d. Vimentin
170. Prognostic factor in head injury:
a. Age of patient b. Glasgow coma scale
c. Mode of injury d. Presence of facial trauma
171. Most common cause of subarachnoid hemorrhage is:
a. Hypertension b. AV malformation
c. Berry aneurysm d. Tumors
172. Most common brain tumor:
a. Meningioma b. Glioma
c. Metastasis d. Astrocytoma
173. Kaposi sarcoma is caused by:
a. HHV 17 b. HHV 8
c. HPV 16 d. Human simian virus 40
174. Blood borne spread is a feature of:
a. Carcinoma b. Sarcoma
c. Dysplasia d. Metaplasia
175. Which is true about lipoma?
a. It is hypoechoic
b. It is hypointense
c. It is hypodense
d. It has Hounsfield units of 200
176. Which contrast agent is given in perforation peritonitis?
a. Iohexol b. Iodixanol
c. Diatrizoate d. Metrizoate
177. Microbubbles are used as contrast in
a. X-ray b. CT
c. USG d. MRI
178. A 60-year-old male has bone pain, vertebral collapse, fracture pelvis, the probable diagnosis is:
a. Multiple myeloma b. Secondaries
c. TB d. Hemangioma of bone
179. Drug of choice for treatment of acute organophosphate poisoning is:
a. Atropine b. Pralidoxime
c. Neostigmine d. d-Tubocurarine
180. All of the following statements are correct about varicocele except:
a. Common on the right side
b. Can present as a later sign of renal cell carcinoma
c. Has bag of worm like feeling
d. Can lead to infertility
181. Fournier's gangrene occurs in the:
a. Toes b. Scrotum
c. Fingers d. Muscles
182. Most common testicular tumor in prepubertal adults is:
a. Yolk sac tumor b. Embryonal cell Ca
c. Seminoma d. Teratoma
183. A patient, resident of Himachal Pradesh presented with a series of ulcers in a row, on his right leg. The biopsy from the affected area was taken and cultured on Sabouraud's Dextrose agar. What would be the most likely causative organism?
a. Sporothrix schenckii b. Cladosporium spp.
c. Pseudallescheria boydii d. Nocardia brasiliensis
184. Pityriasis versicolor is caused by-
a. E. floccosum b. M. gypsum
c. M. furfur d. T. tonsurans
185. Man is secondary host for-
a. Malaria b. Tuberculosis
c. Filariasis d. Relapsing fever
186. The most important reservoir of Leishmaniasis in India is-
a. Dogs
b. Rodents
c. Man
d. Case of post Kala azar dermal Leishmaniasis
187. IgE is secreted by
a. Mast cell b. Basophils
c. Eosinophils d. Plasma cells
188. The arrow is pointing towards which of the following structures?

a. L2-L3 intervertebral disc space
b. L3-L4 intervertebral disc space
c. L4-L5 intervertebral disc space
d. L5-S1 intervertebral disc space
189. Muscle which acts as tensor of vocal cord is supplied by
a. RLN
b. Internal laryngeal nerve
c. External laryngeal nerve
d. Glossopharyngeal nerve

190. A 9-year-old child presented to ENT OPD with Hoarse voice, Croupy cough, Inspiratory stridor & Increasing dyspnea. On palpation of neck, patient also had Bull neck lymphadenopathy. Child also had membrane formed over tonsil, which bleeds on removal. Identify the condition.
- Laryngeal TB
 - Laryngeal diphtheria
 - Syphilis larynx
 - Leprosy larynx
191. Most common site of laryngeal involvement in Wegener's granulomatosis is:
- Supraglottis
 - Glottis
 - Subglottis
 - Epiglottis
192. All of the following cause grayish white membrane formation on tonsils except
- Infectious mononucleosis
 - Streptococcal tonsillitis
 - Diphtheria
 - Ludwig's Angina
193. Cock-up splint is used in management of:
- Ulnar nerve palsy
 - Brachial plexus palsy
 - Radial nerve palsy
 - Combined ulnar and median nerve palsy
194. Winging of scapula is due to palsy of:
- Long thoracic nerve
 - Nerve to latissimus dorsi
 - Spinal accessory nerve
 - Nerve to rhomboid
195. Nail bed of index finger is supplied by:
- Median nerve
 - Ulnar
 - Palmar Branch of median nerve
 - Palmar branch of ulnar nerve
196. Which of the following mucopolysaccharide is responsible for retinal cell-cell attachment?
- Keratin sulfate
 - Dermatan sulfate
 - Chondroitin sulfate
 - Heparan sulfate
197. Enantiomers are isomers that differ in structure at which carbon?
- Last Carbon
 - First Carbon
 - Penultimate Carbon
 - Carbonyl Carbon
198. Nasolacrimal duct opens into which meatus?
- Inferior Meatus
 - Middle Meatus
 - Superior Meatus
 - Supreme Meatus
199. Which of the following promotes rouleaux formation?
- Zeta potential on RBC membrane
 - Fibrinogen
 - Albumin
 - Biconcave shape of RBC
200. In blood coagulation, the rate-limiting step is:
- Fibrinogen to fibrin conversion by action of thrombin
 - Conversion of prothrombin to thrombin
 - Activation of factor X
 - Action of factor VIII
201. Heme is synthesized in which part of the erythroblastic cells?
- Golgi complex
 - Ribosomes
 - Endoplasmic reticulum
 - Mitochondrial matrix
202. SAFE strategy has been developed for the control of:
- Onchocerciasis
 - Trachoma
 - Refractive error
 - Ocular trauma
203. 'NIKSHAY' is a newly launched central government software. It is used for tracking:
- High risk newborns
 - Malaria
 - Tuberculosis
 - High risk pregnancies
204. A screening test is applied for screening of liver cancer in a population of 500. The test shows positive result in 80 individuals and negative in remaining 420. Out of 80 positive individuals 60 confirmed to be diagnosed with liver cancer by diagnostic test and 20 were ruled out. Out of negative 420 individuals 40 had liver cancer. The sensitivity of the test is:
- 60%
 - 80%
 - 90%
 - 95%
205. Hawthorne effect is seen in:
- Case-control study
 - Cohort study
 - Cross-sectional study
 - Retrospective cohort study
206. All of the following are advantages of case control studies except:
- Useful in rare disease
 - Relative risk can be calculated
 - Odds ratio can be calculated
 - Cost-effective and inexpensive
207. Efficacy of new drug A is compared with an existing drug B in:
- Clinical trial phase I
 - Clinical trial phase II
 - Clinical trial phase III
 - Clinical trial phase IV
208. Which is NOT a benefit of Randomization?
- Reduction of bias in selection of groups
 - Ensure comparability of both groups
 - Facilitates blinding of treatment
 - Increases external validity of study
209. Vaccine derived poliovirus outbreaks are mostly due to:
- Type-2 virus
 - Type-3 virus
 - Type-1 virus
 - All of the above
210. Naltrexone is:
- Mu receptor agonist
 - Delta receptor agonist
 - Kappa receptor agonist
 - Mu receptor antagonist
211. All of the following are used in management of acute severe bleeding due to warfarin overdose except:
- Withhold the anticoagulant
 - Vitamin K1
 - Protamine sulphate
 - Fresh frozen plasma

212. Suprarenal gland develops from:

- a. Metanephros
- b. Ureteric bud
- c. Neural crest
- d. Endoderm

213. All are true about brachial plexus EXCEPT:

- a. Lower trunk is formed by root C8 and T1
- b. Lateral cord is formed by upper and middle trunk
- c. Posterior cord is formed by posterior divisions of all three trunks
- d. C4 root is post fixed to plexus

214. Nerve supply to the perineum is

- a. Pudendal nerve
- b. Inferior rectal nerve
- c. Pelvic splanchnic nerves
- d. Hypogastric plexus

215. Sacral promontory is the landmark for

- a. Origin of superior mesenteric artery
- b. Termination of presacral nerve
- c. Origin of inferior mesenteric artery
- d. None of the above

216. What is the ideal time for doing quadruple test?

- a. 8–12 weeks
- b. 11–15 weeks
- c. 15–18 weeks
- d. 18–22 weeks

217. The best gas used for pneumoperitoneum laparoscopy is

- a. N₂
- b. O₂
- c. CO₂
- d. NO

218. Most common type of monozygotic twin pregnancy is:

- a. Monochorionic Monoamniotic twins with Siamese presentation
- b. Monochorionic Monoamniotic (MO-MO) twins
- c. Monochorionic Diamniotic twins (MO-DI)
- d. Dichorionic Diamniotic twins (DI-DI)

219. All are causes of primary amenorrhea EXCEPT

- a. MRKH syndrome
- b. Sheehan's syndrome
- c. Kallmann syndrome
- d. Turner's syndrome

220. GFR is increased by all of the following EXCEPT:

- a. Increased renal blood flow
- b. Efferent arteriolar constriction
- c. Renal stone in ureter
- d. Decreased oncotic pressure

221. Which of the following presents as nephritic syndrome?

- a. P.I.G.N
- b. Minimal change disease
- c. F.S.G.S
- d. Membranous Glomerulopathy

222. Following diagram represents which obstetric grips during palpation?

- a. First Leopold
- b. Second Leopold
- c. Third Leopold
- d. Fourth Leopold

223. The most common cause of tubal block in India is:

- a. Gonorrhea infection
- b. Chlamydia infection
- c. Tuberculosis
- d. Bacterial vaginosis

224. CA-125 is a marker antigen for the diagnosis of:

- a. Colon cancer
- b. Breast cancer
- c. Brain cancer
- d. Ovarian cancer

225. A 13-year-old young girl presents in the casualty with acute pain in the lower abdomen. She has history of cyclical pain for last 6 months and she has not attained her menarche yet. On local genital examination, a tense bulge in the region of hymen was seen. The most probable diagnosis is:

- a. Rokitansky Kuster Hauser syndrome
- b. Testicular feminization syndrome
- c. Imperforate hymen
- d. Asherman's syndrome

226. hCG is secreted by:

- a. Trophoblast cells
- b. Amniotic membrane
- c. Fetal yolk sac
- d. Hypothalamus

227. Which of the following IUCD has a life span of 10 years?

- a. Cu 380 A
- b. Cu 200
- c. LNG IUS
- d. Multiload

228. Nuchal translucency more than 3 mm at 14 weeks is suggestive of

- a. Down syndrome (Trisomy 21)
- b. Oesophageal atresia
- c. Edwards syndrome (Trisomy 18)
- d. Foregut duplication cyst

229. Late deaths in burns is due to:

- a. Sepsis
- b. Hypovolemia
- c. Contractures
- d. Neurogenic

- 230. Which of the following is true about Marjolin's ulcer?**
 a. Ulcer over scar b. Rapid growth
 c. Rodent ulcer d. Painful
- 231. Characteristic feature of basal cell carcinoma is:**
 a. Keratin pearls b. Foam cells
 c. Nuclear palisading d. Psammoma bodies
- 232. Spontaneous regression is seen in all except:**
 a. Salmon patch
 b. Small cavernous hemangioma
 c. Portwine stain
 d. Strawberry angioma
- 233. Delayed wound healing is seen in all except:**
 a. Malignancy b. Hypertension
 c. Diabetes d. Infection
- 234. Which of the following is marker for carcinoma?**
 a. Cytokeratin b. Vimentin
 c. Calcitonin d. CD-45
- 235. Most common cause of skeletal metastasis is:**
 a. Kidney b. Prostate
 c. Breast d. Thyroid
- 236. In which case spontaneous regression is not seen?**
 a. Malignant melanoma b. Osteosarcoma
 c. Neuroblastoma d. Choriocarcinoma
- 237. The most common pure germ cell tumor of the ovary is:**
 a. Choriocarcinoma b. Dysgerminoma
 c. Embryonal cell tumor d. Malignant Teratoma
- 238. The best way of diagnosing Trisomy-21 during second trimester of pregnancy is:**
 a. Triple marker estimation
 b. Nuchal skin fold thickness measurement
 c. Chorionic villus sampling
 d. Amniocentesis
- 239. The shortest diameter in fetal head is:**
 a. Biparietal diameter
 b. Bimastoid diameter
 c. Occipito frontal diameter
 d. Bitemporal Diameter
- 240. Not used as emergency contraception**
 a. Intrauterine LNG system
 b. Mifepristone
 c. Oral LNG
 d. Copper intrauterine device
- 241. Pure gonadal dysgenesis will be diagnosed in the presence of:**
 a. Bilateral streak gonads
 b. Bilateral dysgenetic gonads
 c. One side streak and other dysgenetic gonads
 d. One side streak and other normal looking gonad
- 242. Which of the following drug is not used for medical management of ectopic pregnancy?**
 a. Potassium Chloride b. Methotrexate
 c. Actinomycin D d. Misoprostol
- 243. The following is always an indication of Caesarean section, except:**
 a. Abruptio Placentae
 b. Untreated stage of II B Ca cervix
 c. Active genital herpes
 d. Type IV Placenta Previa (major previa)
- 244. Most common ovarian tumor to undergo torsion**
 a. Benign cystic teratoma b. Dysgerminoma
 c. Serous adenoma d. Brenners tumour
- 245. Not true about Red degeneration of myomas:**
 a. It occurs commonly during pregnancy
 b. Immediate surgical intervention is needed
 c. Due to interference with blood supply
 d. Treated with analgesics
- 246. Best parameter for estimation of fetal age by ultrasound in third trimester is:**
 a. Femur length
 b. Biparietal diameter
 c. Abdominal circumference
 d. Inter-ocular distance
- 247. All of the following statements are true except:**
 a. Oxytocin sensitivity is increased during delivery
 b. Prostaglandins may be given for inducing abortion during IInd trimester
 c. In lactating women genital stimulation enhances oxytocin release
 d. Oxytocin is used for inducing abortion in 1st trimester
- 248. From what cm of cervical dilatation is partogram plotted in regular intervals?**
 a. 4 cm b. 5 cm
 c. 6 cm d. 8 cm
- 249. Mirena has to be replaced after:**
 a. 1 year b. 5 years
 c. 3 years d. 6 months
- 250. A 35-year-old mother of two children is suffering from amenorrhea for last 12 months. She has history of failure of lactation following 2nd delivery but remained asymptomatic thereafter. Skull X-ray shows "Empty sella". Most likely diagnosis is:**
 a. Menopause
 b. Pituitary tumor
 c. Sheehan's syndrome
 d. Intraductal papilloma of breast
- 251. Pap smear is useful in the diagnosis of all, except**
 a. Gonorrhoea
 b. Trichomonas vaginalis
 c. Human papilloma virus
 d. Inflammatory changes
- 252. Most Definitive test for evaluating Intracranial aneurysms is.**
 a. CT b. MRI
 c. Angiography d. PET

253. In myxedema, yellowish tint of the skin is due to:

- Increased levels (decreased elimination) of bilirubin
- Increased carotene in the skin
- Anaemia
- Increased cholesterol levels in plasma

254. In the development of an ovum, second meiotic division is completed:

- Just before ovulation
- Just after ovulation
- Just before fertilization
- Just after fertilization

255. Oxygen saturation of blood in the umbilical artery is about:

- 40%
- 60%
- 75%
- 97%

256. The basic reason for “reperfusion injury” to the myocardium is:

- Generation of free radicals
- Extension of the ischemic zone
- Increased ICF $[Ca^{++}]$
- Increased ECF $[Ca^{++}]$

257. Bifid (or “M” shaped) P-wave on an ECG may be seen in:

- Mitral stenosis
- Atrial flutter
- WPW syndrome
- Sinus bradycardia

258. Clinical features of Kartegener’s syndrome include

- Recurrent sinusitis
- Bronchiectasis
- Situs inversus
- All of the above

259. A 15-year-old boy presents with enophthalmos after trauma to face by cricket ball. CT Scan of face revealed following finding. What would be the most common orbital wall involved?

- Floor
- Medial wall
- Lateral wall
- Superior wall

260. Identify the type of septal fracture shown below & comment on fracture line.

- Chevallet Fracture
- Jarjaway Fracture
- Gurein fracture
- Lefort Fracture

261. What is the ionic basis for after-depolarization in a record of an AP?

- Entry of Ca^{++} via slow channels.
- Late entry of Na^+ via channels that have been activated.
- Altered gradient for K^+ movement.
- Prolonged open state of K^+ channels.

262. The image given below shows two scenarios (A and B) when 2 Kgs of weight is applied to the muscle in its relaxed state. Choose the correct statement regarding the scenarios:

- B has done more work than A
- B has both preload and afterload added to it
- B has undergone maximum tension
- A has produced isometric tension

263. A 12-year-child, who has intellectual disability, is having large face, large jaw, large ear and macroorchidism. Diagnosis is

- Mc Cune Albright syndrome
- Down syndrome
- Cri-du chat syndrome
- Fragile X syndrome

264. Infraclavicular lesion of tuberculosis is known as:

- Ghon’s focus
- Puhl’s focus
- Assmann’s focus
- Simon’s focus

265. Unlawful abortion of a woman with her consent is punishable under

- 310 IPC
- 312 IPC
- 313 IPC
- 314 IPC

- 266. In camera trial of a rape case hearing is done under**
 a. 376 IPC b. 327 (2) CrPC
 c. 53 CrPC d. 375 IPC
- 267. Pick out the cell seen in Rhinoscleroma**
 a. Sarcoid bodies b. Asteroid bodies
 c. Mikulicz cells d. Langerhans cells
- 268. Histogram is used to describe**
 a. Quantitative data of a group of patients
 b. Qualitative data of a group of patients
 c. Data collected on nominal scale
 d. Data collected on ordinal scale
- 269. For a given set of values, Mean = 20, Median = 24 & Mode = 26. The given distribution is:**
 a. Symmetric
 b. Right-skewed
 c. Left-skewed
 d. Can be either symmetric or skewed
- 270. Which of these is not a Parametric test of significance?**
 a. Z-test b. ANOVA
 c. Student 't-test' d. Chi-square test
- 271. While applying chi-square test to a contingency table of 4 rows and 4 columns, the degree of freedom would be:**
 a. 1 b. 4
 c. 9 d. 8
- 272. Contraceptive efficacy is measured by:**
 a. Pearl index only
 b. Pearl index and life table analysis
 c. Life table analysis and couple protection rate
 d. Pearl index and couple protection rate
- 273. All are included in Kangaroo Mother Care except:**
 a. Skin to skin contact
 b. Early discharge and follow up
 c. Free nutritional supplements
 d. Exclusive Breast feeding
- 274. The Medical Termination Of Pregnancy Act does not protect act of termination of pregnancies after:**
 a. 20 weeks b. 24 weeks
 c. 28 weeks d. 30 weeks
- 275. Lice are not the vector of:**
 a. Relapsing fever b. Q fever
 c. Trench fever d. Epidemic typhus
- 276. Most common site of Otosclerotic focus is**
 a. Fissula ante fenestram
 b. Fissula post fenestram
 c. Round window
 d. Stapes supra-structure
- 277. The vector for KFD is:**
 a. Aedes aegypti b. Haemaphysalis
 c. Culex d. Xenopsylla
- 278. MCC of Cervical cancer in India is:**
 a. HPV 31, 33 b. HPV 6, 11
 c. HPV 16, 18 d. HPV 31, 45
- 279. Disease not included in Vision 2020, India is:**
 a. Cataract b. Glaucoma
 c. Diabetic retinopathy d. Onchocerciasis
- 280. Ideal Tuning fork to test hearing in normal adult is**
 a. 125 Hz b. 256 Hz
 c. 512 Hz d. 1024 Hz
- 281. Organ of Corti is present on**
 a. Reissner's membrane
 b. Basilar membrane
 c. Tectorial membrane
 d. Secondary Tympanic membrane
- 282. Triad of Meniere's disease includes all except**
 a. Vertigo b. Hearing loss
 c. Tinnitus d. Diplopia
- 283. Phelp sign is seen in**
 a. Otosclerosis b. Glomus tumors
 c. Meniere disease d. CSOM
- 284. All of the following should be avoided by a patient with lactose intolerance, except:**
 a. Condensed milk b. Ice-cream
 c. Skimmed milk d. Yoghurt
- 285. According to MCI, medical records of patients must be maintained by a Practitioner for a minimum period of:**
 a. 1 year b. 2 year
 c. 3 year d. 5 year
- 286. Illusion is:**
 a. Misinterpretation of real objects
 b. False, firm belief
 c. Absence of sensory stimulus
 d. Hearing of voices
- 287. Pure Aryans have which type of skull:**
 a. Mesaticephalic b. Brachycephalic
 c. Dolicocephalic d. None of the above
- 288. A child can make a tower of 6 cubes at the age of?**
 a. 36 months b. 18 months
 c. 12 months d. 24 months
- 289. Earliest sign of puberty in females is?**
 a. Growth spurt b. Pubarche
 c. Thelarche d. Menarche
- 290. Identify this skin lesion in a newborn seen in first week of life:**

- a. Milia b. Stork bite
 c. Erythema toxicum d. Epstein pearls

291. Conjugated hyperbilirubinemia in infancy is seen in:

- a. Gilbert syndrome
- b. Crigler Najjar syndrome
- c. Dubin Johnson syndrome
- d. Erythroblastosis fetalis

292. What is this device used by health workers to assess nutritional status of under-5 children?

- a. Harpenden calipers
- b. Shakir's tape
- c. Orchidometer
- d. Infantometer

293. Which disease is this child suffering from?

- a. Kwashiorkor
- b. Marasmus
- c. Rickets
- d. Achondroplasia

294. First clinical sign of vitamin A deficiency:

- a. Poor growth
- b. Conjunctival xerosis
- c. Hydrocephalus
- d. Phrynoderma

295. What is the most common underlying cause responsible for the disease in which this X ray finding is seen?

- a. Calcium deficiency
- b. Phosphate deficiency
- c. Vit D deficiency
- d. Vit C deficiency

296. Most common cardiac anomaly in Turner's Syndrome is?

- a. Coarctation of aorta
- b. Bicuspid aortic valve
- c. Ventricular septal defect
- d. Atrial septal defect

297. "Boot shaped" heart is seen in:

- a. Fallot's tetralogy
- b. Transposition of great vessels
- c. Ebstein's anomaly
- d. Ventricular septal defect

298. Severe hypothermia in a neonate refers to axillary temperature less than:

- a. 36.5 C
- b. 36 C
- c. 34 C
- d. 32 C

299. Definition of Extremely low birth weight neonate is?

- a. <2500 gm of birth weight
- b. <1500 gm of birth weight
- c. <1000 gm of birth weight
- d. <700 gm of birth weight

300. Most common cause of Bronchiolitis is:

- a. RSV
- b. Adenovirus
- c. Hospitalize and treat
- d. Mycoplasma
